Memorandum: ***Date:*** **July 8, 2021**

TO: Baltimore County
400 Washington Avenue
Towson, MD 21204

FROM: Mike Lenhart

RE: Greenspring Station Development – Mays Chapel Road Connection Analysis

Executive Summary

Purpose of Analysis:
This memorandum presents a supplemental analysis for the Greenspring Station development, located at 2310 W. Joppa Road, in Baltimore County. The subject development previously completed a Traffic Impact Study, dated December 9, 2020, which was reviewed and approved by both the Maryland State Highway Administration (SHA) and Baltimore County. In June, 2021, Baltimore County staff requested an analysis to review the potential for connection of Mays Chapel Road between Joppa Road and Seminary Avenue, through The Meadows of Green Spring existing neighborhood and the proposed Greenspring Station neighborhood. In response to this request, this supplemental memorandum presents the analysis and results of the potential connection along Mays Chapel Road between Joppa Road and Seminary Avenue.

Results:
Key findings of the analysis included:

- A sensitivity analysis was conducted in order to determine the potential volume of traffic that may be induced to divert through the Mays Chapel Road Connection, as opposed to traveling along Falls Road (MD 25), if the connection were to be constructed. The results of the sensitivity analysis show that the route through the Mays Chapel Road Connection would incentivize the diversion of up to approximately 250 vehicles during the AM peak hour and 389 vehicles during the PM peak hour, in addition to likely thousands of other vehicles per day during off peak times.
    - This translates to more than four vehicles per minute during the AM peak hour and more than six vehicles per minute, or one vehicle every nine seconds, during the PM peak hour that would be incentivized to cut through The Meadows of Green Spring residential neighborhood and proposed Greenspring Station residential neighborhood, as opposed to remaining on Falls Road.
- Falls Road is designated as a Minor Collector by the Maryland Department of Transportation-State Highway Administration (MDOT-SHA) and is designed to handle relatively high volumes of traffic, whereas the existing section of Mays Chapel Road within The Meadows of Green Spring neighborhood is a local street and is not designed for high volumes of traffic.

  - Specifically, the existing paved section of Mays Chapel road has a typical width of approximately 24-feet, with some locations where the width is slightly less. In addition, vehicles occasionally park on the street, thereby further reducing the functional pavement width.
    - This typical section is not designed to handle a high volume of traffic, and, with the potential growth in traffic associated with the Mays Chapel Road Connection, the typical section would not meet the County's minimum paved width requirement of 27 feet for an Urban Residential Street with an ADT greater than 750, as set forth in the Baltimore County Design Manual, Chapter 8, Roads and Streets, Plate R-A.
  - In addition to the above, there are no sidewalks or separated bicycle facilities present along the existing portion of Mays Chapel Road, and an increased volume of traffic would be likely to lead to an increase in conflicts between vehicles and pedestrians/bicyclists within the neighborhood, potentially impacting safety within the community.

- With respect to the intersection operations analysis for the potential Mays Chapel Road Connection, the results of the analysis show that with the Mays Chapel Road Connection, the intersection of Joppa Road & Mays Chapel Road will operate at a failing level of service (LOS), LOS E.
  - In the previously approved Traffic Impact Study, without the Mays Chapel Road Connection, all intersections were shown to operate at acceptable levels of service.
- Beyond the intersection of Joppa Road & Mays Chapel Road, the remaining intersections along Falls Road that were included in the original traffic impact study would operate similarly with and without the Mays Chapel Road Connection; the Mays Chapel Road Connection does not provide meaningful improvement to the intersections along Falls Road that were common to both the 'with connection' analysis and 'without connection' analysis.
- It should be noted that the improvement proposed for the intersection of Falls Road & Joppa Road by the Greenspring Station development improves operations at the intersection to better than existing conditions operations, regardless of whether the Mays Chapel Road Connection is completed or not.

Conclusion

The potential connection of Mays Chapel Road between Joppa Road and Seminary Avenue, through the existing Mays Chapel neighborhood and proposed Greenspring Station neighborhood is not recommended.

The Mays Chapel Road Connection is likely to result in a significant volume of traffic diverting from Falls Road to the Mays Chapel Road Connection, without providing meaningful improvement along Falls Road. Critically, whereas Falls Road is designed to handle significant traffic volumes, Mays Chapel Road is a local street, which is not designed sufficiently to accommodate high traffic volumes. The additional diverted traffic along Mays Chapel Road would result in the existing section of Mays Chapel Road no longer being in compliance with the Baltimore County Design Manual. The potential connection would be likely to result in safety concerns along Mays Chapel Road, in addition to negatively impacting residents of The Meadows of Green Spring and the proposed Greenspring Station neighborhoods. Furthermore, the intersection of Joppa Road & Mays Chapel Road will operate with a LOS "E" during the evening peak hour as a result of the connection, whereas all intersections operated acceptably under the original, approved traffic impact study, which did not include the Mays Chapel Road Connection.

Body of Report

Introduction

This memorandum presents a supplemental analysis for the Greenspring Station development, located at 2310 W. Joppa Road, in Baltimore County. The subject development previously completed a Traffic Impact Study, dated December 9, 2020, which was reviewed and approved by both the Maryland State Highway Administration (SHA) and Baltimore County. In June, 2021, Baltimore County staff requested an analysis to review the potential for connection of Mays Chapel Road between Joppa Road and Seminary Avenue, through The Meadows of Green Spring existing neighborhood and the proposed Greenspring Station neighborhood. In response to this request, this supplemental memorandum presents the analysis and results of the potential connection along Mays Chapel Road between Joppa Road and Seminary Avenue.

The original Traffic Impact Study included the following three intersections: MD 25 & MD 130, MD 25 at Falls Road/Joppa Road, and Joppa Road at the proposed Greenspring Station access. In order to analyze the impact of the potential Mays Chapel Road connection, the following intersections were included in addition to the three intersections from the original Traffic Impact Study: MD 25 at MD 131/W. Seminary Road and MD 131 at Mays Chapel Road. As the additional intersections were not required as part of the scope of the Traffic Impact Study, these intersections are included for informational purposes only.

Exhibit 1 — Exhibit 1 shows the Location Map of the intersections included in the supplemental analysis. Intersections 1, 2, and 3 were included in the original, approved Traffic Impact Study. Intersections 4 and 5 have been included in the supplemental analysis in order to determine the impact of the potential Mays Chapel Road Connection.

Existing Conditions

The volumes for Intersections 1, 2, and 3 were obtained from the original Traffic Impact Study. The volumes at Intersection 4 were obtained from an MDOT SHA traffic count dated February 27, 2020. No traffic data was available for Intersection 5. As such, the inbound and outbound volumes along Mays Chapel Road were obtained by using the ITE Trip Generation Manual to obtain the number of trips generated by the community located along Mays Chapel Road. The through volumes along MD 131 at Intersection 5 were flowed from Intersection 4. The MDOT SHA traffic count and the trip generation and assignment for the community along Mays Chapel Road are located in Appendix A.

Exhibit 2 — Exhibit 2 shows the Existing Lane Use & Traffic Control Devices at each of the study intersections.

Exhibit 3 — Exhibit 3 shows the Existing Peak Hour Volumes.

Background Conditions

A growth rate of 1.5% was applied to the volumes shown on Exhibit 3, the same rate used in the original Traffic Impact Study. Per the original Traffic Impact Study, there are no background developments that will impact the study intersections.

Exhibit 4 — Exhibit 4 shows the Background Peak Hour Volumes, which were obtained by applying the 1.5% growth rate to the volumes shown on Exhibit 3.

Total Conditions – Sensitivity Analysis

A sensitivity analysis was conducted to determine the volume of traffic that would be likely to divert through the Mays Chapel Connection, as opposed to traveling along Falls Road. The Mays Chapel Connection would provide a shorter, more-direct path to travel between Joppa Road and Seminary Avenue, while also providing the ability to avoid the traffic signals along Falls Road. This sensitivity analysis considers increasing diversion percentages to determine if/when using the Mays Chapel Connection would potentially incentivize drivers to utilize the new connection rather than staying on Falls Road. The diverting volumes were taken from the northbound right turn and westbound left turn movements at the intersection of Falls Road at Seminary Road for vehicles destined northbound and southbound along Falls Road, respectively. The diverted volumes were rerouted along Mays Chapel Road. The total amount of Highway Capacity Manual (HCM) delay along the respective travel routes was obtained, and the results are shown on the following exhibits:

Exhibit 5 — Exhibit 5 shows the HCM delay associated with the northbound travel route with varying levels of diversion from Falls Road to the Mays Chapel Connection. As shown, during the morning peak hour the Mays Chapel Connection route accrues less delay than the Falls Road route with up to 100% diversion. During the evening peak hour the Mays Chapel Connection accrues less delay than the Falls Road route with up to 66% diversion. The diversion volumes and subsequent total peak hour volumes are shown in Appendix B.

Exhibit 6 — Exhibit 6 shows the HCM delay associated with the southbound travel route with varying levels of diversion along the Mays Chapel Connection. As shown, the Falls Road route will accrue less delay than the Mays Chapel Connection route during both peak hours. The diversion volumes and subsequent total peak hour volumes are shown in Appendix B.

Based on the results of the sensitivity analysis, up to 100% of vehicles during the AM peak hour and up to 66% of vehicles during the PM peak hour of vehicles traveling in the northbound direction could be induced to utilize the Mays Chapel Road Connection. This equates to approximately 250 vehicles during the AM peak hour and 389 vehicles during the PM peak hour, in addition to likely thousands of other vehicles per day during off peak times. In the southbound direction, the results of the sensitivity analysis did not show any likely induced demand for vehicles to utilize the Mays Chapel Road Connection.

While the sensitivity analysis is instructive in terms of the volume of traffic that could be induced to utilize the Mays Chapel Road Connection, it is unlikely that 100% of traffic would actually divert from its current route in the northbound direction or that 0% of traffic would divert in the southbound direction. Therefore, for the purposes of providing a more-realistic analysis, it was assumed that 33% of northbound vehicles will divert to use the Mays Chapel Road Connection, while 15% of southbound vehicles will divert to the connection.

Total Conditions – Operational Analysis

The Greenspring Station development is proposed to consist of 62 single family units, with a single full movement site access point along Joppa Road, coinciding with the Mays Chapel Road Connection. The total conditions analyses for this supplemental document assume the completion of the Mays Chapel Road Connection as part of the development, as requested by Baltimore County Staff.

Exhibits 7 — Exhibit 7 shows the trip generation for the proposed development. This exhibit matches Exhibit 6 in the approved Traffic Impact Study.

Exhibit 8 Exhibit 8 shows the trip assignment for the site with the potential connection along Mays Chapel Road. The trip assignment percentages match those of the approved Traffic Impact Study.

Exhibit 9 Exhibit 9 shows the assumed diversion of the Mays Chapel neighborhood with the Mays Chapel Road Connection.

Exhibit 10 Exhibit 10 shows the assumed diversion of the background peak hour volumes as a result of the Mays Chapel Connection. As describe above, it is assumed that 33% of northbound traffic along Falls Road destined east along Seminary Avenue (northbound rights at Intersection 4) and 15% of westbound traffic along Seminary Avenue destined south on Falls Road (westbound lefts at Intersection 4) will divert to use the Mays Chapel Connection.

Exhibit 11 Exhibit 11 shows the total peak hour volumes with the Mays Chapel Connection. The volumes on this exhibit combine the background peak hour volumes on Exhibit 4 with the trip generation and diversions due to the connection on Exhibits 8, 9, and 10.

Exhibit 12 Exhibit 12 shows the results of Level-of-Service Analyses for the study intersections using CLV methodology. As shown, all intersections will operate at acceptable levels of service with the exception of the intersection of Joppa Road and Mays Chapel Road/Site Access, which will operate with a LOS "E" during the evening peak hour. It should be noted that the proposed improvement at Intersection 2, as part of the previously approved Traffic Impact Study, will continue to improve the overall operation of the intersection under total conditions beyond that of the existing conditions. The CLV worksheets have been included in Appendix C.

Exhibit 13 Exhibit 12 shows the results of Level-of-Service Analyses for the study intersections using HCM methodology. As shown, all intersections will operate at acceptable levels of service. It should be noted that the proposed improvement at Intersection 2, as part of the approved Traffic Impact Study, will continue to improve the overall operation of the intersection under total conditions beyond that of the existing conditions. The HCM worksheets have been included in Appendix C.

The results tables of the approved Traffic Impact Study have been included in Appendix D for reference.

Conclusion
Key findings of the analysis included:

- A sensitivity analysis was conducted in order to determine the potential volume of traffic that may be induced to divert through the Mays Chapel Road Connection, as opposed to traveling along Falls Road (MD 25), if the connection were to be constructed. The results of the sensitivity analysis show that the route through the Mays Chapel Road Connection would incentivize the diversion of up to approximately 250 vehicles during the AM peak hour and 389 vehicles during the PM peak hour, in addition to likely thousands of other vehicles per day during off peak times.
    - This translates to more than four vehicles per minute during the AM peak hour and more than six vehicles per minute, or one vehicle every nine seconds, during the PM peak hour

that would be incentivized to cut through The Meadows of Green Spring residential neighborhood and proposed Greenspring Station residential neighborhood, as opposed to remaining on Falls Road.

- Falls Road is designated as a Minor Collector by the Maryland Department of Transportation-State Highway Administration (MDOT-SHA) and is designed to handle relatively high volumes of traffic, whereas the existing section of Mays Chapel Road within The Meadows of Green Spring neighborhood is a local street and is not designed for high volumes of traffic.
    - Specifically, the existing paved section of Mays Chapel road has a typical width of approximately 24-feet, with some locations where the width is slightly less. In addition, vehicles occasionally park on the street, thereby further reducing the functional pavement width.
        - This typical section is not designed to handle a high volume of traffic, and, with the potential growth in traffic associated with the Mays Chapel Road Connection, the typical section would not meet the County's minimum paved width requirement of 27 feet for an Urban Residential Street with an ADT greater than 750, as set forth in the Baltimore County Design Manual, Chapter 8, Roads and Streets, Plate R-A.
    - In addition to the above, there are no sidewalks or separated bicycle facilities present along the existing portion of Mays Chapel Road, and an increased volume of traffic would be likely to lead to an increase in conflicts between vehicles and pedestrians/bicyclists within the neighborhood, potentially impacting safety within the community.
- With respect to the intersection operations analysis for the potential Mays Chapel Road Connection, the results of the analysis show that with the Mays Chapel Road Connection, the intersection of Joppa Road & Mays Chapel Road will operate at a failing level of service (LOS), LOS E.
    - In the previously approved Traffic Impact Study, without the Mays Chapel Road Connection, all intersections were shown to operate at acceptable levels of service.
- Beyond the intersection of Joppa Road & Mays Chapel Road, the remaining intersections along Falls Road that were included in the original traffic impact study would operate similarly with and without the Mays Chapel Road Connection; the Mays Chapel Road Connection does not provide meaningful improvement to the intersections along Falls Road that were common to both the 'with connection' analysis and 'without connection' analysis.
- It should be noted that the improvement proposed for the intersection of Falls Road & Joppa Road by the Greenspring Station development improves operations at the intersection to better than existing conditions operations, regardless of whether the Mays Chapel Road Connection is completed or not.

Based on the findings of the analysis, the potential connection of Mays Chapel Road between Joppa Road and Seminary Avenue, through the existing Mays Chapel neighborhood and proposed Greenspring Station neighborhood is not recommended.

The Mays Chapel Road Connection is likely to result in a significant volume of traffic diverting from Falls Road to the Mays Chapel Road Connection, without providing meaningful improvement along Falls Road. Critically, whereas Falls Road is designed to handle significant traffic volumes, Mays Chapel Road is a local street, which is not designed sufficiently to accommodate high traffic volumes. The additional diverted traffic along Mays Chapel Road would result in the existing section of Mays Chapel Road no longer being in compliance with the Baltimore County Design Manual. The potential connection would be likely to result in safety concerns along Mays Chapel Road, in addition to negatively impacting residents of The Meadows of Green Spring and the proposed Greenspring Station neighborhoods. Furthermore, the intersection of Joppa Road & Mays Chapel Road will operate with a LOS "E" during the evening peak hour as a result of the connection, whereas all intersections operated acceptably under the original, approved traffic impact study, which did not include the Mays Chapel Road Connection.

The Heatherfield Association Incorporated

Lutherville, Maryland

November 15, 2022

RE: Heatherfield Association - Board Declaration – Greenspring Manor Development

To Whom it May Concern:

The Heatherfield Association board has met with various members of the community and conducted a meeting on November 15, 2022 to discuss the issues around the proposed Greenspring Manor Development. The Heatherfied Assocaition is comprised of homes on Tally Ho Road (8200 Block and 8300 and 8301), Fox Hunt Lane, White Manor Drive and Horseshoe Circle. The board has voted unanimously that President Dean Merritt (3 Horseshoe Circle) will testify on the board's and neighborhood's behalf. It also believes the primary concerns with the development include:

Density:

Most Heatherfield homes are on approx. 1 acre lots (43,560 sq ft) and more Heatherfield homes than any other neighborhood directly abut the proposed development. The proposed development average lot size of 11,400 sq ft is far too small in comparison to the surrounding homes. The Density concern is also reiterated in the below sections with concerns around traffic and sewer.

Traffic:

The neighborhood is concerned with the failing intersections along Falls Road as well as the other direction at Joppa and Bellona, and Joppa and Thornton roads. It has become difficult to turn out of our neighborhood and there are constant accidents and traffic backups from these intersections.

Safety of our residents which range from newborns to almost 100 years old is of great concern to the community. There are no sidewalks in our neighborhood and many families walk along Tally Ho rd, which was built as a straightaway prior to being connected to Seminary Ridge. The speeding and utter disregard for safety of people walking along the road has grown as outside travelers continue to travel through the area. This will only increase with more homes.

This traffic also uses Tally Ho Rd as a cut through and the neighborhood believes if any road is built on the property it should fully cut through to Mays Chapel Road as planned in the Baltimore County Master Plan.

Sewer and drainage:

Sewage infrastructure is of the utmost importance to all of the homes in the area and it is our understanding that the infrastructure has not been updated to handle the current homes and businesses.

The planned density of the project will increase the problems with the current inadequate sewer system. We should expect increases in the frequency and size of sewage overflows that will damage homes, the environment in the area and downstream in the Jones Falls valley and the Chesapeake Bay. Adding these new sewer users without enhancing the sewer system is counterproductive to the current state, federal and local efforts to clean and renew the stream systems and the bay.

We thank the County and Judge Murphy for allowing us to enter this into evidence and for our president Dean Merritt to speak on our behalf.

Sincerely,

Heatherfield Association Board

EXHIBIT 49

Section 2.4 Overbank Flood Protection Volume Requirements (Q_p)

The primary purpose of the overbank flood protection volume sizing criteria is to prevent an increase in the frequency and magnitude of out-of-bank flooding generated by development (e.g., flow events that exceed the bankfull capacity of the channel and therefore must spill over into the floodplain). Overbank flood protection for the ten-year storm shall only be required if local approval authorities have no control of floodplain development, no control over infrastructure and conveyance system capacity design, or determine that downstream flooding will occur as a result of the proposed development.

For most regions of the State, the overbank flood control criteria translates to preventing the post development ten-year, 24 hour storm peak discharge rate (Q_{p10}) from exceeding the pre development peak discharge rate.

On the Eastern Shore of Maryland, the overbank flood control criteria is defined as preventing the post development two-year, 24 hour storm peak discharge rate (Q_{p2}) from exceeding the pre development peak discharge rate. The rainfall depths associated with the two and ten-year, 24 hour storm events are shown in Table 2.2.

Basis for Determining Overbank Flood Protection Volume

When addressing the overbank flooding design criteria, the following represent the minimum basis for design:

- The models TR-55 and TR-20 (or an equivalent approved by the appropriate local authority) will be used for determining peak discharge rates. The Eastern Shore Dimensionless Hydrograph may be used for sites where appropriate (see Appendix D.14). Any adjustments for unique land features such as Karst topography shall be determined by the local approving authority.

- The standard for characterizing pre development hydrologic land use for non-forested vegetated areas (including agriculture) shall be meadow in good hydrologic condition.

- Off-site areas should be modeled as "present land use condition" in good hydrologic condition for both the 2 and 10-year storm events.

- The length of overland flow used in t_c calculations is limited to no more than 150 feet for pre development conditions and 100 feet for post development conditions. On the Eastern Shore (see Figure 2.4) this maximum distance is extended to 250 feet for pre development conditions and 150 feet for post development conditions.

- Overbank flood protection does not apply to direct discharges to tidal water.

Section 2.5 Extreme Flood Volume (Q_f)

The intent of the extreme flood criteria is to (a) prevent flood damage from large storm events, (b) maintain the boundaries of the pre development 100-year Federal Emergency Management Agency (FEMA) and/or locally designated floodplain, and (c) protect the physical integrity of BMP control structures. This is typically done in two ways:

100-Year Control: requires storage to attenuate the post development 100-year, 24 hour peak discharge (Q_f) to pre development rates. The Q_f is the most stringent and expensive level of flood control and is generally not needed if the downstream development is located out of the 100-year floodplain. In many cases, the conveyance system leading to a stormwater structure is designed based on the discharge rate for the ten-year storm (Qp_{10}). In these situations, the conveyance systems may be the limiting hydrologic control.

Reserve Ultimate 100-Year Floodplain: 100-year storm control may be required by an appropriate review authority if:

- buildings or development are located within the ultimate 100-year floodplain, or
- the reviewing authority does not completely control the 100-year floodplain.

Hydraulic/hydrologic investigations may be required to demonstrate that downstream roads, bridges and public utilities are adequately protected from the Q_f storm. These investigations typically extend to the first downstream tributary of equal or greater drainage area or to any downstream dam, highway, or natural point of restricted stream flow.

Basis for Determining Extreme Flood Criteria

- Consult with the appropriate review authority to determine the analyses required for the Q_f storm.
- The same hydrologic and hydraulic methods used for overbank flood control shall be used to analyze Q_f.
- In addition, off-site areas should be modeled as “ultimate condition” when the 100-year design storm event is analyzed. Table 2.2 indicates the depth of rainfall (24 hour) associated with the 100-year storm event for all counties in the State of Maryland

Introduction

The project area is located at 2310 West Joppa Road, bound by Joppa Road to the south, a tributary to the Jones Falls with one residential property to the east, residential areas off Seminary Farm Road to the north and a large commercial property to the west. The property currently contains a single-family home and agricultural fields on approximately 39.5 acres currently zoned DR-1 and DR-2. 60 new single-family detached homes are being proposed.

This report summarizes the design strategies implemented to meet the Environmental Site Design Stormwater Management and Soil Erosion and Sediment Control requirements, and regulations of the Baltimore County Code and Maryland Department of the Environment (MDE).

Site Drainage Design Methodology

The stormwater management computations have been provided based on the requirements identified by the Baltimore County Code Article 33. Environmental Protection and Resource Management, Title 4 Stormwater Management and Supplement No. 1 to the 2000 Maryland Stormwater Design Manual. 100-year storm management is required for this site and a separate floodplain study has been prepared and is under County review.

Existing Site Drainage Conditions

In the existing condition, the site contains a single-family home and agricultural fields on approximately 39.5 acres. There are very few steep slopes and no soils classified as highly erodible soils. The soils on site are in hydrologic soil groups (HSG) B, C, and D. See Appendix A for the soil map. The site generally drains from the northwest to the southeast. The site is within the Jones Falls watershed. The entire site eventually drains to an existing culvert under Joppa Road which has been analyzed as the project study point.

Post Development Drainage Conditions

The proposed development will generally maintain the drainage patterns of the existing site; however, the proposed development efforts will result in changes to surface runoff conditions within residential areas, proposed roadways, and within proposed storm drain systems. The proposed site runoff will be managed through the implementation of Environmental Site Design practices, specifically 4 submerged gravel wetlands. A separate floodplain study has been prepared and is under County review. Quantity control for increased runoff will be managed within 3 of the 4 proposed submerged gravel wetland areas, including on-site detention for 100-year peak runoff rates.

Stormwater Management Narrative

Natural Resources Protection and Enhancement

All natural features have been depicted on the existing conditions plan. The existing tree line noted on the plans will be protected throughout construction.

Maintenance of Natural Flow Patterns

The proposed site drainage will maintain the existing condition of flow patterns as close as practical. All drainage from the proposed development will be directed to submerged gravel wetlands. The submerged gravel wetlands were located at natural low points, maintaining the natural flow pattern of the site. The 100-year storm flows will be managed on top of the ESD volume within the submerged gravel wetlands.

Reduction of Impervious Areas through better Site Design, Alternative surfaces, and non-structural practices

The proposed development has minimized impervious surfaces to those required to support the intended land-uses (roadways, driveways, and buildings). These areas have been minimized to provide minimum access paths for vehicles and parking areas.

Integration of Erosion and Sediment Controls into Stormwater Strategy

Soil erosion and sediment control practices have been developed in consideration of the proposed stormwater management strategies. The use of sediment basins will reduce sediment from being transported off-site. Temporary stabilization practices (stone, same day stabilization, etc.) will be implemented throughout construction per Soil Erosion and Sediment Control standards and specifications.

Implementation of ESD planning techniques and practices to the MEP

The proposed ESD facilities are located and designed to provide treatment as close to the drainage source as feasible. To minimize required treatment onsite, site planning techniques were utilized to minimize the proposed impervious surface coverage.

Conclusion

The proposed site will maintain the overall existing drainage patterns and will meet the requirements set forth by Baltimore County and the Maryland Department of the Environment. The project meets the requirements for both ESD to the MEP and water quantity (100-year management) through the implementation of 4 submerged gravel wetlands.

Sub-Area Land Use and Curve Number Details

Sub-Area Identifier	Land Use		Hydrologic Soil Group	Sub-Area Area (ac)	Curve Number
Post	Open space; grass cover > 75%	(good)	C	29.72	74
	Open space; grass cover > 75%	(good)	D	.2	80
	Paved parking lots, roofs, driveways		C	8.6	98
	Paved parking lots, roofs, driveways		D	.45	98
	Woods - grass combination	(good)	C	.5	72
	Total Area / Weighted Curve Number			39.47	80

Table 2-2a Runoff curve numbers for urban areas [1/]

From TR-55 Manual

Cover description: Cover type and hydrologic condition	Average percent impervious area [2/]	Curve numbers for hydrologic soil group: A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.) [3/]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only) [4/]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82

Report of
Concept Stormwater Management

Greenspring Manor

2310 West Joppa Road

Baltimore County, Maryland

May 2021

Performance Evaluation

G. Submerged Gravel Wetland (M-2)

Not shown on Development Plan

Facility Number: SGW-4
Drainage area, DA = 198,634 sq ft
4.56 ac
Impervious = 85,378 sq ft I%= 43%
1.96 ac
P_E = 2.60 in
R_V = 0.05+(0.009) I% (100) ;
R_V = 0.44

$$ESD_V = \frac{(P_E)(R_V)(A)}{12} = \frac{(2.60)\ (0.44)\ (198,634)}{12}$$

ESD_V = 18,801 cf could be treated in this facility

Volume Provided (Surface Storage) within the ESD Practice:

Elevation	Area	Volume
326.00	3,594	9,518
328.00	5,924	

Required Pretreatment = 10% of the provided ESD_V
= 951.8 cf

Elevation	Area	Volume
326.00	500	1,000
328.00	500	

Provided Pretreatment = 1,000 cf

Treatment Provided within the ESD Practice:

$$\text{Provided } ESD_V = \frac{(\text{Storage } ESD_V)}{0.75} = \frac{(9,518)}{0.75}$$

Provided ESD_V = 12,691 cf

$$\text{Provided } P_E = \frac{(\text{Provided } ESD_V)\ (12)}{(R_V)\ (DA)} = \frac{(12,691)\ (12)}{(0.44)\ (198,634)}$$

Provided P_E = 1.76 in

SURVEY INFORMATION

1. A FIELD SURVEY OF THE SUBJECT PROPERTY WAS MTPLA LAND SURVEYORS, LLC (MTPLS) IN SEPTEMBER/OCTOBER 2020. TOPOGRAPHIC INFORMATION OBTAINED FROM THIS SURVEY IS BASED ON THE NAVD88 VERTICAL DATUM.

ZONING INFORMATION

1. EXISTING ZONING DR-1 & DR-2
2. THIS DEVELOPMENT IS SUBJECT TO THE COMPREHENSIVE MANUAL OF DEVELOPMENT POLICIES (SECTION 504.2), AND THE COUNTY LANDSCAPE MANUAL (SECTION 409.5.A.1). THIS DEVELOPMENT WILL COMPLY AND BE CONSISTENT WITH ALL OF THE AFOREMENTIONED REGULATIONS, STANDARDS, GUIDELINES, AND POLICIES OR THE PROPER RELIEF WILL BE REQUESTED.
3. ALL SIGNS WILL CONFORM TO BALTIMORE COUNTY ZONING CODE, SECTIONS 450 OR APPROPRIATE RELIEF WILL BE REQUESTED.

EROSION AND SEDIMENT CONTROL PLAN

2310 W. JOPPA ROAD

PREPARED FOR
GREENSPRING JOPPA FALLS, LLC

BALTIMORE COUNTY MD

SHEET NUMBER
C-530

Kimley»Horn

Site Name:	2310 West Joppa Road	Date:	11/10/21
Project #:	114000001	By:	JPM
County:	Baltimore County	Checked:	NJL

Stormwater Management - Environmental Site Design

Site Drainage Area Data:

Step 1. Determine Area Requiring Treatment

Limit of Disturbance:	*1,182,044*	*sq ft*	
	27.14	*acres*	
Existing Impervious Area:	*25,103*	*sq ft*	
	0.58	*acres*	
Existing % Impervious:	*2%*		*< 40%,therefore New Development*
Proposed Impervious Area:	*394,218*	*sq ft*	
	9.05	*acres*	
Proposed % Impervious:	*34%*		

Step 2. Determine Required Treatment Volume

A. Determine Target P_E & ESD_V Using Table 5.3 (MDE SWM Manual Section 5-page 5.21)

Target PE:

HSG	% Imperv.	Area (ac)	PE	Area * P_E	Area (sf)
A	34%	0.00	1.0	0.00	0
B	34%	21.58	1.6	34.53	940,064
C	34%	4.94	1.6	7.90	215,120
D	34%	0.62	1.2	0.74	26,860
Total		27.14		43.17	

Target P_E = (Total Area * P_E)/Area

Target P_E = 1.59

Target ESDv:

I = $(A_E/A)*100\%$

I = *34%*

R_v = *0.05 + (0.009 * (I))*

R_v = *0.36*

P_E = *1.59*

A = *27.14*

$ESDv$ = *[(P_E) (R_v) (A)] /12*

Target ESDv = 1.281 ac-ft = 55,789 cf

Kimley»Horn

Site Name:	2310 West Joppa Road	Date:	11/10/21
Project #:	114000001	By:	JPM
County:	Baltimore County	Checked:	NJL

Stormwater Management - Environmental Site Design

B. Confirm Stormwater Management Treatment

Target ESDv = 55,789 cf

Prov'd ESDv = 62,240 cf

C. Calculate Recharge (R_{EV}) Requirements

Requirements are met with ESD to the MEP

D. Calculate Channel Protection (C_{PV}) Requirements

Requirements are met with ESD to the MEP

E. Calculate Overbank Flood Protection (Q_{P10}) Requirements

Refer to TR-55 Peak Flow Computation Summary

F. Calculate Extreme Flood Protection (Q_{P100}) Requirements

Refer to TR-55 Peak Flow Computation Summary

Kimley»Horn

Site Name:	2310 West Joppa Road	Date:	11/10/21

RANDALL GRACHEK, PE

Partner, NewFields, LLC.

1349 West Peachtree Street, Suite 1950
Atlanta, Georgia 30309

rgrachek@newfields.com
404-347-9050

Certifications and Professional Affiliations

Professional Engineer: Nebraska, Florida, Arkansas, Puerto Rico, Alabama, South Carolina

Education and Training

MS (1985) Civil/Environmental/Water/Wastewater Engineering - University of Nebraska, Lincoln Nebraska

BS (1983) Civil Engineering, University of Nebraska, Lincoln Nebraska

HAZWOPER 40-hr. Health and Safety Certified

NewFields GIS and Statistical Methods Training

Professional Summary

Mr. Grachek has 37 years of experience in the Civil/Environmental Engineering Field and has managed the technical and regulatory aspects of a diverse portfolio of engineering and environmental projects over his career. Mr. Grachek has specific expertise in environmental remediation; water/wastewater process design and treatment/collection system evaluation; CERCLA and RCRA investigations; feasibility studies and strategy development; landfill closure design and construction; groundwater and leachate investigations/analysis; wood treating site remediation; and pesticide plant remediation. Other expertise includes probabilistic cost analysis and technology evaluations for site remediation and corrective action.

Experience Summary

Mr. Grachek has specific experience and expertise in the following Engineering/Environmental Disciplines:

- Environmental Engineering
- Remedial Design/Remedial Action Management
- Landfill Closure Design and Construction
- Civil Engineering/Engineering Design
- Environmental Cost Analysis
- Data Analysis and Evaluation
- Water and Wastewater Engineering

- Remedial Investigation/Feasibility Study Management
- RCRA Facilities Investigations/Corrective Action and Designs
- HSRA Studies and Design
- Litigation Support Engineering
- Civil Engineering Management
- Wood Treating Facility RD/RA

Project Experience/Summary

NewFields, Atlanta GA (1997 – Present).

Responsible for the execution, management and direction of Engineering Investigation, Design, and Construction activities. Selected current projects and past experience with NewFields include:

- Lead Project Engineer for the remediation for a former Ethanol Facility in Nebraska. Included in this ongoing project are all aspects of Civil Engineering design and construction including site work and lagoon construction as well as industrial wastewater design and treatment.

- Engineer and Manager for the implementation of improvements to the Bayer Goff Mountain Landfill in Institute West Virginia. The project includes the performance of engineering and hydrogeological analysis of the hazardous waste landfill, development of alternatives for long-term landfill management and leachate reduction, and performance of design and construction for the improvements.

- Expert Witness and consultant for plaintiff verses a large textile dying facility. Case involved discharge of wastewater to protected waterways and suggested engineering remedies for such.

- Expert Witness and consultant for numerous actions against several large municipal wastewater systems. Cases involved actions to get the municipalities to comply with regulatory requirements and/or consent decrees regarding compliance with stormwater/wastewater standards and to provide adequate wastewater conveyance and treatment capacity.

- Lead Engineer for the construction of an industrial wastewater treatment plant at a major oil terminal facility in Puerto Rico. Currently managing the construction of the plant.

- Senior Engineer for the design of a tertiary wastewater treatment plant in Washington State for a confidential client.

- Lead Engineer and Manager for the design and implementation of a landfill closure for the Bayer Woodbine Facility in Woodbine Georgia. The project includes economic analysis, design and construction management for the closure of a solid waste landfill.

- Lead Engineer for the development of probabilistic cost analysis for industrial and refinery sites worldwide, using Monte Carlo simulations and Oracle Crystal Ball©. Estimates were used for property management and transactions.

- Development of an expert report and recommendation letter for the Potomac Riverkeeper, used to support compelling the City of Alexandria Virginia to implement improvements to their CSO management Program in a timely manner for protection of the receiving waters around Alexandria Virginia.

- Lead Engineer and cost evaluator for several environmental projects (Landfills, removal actions, remediation) in Brazil for large chemical and petrochemical companies.

- Development of expert reports supporting environmental clients in evaluating the adequacy of a power company wastewater treatment process and remediation plans for coal ash wastes in Virginia and the Carolinas. The expert documentation supported timely settlements in these cases.

- Development of an expert report supporting environmental clients in evaluating the proposed capping of contaminated sediments in the Congaree River in South Carolina. The evaluation challenged the adequacy of the technical solution proposed by the local utility.

- Provided support to environmental groups for challenging the adequacy of the permit requirements for the East CSS NPDES permit (Intrenchment Creek) in Atlanta, Georgia and other CSOs in the area.

- Member of the steering committee for the implementation of the City of Atlanta CSO management program involving the construction of a tunnel system under the city to provide storage capacity and direct combined flows to available treatment capacity. This was a part of the City's long-term sewer separation program. Received an award from the City of Atlanta for service to the City.

- Manager of a RCRA corrective Program for Hercules, Inc. at Hercules' Brunswick, Georgia facility. This project includes the performance of a RCRA Facilities Investigation (RFI) and the development of a Corrective Measures Study (CMS); Corrective Action Plans (CAP); Groundwater Remediation; Risk Analysis and detailed cost estimates for this toxaphene affected plant and the surrounding area.

- Lead Engineer and Manager for the design and remediation of the Saraland Superfund Site in Saraland, Alabama. This project involves the demolition and remediation of a government housing project that was built on land contaminated with waste sludge and materials from a former trucking operation. This site was excavated to remove soils that cause an exceedance in the 90% UCL concentrations of constituents in soil protective of groundwater and surface exposure. Groundwater on the site is naturally attenuating to background conditions.

- Lead Engineer and Manager for the final design of the selected remedial action for the Virginia Wood Preserving Site in Richmond, Virginia. This project involves the remediation of a former wood treating facility including such technologies as horizontal directional well installation, surface and groundwater treatment, slurry wall design and construction, wetland mitigation, and design and construction of RCRA capping systems. Performed as Owner's agent, cost control manager and construction manager for the site remedial action. Prepared a CERCLA Feasibility Study for the site for additional remedial measures needed after the initial remedial action.

- Environmental Engineer for the analysis of alternatives for the remediation of a major gulf coast sea terminal on the Gulf of Mexico. This project involves the evaluation of engineering and environmental data and the coordination of pre-design work, potentially leading to design and remediation.

- Lead Engineer and Manager for the delisting of the Rentokil Norcross site from the Georgia Hazardous Sites Inventory. This project involved the investigation and remediation of chromium contaminated soils from this office/warehouse facility in Norcross Georgia, including CSR and CMS development. Detailed soils and groundwater analysis were performed and the site. Guided the project through the HSRA delisting process with the Georgia EPD.

- Design Engineer and Construction Engineer for the remediation of the Bayer Sao Leopoldo pesticides site in Sao Leopoldo, Brazil. Developed design documents and performed bidding, contractor selection, and construction over-site for the excavation and disposal project.
- Design Engineer and Construction Engineer for the Bayer Woodbine Landfill Leachate System Improvements. Developed design documents and performed bidding, contractor selection, and construction over-site for the project.

- Lead Engineer and Manager for the Hercules Savannah HSRA site in Savannah Georgia. This project involved the investigation and development of CSR and CMS documents for the site as well as management of field data.

- Engineer involved in the development of remedial elements for the Bofors-Nobel Superfund Site in Muskegon, Michigan. This project involves the installation of a RCRA Cap and Barrier Wall on a former chemical manufacturing facility. Other involvement on the project includes evaluation of the operation and maintenance of the existing groundwater treatment plant for the site.

- Engineer for the remedial program at a major petroleum terminal facility. Responsibilities include engineering design and analysis of environmental control and remediation plans and the development of cost estimates for the environmental program. Included in this evaluation is the closure of several RCRA units and the potential for the use of barrier and containment technologies in their closure. This project also includes evaluation of previous contractor's plans and cost estimates.

- Technical lead for legal support on closed municipal landfill litigation for a confidential client.

- Consultant to the Lake Lanier Association for the evaluation of existing wastewater treatment operations in the vicinity of Lake Lanier.

Engineering Manager, Dames & Moore, Inc., Atlanta GA (1993-1997)

Environmental Engineering and Engineering Management for major PRP lead Superfund Site Remedial Action Programs, Site Investigations and Environmental Process Engineering.

- Developed with other team members the Remedial Design/Remedial Action Work Plan for the Aberdeen Pesticides Dumps Site in Aberdeen, North Carolina. Reviewed the site Record of Decision and developed a strategic plan to perform the specified remedial action of the former pesticide manufacturing facility.

- Developed the Remedial Action Work Plan and performed the preliminary remedial design for the ROD selected remedy. This project involves the remediation of a former wood treating facility including such technologies as horizontal directional well installation, surface and groundwater treatment, slurry wall construction, wetland mitigation, and RCRA capping. Performed post ROD Risk Analysis for reduction of RA scope and cost.

- Performed an analysis of a potential catastrophic tank spill involving tall oil and black liquor for the Mead Paper Company in Mahrt, Alabama. Evaluated the ability of the current activated sludge treatment plant to handle a large tank spill through the treatment system.

- Manager of the Remedial Program at the Newport Wellfield Site in Newport Ohio. Developed RD Work Plans and detailed cost estimates, conducted the site investigation, and was the lead engineer and consultant during the site removal action and the attainment of a natural attenuation

remedy for groundwater. This site is a State of Ohio lead involving soil and groundwater contaminated with BTEX, TCE and its breakdown products and PAHs.

- Lead Environmental Engineer for RCRA corrective action analysis and design of an aquifer pump and treat system for pesticide (toxaphene) contaminated groundwater at the Hercules-Brunswick plant in Brunswick, GA.

- Project Manager and Lead Engineer for development of a CERCLA Feasibility Study for Beazer East/DuPont at the former Koppers Wood Treatment Facility in Newport, DE. The site involves creosote and PCP contamination of soils and groundwater as well as sensitive ecological and wetland issues.

- Project Manager and Lead Engineer on a Feasibility Study for a HSRA site in Americus, GA. This former manufactured gas plant is undergoing a HSRA Corrective Action process.

- Project Manager for the RCRA compliance and Corrective Action at the Beazer/Koppers Wood Treatment Project facility in Montgomery, Alabama. This project involves corrective action for creosote; PCP and CCA contaminated soil and groundwater. Developed a corrective action strategy for the plant involving the conceptual design of sheet pile and jet grouted barrier walls with hydraulic containment support.

Project Manager, U.S. Army Corps of Engineers, Omaha District, Omaha NE (1988-1993).

Managed and performed Engineering work on numerous major hazardous waste sites for USEPA and the U.S. Department of Defense. Responsibilities included the development of remedial investigation and remedial action (construction) scope of services documents and cost estimates for execution of environmental projects. Projects include:

- Fort Ord Federal Facility, Monterey, CA. Performed preliminary assessments, site investigations and RCRA investigations at numerous military HTRW sites within the military reservation. Developed the draft work plan for the installation wide RI/FS. Sites included municipal/industrial landfills, fire training areas, motor pools, USTs, and an abandoned wastewater treatment facility. Key member of the Army's negotiating team during Federal Facility Agreement negotiations with state and local agencies and EPA Region IV.

- Dover AFB Federal Facility, Dover, DE. Managed the development of a treatability work plan and laboratory and field testing of an air sparging/soil vapor extraction system for a TCE contaminated aquifer on base. This work was in response to a state RCRA Notice of Violation (NOV) to Dover AFB involving remediation of this aquifer. Supported Base personnel in negotiation of a resolution to the NOV. Results of this program in EPA Region III indicate successful remediation of groundwater using this technology.

- Morgantown Ordinance Works, Morgantown, WV. Supported the Army and the PRP group in negotiations with EPA regarding the remedial program at this former ordnance plant. Served as the lead technical coordinator for all technical work on the project. Developed the scope and managed the performance of a legal, historical, and cost recovery study for the Army involving their roles as a PRP on the site. Represented the Army with the site PRP group (Olin, DuPont, and Tenneco) in negotiations with EPA Region III regarding potential site remedies and the site RI/FS.

- Operating Industries Superfund Site, Monterey Park, CA. Developed and managed an operation & maintenance program for a 192-acre hazardous/municipal landfill in east Los

Angeles, California. Issues addressed included gas production and destruction, toxic volatile gas emissions, landfill subsidence, underground fires and slope stability. Performed a detailed analysis of the existing cap and barrier elements of the landfill including subsidence monitoring and cap integrity analysis.

- Rhinehart Tire Fire Superfund Site, Winchester, VA. Managed the design of a remedial system for the site of a 1983 tire fire involving the burning of over 7,000,000 tires, producing over 800,000 gallons of oil/sludge. This work included design and construction of a containment dam, slope stabilization using shot-crete, oil collection, oil/water separators and a 100-gpm water/leachate treatment system for metals. The water treatment system utilized chemical precipitation of zinc, aluminum and other metals as well as clarification and sand filtration. This site is a major EPA lead site in Region III.

- Southern Maryland Wood Preservers Superfund Site, Hollywood, MD. Managed and performed pre-design, design and design reviews for the remedial action program at a major former wood treating site involving over 150,000 cubic yards of creosote and PCP contaminated soil and contaminated groundwater. The first phase of the project involved the design and construction of a sheet pile barrier wall system for the containment of the area for the site containing DNAPL creosote. The second phase involved the design of a thermal treatment remedy, excavation and associated civil engineering, groundwater treatment and air emissions control. The water treatment design included pretreatment (Oil/Water Separation, flocculation, clarification, filtration), UV/Oxidation treatment, post aeration and sludge handling. Wetland restoration design was a key element to this project. Also involved were extensive thermal (soil) and groundwater treatability tests to support design.

- Norwood PCB Superfund Site, Norwood, MA. Evaluated the feasibility of using the BEST Technology soil washing system for use at this PCB contaminated site. The BEST technology is a solvent extraction system utilizing a mobile solvent (triethylamine (TEA)) to separate contaminants from soils and sludges.

- Kane and Lombard Superfund Site, Baltimore, MD. Managed the design and the construction of a soil-bentonite slurry wall and RCRA cap system for this inner-city Baltimore Superfund Site. Site contaminants included priority pollutant metals.

- Auto Ion Superfund Site, Kalamazoo; MI. Supported EPA Region V in evaluating plans (implemented by site PRPs) for the remediation of arsenic and chromium contaminated soils at this former battery and plating facility.

Managed and developed an innovative project management system for the Omaha District's environmental programs. This system included aspects of project management philosophy as well as total quality management.

Managed a section of environmental project managers in the Environmental Branch, Omaha District. Duties included supervision and monitoring of junior staff as well as appraisals of performance and budget considerations.

Project Engineer, HDR Engineering Inc., Omaha NE (1985-1988).

Project Engineer on various municipal wastewater treatment system projects including:

- Batavia WWTP, Batavia, IL. Performed a sanitary sewer system evaluation using computer modeling for this Chicago area city. This computer model allows the city to predict flow variations and to size appropriate piping systems for their municipal sewer.

- Gillette WWTP, Gillette WY. Project engineer for the design of a 2-mgd activated sludge treatment plant. Responsible for development of drawings, specifications, and the bid package for competitive bidding of this project. Designed unit processes included screening, grit removal, activated sludge, clarification, disinfection, and sludge digestion.

- Texarkana WWTP, Texarkana, TX. Performed a value engineering study during the design of this activated sludge treatment plant. Focus was on innovative sludge management systems.

- Papio WWTP, Omaha, NE. Performed shop drawing reviews and construction oversight on this large, activated sludge treatment plant. Review included primary clarification, settling basins and sludge handling/Incineration.

- Sidney WWTP, Sidney, NE. Prepared bid documents and provided construction oversight on this 1 mgd trickling filter plant. Designed unit processes including screening, grit removal, clarification, sludge digestion, trickling filters, and disinfection.

Project Engineer on various hazardous waste projects including:

- Basin F, Rocky Mountain Arsenal Federal Facility, Denver, CO. Lead engineer in the development of the remedial action design for the 93-acre hazardous waste lagoon at the arsenal. Engineer for the elements of the remedial design including soil excavation and treatment, water treatment and storage, enhanced evaporation, waste pile and RCRA Cap installation. Contaminants included pesticides, demilitarized nerve gas agents and mustard gas. Also unexploded ordnance situations were encountered.

- Monroe Plant, Cozad, NE. Field engineer during the installation of recovery wells in a TCE contaminated aquifer. Project engineer for construction of an Air Stripping System to remove TCE from groundwater. Provided field oversight for sludge dewatering and closure of waste lagoons contaminated with TCE and heavy metals. This was a PRP Lead Project in EPA Region VII.

- Rural Ridge Nike Site, Pittsburgh, PA. Performed site investigation activities at this former Nike Missile site to characterize contamination from military operations including propellants, BTEX and TPH.

Graduate Assistant - University of Nebraska - Lincoln, NE (1983-1985)

- Assisted in teaching environmental/sanitary engineering courses and laboratories to undergraduate students. Teaching concentrated on chemical and biological water and wastewater treatment.

- Performed research involving Biological Denitrification of Water Supplies using Packed Bed Reactors. This Thesis research involved the use of facultative Aerobic (Anoxic) Microorganisms to convert Nitrate in water to nitrogen gas through microorganism's metabolic pathways.

PUBLICATIONS

MS Thesis, "Biological Denitrification using Packed Bed Reactors," (1985). Presented to Nebraska State AWWA Conference in Lincoln, NE.

"Sheet Pile Barrier Walls as an alternative to Slurry Walls for Temporary Containment at Hazardous

Waste Sites," (1990). Presented to HMCRI's "Superfund 90" conference in Washington, D.C.
"Case Study, Rhinehart Tire Fire Superfund Site," (1991). Presented to AWMA's annual conference in Vancouver, BC.

"Community Relations Actions at Federal Facilities," (1992). Presented at the ADPA annual environmental symposium in Alexandria, VA.

Good Morning McCann:
The file that you have is the correct file....it is the one we used for Greenspring Manor.

CAUTION: This message from michael@mmccannlaw.net originated from a non Baltimore County Government or non BCPL email system. Hover over any links before clicking and use caution opening attachments.

It is helps, attached is the sewer capacity analysis that was produced for Greenspring Station. As I said, there should be the same document for Greenspring Manor.

Thank you!

Michael

Thank you. If all documents have been produced, then they have been produced. As I said, I did not see any sewer capacity analysis for Greenspring Manor project amongst the documents. That is surprising but it may be because the analysis was performed after the cd was produced to me. Can someone please confirm that none exists? I suspect it would be very easy to do.

If someone is not willing to do that, I am hereby submitting a new PIA request asking again for:

6. All documents reflecting, referring or relating to the current capacity of any other sewer segments (other than those in #1 above) downstream of Greenspring Station and/or downstream of the proposed Greenspring Manor development, including the sewer capacity analysis for Greenspring Manor.

Thank you.

Michael

Good Morning Mr. McCann:
The Agency has completed the request.
Item #6 was included on the DVD and item #7 was withdrawn from the request. Therefore we feel that request has been fulfilled.

D'Andrea

Hi Jennifer. Sorry to be a pain. I really need to hear back from you on this, either way.

If it is a new request, please confirm. It is below, sent on 11/5.

If it not a new request, as I think is pretty clear, please let me know when the documents will be produced.

Thank you.

Michael

Subject: PIA Request

Hi Jennifer. I did not hear back from you in response to my email below, and continue to believe that DPW's documents pertaining to the sewer associated with the proposed Greenspring Manor project are already covered by my PIA request submitted in May, specifically the following:

6. All documents reflecting, referring or relating to the current capacity of any other sewer segments (other than those in #1 above) downstream of Greenspring Station and/or downstream of the proposed Greenspring Manor development.

7. All documents reflecting, referring or relating to any other repairs, replacement or maintenance of other sewer segments (other than those in #1 above) downstream of Greenspring Station and/or downstream of the proposed Greenspring Manor development.

Please confirm as soon as possible all docs pertain to the project will be produced.

Sorry, but the hearing in this case is fast approaching.

Thanks. Have a nice weekend.

Michael

Hi Jennifer. I finally had some time to review the cd that was produced. I saw few, if any, documents pertaining specifically to the Greenspring Manor development. That may be because my request preceded DPW's review of that project. Can you let me know the quickest way to get those documents? I imagine there would be a limited number and relatively easy to locate.

Thank you!

Michael

From: Michael McCann
Sent: Tuesday, May 18, 2021 2:25 PM
To: dwalker2@baltimorecountyd.gov
Subject: PIA Request

Mr. Walker: Per the Public Information Act, I am requesting the following documents:

1. All documents reflecting, referring or relating to the current capacity of the following sewer segments:

upstream manhole	downstream manhole
43794	43793
43793	43792
43792	43791
43791	43790
43790	43789
43789	43788
43788	43787
43787	43786

2. All documents reflecting, referring or relating to any requirement or agreement that the capacity of some or all of the above sewer segments was to be addressed by Johns Hopkins in connection with improvements made at Greenspring Station.

3. All documents reflecting, referring or relating to whether John Hopkins in fact addressed the capacity issues in some or all of the above sewer segments in connection with improvements made at Greenspring Station.

4. All documents reflecting, referring or relating to the repairs, replacements or other manner in which the capacity in the above sewer segments was addressed, including information relating to when the work was performed, who performed the work, and any description of the work.

5. All correspondence between the County and Johns Hopkins, or its consultants or other representatives, regarding the above sewer segments and/or repairs or replacements to them.

6. All documents reflecting, referring or relating to the current capacity of any other sewer segments (other than those in #1 above) downstream of Greenspring Station and/or downstream of the proposed Greenspring Manor development.

7. All documents reflecting, referring or relating to any other repairs, replacement or maintenance of other sewer segments (other than those in #1 above) downstream of Greenspring Station and/or downstream of the proposed Greenspring Manor development.

8. All reports submitted to the MDE and/or EPA, beginning in 2019, pursuant to the Consent Decree entered in 2005 in the matter of *United States of America et al. v. Baltimore County, Maryland*.

Thank you.

Please contact me if you have any questions.

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MARYLAND
NORTHERN DIVISION

UNITED STATES OF AMERICA and STATE OF MARYLAND, Plaintiffs, v. BALTIMORE COUNTY, MARYLAND, Defendant.	)	Civil Action No.

CONSENT DECREE

WHEREAS, Plaintiff, the United States of America ("United States"), by the authority of the Attorney General of the United States and through its undersigned counsel, acting at the request and on behalf of the Administrator of the United States Environmental Protection Agency ("EPA"), has filed the Complaint in this action seeking injunctive relief and civil penalties pursuant to Section 309 of the Clean Water Act, 33 U.S.C. § 1319, naming as defendant Baltimore County, Maryland ("Baltimore County") pursuant to Section 309(b) of the Clean Water Act, 33 U.S.C. § 1319(b);

WHEREAS, Plaintiff, the State of Maryland, Department of the Environment ("MDE"), has joined in the Complaint and seeks injunctive relief and civil penalties for Baltimore County's alleged violations of Title 9, Subtitle 3 of the Environment Article, Annotated Code of Maryland;

WHEREAS, Baltimore County operates a sanitary sewer collection system that serves most citizens of Baltimore County who live inside the urban-rural demarcation line, some citizens of Anne Arundel and Howard Counties, and the facilities located at Baltimore-Washington International Airport owned by the State of Maryland;

WHEREAS, the United States and the State of Maryland allege that Baltimore County has violated and continues to violate Section 301 of the Clean Water Act, 33 U.S.C. § 1311, and Sections 9-322 and 9-323 of the Environment Article, Annotated Code of Maryland, by discharging untreated sewage from its sanitary sewer collection system to waters of the United States and to waters of the State of Maryland;

WHEREAS, Baltimore County asserts that it professionally and competently operates and maintains its sanitary sewer collection system;

WHEREAS, the Parties have negotiated in good faith and have reached a settlement of the issues raised in the Complaint. Baltimore County's agreement to this Consent Decree is not an admission of liability, nor is it an adjudication of any fact or law;

WHEREAS, the Parties agree, and the Court finds, that settlement of the claims alleged in the Complaint without further litigation or trial of any issues is fair, reasonable and in the public interest and that the entry of this Consent Decree is the most appropriate way of resolving the claims alleged in the Complaint.

NOW THEREFORE, it is hereby ORDERED, ADJUDGED and DECREED as follows:

I. JURISDICTION AND VENUE

1. This Court has jurisdiction over the subject matter of this action and over the Parties to this action pursuant to Section 309(b) of the Clean Water Act, 33 U.S.C. § 1319(b), and 28 U.S.C. §§ 1331, 1345, 1355, and 1367. The Complaint states claims upon which relief may be granted against Baltimore County under Section 309 of the Clean Water Act, 33 U.S.C. § 1319, and Sections 9-339 and 9-342 of the Environment Article, Annotated Code of Maryland, for injunctive relief and civil penalties. Venue is proper in this District pursuant to Section 309(b) of the Clean Water Act, 33 U.S.C. § 1319(b), and 28 U.S.C. §§ 1391(b) and 1395(a). Baltimore County waives any and all objections or defenses that it might have to the Court's jurisdiction to enter and enforce this Consent Decree or to venue in this

District.

II. BINDING EFFECT

2. The provisions of this Consent Decree shall apply to and be binding on the United States and the State of Maryland, and on Baltimore County, its agents, successors, and assigns.

3. Effective from the Date of Lodging of this Consent Decree until its termination, Baltimore County shall give written notice of and provide a copy of this Consent Decree to any person or entity to whom Baltimore County may transfer ownership or operation of any portion of its Collection System. Baltimore County shall notify EPA, MDE and the United States Department of Justice in writing of any successor in interest at least twenty-one (21) days prior to any such transfer. No transfer of ownership or operation of the Collection System shall relieve Baltimore County of its obligations to ensure that the terms of this Consent Decree are implemented.

4. Baltimore County shall be solely responsible for ensuring that performance of the work contemplated under this Consent Decree is undertaken in accordance with the deadlines and requirements contained in this Consent Decree, and any exhibits hereto. Any action taken by any contractor or consultant retained to implement Baltimore County's duties under this Consent Decree shall be considered an action of Baltimore County for purposes of determining compliance with this Consent Decree. In an action to enforce this Consent Decree, Baltimore County shall not assert as a defense against the United States, EPA or MDE any act or failure to act by any of its officers, council members, managers, commissioners, employees, agents, contractors, successors and assigns; however, this Consent Decree shall not limit Baltimore County's right to employ contractors and consultants and to take all appropriate action against any person or entity that causes or contributes to Baltimore County's failure to perform.

III. PURPOSE

5. The express purpose of the Parties entering into this Consent Decree is for Baltimore

County to take all measures necessary to comply with the Clean Water Act and the regulations promulgated thereunder, and the Maryland water pollution control laws and the regulations promulgated under such laws, with the goal of eliminating Sanitary Sewer Overflows.

IV. DEFINITIONS

6. Unless otherwise defined herein, the terms used in this Consent Decree will have the meaning given to those terms in the Clean Water Act, 33 U.S.C. §§ 1251 et seq., and the regulations promulgated thereunder or, if not defined in the Clean Water Act or its regulations, then as defined in Title 9, Subtitle 3 of the Environment Article, Annotated Code of Maryland, and the regulations promulgated thereunder. Any other words shall be given their ordinary meaning.

The following terms used in this Consent Decree, its appendices, and studies and plans submitted by Baltimore County and approved by EPA and MDE will be defined as follows:

A. "Annual Report" shall mean the annual progress report to be submitted by Baltimore County pursuant to Paragraph 20 of this Consent Decree.

B. "Building Backup" shall mean a release from the Collection System, through a lateral to a building or structure.

C. "Collection System" or "Separate Sanitary Sewer Collection System" shall mean the collection and transmission system (including all pipes, Force Mains, sanitary sewer lines, SSO Structures, Pump Stations, manholes, and appurtenances thereto) owned by Baltimore County and designed to convey only sewage, and not storm water, from residences, commercial buildings, industrial plants and institutions for treatment at Baltimore City's Patapsco or Back River wastewater treatment plants, including portions of the system added after the Effective Date.

D. "Date of Lodging of the Consent Decree" or "Date of Lodging" shall mean the date on which the Consent Decree is lodged with the United States District Court for the District of Maryland.

E. "Day" or "days" shall mean a calendar day or calendar days. When the day a report or other deliverable is due under this Consent Decree falls on a Saturday, Sunday or any Federal, State of Maryland or Baltimore County legal holiday, Baltimore County shall have until the next calendar day that is not one of the aforementioned days for submittal of such report or other deliverable, with the exception of overflow reports required by Paragraph 18 of this Consent Decree.

F. "Deliverable" shall mean any written plan, report, map, or other document required to be submitted by Baltimore County pursuant to Section V (Remedial Measures) identified on Appendix H to this Consent Decree. The Quarterly Reports and Annual Reports required to be submitted by Baltimore County pursuant to Section VI (Reporting Requirements), and any certification required to be submitted pursuant to this Consent Decree, are not "Deliverables" as defined in this Consent Decree.

G. "DEPRM" shall mean the Baltimore County Department of Environmental Protection and Resource Management, and any successor agency.

H. "Discharge" shall mean any "discharge of a pollutant" as defined in 40 C.F.R. § 122.2, and/or any "discharge" as defined in Section 9-101(b) of the Maryland Environment Code Annotated (1996 Repl. Vol.) ("(1) The addition, introduction, leaking, spilling or emitting of a pollutant into waters of this State; or (2) The placing of a pollutant in a location where the pollutant is likely to pollute."), from the Collection System.

I. "DPW" shall mean the Baltimore County Department of Public Works, and any successor agency.

J. "Effective Date" shall mean the effective date of this Consent Decree as provided in Paragraph 79.

K. "Eligible SEP Costs" shall mean the costs of designing, planning, and implementing supplemental environmental projects ("SEPs"), but shall not include Baltimore County's

overhead, administrative expenses, legal fees, and contractor oversight.

L. “Force Main” shall mean any pipe that receives and conveys wastewater under pressure from the discharge side of a pump installed in a Pump Station.

M. “Gravity Sewer Line” shall mean a pipe that receives, contains and conveys wastewater not normally under pressure, but is intended to flow unassisted under the influence of gravity.

N. “Gravity Line Segment” shall mean that part of a Gravity Sewer Line that is between one manhole and the next closest manhole on the sewer line in question.

O. "Grease Generating Facility" shall mean any facility, including but not limited to food preparation, handling, and processing establishments, which conducts activities that routinely generate fats, oils and greases. The term “Grease Generating Facility” does not include a kitchen in an individual residential unit.

P. "Hydrograph" shall mean the graphical representation of flow volume over time of wastewater, infiltration, and inflow at a particular point in the Collection System. Hydrographs characterize diurnal variations in wastewater flow rates, as well as flow response to a wet weather event, at a particular point in the Collection System.

Q. “Hyetograph” shall mean the graphical representation showing the average rainfall distribution over the Baltimore County area. The graphs show rainfall intensity or volume as a function of time.

R. “Illegal Storm Water Discharge” shall mean the unauthorized discharge of storm water to the Collection System, whether such discharge occurs through an illegal connection or through an authorized connection, from a privately-owned source of inflow and/or infiltration, including but not limited to areaway drains, sump pumps, foundation drains, roof drains, and defective laterals.

S. "Major Gravity Line" shall mean any of the following:

i. all Gravity Sewer Lines that are ten inches in diameter or larger;

ii. all eight-inch lines that are necessary to accurately represent flow attributable to a specific service area in any Collection System Sewershed;

iii. all Gravity Sewer Lines that convey wastewater from one Pump Station service area to another Pump Station service area;

and

iv. All Gravity Sewer Lines that have caused or contributed, or that Baltimore County knows are likely to cause or contribute, to capacity-related Sanitary Sewer Overflows.

T. "Non-Pump Station SSO Structure" shall mean any SSO Structure located anywhere in the Collection System other than at a Pump Station.

U. "Parties" shall mean the United States of America, the State of Maryland, and Baltimore County.

V. "Pump Station" shall mean facilities owned by Baltimore County and comprised of pumps which lift wastewater to a higher hydraulic elevation, including all related electrical, mechanical, and structural systems necessary to the operation of the pump(s), but shall not include grinder pumps.

W. "Pump Station Design Capacity" shall mean the capacity that a Pump Station is designed to pump with its largest pump out of service.

X. "Pump Station SSO Structure" shall mean any SSO Structure located at a Pump Station.

Y. "Quarterly Report" shall mean the quarterly progress report to be submitted by Baltimore County pursuant to Paragraph 19 of this Consent Decree.

Z. "Sanitary Sewer Overflow" or "SSO" shall mean any spill, release, or Discharge

from the Collection System, including all Building Backups.

AA. "Sanitary Sewer Overflow Structure" or "SSO Structure" shall mean any structure in Baltimore County constructed for the purpose of allowing discharge from the Separate Sanitary Sewer Collection System at a point prior to connection with the Baltimore City collection system or the headworks of either the Patapsco or Back River wastewater treatment plants.

BB. "Sewer Basin" or "Sewershed" shall mean a section of Baltimore County's Collection System that is a distinct drainage and/or wastewater collection area and designated as such by Baltimore County.

CC. "Substantial Completion" shall mean, when used in reference to construction projects required under this Consent Decree, the date, as certified by the Engineer in charge of a construction project, when the construction project or specified part thereof is sufficiently completed, in accordance with the contract documents, such that the project or specified part thereof can be used to accomplish the purposes for which it was intended.

DD. "United States" shall mean the United States of America, acting on behalf of EPA.

V. REMEDIAL MEASURES

7. Elimination of Sanitary Sewer Overflows.

A. **General Requirements**. Baltimore County shall develop and implement the measures set forth in Paragraphs 7 through 18 with the goal of eliminating all SSOs from Baltimore County's Collection System.

B. **Sanitary Sewer Overflow Characterization Report**.

i. No later than ninety (90) days after the Effective Date of this Consent Decree, Baltimore County shall submit to EPA and MDE a Sanitary Sewer Overflow Characterization

Report that includes:

(a) A map depicting the Collection System and all of its appurtenances as described below. The map shall depict the locations of all known SSO Structures and the sanitary sewers associated with those SSO Structures, as well as all outfalls, manholes, and Pump Stations;

(b) Identification of the Sewersheds that contribute flow to the Baltimore County Collection System;

(c) Identification, including mapping, of the location, frequency, date, duration, and volume (measured durations and volumes where available, or best estimates) of SSOs (on a per event basis) since June 2000 to the extent such information is available; and

(d) Identification of each known cause or condition that contributed to each SSO identified in Paragraph 7.B.i(c).

ii. Baltimore County shall update the Sanitary Sewer Overflow Characterization Report on an annual basis to include SSO events and other new or corrected information identified during the prior year. Baltimore County shall submit the updated Sanitary Sewer Overflow Characterization Report as part of the applicable Annual Report.

C. **Monitoring and Elimination of Sanitary Sewer Overflow Structures**. Baltimore County shall monitor all Sanitary Sewer Overflow Structures ("SSO Structures") in its Collection System in accord with the procedures set forth below. Baltimore County shall eliminate all Non-Pump Station SSO Structures in accord with the procedures and schedules set forth below.

i. **Monitoring of SSO Structures**. As of the Date of Lodging of this Consent Decree, Baltimore County had identified 64 SSO Structures located at or relating to Pump Stations ("Pump Station SSO Structures") (identified on Appendix A1 to this Consent Decree) and 38 additional SSO Structures located within its Collection System ("Non-Pump Station SSO Structures") (identified on Appendix A2 to this Consent Decree). Baltimore County shall conduct monitoring of

each Pump Station and Non-Pump Station SSO Structure as set forth in this Paragraph 7.C.i, and shall report the results of such monitoring for each SSO Structure pursuant to Paragraph 7.C.ii., below, for Non-Pump Station SSO Structures until such time as Baltimore County certifies elimination of the respective SSO Structure pursuant to Paragraph 7.C.iv., below, and for Pump Station SSO Structures until termination of the Consent Decree.

(a) Monitoring of Pump Station SSO Structures. Baltimore County shall monitor each Pump Station SSO Structure for potential discharges by monitoring wet well levels and activation of the wet well high level alarms at the Pump Station. By 270 days from the Effective Date, Pump Station SSO Structures shall be monitored by a level sensing device (e.g., Red Cap probe or liquid level chart) connected to the SCADA system and set to trigger an alarm before or when the wet well level reaches the invert elevation of the SSO Structure. Baltimore County shall conduct periodic field tests of the level sensing device and SCADA system to ensure the accuracy of the elevation and the proper transmission of information regarding a discharge from the SSO Structure.

(b) Monitoring of Non-Pump Station SSO Structures. As of the Date of Lodging of this Consent Decree, Baltimore County is monitoring 9 Non-Pump Station SSO Structures through the use of a level monitor capable of recording the presence or absence of discharge, and 29 Non-Pump Station SSO Structures through the use of continuous flow meters. The method of monitoring for each Non-Pump Station SSO Structure as of the Date of Lodging is identified on Appendix A2 to this Consent Decree.

(1) Baltimore County shall monitor all Non-Pump Station SSO Structures that are not equipped with flow meters by inspecting the level monitors at least monthly, and within 5 days of any rainfall event that is one inch or greater in a 24-hour period ("one inch, 24-hour rainfall event"). If any of these SSO Structures show evidence of discharge, Baltimore County shall, within 30 days of discovery of such discharge, install a flow meter at the SSO Structure and report the

installation of such meter to EPA and MDE in the next quarterly report required pursuant to Paragraph 7.C.ii., below.

(2) Baltimore County shall monitor all Non-Pump Station SSO Structures that are equipped with flow meters by continuous use of such flow meters.

ii. **Reporting of Monitoring Information**. Baltimore County shall record, maintain, and submit to EPA and MDE in each Quarterly Report the following information regarding any discharges from SSO Structures during the prior calendar quarter.

(a) With respect to Pump Station SSO Structures and Non-Pump Station SSO Structures that are not equipped with flow meters:

(1) name, corresponding number, and full address of the SSO Structure;
(2) date of monitoring event;
(3) reason for monitoring event (e.g., routine monitoring or rain event)
(4) date of relevant weather conditions (if applicable)
(5) description of relevant weather conditions (e.g., type of precipitation, location of rain gauge and storm event);
(6) presence/absence of discharge;
(7) receiving waters (if applicable);
(8) identified cause (if applicable);
(9) details of corrective action taken or planned.

(b) With respect to Non-Pump Station SSO Structures that are equipped with flow meters:

(1) name, corresponding number, and full address of the SSO Structure;
(2) date of discharge;
(3) duration of overflow;
(4) date of relevant weather conditions (if applicable);
(5) description of relevant weather conditions (e.g., type of precipitation);
(6) gallons discharged;
(7) receiving waters;
(8) identified cause; and
(9) details of corrective action taken or planned.

(c) In addition to the above reporting requirements, Baltimore County must also report any discharges from the SSO Structures as required by Paragraph 18 of this Consent Decree and with any applicable federal and state reporting requirements.

iii. **Submission of Non-Pump Station SSO Structures Elimination Plan**. Within one year of the Date of Lodging of the Consent Decree, Baltimore County shall submit to EPA and MDE for review and approval a Non-Pump Station SSO Structures Elimination Plan for the Elm Road and Ripple Road Non-Pump Station SSO Structures that shall provide for the elimination of those SSO Structures as set forth below. Within two years of the Effective Date, Baltimore County shall submit to EPA and MDE for review and approval a Non-Pump Station SSO Structures Elimination Plan that shall provide for the elimination of all other known Non-Pump Station SSO Structures in the Collection System that have not been eliminated at the time of submission of the Elimination Plan. For each Non-Pump Station SSO Structure, the Elimination Plans shall include each of the following elements:

(a) Summary of Monitoring and Evaluation Data. Baltimore County shall provide:

(1) a summary of all available monitoring data, including an analysis of the activation threshold, frequency of activation, duration and volume of discharges during the monitoring period, and instances of flow metering inoperability (including period of inoperability, cause, corrective action, and projected return to service);

(2) identification of the receiving waters or other discharge area;

(3) an analysis of the likely underlying cause of the capacity issue(s) being alleviated by the SSO Structure discharges, including a summary of any available information regarding the original reason for installation of the SSO Structure; and

(4) a preliminary assessment of the potential impacts of immediate closure of the SSO Structure.

(b) Evaluation of Mitigation Activities. Baltimore County shall conduct an evaluation of potential mitigation measures to reduce the amount and duration of discharges from the SSO Structure and to mitigate the impacts associated with such discharges. The mitigation measures evaluated should include short-term collection activities (*e.g.*, the use of vacuum trucks), the use of temporary constructed bypasses of lines with insufficient capacity to reduce the amount and duration of discharges, and the implementation of more rapid and effective containment and removal response activities to mitigate the impacts of discharges. Baltimore County shall implement the mitigation measures most appropriate to mitigate impacts of discharges from the relevant SSO Structure until the SSO Structure is eliminated. Baltimore County shall report in each Quarterly Report any mitigation measures taken with respect to a discharge from an SSO Structure during the prior calendar quarter.

(c) Plan and Schedule for Elimination. Baltimore County shall develop a proposed plan and schedule that provides for elimination of each Non-Pump Station SSO Structure as follows:

(1) for the Elm Road Non-Pump Station SSO Structure, no later than 18 months from the Date of Lodging of the Consent Decree;

(2) for the Ripple Road Non-Pump Station SSO Structure, no later than 24 months from the Date of Lodging of the Consent Decree;

(3) for all other Non-Pump Station SSO Structures included in the Elimination Plan, as soon as practicable but no later than the earlier of one year after the completion of the I/I Evaluation and Long-Term Capacity Evaluation required by Paragraph 9 for the Sewershed in which the Non-Pump Station SSO Structure is located, or six years after the Effective Date. EPA and

MDE may extend the schedule for elimination of any individual Non-Pump Station SSO Structure upon a demonstration by Baltimore County that the specific circumstances relevant to that Non-Pump Station SSO Structure justify an extension.

iv. **Implementation of Elimination Plan and Certification of Elimination**. Within 30 days after approval or approval with conditions by EPA and MDE of the Elimination Plans, as provided in Section VIII (Review and Approval Procedures) of this Consent Decree, Baltimore County shall implement the Elimination Plans as approved and consistent with the approved scheduled contained therein, and the approved Elimination Plans shall be incorporated into, and become enforceable under, this Consent Decree. For each Non-Pump Station SSO Structure eliminated pursuant to this Paragraph 7.C., Baltimore County shall certify to EPA and MDE that such Non-Pump Station SSO Structure has been eliminated and shall summarize the actions taken by the County to eliminate the Non-Pump Station SSO Structure in the Quarterly Report for the calendar quarter in which the Non-Pump Station SSO Structure was eliminated.

v. **Post-Elimination Monitoring**. For each Non-Pump Station SSO Structure eliminated pursuant to this Paragraph 7.C., Baltimore County shall evaluate the hydraulic impacts, such as related SSOs, of the elimination of the SSO Structure on the relevant portions of the Collection System for a period of 18 months following elimination of the SSO Structure. By agreement of the parties, the hydraulic impacts evaluation period may be shortened to less than 18 months. Baltimore County shall consider this information in its evaluation of the long-term capacity and peak flow management of its Collection System as required by Paragraph 9.

vi. **Required Response to Certain Discharges from Pump Station SSO Structures**. If, during the monitoring of Pump Station SSO Structures required pursuant to Paragraph 7.C.i. above, Baltimore County identifies a discharge from a Pump Station SSO Structure that is caused by an event other than the complete loss of pumping capacity at the Pump Station, Baltimore County

shall conduct an analysis of the likely underlying cause of the discharge and, within 90 days of detection of the discharge, submit to EPA and MDE for review and approval a proposed plan and schedule for preventing further discharges arising from the same cause. This requirement shall include discharges from a Pump Station SSO Structure that result from exceeding the Pump Station Design Capacity.

vii. **Application to Newly-Discovered SSO Structures**. The requirements of this Paragraph 7.C. shall also apply to any SSO Structures that are identified after the Date of Lodging of the Consent Decree. To the extent that a Non-Pump Station SSO Structure is discovered after submission of the original Elimination Plan required by Paragraph 7.C.iii., Baltimore County shall submit to EPA and MDE, within 180 days of discovery of the additional Non-Pump Station SSO Structure, a supplement to the original Elimination Plan that contains the same information for, and proposes a plan and schedule for, elimination of the newly-discovered Non-Pump Station SSO Structure.

D. **Construction Projects**. Baltimore County shall complete the Collection System construction projects identified in Appendix B according to the milestone dates set forth therein. The milestone dates set forth in Appendix B are incorporated into, and enforceable under, the Consent Decree as if fully set forth herein. In each Quarterly Report, Baltimore County shall summarize the status of the projects required by Paragraph 7.D. (as listed on Appendix B) as of the end of the prior calendar quarter. Following completion of each construction project identified on Appendix B, Baltimore County shall certify to EPA and MDE that construction has been completed and shall provide a plan for post-construction monitoring consistent with Paragraph 7.D.iii., below, in the Quarterly Report for the calendar quarter in which construction was completed.

i. For construction projects listed on Appendix B that have commenced or are scheduled to commence prior to two years from the Effective Date, Baltimore County shall retain any relevant rainfall and flow monitoring data collected prior to commencement of construction of such

project.

ii. For construction projects listed on Appendix B and scheduled to commence construction after two years from the Effective Date, Baltimore County shall monitor flow and rainfall for eighteen (18) months prior to commencement of construction as necessary to allow the characterization of flow in the portions of the Collection System and overflows impacted by such construction project(s). Such flow and rainfall monitoring shall be performed in accordance with the requirements of Paragraph 9.

iii. Following completion of any construction project listed on Appendix B, Baltimore County shall monitor flow and rainfall for a period of eighteen (18) months to ascertain the effectiveness of the construction project. Such flow and rainfall monitoring shall be performed in accordance with the requirements of Paragraph 9.

iv. By agreement of the Parties, the flow and rainfall monitoring period(s) required by Paragraph 7.D.ii and iii may be shortened to less than 18 months.

v. Any flow and rainfall monitoring data collected by Baltimore County pursuant to this Paragraph prior to the submission of the Sewershed Repair, Replacement, and Rehabilitation Plan for the Sewershed in which the relevant construction project is located shall be considered in developing the relevant SRRR Plan, and shall be made available to EPA and MDE upon request. Any flow and rainfall monitoring data collected by Baltimore County pursuant to this Paragraph after the submission of the SRRR Plan for the Sewershed in which the relevant construction project is located shall be considered by Baltimore County as part of its ongoing evaluation of Collection System performance and shall be made available to EPA and MDE upon request.

E. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 7 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

8. **Collection System Inspection**.

A. **General Requirements.** Baltimore County shall conduct a comprehensive inspection of its Collection System in accord with the criteria set forth in this Paragraph in order to identify causes or potential causes of SSOs.

B. **Submission of Inspection Plan.** Within 60 days of the Effective Date, Baltimore County shall submit a proposed Collection System Inspection Plan to EPA and MDE for approval pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree. Baltimore County's Inspection Plan shall provide for the inspection of Gravity Sewer Lines, Force Mains, manholes, and other appurtenances as set forth in Paragraph 8.C. and D. below, and shall specifically include:

i. Specific inspection activities directed at identifying system defects that may cause SSOs, including but not limited to, design and construction defects, structural defects, debris, root intrusion and grease accumulation, that should be given priority consideration for future repair, replacement or rehabilitation or more frequent maintenance.

ii. A list of all sewer sub-basins that will be inspected pursuant to Paragraph 8.C.i.-iii. below, and a proposed schedule for completing those inspections.

iii. A list of all Gravity Line Segments that Baltimore County believes are subject to the exemptions from CCTV inspection requirements set forth in Paragraph 8.C.vi.

C. **Gravity Sewer Line Inspection.**

i. Within 18 months of the Effective Date:

(a) Baltimore County shall perform closed circuit television ("CCTV") inspections of all Gravity Sewer Lines greater than or equal to 8 inches and less than or equal to 27 inches in diameter that are located within sewer sub-basins in which non-Pump Station SSO Structures are located and/or in which Baltimore County has identified potential structural defects based

on the presence of SSOs or on demonstrated insufficient capacity occurring prior to the Effective Date.

(b) Baltimore County shall perform CCTV inspections, or inspections using comparable methods accepted as industry standard for larger lines, of all Gravity Sewer Lines greater than 27 inches in diameter that are located within sewer sub-basins in which Non-Pump Station SSO Structures are located and/or in which Baltimore County has identified potential structural defects based on the presence of SSOs or on demonstrated insufficient capacity occurring prior to the Effective Date. In performing these inspections, Baltimore County shall not be required to disrupt service in these lines.

(c) Following completion of the requirements set forth in Paragraphs 8.C.i.a. & b., above, Baltimore County shall certify that all such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

ii. Within 6 years of the Effective Date, Baltimore County shall perform CCTV inspections of all Gravity Sewer Lines greater than or equal to 8 inches and less than or equal to 27 inches in diameter that are located within sewer sub-basins in which the average year of original pipe installation is 1960 or earlier and/or in which Baltimore County has identified potential structural defects based on the presence of root blockages or other blockages occurring prior to the Effective Date, and which are located within the following Sewer Basins:

Herring Run
Jones Falls
Patapsco
Gwynns Falls
Dead Run
West Low Level
Stemmers Run

Following completion of the inspection requirements of Paragraphs 8.C.ii., 8.C.iv., 8.D.i., and 8.D.ii(b)(1) for any Sewershed, Baltimore County shall certify that all such requirements have been

completed for that Sewershed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

iii. Within 9 years, 6 months of the Effective Date, Baltimore County shall perform CCTV inspections of all Gravity Sewer Lines greater than or equal to 8 inches and less than or equal to 27 inches in diameter that are located within sewer sub-basins in which the average year of original pipe installation is 1960 or earlier and/or in which Baltimore County has identified potential structural defects based on the presence of root blockages or other blockages occurring prior to the Effective Date, and which are located in any Sewer Basin other than those basins listed in Paragraph 8.C.ii. above. Following completion of the inspection requirements of Paragraphs 8.C.iii., 8.C.iv., 8.D.i., and 8.D.ii(b)(1) for any Sewershed, Baltimore County shall certify that all such requirements have been completed for that Sewershed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

iv. **CCTV Inspection of Gravity Lines Larger than 27" in Diameter**. Baltimore County shall perform CCTV inspections, or inspections using comparable methods accepted as industry standard for larger lines, of all Gravity Sewer Lines greater than 27 inches in diameter. In performing these inspections, Baltimore County shall not be required to disrupt service in these lines. Baltimore County shall complete such inspections in each Sewer Basin within the time period provided for completion of CCTV inspection in that basin pursuant to Paragraph 8.C.ii. & iii. above.

v. **CCTV Inspection Following SSOs**. Beginning 75 days from the Date of Lodging of the Consent Decree, Baltimore County shall conduct CCTV inspection of any Gravity Line Segment of the Collection System where an SSO has occurred within 10 working days of when Baltimore County discovers or has knowledge of the occurrence of the SSO, unless

(a) Baltimore County identifies the cause of the SSO as a blockage in a County-owned lateral adjacent to the Gravity Line Segment and cleans the County-owned lateral;

(b) Baltimore County identifies the cause of the SSO as a blockage in the Gravity Line Segment directly visible from the manhole; or

(c) Baltimore County has previously inspected the Gravity Line Segment with CCTV pursuant to this Paragraph 8.C.v. due to a prior SSO for which Baltimore County is in the process of developing or implementing corrective action.

vi. **Exceptions to CCTV Requirements**.

(a) Specific Segments. The following Gravity Line Segments shall be exempt from the inspection requirements set forth in Paragraph 8.C.i.-iv. above:

(1) Any Gravity Line Segment that has been structurally rehabilitated by pipe relining or replacement within the 10-year period prior to the Effective Date.

(2) Any Gravity Line Segment that has been inspected by CCTV as part of a rehabilitation or construction project that is ongoing as of the Effective Date.

(b) Alternative Methods. Prior to performing CCTV inspection of any gravity line pursuant to Paragraph 8.C.i.-iii. above, Baltimore County may seek approval from EPA and MDE to use one or more alternative methods of inspection that will provide comparable or equivalent information.

vii. **Inspection Criteria**. Baltimore County shall perform CCTV inspections required by this Paragraph in accordance with "Specification Guidelines: Wastewater Collection Systems Maintenance and Rehabilitation" prepared by the National Association of Sewer Service Companies ("NASSCO"); the "Handbook: Sewer System Infrastructure Analysis and Rehabilitation, EPA/625/6-91/030," Oct. 1991 (hereinafter "SSES Handbook"); and sound engineering practice.

D. **Other Inspections**.

i. Manholes and Other Appurtenances. Baltimore County shall perform inspections, using appropriate methodologies, of all manholes and other appurtenances located within or immediately adjacent to the gravity line segments to be inspected pursuant to Paragraph 8.C.i.-iv. above. Inspection of these manholes and other appurtenances shall be completed within the time periods set forth in Paragraph 8.C.i.-iv. above for inspection of the related gravity line segments.

ii. **Force Mains**.

(a) Inspection/Evaluation. Baltimore County shall perform inspections, or other appropriate evaluations, of all Force Mains in its Collection System. Inspection/evaluation of Force Mains shall be carried out utilizing one or more methodologies appropriate to the specific characteristics of each Force Main, which methodologies may include, but are not limited to, visual/CCTV, radiography, ultrasonic/sonar and coupon sampling. Baltimore County shall determine the appropriate inspection/evaluation methodology by performing a risk assessment for each Force Main to determine the risk of failure, based on criteria such as pipe material, diameter, age, depth, profile, flow conditions, operating conditions, soil conditions, internal/external corrosion protection, past performance, transient analysis, and consequence of failure. Force Main inspections/evaluations shall be carried out in such a manner as to allow adequate assessment of the condition of each Force Main. Baltimore County shall consider alternatives for integrating Force Main location information developed during the inspection process into its "Miss Utility" locator program.

(b) Timing.

(1) Baltimore County shall perform the requirements set forth in Paragraph 8.D.ii.(a) above for all Force Mains installed prior to 1980 and the Dundalk, Forge Acres, and Bird River Force Mains within the time periods set forth in Paragraph 8.C.ii.-iii. above for completion of inspections within the Sewershed in which the Force Main is located.

(2) Baltimore County shall perform the requirements set forth in Paragraph 8.D.ii.(a) above for all Force Mains not covered by 8.D.ii(b)(1) above prior to termination of the Consent Decree. Following completion of these inspection requirements, Baltimore County shall certify that all such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

E. **Implementation of Inspection Plan.** Within 30 days after approval or approval with conditions by EPA and MDE of the Inspection Plan, as provided in Section VIII (Review and Approval Procedures) of this Consent Decree, Baltimore County shall implement the Inspection Plan as approved consistent with the approved schedules contained therein, and the approved Inspection Plan shall be incorporated into, and become enforceable under, this Consent Decree. Baltimore County shall identify and record all deficiencies identified through the inspections required by this Paragraph for purposes of reporting and addressing those deficiencies in the SRRR Plans as required by Paragraph 10.

F. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 8 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

9. **Rainfall and Flow Monitoring**.

A. **General Requirements**. Baltimore County shall collect rainfall and flow monitoring data as set forth below and utilize that data to perform evaluations of (i) inflow/infiltration ("I/I") into the Collection System, (ii) the Collection System's capacity to collect and convey peak flows experienced by or predicted for the Collection System without causing dry-weather and wet-weather SSOs, and (iii) the effectiveness of measures implemented by Baltimore County pursuant to this Consent Decree to reduce I/I and to increase system capacity.

B. **Rainfall and Flow Monitoring**. Baltimore County shall submit a Rainfall and Flow Monitoring Plan as required by Paragraph 9.B.v. below, and shall collect rainfall and flow monitoring data pursuant to this Paragraph 9.B. and its Rainfall and Flow Monitoring Plan as approved by EPA and MDE.

i. **Rainfall Monitoring**. Baltimore County shall collect rainfall data as necessary to allow the characterization of flow from each Sewershed service area, the characterization of every known SSO, the development of the Model as required by Paragraph 14, and evaluation of the effectiveness of measures implemented by Baltimore County pursuant to this Consent Decree to reduce I/I and to increase system capacity. Baltimore County shall monitor the contribution from rainfall to each Sewershed within Baltimore County's jurisdictional boundary by using (a) a distribution of rain gauges, (b) multiple rain gauges in concert with Doppler radar, or (c) other monitoring methodologies, subject to review and approval by EPA and MDE, that produce information at least as representative as the use of rain gauges in concert with Doppler radar. If Baltimore County elects to use rain gauges only, Baltimore County shall use a network of appropriately distributed rain gauge stations with a minimum coverage of one rain gauge station per two (2) square miles with no fewer than three (3) rain gauge stations per Sewershed. If Baltimore County elects to use rain gauges in concert with Doppler radar, Baltimore County shall use a network of appropriately distributed rain gauge stations with a minimum coverage of one (1) rain gauge station per ten (10) square miles as well as data collected using Doppler radar that provides a minimum resolution of one (1) pixel per four (4) square kilometers. Baltimore County shall also measure rainfall occurring in portions of the Collection System Sewersheds outside the Baltimore County limits by using appropriately distributed rain gauges located at the upstream jurisdictional boundary(s) (i.e., Baltimore County/Howard County and/or Baltimore County/Anne Arundel County) in the respective Sewershed(s), and, if Baltimore County is proceeding under subparagraph (b) above, by using Doppler radar, to achieve a resolution as close to one pixel per four

square kilometers as is practical. Baltimore County shall also, where practical and appropriate, locate additional rain gauges within Sewershed areas outside its jurisdiction, on properties owned or operated by Baltimore County (such as water treatment facilities), or where practical and appropriate, by agreement with third parties. Baltimore County shall locate, install, operate, calibrate, and maintain all rain gauges, and shall utilize Doppler radar data (if utilized), in accordance with the manufacturer's/service provider's recommendations and good industry practices.

ii. **Flow Monitoring.** Flow data shall be collected using a system of permanent and temporary flow monitors, including the flow or the pump run time records available from all Pump Stations located in the Collection System.

(a) Baltimore County shall collect flow data at such locations in the Collection System as are necessary to allow the characterization of flow from each Sewershed service area, the characterization of every known SSO, the development of the Model as required by Paragraph 14, and evaluation of the effectiveness of measures implemented by Baltimore County pursuant to this Consent Decree to reduce I/I and to increase system capacity.

(b) Baltimore County shall inspect all flow meters with sufficient frequency to meet the data requirements set forth in Paragraph 9.B.iii., below. Baltimore County shall maintain and calibrate all flow meters per the manufacturer's specifications or shall propose alternative maintenance or calibration procedures and criteria for approval by EPA and MDE.

iii. Baltimore County shall conduct its flow and rainfall monitoring in accordance with the SSES Handbook, the NASSCO Guidelines, and sound engineering practices. Baltimore County's flow and rainfall monitoring network shall be designed, installed, operated and maintained to provide data representative of actual rainfall and flow conditions and of sufficient quality for use in the development, calibration, and verification of the Model as required by Paragraph 14, for at least ninety percent (90%) of the time each meter experiences measurable flow. Monitoring site

selection, equipment selection and installation, calibration, and maintenance, and data quality assurance checks shall all be carried out to optimize monitoring accuracy, to minimize the loss of data due to meter downtime, and shall all conform with the equipment manufacturers' recommendations and current, good engineering practice. Field calibration results for each meter, along with an evaluation of the accuracy for each meter, shall be retained consistent with Section XVIII (Record Keeping) of this Consent Decree. These shall include (for flow monitoring) monitoring site diagrams, scattergraph plots of field data sets, manual field depth and velocity measurements, and (if the site is free flowing) the appropriate pipe curve.

iv. Rainfall and flow data shall be handled and analyzed using appropriate, industry-accepted quality assurance and quality control procedures that will assure that the measurements are representative of actual rainfall and flow conditions and that the data are of sufficient quality for use in the development, calibration, and verification of the Model as required by Paragraph 14.

v. By no later than 180 days from the Effective Date, Baltimore County shall submit a Rainfall and Flow Monitoring Plan, and accompanying implementation schedule, to EPA and MDE for review and approval. This Plan shall describe in detail the approach that Baltimore County will utilize to monitor rainfall and flow in each Sewershed, including any areas of the Sewershed outside of Baltimore County's jurisdiction. The Plan also will provide a detailed discussion of the technical basis for the proposed approach to rainfall monitoring, including the number of rain gauges to be used in each Sewershed and their approximate locations. The Plan shall also identify the estimated number and general location of flow monitoring points in each Sewershed and provide a map that identifies the location of each rain gauge and flow monitor. It is recognized that details such as particular monitoring locations may change based upon field inspection activities; however, the Plan shall describe how the proposed flow monitoring points will allow the collection of data that is adequate to support successful

calibration and verification of the Model, as required by Paragraph 14.B., and characterization of the Collection System's response to wet weather events as required by Paragraph 9.C.ii. The Plan shall also describe how Baltimore County, consistent with Paragraph 9.B.vi. below, proposes to ensure that its monitoring program will be capable of evaluating the effectiveness of measures implemented by Baltimore County pursuant to this Consent Decree (including Paragraphs 7, 10, and 13) to reduce I/I and to increase system capacity.

vi. Within one year of approval of its Rainfall and Flow Monitoring Plan, and on an annual basis thereafter until termination of the Consent Decree, Baltimore County shall evaluate the number and placement of flow monitors and rain gauges throughout the Collection System and in each Sewershed and make any modifications necessary to ensure that the then-current number and placement of flow monitors and rain gauges capture representative wastewater flow and rainfall data sufficient to satisfy the requirements of this Paragraph 9.B., including evaluation of the impact on the Collection System or Sewershed of the completion of any repair, replacement or rehabilitation projects designed to reduce I/I or to increase capacity. In each Annual Report, Baltimore County shall summarize the results of the evaluation for the prior year, including the location of rain gauges or flow monitors changed during the prior calendar year, and provide a revised location map.

C. **Evaluation of Monitoring Data**. Baltimore County shall complete an Inflow/Infiltration Evaluation and a Long-Term Capacity/Peak Flow Management Evaluation for each Sewershed as set forth in Paragraphs 9.C.i. and ii. below. Baltimore County shall complete each Evaluation no later than 60 days prior to the date by which it is required to submit the SRRR Plan for the relevant Sewershed pursuant to Paragraph 10, and shall summarize and incorporate the results of the Evaluations in the SRRR Plan for the relevant Sewershed.

i. **Inflow/Infiltration Evaluation**. For each Sewershed, Baltimore County shall complete the evaluation of I/I into the Collection System within that Sewershed. These evaluations

shall include identification of sources of infiltration, sources of inflow, and methods for reducing I/I into the Collection System. As part of these required I/I evaluations, Baltimore County shall utilize the rainfall and flow monitoring data collected pursuant to this Paragraph: (a) to determine baseline normalized (e.g., gallons/inch-mile) I/I rates in each Sewershed; (b) to determine the efficacy of the capital projects completed pursuant to Paragraph 7 to reduce I/I rates; and (c) to predict the effectiveness of the capital projects required by Paragraph 7 but not yet completed, and any additional rehabilitation or other corrective action proposed by Baltimore County in each SRRR Plan to reduce peak wet weather flows and/or to address portions of the Collection System with insufficient capacity, including actual or potential SSOs. For purposes of this Paragraph 9 only, the term "evaluation" shall be interpreted in accordance with the meaning ascribed to that term in sub-chapters 3.3, 3.4, 3.5, 3.6 and Chapter 4 of the SSES Handbook and in accordance with the technical procedures for identification of I/I set forth in sub-chapters 3.3, 3.4, 3.5, 3.6, and Chapter 4 of the SSES Handbook. Following completion of the I/I Evaluation for any Sewershed, Baltimore County shall certify that the I/I Evaluation has been completed for that Sewershed and summarize the actions taken by Baltimore County to complete the I/I Evaluation in the Quarterly Report for the calendar quarter in which I/I Evaluation was completed.

ii. **Long-Term Capacity/Peak Flow Management Evaluation**. Baltimore County shall use the data and information collected and analyzed in Paragraphs 8 and 9 to evaluate whether the construction projects required by Paragraph 7.D. of the Consent Decree and the projects Baltimore County proposes to complete pursuant to Paragraph 10 will ensure adequate long-term transmission capacity in the Collection System. At a minimum, Baltimore County shall evaluate the hydraulic capacity of all Major Gravity Lines, Force Mains, Pump Stations, and relevant appurtenances (collectively referred to as “Modeled Components” for purposes of this Paragraph 9.C.ii.).

(a) As part of the evaluation required by this subparagraph, Baltimore County shall use the information, including I/I rates, that it is required to develop pursuant to this

Paragraph of the Consent Decree to assess existing and long-term capacity of the Collection System, to evaluate the ability of the Collection System to transmit peak flows experienced by and predicted for the Collection System, and to identify appropriate measures to address capacity issues with the goal of eliminating capacity-related SSOs. Baltimore County shall use flow data and rainfall data collected pursuant to this Paragraph and the Model required by Paragraph 14 both to accurately represent wastewater flow attributable to each service area and to estimate the impact of peak flows experienced by the Collection System on the capacity of the Modeled Components to manage peak flows. Peak flows shall be determined using flow monitoring conducted pursuant to this Paragraph and shall take into account variables including, but not limited to: the average age of the gravity sewer system; soil-type and porosity (where applicable); maximum, minimum and average yearly groundwater elevations; proximity to surface water bodies; tidal influence; amount of drainage area; service area size; land use; historic I/I data; seasonal population patterns (where applicable); Collection System construction materials; and year 2025 predicted population and land uses.

(b) Baltimore County shall determine predicted peak flows for each of its Sewersheds under baseline and future flow conditions for, at a minimum, 2, 10, and 20 year/24-hour storm events. In developing the Hyetographs and Hydrographs for these storm events, Baltimore County shall utilize either (i) an SCS Type II rainfall distribution, or (ii) an alternative rainfall distribution that is more representative of actual Baltimore County rainfall patterns than the SCS Type II distribution. If Baltimore County utilizes an alternative rainfall distribution pursuant to Paragraph 9.C.ii(b)ii., Baltimore County shall provide with its analysis an explanation of its determination that the alternative rainfall distribution was more representative. Baseline conditions shall be those in effect at the time flow metering is completed in each Sewershed. Future conditions shall be based on reasonable population projections for year 2025. Baltimore County shall include in its evaluation the effects of completion of the capital projects required under Paragraph 7 and any projects that it proposes to

complete pursuant to each SRRR Plan developed pursuant to Paragraph 10. The baseline reference for those projects shall be the period during which rainfall and flow monitoring were last carried out. Baltimore County may consider the utilization of existing, practical in-line storage capacity (i.e., storage capacity that can be used without modification to the existing system and that does not cause any SSOs) in evaluating the capacity of the Collection System and the ability of the Modeled Components to manage peak flows resulting from storm events.

(c) Baltimore County shall develop rainfall Hyetographs and I/I Hydrographs for each Sewershed. The Hyetographs and Hydrographs shall be developed using:

(1) Available historical rainfall and flow data;

(2) Rainfall and flow data collected pursuant to this Paragraph, or otherwise;

(3) Population data;

(4) Winter water use records; and

(5) Other appropriate information.

Baltimore County shall identify and apply widely-used and accepted engineering methodologies to determine baseflow rates and diurnal baseflow variation, dry weather infiltration, relationships between rainfall and wet weather flow volumes and rates in each portion of each Sewershed, and to identify a representative Hydrograph shape(s). The Hyetographs and I/I Hydrographs shall be developed for the storm recurrence frequencies identified in subparagraph (b) above. The I/I Hydrographs shall be integrated with baseline wastewater, rainfall, and flow data and used in the Model to understand the flow through the Modeled Components.

(d) In evaluating the impact of the capital improvement projects required by Paragraphs 7.D. and 13.B. of the Consent Decree, and the capital projects that Baltimore County proposes in any SRRR Plan, on the adequacy of long-term transmission capacity and the ability

of the Collection System to transmit peak flows, Baltimore County shall account for the Collection System's existing and modeled capacity, the estimated population and wastewater flow rates for the year 2025, and estimated sewer deterioration rates, and shall use the results of that evaluation to:

(1) Identify any Modeled Components that restrict flow of wastewater through the Collection System that cause or contribute, or are likely to cause or contribute, to SSOs from the Collection System;

(2) Quantify the maximum flow that any Modeled Component identified in 9B.ii.(d)(1) above can convey without causing or contributing to an SSO;

(3) Identify all Modeled Components that cannot manage peak flows during a full range of storm events listed in Paragraph 9.B.ii(b) without causing or contributing to an SSO; and

(4) Identify the improvements to the Collection System necessary to ensure adequate long-term capacity consistent with the SSES Handbook during a full range of storm events specified in this Paragraph 9.C.ii.

(e) The improvements Baltimore County shall consider to assure adequate capacity shall include expansion and/or replacement of Modeled Components, including Pump Stations, reduction of inflow and infiltration, and installation of larger replacement sewers or relief sewers.

(f) Following completion of the long-term capacity/peak flow management evaluation for any Sewershed, Baltimore County shall certify that the long-term capacity/peak flow management evaluation has been completed for that Sewershed and summarize the actions taken by Baltimore County to complete the long-term capacity/peak flow management evaluation in the Quarterly Report for the calendar quarter in which the long-term capacity/peak flow management evaluation was completed.

(g) It is not the purpose of this Consent Decree to require Baltimore County to design or otherwise construct its Collection System to any specific recurring storm interval, or any particular event modeled pursuant to this Consent Decree.

D. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 9 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

10. **Sewershed Repair, Replacement and Rehabilitation Plans**.

A. **General Requirements**. Following completion of the Collection System Inspection required by Paragraph 8, and considering the rainfall and flow monitoring data collected pursuant to Paragraphs 7.D. and 9, Baltimore County shall prepare a Sewershed Repair, Replacement and Rehabilitation Plan ("SRRR Plan") for each Sewershed that describes the deficiencies identified through the Collection System Inspection and provides for the performance of any repair, replacement, rehabilitation or other corrective action necessary to address those deficiencies. Baltimore County shall complete implementation of the SRRR Plans for all 32 Sewersheds in its Collection System by no later than 14 years, six months from the Effective Date.

B. **Development and Submission of SRRR Plans and Schedules.** Within one year of completion of the Collection System Inspection for each Sewershed as required by Paragraph 8, Baltimore County shall prepare and submit to EPA and MDE for approval, pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, a SRRR Plan for that Sewershed. Each SRRR Plan shall provide for future repair, replacement, and rehabilitation of Collection System components within that Sewershed in accordance with a prescribed schedule that provides for completion of construction and implementation of each project to be performed pursuant to the approved SRRR Plan by no later than 4 years from EPA and MDE approval or approval with conditions

of the SRRR Plan pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree. In proposing schedules for implementation of the SRRR Plans, Baltimore County shall prioritize the work to be performed in each Sewershed based on an evaluation of the rehabilitation activities that are expected to contribute most effectively to the prevention of SSOs.

C. **Criteria for SRRR Plans.** Within each SRRR Plan, Baltimore County shall:

i. Evaluate the effectiveness of the projects completed or proposed to be completed pursuant to Paragraph 7.D. for the relevant Sewershed. Baltimore County shall use rainfall and flow monitoring data collected in accordance with requirements of Paragraphs 7.D. and 9 of the Consent Decree, and shall use the Model developed in accordance with Paragraph 14 of the Consent Decree, to demonstrate the effectiveness of the construction projects;

ii. Identify all deficiencies in the relevant Sewershed discovered during the Collection System Inspection conducted pursuant to Paragraph 8;

iii. Identify all corrective actions taken (including date completed), or to be taken, by Baltimore County (including but not limited to preventative maintenance, repair, replacement, or rehabilitation) to address the deficiencies identified during inspection of the relevant Sewershed;

iv. Describe the priority scheme used to set priorities for correcting identified deficiencies within each Sewershed, including any decision not to correct an identified deficiency;

v. Describe the decision-making criteria used to select future corrective action;

vi. Propose a plan and schedule for implementing rehabilitation and other corrective action determined necessary to correct deficiencies in the relevant Sewershed identified during the inspections required by Paragraph 8, taking into consideration the Long-Term Capacity/Peak Flow Management analysis performed for the relevant Sewershed pursuant to Paragraph 9; the prioritization scheme to be applied to correction of these deficiencies; and an estimate of the cost

necessary to complete any proposed rehabilitation and other corrective actions. For purposes of this Paragraph only, the term "rehabilitation" shall be interpreted in accordance with the meaning ascribed to that term in Chapters 5.4 and 6 of the SSES Handbook, and in accordance with the technical procedures for sewer system rehabilitation set forth in Chapter 6 of the SSES Handbook.

vii. Propose a plan and schedule for eliminating those physical connections (i.e., cross connections) between the Collection System and the storm water collection system that allow or have the potential to allow sanitary waste to be discharged to the storm water collection system;

viii. Present the results of the long-term capacity/peak flow management evaluation conducted pursuant to Paragraph 9.C.ii, and determine for each Sewershed the range of storm events as specified in Paragraph 9.C.ii(b) for which the Collection System in its existing condition can convey peak flows without the occurrence of SSOs. As part of its analysis, Baltimore County shall identify all modeled Collection System Components and Pump Stations that cause or contribute to flow restrictions or that have the potential to cause or contribute to overflows;

ix. Consistent with the results of the long-term capacity/peak flow management evaluation conducted pursuant to Paragraph 9.C.ii, project for each Sewershed the range of storm events as specified in Paragraph 9.C.ii(b) for which the Collection System will be able to convey peak flows without the occurrence of SSOs. Such projection shall assume completion of the construction projects required by Paragraph 7 of this Consent Decree, and completion of the proposed rehabilitation or other corrective action projects recommended by the SRRR Plan required by this Paragraph 10. As part of its analysis, Baltimore County shall identify all modeled Collection System components and Pump Stations that cause or contribute to flow restrictions or that have the potential to cause or contribute to overflows;

x. Present the results of the rainfall and flow monitoring conducted in the Sewershed, including a map that depicts all monitored locations, dates of monitoring, a description of

quality assurance and quality control analyses performed for samples collected and data analyzed and the results of those analyses (i.e., summarize data quality assurance and data "lost" or "qualified"), and present the results of the I/I evaluation performed pursuant to Paragraph 9.C.i., including a description of the smoke testing and dye testing activities performed in the Sewershed, a summary of the results of such testing, a quantification of the rates of I/I for the Sewershed and the portions of the Sewershed's Collection System impacted by I/I, and any identified sources of I/I to the Collection System located in the Sewershed;

xi. Baltimore County shall incorporate into each SRRR Plan a description of additional data collection activities that will be implemented after the completion of rehabilitation and other corrective action(s) proposed pursuant to Paragraphs 10.B. and 10.C. to evaluate their effectiveness consistent with Paragraph 10.E. (Performance Assessment) below.

D. **Approval and Implementation of SRRR Plans**. Within 30 days after approval or approval with conditions by EPA and MDE of an SRRR Plan for a specific Sewershed, as provided in Section VIII (Review and Approval Procedures) of this Consent Decree, Baltimore County shall implement the SRRR Plan as approved and consistent with the approved schedules contained therein. Each approved SRRR Plan shall be incorporated into, and become enforceable under, this Consent Decree. In each Quarterly Report, Baltimore County shall provide a summary of Baltimore County's progress in completing implementation of each SRRR Plan during the prior calendar quarter. Following completion of the implementation of the SRRR Plan for any Sewershed, Baltimore County shall certify that the SRRR Plan has been implemented for that Sewershed and summarize the actions taken by Baltimore County to complete the SRRR Plan in the Quarterly Report for the calendar quarter in which the SRRR Plan was completed.

E. **Performance Assessment**. Baltimore County shall conduct a Performance Assessment of the work performed in each Sewershed as required under Paragraphs 7, 10, and 13 to

determine the effectiveness of the evaluation and corrective action work performed.

i. The Performance Assessment shall, at a minimum,

(a) evaluate the number and causes of SSOs that occur on an annual basis in each Sewershed;

(b) quantify the reduction of I/I in each Sewershed;

(c) evaluate the effectiveness of repair, replacement, and rehabilitation projects in addressing identified structural and/or capacity issues;

(d) evaluate the effectiveness of preventative and proactive maintenance practices in reducing root, grease, and other blockages.

ii. The Performance Assessment shall be completed for each Sewershed within 18 months after complete implementation of the SRRR Plan for that Sewershed.

iii. Baltimore County shall submit a Performance Assessment report for each Sewershed summarizing the results of the Performance Assessment for that Sewershed to EPA and MDE for review and comment within 90 days after completion of the Performance Assessment for that Sewershed.

iv. Following completion of the Performance Assessment, Baltimore County shall modify its Collection System operation and maintenance program as appropriate to achieve the purpose of this Consent Decree.

F. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 10 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

11. **Fats, Oils, and Grease Control Program**.

A. **Summary of Requirements.** Baltimore County shall perform a comprehensive

review of its current procedures for the control of fats, oils, and grease ("FOG Program") within its Collection System and implement specific modifications to its FOG Program to improve its effectiveness, with the goal of eliminating SSOs caused or contributed to by fats, oils, and grease (hereinafter collectively "grease") blockages.

B. **Continuation of Current FOG Program**. Until such time as more stringent FOG controls are implemented through the FOG Program Modification Plan developed pursuant to this Paragraph 11, Baltimore County shall continue to enforce its current FOG Program, including specifically the County requirements authorized by the Code of Baltimore County, Food Service Facility Regulations § 1.01.01, which requires, among other things, that all new and certain remodeled Grease Generating Facilities must install a grease abatement system as a prerequisite to qualification for an operating permit; the Code of Baltimore County, Article 20, Title 5, Waste Water Regulation; and the National Standards of Plumbing Code Illustrated (1996 and 1998 Supplement), Sec. 6.1.1, Interceptors.

C. **Review of Current FOG Program and Evaluation of Potential Improvements**. Within 180 days of the Date of Lodging, Baltimore County shall complete a preliminary review of its current FOG program to identify deficiencies in the Program, including conflicts regarding inter-departmental requirements, and to make recommendations to ensure that the requirements of this Paragraph 11 can be satisfied within the time frames provided. Within 30 days of completing this preliminary review, the County shall submit a report on the findings of the review to MDE and EPA for review and comment. In conducting its review, Baltimore County shall, at a minimum:

i. Review applicable statutes and regulations to determine whether the County has sufficient statutory and regulatory authority to effectively identify and control sources of fats, oils and grease that may enter the Collection System, including the authority to require grease abatement devices and best management practices ("BMP's") and to assess penalties for non-

compliance, and identify and evaluate potential modifications to resolve any identified deficiencies.

ii. Review current DEPRM and DPW enforcement practices, including but not limited to, field inspection methodologies, violation notification, penalty assessment, and administrative and judicial enforcement processes.

iii. Review current DEPRM and DPW database assets to ascertain the type of information available, frequency of data collection and entry, and accessibility of data.

D. **Database and GIS Mapping of Grease Generating Facilities**.

i. Within one year of the Effective Date, Baltimore County shall create a database of Grease Generating Facilities that includes for each Facility the address, owner/responsible party, presence or absence of a grease abatement system, history of violations, inspection history, and any other information relevant to assessing the Facility's potential contribution to grease-related blockages and/or SSOs.

ii. Within one year of the Effective Date, Baltimore County shall use its geographical information system ("GIS") to develop a map that identifies the following: (a) SSOs caused or contributed to by grease blockages since June 30, 2000; (b) the locations of all known Grease Generating Facilities; and (c) the locations of any Grease Generating Facilities that have been the subject of enforcement actions by Baltimore County due to FOG-related blockages since June 30, 2000.

iii. The database and map required in Paragraph 11.D.i. & ii., above, shall be updated at least semi-annually to reflect the ongoing inspection and enforcement histories of all new and existing Grease Generating Facilities. Baltimore County shall provide the most recent version of the database and map to EPA and MDE as part of each Annual Report.

E. **Survey and Inspection of Potential Grease Generating Facilities**.

i. Within one year of the Effective Date, Baltimore County shall develop and incorporate criteria for FOG evaluation, including criteria for assessing the risk that a Grease

Generating Facility will cause or contribute to a grease blockage in the Collection System, into the protocol for routine inspections of permitted food service facilities and inspection of other Grease Generating Facilities over which Baltimore County exercises FOG-related jurisdiction, and develop revised inspection forms for recording FOG-related information;

ii. Within one year of the Effective Date, Baltimore County shall conduct a baseline FOG inspection of each Grease Generating Facility in the County's service area. The baseline inspection, which may be conducted concurrently with other routine Facility inspections, shall determine whether the Facility(ies) are equipped with a grease abatement system, whether the systems are being operated and maintained properly, and whether grease hauler removal information is being maintained; and

iii. Within eighteen (18) months of the Effective Date, Baltimore County shall enter all FOG information obtained from the baseline inspections into the database and GIS maps developed pursuant to Paragraph 11.D.

iv. Following completion of the baseline inspection requirements set forth in Paragraph 11.E.ii., Baltimore County shall certify completion of such requirements and summarize the actions taken by Baltimore County to complete such requirements in the Quarterly Report for the calendar quarter in which such requirements were completed.

F. **Notice to Responsible Parties**.

i. Within one year of the Effective Date, Baltimore County shall notify in writing the responsible party(ies) for each Grease Generating Facility of the general obligation to prevent the discharge of fats, oils and grease to the Collection System.

ii. Following EPA and MDE approval of Baltimore County's FOG Program Modification Plan under Paragraph 11.G., and no later than 90 days after completion of the requirements of Paragraph 11.E.ii., Baltimore County shall notify in writing each responsible party for each Grease

Generating Facility of the obligations under the County's FOG Program and provide additional information to assist in achieving compliance with those obligations, including contact information for approved grease transport services. Baltimore County shall thereafter provide such notice on an annual basis.

iii. Following completion of the notice requirements set forth in Paragraph 11.F.i. and ii.(excluding the annual notice requirement), Baltimore County shall certify completion of such requirements and summarize the actions taken by Baltimore County to complete such requirements in the Quarterly Report for the calendar quarter in which such requirements were completed.

G. **Review and Modification of Current FOG Program**. Baltimore County shall complete a comprehensive review of its current FOG Program, as well as the information collected during the baseline inspections required by Paragraph 11.E., to determine the Program's effectiveness, to evaluate potential improvements and alternatives, and to propose specific modifications to improve the Program's effectiveness in preventing grease blockages within the Collection System. By no later than 60 days after the completion of the baseline inspections required by Paragraph 11.E., Baltimore County shall submit to EPA and MDE, for approval pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, a FOG Program Modification Plan that summarizes the results of Baltimore County's FOG Program review; proposes specific modifications, implementation plans and schedules for, at a minimum, each of the Program components identified in this Paragraph 11.G.; and provides for full implementation of the proposed modifications by no later than two years from final approval by EPA and MDE pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree of Baltimore County's FOG Program Modification Plan. In developing its FOG Program Modification Plan, Baltimore County shall:

i. Propose specific modifications to address any conflicts or deficiencies in Baltimore County's statutory and regulatory authority identified during or subsequent to Baltimore

County's review conducted pursuant to Paragraph 11.C., and a schedule for development and enactment of such modifications;

ii. Evaluate alternative methods, including permitting and contract programs, for assigning specific, enforceable responsibilities to Grease Generating Facilities to eliminate discharges of fats, oils and grease to the Collection System, and propose a specific plan and schedule for implementing such a program (including procedures for timely notification of violations, escalation of enforcement actions, and the imposition of civil penalties and injunctive relief) within Baltimore County's service area;

iii. Evaluate alternative methods for implementing grease abatement system management, operation and maintenance standards, including best management practices that address acceptable technology (including type, size and proper installation of abatement systems), on-site record keeping requirements, cleaning frequency, cleaning standards, use of additives, and ultimate disposal of grease removed, and propose a specific plan and schedule for adopting and implementing such standards and practices within Baltimore County's service area;

iv. Evaluate all methods of effecting grease management, including best management practices ("BMPs") and cleaning practices, at Grease Generating Facilities not currently required to implement a grease abatement system, and propose a specific plan and schedule for implementing such standards and practices within Baltimore County's service area. Baltimore County shall also consider additional steps for such Facilities, including whether (a) to revise regulations to require installation and operation of grease abatement systems, (b) to implement a program for increased cleaning by Baltimore County of the main into which the relevant lateral connects, (c) to require the Grease Generating Facilities to regularly clean the lateral pipes that connect to Baltimore County's Collection System, and/or (d) to implement any other equally effective program or remedial measure for reducing FOG blockages. As part of this evaluation, Baltimore County shall also consider the extent to

which multi-person residential buildings contribute FOG to the Collection System and consider alternatives for reducing such FOG contributions;

v. Evaluate alternative methods for scheduling, prioritizing, and conducting regular inspections to assess compliance by Grease Generating Facilities with prohibitions on the discharge of fats, oils and grease to the Collection System, and propose a specific plan and schedule for incorporating revised compliance requirements into the inspection protocol and database design and for implementing ongoing FOG inspections within Baltimore County's service area;

vi. Evaluate staffing and ancillary requirements necessary to improve the effectiveness of Baltimore County's FOG Program, and propose a plan and schedule for securing funding for and training the necessary staff;

vii. Evaluate potential performance indicators that may be used to measure the effectiveness of the FOG Program, including measurements for the reduction in the frequency of FOG-related SSOs and blockages, and propose a plan for tracking effectiveness under Baltimore County's modified FOG Program to be used in conducting ongoing FOG Program evaluations under Paragraph 11.I; and

viii. Evaluate public education and outreach and compliance assistance efforts necessary to inform commercial and residential property owners and occupants about the need to minimize the introduction of grease into the Collection System, and propose a plan for implementing such efforts within Baltimore County's service area, consistent with Paragraph 11.F.

H. **Implementation of FOG Program Modification Plan**. Upon approval or approval with conditions by EPA and MDE of Baltimore County's FOG Program Modification Plan, pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, Baltimore County shall implement the Plan as approved and according to the approved schedule(s), and the FOG Program Modification Plan shall be incorporated into, and become enforceable under, this Consent Decree. In

each Quarterly Report, Baltimore County shall provide a summary of Baltimore County's progress in completing implementation of its approved FOG Program Modification Plan during the prior calendar quarter. Following implementation of the FOG Program Modification Plan, Baltimore County shall certify completion and summarize the actions taken by Baltimore County to implement the FOG Program Modification Plan in the Quarterly Report for the calendar quarter in which such requirements were completed.

I. **Annual Evaluations of Modified FOG Program**. Within one year of implementation of the FOG Program Modification Plan pursuant to Paragraph 11.H., above, and on an annual basis thereafter, Baltimore County shall evaluate the effectiveness of its modified FOG Program using the performance indicators developed pursuant to Paragraph 11.G.vii., above. The results of each annual evaluation should be included in the next Annual Report submitted to EPA and MDE pursuant to Section VI (Reporting Requirements).

J. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 11 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

12. **Illegal Storm Water Discharges**.

A. **General Requirements**. Baltimore County shall, through the use of methodologies such as CCTV and smoke and dye testing during the performance of the Collection System inspections required pursuant to Paragraph 8, seek to identify Illegal Storm Water Discharges to the Collection System, and upon identification shall eliminate such discharges, where such discharges, individually or cumulatively, are likely to cause or contribute to an SSO.

B. **Specific Requirements**.

i. Elimination of Illegal Storm Water Discharges.

(a) Within 30 days of identifying an Illegal Storm Water Discharge into the Collection System, Baltimore County shall notify the owner of the connection (including all associated laterals or other privately-owned conduits used to transport discharge to the connection) that is the source of such discharge that the connection is the source of an illegal discharge, and shall require the owner to take all appropriate steps to eliminate the illegal discharge.

(b) Within 180 days after notifying the owner to eliminate the Illegal Storm Water Discharge, if the owner has failed to eliminate the illegal discharge, Baltimore County shall take all lawful and appropriate steps including, but not limited to, repairing, rehabilitating, or replacing the connection that is the source of the discharge, or initiating enforcement action to cause the repair, rehabilitation, replacement, or termination of that service connection.

(c) Alternatively, Baltimore County may require the owner to pay the appropriate fines and/or authorize the discharge if Baltimore County ensures through the provision of adequate sewer system capacity that the discharge will not cause or contribute to an SSO.

(d) The foregoing remedies shall not be exclusive of other administrative or judicial remedies provided by law or regulation.

ii. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 12 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

13. **Pump Station Inspection, Rehabilitation, Repair and Replacement**.

A. **General Requirement**. Baltimore County shall undertake the measures set forth in this Paragraph, with the goal of eliminating SSOs related to Pump Stations in the Baltimore County Collection System.

B. **Pump Station Rehabilitation/Repair**. Baltimore County shall complete the specific Pump Station rehabilitation, repair, and replacement projects identified in Appendix C in

accordance with the milestone dates set forth in Appendix C. The milestone dates set forth in Appendix C are incorporated into, and enforceable under, the Consent Decree as if fully set forth herein. In each Quarterly Report, Baltimore County shall summarize the status of the projects required by this Paragraph 13.B. (as listed on Appendix C) as of the end of the prior calendar quarter. Following completion of each construction project identified on Appendix C, Baltimore County shall certify to EPA and MDE that construction has been completed in the Quarterly Report for the calendar quarter in which construction was completed.

C. **Pump Station Backup Power**. Baltimore County shall ensure that adequate backup power is maintained for each Pump Station.

i. Within one year of the Effective Date, and for each calendar year thereafter during the period that this Consent Decree is in effect, Baltimore County shall complete an evaluation of the effectiveness of its existing Pump Station backup power program, including the use of portable generators as backup power for multiple stations, in preventing SSOs relating to power outages at Pump Stations during the preceding year. Baltimore County shall submit the results of the annual evaluation to EPA and MDE in the applicable Annual Report.

ii. If any Pump Station experiences an SSO due to loss of power Baltimore County shall, within 180 days of the discovering the SSO, submit a plan to EPA and MDE for review and approval that provides for either (1) installation of a permanent backup generator or other on-site backup power source at the affected Pump Station, (2) procurement of additional portable generators sufficient to prevent future SSOs due to loss of power at the affected Pump Station, or (3) implementation of other measures, approved by EPA and MDE, designed to prevent further SSOs relating to power outages at the affected Pump Station. Upon approval or approval with conditions by EPA and MDE of Baltimore County's plan under this Paragraph 13.C.ii., Baltimore County shall implement the Plan as approved and according to the approved schedule(s). Following implementation

of the approved plan, Baltimore County shall certify completion and summarize the actions taken by Baltimore County to implement the approved plan in the Quarterly Report for the calendar quarter in which the plan requirements were completed.

D. **Pump Station Remote Monitoring**.

i. By agreement of the Parties, Baltimore County shall install a supervisory control and data acquisition ("SCADA") system for remote monitoring of Pump Stations as provided for in its Contract No. 02119 with Hartwell Engineering, Inc. ("SCADA Contract"). Baltimore County shall ensure, and shall certify to EPA and MDE in the applicable Quarterly Report, that the SCADA system is installed, operational, and capable of satisfying the requirements of this Paragraph 13.D. with respect to each Pump Station by no later than the Effective Date of this Consent Decree.

(a) For each Pump Station, the SCADA system shall continuously poll, report, and transmit, at a minimum, the following parameters, where the referenced attributes are present:

(1) Wet well high level and low level alarms;

(2) Dry well flood alarms;

(3) Dry well sump pumping failure, where available;

(4) Flow (instantaneous and average) determined from a flow meter;

(5) Failure of any one of the following parameters (as a single alarm):

(i) loss of three-phase power;

(ii) single phase condition;

(iii) phase reversal;

(iv) over-voltage and under-voltage;

(v) use of standby power;

(vi) failure of standby power; and

(vii) second power source;

(6) Pump failure (for each pump);

(7) Pump running times;

(8) Pump starts; and

(9) Remote signal failure alarms.

(b) With respect to all Pump Stations, system monitoring data of wet well levels shall be stored in an archival data base for a period of five years. In addition, the Pump Station operating hours for each pump shall be recorded monthly and entered into an archival data base. Baltimore County shall retain for each month the 24-hour maximum and the monthly average flow data for each Pump Station in accord with Section XVIII (Record Keeping).

(c) The new SCADA system shall enable Baltimore County to store a record of each alarm generated by the SCADA system that includes the date, time, location, and parameter of the alarm. Baltimore County shall maintain alarm information for a minimum of five years and make this information available to MDE or EPA upon request.

ii. Prior to the implementation of the SCADA system required by this Paragraph 13.D., Baltimore County shall continue to monitor its Pump Stations using its existing system. Baltimore County shall archive all available alarm data generated by its current system for the five-year period prior to implementation of the new SCADA system.

E. **Pump Station Inspection and Evaluation**.

i. **Pump Station Classification**. For purposes of this Paragraph, each of the Pump Stations in Baltimore County's Collection System has been designated as either Tier 1, 2, or 3. The listing of Pump Stations by tier is attached to this Consent Decree as Appendix D.

ii. **Pump Station Inspection**. Until such time as Baltimore County fully implements the SCADA system required by Paragraph 13.D., Baltimore County shall conduct a physical inspection of each Pump Station at least once per week. Following implementation of continuous monitoring of each Pump Station under the new SCADA system, Baltimore County shall conduct a physical inspection of each Tier 1 Pump Station at least once per week, each Tier 2 Pump Station at least once every two weeks, and each Tier 3 Pump Station at least once per month.

(a) Baltimore County shall conduct the inspections required by this Paragraph 13.E.ii. in accordance with the inspection checklists attached to this Consent Decree as Appendix E. Baltimore County may modify the inspection checklists consistent with appropriate engineering and operation standards. Baltimore County shall provide EPA and MDE with a description of any modifications to the inspection checklists and an updated version of the checklists within the Annual Report for any year in which such modifications were made.

(b) Upon completion of the engineering evaluation/condition assessment required by Paragraph 13.F. below, Baltimore County shall update the inspection checklist(s) to ensure that the inspection protocol is sufficient to verify that each Pump Station is in good working order.

(c) Completed checklists and inspection reports shall be maintained by Baltimore County in accordance with the requirements of Section XVIII (Recordkeeping).

iii. For each deficiency identified during an inspection conducted in accordance with requirements of this Paragraph 13.E., Baltimore County shall either correct the deficiency within twenty-four hours, or, alternatively, issue a work order for the correction of the deficiency, in which Baltimore County shall assign a priority ranking in accordance with the ranking system attached to this Consent Decree as Appendix F, and complete action necessary to correct such deficiency consistent with the priority ranking and the impact of the deficiency on the functionality of

Baltimore County's Collection System. All identified deficiencies within Priority Classifications 2, 3, or 4 shall be corrected by no later than six (6) months from the date of the inspection in which that deficiency was first observed, unless such deficiencies are otherwise scheduled for correction pursuant to a separate requirement under this Consent Decree. Baltimore County may seek approval from EPA and MDE for an extension of time to correct any deficiency within Priority Classification 2 based on the limited availability of remedial materials.

iv. In addition to the actions required by subparagraph iii., above, in the event that any deficiency is identified that results in an SSO, Baltimore County shall act immediately to implement emergency measures to prevent or mitigate an SSO until the deficiency is corrected.

F. **Pump Station Engineering Evaluation/Condition Assessment**. Baltimore County shall perform or arrange for performance of an engineering evaluation and condition assessment by a professional engineer licensed in the State of Maryland for each Pump Station in its Collection System, except as set forth in Paragraph 13.F.v., below.

i. Each engineering evaluation/condition assessment required by this Paragraph 13.F. shall, at a minimum, include an assessment of the Pump Station's pumping system and mechanical, electrical, structural, and architectural condition. The engineering evaluation/condition assessment shall also determine whether the Pump Station utilizes an SSO Structure and, if so, evaluate whether such SSO Structure can be eliminated or modified so as to mitigate the potential impacts of discharges from the SSO Structure.

ii. Baltimore County shall complete each required engineering evaluation/ condition assessment within the time frames set forth below.

Tier 1 Pump Stations:	Within one year of Effective Date.
All Tier 2 or Tier 3 Pump Stations That Were Placed Into Service More Than 25 Years Prior to the Date of Lodging and That Have Experienced a Non-Power-Related SSO Since June 2000:	Within two years of Effective Date.
All Remaining Tier 2 Pump Stations:	Within three years of Effective Date.
All Remaining Tier 3 Pump Stations:	Within five years of Effective Date.

iii. Within 30 days of the completion of an engineering evaluation/condition assessment, Baltimore County shall submit to EPA and MDE for review and comment a report that identifies the scope of the evaluation and condition assessment, identifies the specific criteria applied during the evaluation, provides a summary of deficiencies identified, provides a summary of items due for scheduled replacement, and identifies appropriate remedial responses, including a summary of anticipated remedial costs.

iv. For each deficiency or instance of non-performing equipment identified during an engineering evaluation/condition assessment conducted in accordance with requirements of this Paragraph 13.F, Baltimore County shall assign a priority ranking in accordance with the following ranking system focusing on the prevention, mitigation, and correction of SSOs:

Priority 1	Impact on capability of Pump Station to operate at full capacity, personnel safety, or structural or building integrity issues.
Priority 2	Station equipment reliability issues, chronic maintenance problems, and Mechanical and Electrical Code issues.
Priority 3	Housekeeping, station appearance, or minor station operation or maintenance issues.

(a) For each identified Priority 1 or Priority 2 deficiency, Baltimore County shall include in or with its report a specific schedule that provides for completion of a remedial response to such deficiency consistent with its assigned priority, but not later than two years from completion of the engineering evaluation/condition assessment. Baltimore County shall implement each

remedial response under this subparagraph (a) consistent with the proposed schedule, and each such schedule shall be incorporated into and enforceable under this Consent Decree. EPA and MDE may extend the schedule for completion of a remedial response activity upon demonstration by Baltimore County that the specific circumstances relevant to that response activity justify an extension. Following implementation of the required repairs for each Pump Station, Baltimore County shall certify completion and summarize the actions taken by Baltimore County in the Quarterly Report for the calendar quarter in which the repair requirements were completed.

(b) In the event that any deficiencies identified during the engineering evaluation/condition assessment result in an SSO, Baltimore County shall act immediately to correct the deficiency or to implement emergency measures to prevent or mitigate an SSO until the deficiency is corrected.

v. Baltimore County shall not be required to perform an engineering evaluation/condition assessment pursuant to this Paragraph 13.F. for the following Pump Stations:

(a) The following Pump Stations that were placed into service less than 10 years prior to the Date of Lodging of this Consent Decree:

Middle Back River Neck
Rosalie Avenue
Bowleys Quarters
Holly Neck
Vincent Farms
Back River Neck
Beachwood Estates
Beachwood Estates North
Reistertown Village
Franklin Station
Hopewell Point

(b) The following Pump Stations for which Baltimore County has completed a recent engineering evaluation,

Whitemarsh
Hawthorne #1
Woodwind
Texas
Cockeysville

provided that Baltimore County certifies that it has complied or will comply with the

requirements of Paragraph 13.F.iv., above, for each such Pump Station within two (2) years of the Effective Date.

(c) Any Pump Station that Baltimore County has committed, through specific allocation of capital budget funding, to replace in its entirety, where such commitment occurs prior to the deadline for completion of an engineering evaluation/condition assessment under this Paragraph. Baltimore County shall provide notice to EPA and MDE, including appropriate documentation, regarding any Pump Stations for which it intends to utilize this exemption at least 30 days prior to the date when the engineering analysis and condition assessment would otherwise be due pursuant to Paragraph 13.F.ii., above.

vi. Notwithstanding Paragraph 13.F.v. above, EPA and MDE may direct that Baltimore County perform an engineering evaluation/condition assessment pursuant to this Paragraph 13.F. for any of the Pump Stations identified in Paragraph 13.F.v(a) or (b) in the event that performance data, including the occurrence of SSOs, for that Pump Station collected after the Date of Lodging indicates that such an evaluation is necessary.

G. **Pump Station Equipment Inventory**.

i. Within two hundred seventy days (270) of the Effective Date, Baltimore County shall complete an asset inventory and attribute database for all equipment and systems in each Pump Station and update its maintenance records to include all new information. Following completion of the requirements of this Paragraph 13.G.i., Baltimore County shall certify that all such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

ii. Within two hundred seventy days (270) of the County's selection of a Pump Station information management system pursuant to Paragraph 13.H. and identification of the relevant system specifications, Baltimore County shall assign a unique identification number to each

critical component at each Pump Station and update its maintenance records to include the identification numbers. If physically practicable, Baltimore County shall place an identification tag on each critical component. Following completion of the requirements of this Paragraph 13.G.ii. Baltimore County shall certify that all such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

iii. In the event that a rehabilitation, repair, or replacement project requires replacement of a critical component at a Pump Station, Baltimore County shall assign identification numbers to the new components and update its maintenance records within thirty (30) days of project completion.

H. **Pump Station Information Management System**. Within three years of the Effective Date, Baltimore County shall convert or transfer its existing Pump Station maintenance record keeping system, including all equipment inventory information, into an electronic information management system capable of collecting and tracking information regarding the operation, performance and maintenance of all Pump Stations. Baltimore County may accomplish this conversion or transfer either by expanding its Collection System Utilities Management Application to include Pump Station information or through use of an independent management system that is compatible with the Utilities Management Application. Following completion of the requirements of this Paragraph 13.H., Baltimore County shall certify that such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

I. **Pump Station Preventative Maintenance**. Baltimore County shall implement a Pump Station preventative maintenance program to ensure the proper operation and maintenance of its Pump Stations that includes the following measures:

i. Within ninety (90) days of completion of each rehabilitation/repair project required under Paragraph 13.B, Baltimore County shall update its preventative maintenance standard operating procedures and schedules to reflect all new and/or rehabilitated equipment.

ii. Within ninety (90) days of the Effective Date, Baltimore County shall develop a procedure (or document existing procedures) for determining the cause of equipment and/or system failures at Pump Stations and identifying preventive maintenance measures for minimizing future failures.

iii. Routinely track preventative maintenance of Pump Stations, including, but not limited to, the following:

(a) Appropriate, necessary and periodic service and calibration of all instrumentation, including flow meters, liquid level sensors, alarm systems, elapsed time meters, and remote monitoring equipment;

(b) Appropriate, necessary and periodic inspection and service for each Pump Station, including engines, motors, generators, pumps, wet wells, Pump Station valves, and related equipment; and

(c) Appropriate, necessary and periodic inspection and testing and, if necessary, servicing of all pumps including impellers, seals and bearings, wear clearances, couplings, drives and motors.

J. **Pump Station Operation and Maintenance Manuals**. Within one year of the Effective Date, Baltimore County shall ensure that an updated operation and maintenance manual is maintained for and located at each Tier 1 and Tier 2 Pump Station. Each operation and maintenance manual shall reflect current station configuration, equipment, and characteristics, and shall provide operating parameter value ranges representing recommended operating levels, a summary of historical pump run times, and detailed procedures to prevent overflows or spills while performing repairs at each

Pump Station. Baltimore County shall update the operation and maintenance manual for each Pump Station at which a rehabilitation, repair, or replacement project has been performed no later than 90 days after the date for completion of the project.

K. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 13 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

14. **Collection and Transmission System Model**.

A. Using the INFOWORKS CS computerized collection and transmission system modeling program for its Collection System, Baltimore County shall implement and maintain a computerized collection and transmission system model or models (the "Model") for the Collection System to evaluate the impact of I/I rehabilitation projects, proposed system modifications, upgrades, and expansions to the transmission capacity and performance of the Collection System. Baltimore County shall develop a Model or Models meeting the requirements of this Paragraph for each Sewershed that includes the Model elements identified in Paragraph 14.B. To the extent practical, Baltimore County shall coordinate the development of its Model(s) with the City of Baltimore's modeling efforts. The Model(s) and the data collection activities upon which they are based, shall be developed and implemented so as to ensure that the Model(s) are integrated to the extent necessary to function in a hydraulically representative fashion for the Collection System. The integrated Model(s) shall allow Baltimore County to assess the capacity of its Collection System, as provided herein, and to identify the measures necessary to address capacity limitations as required by Paragraph 9.

B. **Model Elements.**

i. The Model required by this Paragraph shall, at a minimum, be used for predicting:

(a) Rate of wastewater flow and temporal variation of rate of flow in the Force Mains and the Major Gravity Lines;

(b) Hydraulic pressure (psig) or hydraulic grade line ("HGL") of wastewater at any point in Force Mains and the Major Gravity Lines;

(c) Flow capacity of each of the Pump Stations in the Collection System;

(d) Flow capacity of each Pump Station with its back-up pump out-of-service;

(e) Peak flows to and/or from each Pump Station during storm events of a magnitude of up to 20 years; and

(f) Likelihood and location of SSOs within those portions of each Sewershed modeled under high flow conditions, including Pump Station service areas where the Pump Station's back-up pump is out-of-service, and considering available wet well capacity, existing, functional off-line storage capacity, and normal in-line storage capacity.

ii. The Model shall also be:

(a) Configured based on representative, accurate and verified system attribute data (i.e., pipe sizes and invert elevations, manhole rim elevations, etc.);

(b) Calibrated using spatially and temporally representative rainfall data and flow data, either existing or obtained under this Consent Decree pursuant to Paragraph 9; and

(c) Verified using spatially and temporally representative rainfall data and flow data; that data shall be independent of the data used to calibrate the Model.

C. **Model Project Approach Report**.

i. Within one hundred and fifty (150) days from the Effective Date of this Consent Decree, Baltimore County shall submit to EPA and MDE for approval pursuant to Section VIII

(Review and Approval Procedures) of this Consent Decree a report that sets forth a project approach and detailed schedule of development, installation and implementation of the Model for the Collection System (the "Project Approach Report"). The Project Approach Report shall include, at a minimum, the following information:

(a) Identification of all input parameters, constants, assumed values and expected outputs; and

(b) A digital map of the Collection System that identifies and characterizes both the portions of the Collection System that shall be included in the Model and the portions of the Collection System that shall be excluded from the Model.

ii. The Project Approach Report required by this Paragraph 14.C. shall also identify how the Model will be adapted to predict wastewater flows through the Collection System, including:

(a) Identification of specific types of input data that are to be used and how attribute data accuracy and representativeness will be assured;

(b) Configuration of the Model;

(c) Procedures and protocols for performance of sensitivity analyses (i.e., how the Model responds to changes in input parameters and variables);

(d) Procedures for calibrating the Model to account for values representative of the Collection System using actual system data (e.g., precipitation and flow data), which include measures to assure that calibration variables such as pipe friction factors, are kept within generally-accepted realistic ranges;

(e) Procedures for verification of the Model's performance using actual system data (e.g., precipitation and flow data);

(f) Procedures and methodologies for the generation of wet weather Hydrographs for each Sewershed flow monitoring basin; and

(g) Approach to documenting the implementation of the above procedures and the results of calibration and verification efforts.

D. Within sixty (60) days of approval or approval with conditions by EPA and MDE, as provided in Section VIII (Review and Approval Procedures), Baltimore County shall begin implementation of the Project Approach Report, and the Project Approach Report as approved shall be incorporated into, and become enforceable under this Consent Decree.

E. **Model Certification.** Baltimore County shall complete implementation of the Model for each Sewershed, on or before submission of the SRRR Plan for the respective Sewershed required under Paragraph 10, and shall certify to EPA and MDE that:

i. The Model includes the elements required by Paragraph 14.A. and B. to complete the work required by Paragraph 9.C.; and

ii. The Model has been calibrated (including the performance of sensitivity analyses) and verified in accordance with the Project Approach Report using actual system data (e.g., flow data) from permanent and temporary monitoring points in the Collection System.

Baltimore County shall provide its certification and shall describe the results of the Model calibration and verification for each Sewershed in the applicable Quarterly Report.

15. **Collection System Operation and Maintenance.**

A. **General Requirements.** Baltimore County shall develop and implement a comprehensive maintenance program for the Collection System and Collection System components to provide for the proper operation and maintenance of equipment while minimizing failures, malfunctions, line blockages, and SSOs.

B. **Submission of Operation and Maintenance Plan**. Within 120 days of the Effective Date, Baltimore County shall submit for review and comment by EPA and MDE a comprehensive operation and maintenance plan that shall provide for, at a minimum, the following:

i. A gravity line inspection program that provides for

(a) CCTV or other inspection of Gravity Sewer Lines as required by Paragraph 8 of this Consent Decree;

(b) CCTV inspection, consistent with the requirements of Paragraph 8.C., of all Gravity Sewer Lines greater than or equal to 8 inches and less than or equal to 27 inches in diameter that were constructed prior to 1980, to be completed within 15 years of the Effective Date. Baltimore County shall not be required to re-inspect gravity line segments inspected pursuant to the requirements of Paragraph 8.C. solely for the purpose of complying with the requirements of this Paragraph 15.B.i(b). In each Annual Report, Baltimore County shall summarize its progress toward completion of the requirements set forth in Paragraphs 15.B.i(b) and 15.B.v(b) as of the end of the prior calendar year. Following completion of the requirements set forth in Paragraphs 15.B.i(b) and 15.B.v(b), Baltimore County shall certify that all such requirements have been completed and summarize the actions taken by Baltimore County to complete these requirements in the Quarterly Report for the calendar quarter in which the requirements were completed.

(c) Ongoing CCTV or comparable inspection of the Collection System necessary to maintain a current assessment of the condition of the Collection System, including a program goal of inspecting all Gravity Sewer Lines greater than 8 inches in diameter on a regular, scheduled basis that provides for inspection of the entire Collection System every 15 years.

ii. A sewer line cleaning program adequate to address blockages and potential blockages within the Collection System. In addition to addressing ongoing cleaning requirements, the cleaning program shall provide for the cleaning of all Gravity Sewer Lines greater

than 8 inches in diameter within 7 years of the Effective Date, and shall provide for the regular, scheduled cleaning of all such lines thereafter at least every 7 years. In each Annual Report, Baltimore County shall summarize its progress toward completion of the initial cleaning requirements set forth in this Paragraph 15.B.ii. as of the end of the prior calendar year. Following completion of the requirement for cleaning all Gravity Sewer Lines greater than 8 inches in diameter within 7 years of the Effective Date, Baltimore County shall certify that such requirement has been completed and summarize the actions taken by Baltimore County to complete the requirement in the Quarterly Report for the calendar quarter in which the requirement was completed.

iii. Routine preventative maintenance of Pump Stations consistent with Paragraph 13.I.;

iv. Routine preventative maintenance of grinder pumps;

v. Inspection of manholes

(a) Inspection of manholes as provided in Paragraph 8.D;

(b) Inspection of manholes located within or immediately adjacent to gravity line segments to be inspected pursuant to Paragraph 15.B.i.b. above;

(c) Routine inspection of manholes that are entered for the purposes of cleaning, inspection, or other routine maintenance activities.

vi. Procedures for ensuring that new sewers and connections are properly designed and constructed (including testing of new sewer installations) to prevent SSOs and to ensure that new connections of inflow sources are prohibited;

vii. Procedures for ensuring that rehabilitation projects are properly designed and constructed (including testing of rehabilitation installations) to prevent SSOs;

viii. A root control program that addresses, at minimum, scheduling and performing corrective measures including both short-term mitigation of root intrusion (i.e., routine

maintenance) and rehabilitation of the areas in which root intrusion has caused recurring blockages (i.e., sewer replacement or relining), and a proposal that includes scheduled inspection and cleaning of known problem areas;

ix. Procedures for responding to, investigating, mitigating, correcting, and preventing Building Backups.

x. Procedures for identification of all known locations where Baltimore County does not have ready physical and legal access to the Collection System, the causes for lack of access, and its strategy for obtaining and maintaining access to such location;

xi. Procedures for documenting complaints (including procedures for ensuring that complaints reach the appropriate departments), work orders, updates to equipment inventory, and changes to Collection System components, as well as entry of such data into databases comprising the information management system required under Paragraph 16;

xii. Procedures for corrective maintenance response and reporting;

xiii. Procedures to ensure that staff receive regular training, including wastewater operator certification as required, to avoid potential SSOs relating to operator error; and

xiv. A FOG program consistent with the requirements of Paragraph 11.

C. **Implementation of Operation and Maintenance Program**. Baltimore County shall begin implementation of its operation and maintenance plan within 90 days of submittal to EPA and MDE for comment.

D. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 15 as specifically set forth in Section VI (Reporting Requirements), Paragraph 20.B.xiii. & ix., of this Consent Decree.

16. **Information Management System Program**.

A. **Utilities Management Application for Collection System**. By agreement of the Parties, Baltimore County shall implement its planned Utilities Management Application to establish, update, and coordinate data systems used to collect information regarding the operation, maintenance and performance of the Collection System, as provided in Baltimore County Contract No. 42235, attached as Appendix G. Baltimore County shall install all hardware and software necessary for the Utilities Management Application and ensure that such hardware and software are operational and that the County has beneficial use of the specified features by no later than September 1, 2005. Baltimore County shall certify completion of these requirements in the applicable Quarterly Report.

B. **Geographic Information System**. As part of its information management system programs above, Baltimore County shall use a computerized geographic information system ("GIS") to map the Collection System.

i. The GIS shall be able to:

(a) Display all Collection System components and Pump Stations;

(b) Use embedded objects (or other alternative, equivalent methods) to link to schematic diagrams and attribute data (including inventory information) for Collection System components;

(c) Display by color coding the portions of the Collection System that have been inspected and rehabilitated; and

(d) Display the location(s) at which samples from flow meters and rain gauges have been collected for development of the model required under Paragraph 14.

ii. Baltimore County shall install all hardware and software necessary for the GIS system and ensure that the system is operational and that the County has beneficial use of the specified features by no later than one year from the Effective Date. Following completion of these

requirements, Baltimore County shall certify in the applicable Quarterly Report, and, if requested, demonstrate to EPA and MDE, that the GIS is fully functioning and capable of displaying the information described in Paragraph 16.B.i., above. Baltimore County shall complete the installation of, and transfer of all relevant data to, the GIS System for each Sewershed by no later than the date that the SRRR Plan for such Sewershed is due under Paragraph 10.

C. **Global Positioning System**.

i. Within one hundred and twenty (120) days of the Effective Date of this Consent Decree, Baltimore County shall have global positioning system (GPS) units available to its Utilities Maintenance Division for use to correct and/or update component information on the Collection System maps. Baltimore County shall certify completion of this requirement in the applicable Quarterly Report.

ii. Baltimore County shall use GPS units or other equivalent methods to record the location of sewer maintenance work related to the removal of tree roots and/or grease. Baltimore County shall track and plot this information as part of its root and grease programs required by Paragraph 15.

D. **Inventory of Collection System Components**.

i. Within two (2) years of the Effective Date, the Utilities Management Application shall include an inventory database of the Collection System components. Following completion of this requirement, Baltimore County shall certify in the applicable Quarterly Report, and, if requested, demonstrate to EPA and MDE, that the Utilities Management Application is functioning and capable of displaying the information identified in Paragraph 16.D.ii., below.

ii. By no later than the date that the SRRR Plan for the relevant Sewershed is due pursuant to Paragraph 10, the inventory database shall include, for each component in such Sewershed, a unique identification number and a corresponding data file that stores the following

information:

(a) Identification number;

(b) Capacity (e.g., for pipes: diameter, for valves: flow rate);

(c) Date of installation;

(d) Location of installation (address and/or latitude and longitude);

(e) Useful life and scheduled date for repair, replacement, or rehabilitation;

(f) Repair history;

(g) Make and model, if applicable;

(h) Type (e.g., material of construction, configuration of valve, etc.); and

(i) Service status (i.e., whether or not component is in service).

E. **Update Inventory of Collection System Components.** Beginning two years from the Effective Date, Baltimore County shall update, within ninety (90) days of completion of any inspection, condition assessment, or rehabilitation of a Collection System component required pursuant to the terms of this Consent Decree, the Utilities Management Application inventory database such that the updated inventory database includes, for the relevant component, the information described in Paragraph 16.D.ii.

F. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the requirements in this Paragraph 16 as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

17. **Emergency Response Plan**

A. Baltimore County shall develop and implement an Emergency Response Plan to

respond adequately to the occurrence of Discharges from its Collection System and to protect the health and welfare of persons in the event of Discharges.

B. **Specific Requirements**. Within sixty (60) days of the Effective Date of this Consent Decree, Baltimore County shall provide to EPA and MDE, for approval pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, an Emergency Response Plan that addresses the actions to be taken by Baltimore County in the event of a Discharge. The Emergency Response Plan shall include, but not be limited to, the following:

i. A detailed description of the actions Baltimore County will undertake to provide notice to the public in the event of a Discharge in accordance with Environment Article, Section 9-331.1, Annotated Code of Maryland and regulations promulgated thereunder;

ii. A description of how Baltimore County shall notify MDE and EPA when Discharges occur. Baltimore County shall notify MDE of the occurrence of Discharges in accordance with Environment Article, Section 9-331.1, Annotated Code of Maryland and regulations promulgated thereunder;

iii. A description of how Baltimore County shall coordinate with local health departments regarding the posting of waters where a Discharge has occurred in accordance with the regulations promulgated under the Environment Article, Section 9-331.1, Annotated Code of Maryland;

iv. A detailed plan describing the standard operating procedures to be followed by Baltimore County personnel in responding to a Discharge, including the steps to be taken to minimize the volume of untreated wastewater discharge as a result of a Discharge;

v. A general identification of resources that Baltimore County shall make available to correct or repair conditions causing or contributing to the Discharge. This shall include an organizational chart identifying the operational units responsible for conducting such tasks;

vi. A plan to ensure adequate training of Baltimore County personnel

responding to a Discharge.

C. Upon learning of an Discharge, Baltimore County shall perform monitoring, sampling, and analysis in accordance with the regulations promulgated under the Environment Article, Section 9-331.1, Annotated Code of Maryland. Baltimore County shall provide copies of field sample reports and laboratory analysis results to EPA and MDE upon request.

D. Upon approval or approval with conditions by EPA and MDE of Baltimore County's Emergency Response Plan, pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, Baltimore County shall implement the Plan as approved, and the Emergency Response Plan shall be incorporated into, and shall become enforceable under, this Consent Decree. The Parties agree to meet and confer, as needed, to discuss the development and implementation of Baltimore County's Emergency Response Plan.

E. Baltimore County shall review the Emergency Response Plan on an annual basis and update the Plan as necessary. Each annual update of the Emergency Response Plan shall be submitted to EPA and MDE for approval pursuant to Section VIII (Review and Approval Procedures) of this Consent Decree, and upon EPA and MDE approval shall be incorporated into, and become enforceable under, this Consent Decree. Baltimore County shall maintain a copy of the Emergency Response Plan required by this Paragraph 17 at each of its Tier 1 and Tier 2 Pump Stations.

F. Any dispute with respect to any portion of the Emergency Response Plan required by this Paragraph shall not delay the development or implementation of the undisputed portions of the Emergency Response Plan.

G. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its implementation of its Emergency Response Plan as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

H. **Response to Building Backups**. Consistent with Paragraph 15.B.ix., Baltimore County shall also develop and implement procedures for responding to, investigating, mitigating, and correcting Building Backups.

18. **Reporting of Discharges and Building Backups and Record Keeping**.

A. **General Requirement**. Baltimore County shall report information about Discharges and Building Backups to MDE and EPA and keep appropriate records related to Discharges and Building Backups.

B. **Specific Requirements for Discharges**.

i. Baltimore County shall report to MDE by oral notification any Discharges within twenty-four (24) hours of the time Baltimore County first becomes aware of the Discharge.

ii. A written report shall also be provided to EPA and MDE within five (5) days of the time Baltimore County first became aware of the Discharge. Any written report shall be made to the Water Protection Division, United States Environmental Protection Agency, Region III and to the Compliance Program, Water Management Administration, MDE, and shall contain the information required under Code of Maryland Regulations (COMAR) 26.08.10.04 & .05.

C. **Specific Requirements for Building Backups**. On an annual basis, as part of each Annual Report to be submitted pursuant to this Consent Decree, Baltimore County shall report any known Building Backups. The report should include:

i. the location of the Building Backup;

ii. the cause of the Building Backup, if known;

iii. an estimate of the amount of sewage released into the building; and

iv. the location of sewage disposal (if known).

D. Baltimore County shall maintain for at least five years a list and description of any complaints from customers or others related to reported Building Backups.

E. Until termination of the Consent Decree, Baltimore County shall maintain records of the written reports required by Paragraph 18.B. and C., above, as set forth in Section XVIII (Record Keeping) of this Consent Decree.

VI. REPORTING REQUIREMENTS

19. **Quarterly Reporting**.

A. **Timing**. Beginning with the first full calendar quarter after the Effective Date, and for each calendar quarter thereafter until termination of the Consent Decree, Baltimore County shall submit to EPA and MDE a Quarterly Report containing the information set forth in Paragraph 19.B., below. The Quarterly Report shall be postmarked and sent by the 45th day after the end of the calendar quarter (which shall be May 15, August 14, November 14, or February 14, respectively, or the next business day consistent with the definition of "day" in Section IV of this Consent Decree). In lieu of submitting a separate Quarterly Report for any fourth calendar quarter, Baltimore County may submit a combined Quarterly and Annual Report, provided that the combined Report is submitted no later than the due date for the relevant Quarterly Report and includes all information required to be included in the Quarterly Report pursuant to this Paragraph 19 and all information required to be included in the Annual Report pursuant to Paragraph 20, below.

B. **Contents**. The Quarterly Report shall include the information set forth below regarding activities performed in the prior calendar quarter (or, in the case of the first Quarterly Report, activities performed since the Effective Date):

i. **SSO Structures**.

(a) Report the information required by Paragraph 7.C.ii.(a) & (b) with respect to any discharges from SSO Structures during the previous quarter;

(b) Identify any SSO Structure where a flow meter has been installed pursuant to Paragraph 7.C.i(b)(1) during the previous quarter and when such meter was installed; and

(c) Report mitigation measures undertaken pursuant to Paragraph 7.C.iii(b) with respect to any discharges from SSO Structures during the previous quarter.

ii. **Construction Projects**. Summarize the status of each of the projects identified on Appendices B and C, including whether Baltimore County anticipates completing the projects by the applicable deadlines.

iii. **Collection System Inspection**.

(a) Summarize Baltimore County's progress in completing the inspection requirements of Paragraph 8.C.i., including the total miles of gravity line and number of manholes and other appurtenances to be inspected, the miles of gravity line and number of manholes and other appurtenances inspected in the preceding quarter, and the miles of gravity line and number of manholes and other appurtenances remaining to be inspected, and report whether Baltimore County anticipates completing the required inspections by the applicable deadline;

(b) For each Sewershed, summarize Baltimore County's progress in completing the inspection requirements of Paragraphs 8.C.ii., 8.C.iii., 8.C.iv., and 8.D., including the total miles of gravity line and number of Force Mains, manholes and other appurtenances to be inspected, the miles of gravity line and number of manholes and other appurtenances inspected in the preceding quarter, and the miles of gravity line and number of manholes and other appurtenances remaining to be inspected, and report whether Baltimore County anticipates completing the required inspections by the applicable deadline; and

(c) Summarize Baltimore County's compliance during the previous quarter with the requirements in Paragraph 8.C.v. (CCTV Inspection Following SSOs), including the date of the SSO, the date of inspection of the corresponding Gravity Line Segment, the number of and

location of Gravity Line Segments that were not inspected with CCTV within 10 working days following an SSO, and an explanation of any applicable exemptions asserted by Baltimore County.

iv. **SRRR Plan Implementation**. For each Sewershed, summarize Baltimore County's progress in implementing its approved SRRR Plan pursuant to Paragraph 10.D., and report whether Baltimore County anticipates completing implementation by the applicable deadline.

v. **FOG Program Modification**. Summarize Baltimore County's progress in implementing its approved FOG Program Modification Plan pursuant to Paragraph 11.H., and report whether Baltimore County anticipates completing implementation of the required modifications by the applicable deadline.

vi. **Supplemental Environmental Projects**. Summarize Baltimore County's efforts and progress in completing the SEP requirements pursuant to Section X, including the total expenditures for each SEP through the reporting period, any delays or problems encountered and the steps taken to resolve and prevent such delays and problems from continuing, and report whether Baltimore County anticipates completing its obligations with respect to each SEP by the applicable deadline.

vii. **Compliance Issues**.

(a) If Baltimore County completes a project or requirement during the previous quarter that is subject to a requirement that Baltimore County certify completion, Baltimore County shall be deemed to have certified completion of any such project or requirement by specifically identifying the project or requirement in the Quarterly Report and stating the date on which the project or requirement was completed.

(b) If a requirement due to be completed during the reporting period was not completed, Baltimore County shall provide an explanation for why the requirement was not completed, what steps are being taken to ensure prompt completion, and when Baltimore County

anticipates completing the requirement.

(c) If Baltimore County becomes aware of any problems that may prevent it from meeting future compliance deadlines under any provision of this Consent Decree, Baltimore County should notify EPA and MDE of those anticipated problems in the next Quarterly Report, including an explanation of the problem, what steps are being taken to minimize delay, and when Baltimore County anticipates completing the requirement.

20. **Annual Reporting**.

A. **Timing**. By April 1 of the calendar year following the calendar year of the Effective Date, and on April 1 of each calendar year thereafter until termination of this Consent Decree, Baltimore County shall submit an Annual Report. The Annual Report shall cover the activities identified in Paragraph 20.B., below, that were performed in the preceding calendar year through December 31.

B. **Contents**. The Annual Report shall address the following subject areas as follows:

i. **SSO Structures**.

(a) Summarize Baltimore County's progress in implementing its approved Non-Pump Station SSO Structures Elimination Plan pursuant to Paragraph 7.C.iv., and report whether Baltimore County anticipates completing implementation by the applicable deadline;

(b) Summarize the results of any post-elimination monitoring conducted by Baltimore County pursuant to Paragraph 7.C.v. following elimination of any Non-Pump Station SSO Structure.

(c) Summarize Baltimore County's progress in implementing any plans required pursuant to Paragraph 7.C.vi. in response to certain discharges from Pump Station SSO Structures.

ii. **Rainfall and Flow Monitoring Plan**.

(a) Summarize the results of the annual evaluation required by Paragraph 9.B.vi. of the number and placement of flow monitors and rain gauges;

(b) Report whether and how the location of rain gauges and flow monitors have changed during the prior year and provide a revised location map as required by Paragraph 9.B.vi.

(c) Report and briefly explain any deviations during the prior year from the requirements in Paragraphs 9.B.i.-iv. or from Baltimore County's approved Rainfall and Flow Monitoring Plan submitted pursuant to Paragraph 9.B.v.

iii. **Evaluation of Rainfall and Flow Monitoring Data**.

(a) For each Sewershed, summarize Baltimore County's progress in completing the Inflow/Infiltration Evaluation required by Paragraph 9.C.i., and report whether Baltimore County anticipates completing implementation by the applicable deadline.

(b) For each Sewershed, summarize Baltimore County's progress in completing the Long-Term Capacity/Peak Flow Management Evaluation required by Paragraph 9.C.ii., and report whether Baltimore County anticipates completing implementation by the applicable deadline.

iv. **FOG Program**.

(a) Provide the results of the annual evaluation required by Paragraph 11.I. of the effectiveness of the modified FOG Program.

(b) Provide an updated database and map of Grease Generating Facilities as required by Paragraph 11.D.iii.

v. **Illegal Storm Water Discharges**. Identify any Illegal Storm Water Discharges to the Collection System that occurred during the reporting period and summarize the actions taken by Baltimore County in response to each such discharge, including Baltimore County's

specific actions taken in compliance with Paragraph 12.

vi. **Pump Stations**.

(a) Report the results of the annual evaluation required by Paragraph 13.C.ii. of the effectiveness of Baltimore County's backup power program.

(b) Summarize Baltimore County's progress in implementing any plan required by Paragraph 13.C.iii. to address SSOs related to power outages at Pump Stations.

(c) For each Pump Station, list any deficiencies identified during the reporting period through the inspections required pursuant to Paragraph 13.E.ii. and assigned Priority Classification 2, 3, or 4 from Appendix F, and identify the date of the inspection in which that deficiency was first observed, the date on which the deficiency was corrected or is expected to be corrected, the nature of the correction, and, if the deficiency was not corrected within six months, an explanation of the reasons for the delay in correction.

(d) For each Pump Station, list any deficiencies identified during the reporting period through the Engineering Evaluations/Condition Assessments required pursuant to Paragraph 13.F. and assigned Priority Classification 1 or 2 pursuant to Paragraph 13.F.iv., and identify the date the deficiency was first identified, the date on which the deficiency was corrected or is expected to be corrected, the nature of the correction, and, if the deficiency was not corrected within two years, an explanation of the reasons for the delay in correction.

(e) Summarize Baltimore County's progress in completing the implementation of the Pump Station Information Management System as required by Paragraph 13.H., and report whether Baltimore County anticipates completing implementation by the applicable deadline.

vii. **Collection and Transmission System Model**. Summarize Baltimore County's progress in completing implementation of the Collection and Transmission System Model in each Sewershed as required by Paragraph 14.E., and report whether Baltimore County anticipates

completing implementation by the applicable deadline.

viii. **Supplemental Collection System Inspection**. Summarize Baltimore County's progress in completing the inspection requirements of Paragraphs 15.B.i(b) and 15.B.v., including the total miles of gravity line and number of manholes and other appurtenances to be inspected, the miles of gravity line and number of manholes and other appurtenances inspected in the preceding year, and the miles of gravity line and number of manholes and other appurtenances remaining to be inspected, and report whether Baltimore County anticipates completing the required inspections by the applicable deadline.

ix. **Cleaning of Gravity Line Segments**. Summarize Baltimore County's progress in completing the requirement in Paragraph 15.B.ii. for cleaning of all Gravity Sewer Lines greater than 8 inches in diameter within 7 years of the Effective Date, including the total miles of gravity line to be cleaned pursuant to this requirement, the miles of gravity line cleaned during the reporting period, and miles of gravity line remaining to be cleaned to meet this requirement, and report whether Baltimore County anticipates completing the required cleaning by the applicable deadline.

x. **Collection System Inventory**. Summarize Baltimore County's progress in completing the implementation of the inventory database of Collection System components as required by Paragraph 16.D., and report whether Baltimore County anticipates completing implementation by the applicable deadline.

xi. **Emergency Response**. Report and briefly explain any deviations during the reporting period from Baltimore County's approved Emergency Response Plan submitted pursuant to Paragraph 17.

xii. **Reporting of Building Backups Consistent with Paragraph 18.C.**. Baltimore County shall report any known Building Backups, including for each such Building Backup:

(a) the location of the Building Backup;

(b) the cause of the Building Backup, if known;

(c) an estimate of the amount of sewage released into the building; and

(d) the location of sewage disposal, if known.

21. General Provisions.

A. All Quarterly and Annual Reports shall be submitted to the persons designated in Section XIX (Form of Notice) of this Consent Decree. Baltimore County shall provide at least one original executed copy of each Report to EPA (Sharon Fang, Water Protection Division, USEPA Region III) and to MDE (Chief, Enforcement Division, Compliance Program, Water Management Administration, MDE). All other copies may be provided electronically.

B. The Quarterly and Annual Reports shall be certified, consistent with the requirements of 40 C.F.R. § 122.22(a)(3), by the person responsible for compliance or by a person responsible for overseeing implementation of this Consent Decree, as follows:

> I certify under penalty of law that this information was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my directions and my inquiry of the person(s) who manage the system, or the person(s) directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

C. Baltimore County shall not object to the authenticity of any certified Quarterly or Annual Report in any proceeding to enforce this Consent Decree.

VII. RIGHT OF ENTRY

22. A. EPA and MDE, together with their authorized representatives and contractors, shall each have authority at all reasonable times, upon the presentation of credentials, to enter the premises of Baltimore County to:

i. Monitor the progress of activities required by this Consent Decree;

ii. Verify any data or information submitted to the United States and Maryland;

iii. Obtain samples;

iv. Observe performance tests;

v. Inspect and evaluate any portion of the Collection System; and

vi. Review and copy any record required to be kept under the terms and conditions of this Consent Decree.

B. Upon request, Baltimore County shall provide EPA or MDE or their authorized representatives splits of any samples collected by Baltimore County or its consultants and contractors. Upon request, EPA or MDE shall provide Baltimore County splits of any samples collected by EPA or MDE.

C. These inspection rights are in addition to, and in no way limit or otherwise affect, EPA's and MDE's statutory authorities to conduct inspections, to require monitoring and to obtain information from Baltimore County as authorized by law.

VIII. REVIEW AND APPROVAL PROCEDURES

23. A. After receipt and review of any plan, program or other document which is required to be submitted for approval pursuant to this Consent Decree, EPA and MDE may (1) approve the submission; (2) approve the submission or portions of the submission upon specified conditions; (3) approve part of the submission and disapprove the remainder; or (4) disapprove the submission and direct Baltimore County to modify the submission.

B. In the event of approval of the complete submission, Baltimore County shall proceed to take any actions required by the plan, program or other approved document, as approved in writing by EPA and MDE.

C. In the event of written approval of portions of the submission or approval upon specified conditions, Baltimore County shall proceed to take the actions identified in the non-deficient portion of the plan, program, other document, or portion thereof, in accordance with any applicable

conditions specified by EPA and MDE, subject only to Baltimore County's right to invoke the Dispute Resolution procedures set forth in Section XIII of this Consent Decree with respect to the conditions imposed or the disapproved portions. Implementation of any non-deficient portion of the submission shall not eliminate the potential of Baltimore County to incur stipulated penalties pursuant to Section XI.

24. Upon receipt of a notice of disapproval of all or part of a submission from EPA and MDE, Baltimore County shall, within 30 days, correct the deficiencies as directed by EPA's and MDE's written comments and resubmit the plan, program or other document for approval. Any stipulated penalties applicable to the original submission, as provided in Section XI of this Consent Decree, shall accrue during the 30-day period, but shall not be payable unless the resubmission is untimely or is disapproved in whole or in part.

25. In the event that a resubmitted plan, program or other document, or portion thereof, is disapproved by EPA and MDE, EPA and MDE may again require Baltimore County to correct the deficiencies in accord with Paragraph 24, subject to Baltimore County's right to invoke the Dispute Resolution Procedures set forth in Section XIII of this Consent Decree and the right of EPA and MDE to seek stipulated penalties as provided in this Section VIII.

IX. CIVIL PENALTY

26. Baltimore County shall pay a total civil penalty in the amount of $750,000.00 to the United States and the State of Maryland for violations as alleged by the United States and the State of Maryland in the Complaint. Baltimore County shall pay fifty percent (50%) of the civil penalty to the United States within thirty (30) days of the Effective Date of this Consent Decree in accordance with the procedures described in Paragraph 28, below. Baltimore County shall pay fifty percent (50%) of the civil penalty to the State of Maryland within thirty (30) days of the Effective Date in accordance with the procedures described in Paragraph 29, below.

27. The United States and the State of Maryland shall be deemed judgment creditors for purposes of collection of this penalty.

28. Payment of the civil penalty to the United States shall be made by Electronic Funds Transfer ("EFT") to the U.S. Department of Justice ("DOJ") lockbox bank, referencing DOJ No. 90-5-1-1-4402/2 and USAO File Number 2002V00703. Payment shall be made in accordance with instructions provided by the United States to Baltimore County following execution of this Consent Decree. Any EFT received at the DOJ lockbox bank after 11:00 A.M. Eastern Time will be credited on the next business day. Notice of the EFT shall simultaneously be mailed to the following:

Docket Clerk (3RC00)
U.S. EPA - Region III
1650 Arch Street
Philadelphia, PA 19103-2029;

Deane Bartlett (3RC20)
U.S. EPA - Region III
1650 Arch Street
Philadelphia, PA 19103-2029; and

Chief, Environmental Enforcement Section
Environment and Natural Resources Division
U.S. Department of Justice
P.O. Box 7611
Washington, D.C. 20044-7611
Re: DOJ No. 90-5-1-1-4402/2.

The transmittal letter forwarding such notice shall include the caption, civil action number and judicial district of this action.

29. Payment to the State of Maryland shall be made by tendering to the Maryland Department of the Environment, P.O. Box 2057, Baltimore County, MD 21203-2057, check made payable to: “Maryland Clean Water Fund.”

30. If Baltimore County fails to tender all or any portion of the civil penalty payment owed to the United States within thirty (30) days of the Effective Date, interest on the unpaid amount shall accrue in accordance with the provisions of 28 U.S.C. § 1961 and be paid from the date said payment is

due until all amounts owed are paid.

X. SUPPLEMENTAL ENVIRONMENTAL PROJECTS

31. Baltimore County shall perform the following supplemental environmental projects ("SEPs"), which the Parties agree are intended to secure significant environmental protection and improvements that are not otherwise required by law. As described below, Baltimore County shall expend at least $4,500,000 to complete the SEPs in accordance with the provisions of this Section X of the Consent Decree and Appendices I, J, and K, which are attached hereto and incorporated by reference into and enforceable under this Consent Decree.

A. **Patapsco BNR/ENR Design Project.** Baltimore County shall participate as appropriate in, and contribute funding in an amount up to $3,000,000, for the design of the Biological Nutrient Removal/Enhanced Nutrient Removal project at the Patapsco Wastewater Treatment Plant in Baltimore City ("Patapsco BNR/ENR Design Project"), as described more fully in Appendix I. Baltimore County shall complete the SEP in accordance with the procedures and schedule identified in Appendix I.

B. **Back River Debris Removal Project**.

i. Baltimore County shall design, install, and operate a trash collection system in Moore's Run (a tributary to Back River) near the Red House Run Pump Station to remove floating debris for landfill disposal, as described more fully in Appendix J. This SEP shall be completed within five (5) years of the Effective Date. Baltimore County's expenditures for design and implementation of this SEP shall not be less than, but may exceed, $200,000 in Eligible SEP Costs.

ii. Within 180 days after the Effective Date, Baltimore County shall submit a Statement of Work ("SOW") for this SEP to EPA and MDE, for review and approval pursuant to Section VIII (Review and Approval Procedures) of the Consent Decree, that includes a plan for implementation of the SEP, a schedule for implementation of the SEP including interim milestones, cost

estimates for the various phases of the project, and a certification of the truth and accuracy of the statements in Paragraph 33 below. Upon approval by EPA and MDE of the SOW, the SOW shall be incorporated by reference into and enforceable under this Consent Decree.

C. **Stream Restoration Projects.**

i. Baltimore County shall design and implement the following stream restoration SEPs, as described more fully in Appendix K.

Gwynns Falls at Gwynnbrook Avenue

Paradise Avenue (tributary to West Branch of Herbert's Run)

Minebank Run Tributary at Waller Court

Herring Run at Collinsdale.

Construction of these SEPs shall be completed within five (5) years of the Effective Date.

ii. Baltimore County's expenditures for the SEPs identified in Paragraph 31.C.i. shall not be less than, but may exceed, $1,300,000 in Eligible SEP Costs. For purposes of the SEPs identified in Paragraph 31.C.i. and Appendix K, Eligible SEP Costs shall also include costs expended by Baltimore County for inspection, right-of-way acquisition, and monitoring. At the time that Baltimore County submits its SEP Completion Report(s) for the SEPs identified in Paragraph 31.C.i. and Appendix K, Baltimore County shall certify, consistent with the language set forth in Paragraph 21.B., that the Eligible SEP Costs identified by Baltimore County do not include costs that Baltimore County would have otherwise expended to preserve any aspect of its Collection System or other infrastructure from stream impacts in the affected areas.

iii. Within 180 days after the Effective Date, Baltimore County shall submit a Statement of Work ("SOW") for each of the SEPs identified in Paragraph 31.C.i. to EPA and MDE, for review and approval pursuant to Section VIII (Review and Approval Procedures) of the Consent Decree, that includes a plan for implementation of the SEP, a schedule for implementation of the SEP including

interim milestones, cost estimates for the various phases of the project, and a certification of the truth and accuracy of the statements in Paragraph 33 below. Upon approval by EPA and MDE of the SOWs, each SOW shall be incorporated by reference into and enforceable under this Consent Decree.

D. In the event that Baltimore County has not expended $4,500,000 in Eligible SEP Costs, as required by Paragraph 31, within five years plus 180 days of the Effective Date, Baltimore County shall propose a substitute project or projects requiring expenditures of Eligible SEP Costs in an amount equal to or greater than the difference between $4,500,000 and the amount of Eligible SEP Costs actually paid by Baltimore County pursuant to this Paragraph 31. All proposed substitute projects are subject to the approval of EPA and MDE and must be consistent with EPA guidance regarding SEPs. In the event that EPA and MDE approve a substitute project or projects, Baltimore County shall, within 90 days of such approval, submit a Statement of Work ("SOW") for the SEP(s) to EPA and MDE, for review and approval pursuant to Section VIII (Review and Approval Procedures) of the Consent Decree, that includes a plan for implementation of the SEP(s), a schedule for implementation of the SEP(s) including interim milestones, cost estimates for the various phases of the project(s), and a certification of the truth and accuracy of the statements in Paragraph 33 below. Upon approval by EPA and MDE of the SOW(s), the SOW(s) shall be incorporated by reference into and enforceable under this Consent Decree. Disputes regarding EPA's and MDE's determination to approve or disapprove a substitute project or projects shall not be subject to Section XIII (Dispute Resolution) of this Consent Decree.

32. Baltimore County is responsible for the satisfactory completion of each SEP in accordance with the requirements of the Consent Decree. "Satisfactory completion" means that Baltimore County shall complete the project requirements in accord with all specifications in the relevant Appendices and in the approved SOWs. Baltimore County shall also ensure that it spends not less than the total SEP amount set forth in Paragraph 31, and the specific SEP amounts set forth in

Paragraph 31.B.i. (for the Back River Debris Removal Project), and in Paragraph 31.C.ii. (for the Stream Restoration Projects). Baltimore County recognizes and agrees that no part of Baltimore County's expenditures for these SEPs shall include or be reimbursed by federal or state funds, including federal or state low interest loans, contracts, or grants, or be specifically reimbursed by Howard County or Anne Arundel County. Baltimore County may use contractors and/or consultants in planning and implementing the SEPs.

33. With regard to the SEP, Baltimore County certifies the truth and accuracy of each of the following:

A. That all cost information provided to EPA and MDE in connection with EPA's and MDE's approval of the SEPs is complete and accurate and represents a fair estimate of the costs necessary to implement the SEPs;

B. That, as of the Date of Lodging of this Decree, Baltimore County is not required to perform or develop the SEPs by any federal, state, or local law or regulation, or as injunctive relief awarded in any other action in any forum, except that the Parties recognize that Baltimore County's payment of funds for the Patapsco BNR/ENR Design Project identified in Paragraph 31.A. will be undertaken consistent with the current Sewerage Agreement between Baltimore County and Baltimore City providing for the contribution by Baltimore County of a percentage of certain expenses relating to operation of Baltimore City's sewer system;

C. That Baltimore County has not received, and is not negotiating to receive, credit for the SEPs in any other enforcement action; and

D. That Baltimore County will not receive any reimbursement for any portion of the SEPs from any other person.

34. **SEP Completion Report.**

A. Within 30 days after the date set for completion of each SEP, Baltimore County

shall submit a SEP Completion Report to EPA and MDE. The SEP Completion Report shall contain the following information regarding the relevant SEP:

i. A detailed description of the SEP as implemented;

ii. A description of any problems encountered in completing the SEP and the solutions thereto;

iii. An itemized list of all Eligible SEP Costs;

iv. Certification that the SEP has been fully implemented pursuant to the provisions of this Decree; and

v. A description of the environmental and public health benefits resulting from implementation of the SEP (with a quantification of the benefits and pollutant reductions, if feasible).

B. EPA and MDE may, in their sole discretion, require information in addition to that described in Paragraph 34.A., in order to determine the adequacy of SEP completion or eligibility of SEP costs.

C. After receiving the SEP Completion Report, EPA and MDE shall notify Baltimore County whether or not Baltimore County has satisfactorily completed the SEP. If the SEP has not been satisfactorily completed in accordance with all schedules, or if the total amount expended on performance of all SEPs is less than the amount set forth in Paragraph 31, or if the amount expended on the Back River Debris Removal Project is less than amount set forth in Paragraph 31.B.i., or if the amount expended on the Stream Restoration Projects is less than the amount set forth in Paragraph 31.C.ii., stipulated penalties may be assessed under Section XI (Stipulated Penalties) of this Consent Decree.

D. Disputes concerning the satisfactory completion of the SEPs and the amount of Eligible SEP Costs shall be resolved under Section XIII (Dispute Resolution) of this Decree.

35. Each submission required under this Section shall be signed by an official with knowledge of the SEP and shall bear the certification language set forth in Paragraph 21.B., above.

36. Any public statement, oral or written, in print, film, or other media, made by Baltimore County making reference to any SEP under this Decree shall include the following language:

> This project was undertaken in connection with the settlement of an enforcement action, United States and the State of Maryland v. Baltimore County, Maryland (D. Md.), taken on behalf of the U.S. Environmental Protection Agency under the Clean Water Act and by the State of Maryland under the Maryland Environment Article.

37. **Reporting Requirements**. Baltimore County shall report to EPA and MDE on its performance of the SEPs as specifically set forth in Section VI (Reporting Requirements) of this Consent Decree.

XI. STIPULATED PENALTIES

38. Baltimore County shall be liable to the United States and the State of Maryland for stipulated penalties for the following violations of this Consent Decree as specified below. Baltimore County shall not be liable for any stipulated penalties under this Consent Decree except as set forth in this Section XI.

A. **Designated Rehabilitation and Replacement Projects**. For each day that Baltimore County fails to achieve Substantial Completion of any project identified in Paragraph 7.D. and Appendix B, or in Paragraph 13.B. and Appendix C, in accordance with the applicable schedules set forth in those Paragraphs and Appendices, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$2,500
After 60 Days	$6,000

B. **Delays in Submission of Deliverables**. Baltimore County shall be liable for stipulated penalties for each failure to timely submit to the United States and the State of Maryland a Deliverable, including any required revision, update, or supplement to a Deliverable, subject to a deadline under Section V (Remedial Measures) or Section VI (Review and Approval Procedures) of this Consent Decree as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Submit
1st to 30th Day	$1,000
31st to 60th Day	$1,500
After 60 Days	$2,250

In the event that Baltimore County is potentially liable for stipulated penalties under this Paragraph 38.B. and under another provision of this Paragraph 38 for failure to timely submit the same Deliverable, EPA and/or MDE, in their sole discretion, may demand payment of stipulated penalties from Baltimore County pursuant to either, but not both, of the applicable provisions.

C. **SSO Structures**.

i. For each day that Baltimore County fails to timely submit the Non-Pump Station SSO Structures Elimination Plan as required by Paragraph 7.C.iii., a supplemental Elimination Plan as required by Paragraph 7.C.vii., or a proposed plan and schedule regarding Pump Station SSO Structures as required by Paragraph 7.C.vi., Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Submit
1st to 30th Day	$1,000
31st to 60th Day	$2,500
After 60 Days	$6,000

ii. For each day that Baltimore County fails to timely complete elimination of a Non-Pump Station SSO Structure pursuant to the schedule set forth in the Non-Pump Station SSO Structures Elimination Plan required by Paragraph 7.C.iii., or a supplemental Elimination Plan as required by Paragraph 7.C.vii., Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day per SSO Structure for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$2,500
After 60 Days	$6,000

iii. For each failure to monitor an SSO Structure as required by Paragraph 7.C.i., including each failure to install and operate a continuous flow monitor as required, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Monitor
1st to 30th Day	$1,000
31st to 60th Day	$2,000
After 60 Days	$3,000

D. **Collection System Inspection**.

i. If Baltimore County fails to complete CCTV inspection of all required Gravity Line Segments or inspection of other components in a sewer sub-basin as required by Baltimore County's approved Collection System Inspection Plan and schedule, Baltimore County shall be liable for stipulated penalties of $250 per day for each mile of pipe not inspected and $50 per day for each manhole or other appurtenance or Force Main not inspected.

ii. For each failure to timely inspect with CCTV a Gravity Line Segment following an SSO as required by Paragraph 8.C.v., Baltimore County shall be liable for stipulated

penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$200
31st to 60th Day	$500
After 60 Days	$1,000

E. **Rainfall and Flow Monitoring**.

i. For each failure to comply with the requirements of its Rainfall and Flow Monitoring Plan, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Comply
1st to 30th Day	$250
31st to 60th Day	$500
After 60 Days	$1,000

ii. For each failure to comply with any requirements set forth in Paragraph 9.B.i. & ii., or the post-construction monitoring requirements set forth in Paragraphs 7.C.v. and 7.D.iii., Baltimore County shall be liable for stipulated penalties in the amount of $250.

iii. For each day that Baltimore County fails to timely complete and certify completion of an Inflow/Infiltration Evaluation or a Long-Term Capacity/Peak Flow Management Evaluation for a Sewershed as required by Paragraph 9.C., Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$1,500
After 60 Days	$2,250

F. **SRRR Plans**. For each day that Baltimore County fails to timely complete construction and implementation of a project to be performed pursuant to an approved SRRR Plan and schedule, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,500
31st to 60th Day	$3,000
After 60 Days	$6,000

G. **FOG Program**.

i. For each failure to timely inspect a Grease Generating Facility as required by Paragraph 11.E.ii. or to timely provide written notice to a Grease Generating Establishment as required by Paragraph 11.F., Baltimore County shall be liable for stipulated penalties of $250 per Grease Generating Facility not timely inspected or notified. Baltimore County shall not be liable for stipulated penalties under this Paragraph in the event that it demonstrates that it sought to timely inspect, but was denied access to, a Grease Generating Facility owned or operated by the United States or the State of Maryland.

ii. For each day that Baltimore County fails to timely complete implementation of its approved FOG Program Modification Plan consistent with Paragraph 11.H., Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$2,500
After 60 Days	$5,000

H. **Illegal Storm Water Discharges**. For each failure to comply with the requirements of Paragraph 12.B.i. regarding the elimination of Illegal Storm Water Discharges that are

likely to cause or contribute to an SSO, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Comply
1st to 30th Day	$250
31st to 60th Day	$500
After 60 Days	$1,000

I. **Pump Stations**.

i. For each day that Baltimore County fails to timely complete implementation of an approved plan submitted pursuant to Paragraph 13.C.iii. regarding an SSO due to loss of power, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$1,500
After 60 Days	$2,250

ii. For each failure to timely correct a Pump Station deficiency as required by Paragraph 13.E.iii. or Paragraph 13.F.iv(a), Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Complete
1st to 30th Day	$1,000
31st to 60th Day	$1,500
After 60 Days	$2,250

J. **Operation and Maintenance Inspection and Cleaning Requirements**.

i. If Baltimore County fails to timely complete CCTV inspection of all Gravity Sewer Lines as required by Paragraph 15.B.i(b) or inspection of all manholes as required by

Paragraph 15.B.v(b), Baltimore County shall be liable for stipulated penalties of $250 per day for each mile of pipe not inspected and $50 per day for each manhole or other appurtenance not inspected.

ii. If Baltimore County fails to timely complete cleaning of all Gravity Sewer Lines greater than 8 inches in diameter within 7 years of the Effective Date as required by Paragraph 15.B.ii., Baltimore County shall be liable for stipulated penalties of $250 per day for each mile of pipe not cleaned.

K. **Emergency Response Plan**. For each failure to comply with the requirements of its approved Emergency Response Plan submitted pursuant to Paragraph 17, Baltimore County shall be liable for stipulated penalties in the amount of $1,000.

L. **Reporting of Discharges**. For each failure to provide oral or written notification of a Discharge as required by Paragraph 18.B., Baltimore County shall be liable for stipulated penalties of $2000.

M. **Quarterly and Annual Reporting**. For each failure to timely submit a complete Quarterly Report or Annual Report as required by Paragraphs 19 or 20, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Submit
1st to 60th Day	$750
After 60 Days	$2,000

N. **Certifications**. For each failure to timely submit a certification required under Paragraphs 7.C.iv., 7.D., 8.C.i(c), 8.C.ii, 8.C.iii., 8.D.ii(b)(2), 9.C.i., 9.C.ii(f), 10.D, 11.E.iv., 11.F.iii., 11.H., 13.B., 13.C.iii., 13.D., 13.F.iv(a), 13.G.i., 13.G.ii, 13.H., 14.E., 15.B.i(b), 15.B.ii, 16.A., 16.B.ii., 16.C.i., or 16.Di.. of this Consent Decree, Baltimore County shall be liable for stipulated penalties as set forth below:

Period of Non-Compliance	Penalty per Day for Failure to Timely Submit
1st to 60th Day	$750
After 60 Days	$2,000

In the event that Baltimore County is potentially liable for penalties under any provision of Paragraph 38 for failure to timely perform a requirement of the Consent Decree and is also potentially liable for penalties under this Paragraph 38.N. for failure to timely certify performance of that same requirement, EPA and/or MDE, in their sole discretion, may demand payment of stipulated penalties from Baltimore County pursuant to either, but not both, of the applicable provisions.

O. **Civil Penalty**. For each day that Baltimore County fails to timely pay the civil penalty required under Section IX in accord with the schedule therein, Baltimore County shall be liable for stipulated penalties in the amount of $1000.

P. **Supplemental Environmental Projects**. In the event that Baltimore County fails to perform or complete a SEP in accordance with the terms of Section X (Supplemental Environmental Projects) of this Consent Decree, Appendices I, J, and K, as applicable, and any approved SOW, and/or to the extent that Baltimore County's expenditures of Eligible SEP Costs for the SEP do not equal or exceed the required cost for the relevant SEP(s) as set forth in Paragraph 31, Baltimore County shall be liable for stipulated penalties according to the provisions set forth below:

i. Except as set forth in Paragraph 38.P.ii. below, if Baltimore County fails to satisfactorily complete a SEP identified in Paragraph 31.B. or 31.C. above, Baltimore County shall be liable for a stipulated penalty in the amount of the difference between the amount required to be spent for the SEP pursuant to Paragraph 31 and the Eligible SEP Costs actually expended by the County on the SEP, plus an additional stipulated penalty in the amount of 15% of the estimated cost of the SEP as set forth in Paragraph 31 and/or the applicable SOW.

ii. If Baltimore County fails to satisfactorily complete a SEP, but EPA and

MDE determine that Baltimore County has made good faith efforts to complete the SEP, Baltimore County shall be liable for a stipulated penalty in the amount of the difference between the amount required to be spent for the SEP pursuant to Paragraph 31 and the Eligible SEP Costs actually expended by the County on the SEP.

iii. If Baltimore County satisfactorily completes all SEPs, but fails to expend the total amount required under Paragraph 31, or the specific amounts required under Paragraphs 31.B.i. or 31.C.ii., Baltimore County shall be liable for a stipulated penalty in the amount of the difference between the amount required to be spent for the SEPs pursuant to Paragraph 31 and the Eligible SEP Costs actually expended by the County on the SEPs.

iv. For each day Baltimore County fails to timely complete a SEP, Baltimore County shall be liable for stipulated penalties as follows:

Period of Non-Compliance	Penalty per Day for Failure to Comply
1st to 30th Day	$150
31st to 60th Day	$300
After 60 Days	$600

The penalties under this subparagraph shall accrue until such time as Baltimore County notifies EPA and MDE that it no longer intends to complete the relevant SEP, at which time the stipulated penalties set forth in Paragraphs 38.P.i. or ii. immediately above shall apply.

v. **SEP Deliverables.** For failure to submit a SEP Completion Report as required by Paragraph 34, or to submit a SEP SOW as required by Paragraph 31, Baltimore County shall be liable for stipulated penalties in the amount of $500 for each day after the submission was originally due until the document is submitted.

39. **Discharges**.

A. For the first three years following the Effective Date of this Consent Decree, and

as a result of the need to make numerous system, operational and procedural changes to implement the remedial measures required by this Consent Decree and to develop the logistical infrastructure necessary to implement these measures, Baltimore County shall be liable for stipulated penalties to the United States and the State of Maryland for each Discharge in the amounts set forth below:

Less than 100 gallons	$50
100 to 2,499 gallons	$250
2,500 to 9,999 gallons	$500
10,000 to 99,999 gallons	$1,875
100,000 to 999,999 gallons	$5,000
1 million or more gallons	$7,500

B. Commencing three years after the Effective Date of this Consent Decree, Baltimore County shall be liable for stipulated penalties to the United States and the State of Maryland for each Discharge in the amounts set forth below:

Less than 100 gallons	$125
100 to 2,499 gallons	$750
2,500 to 9,999 gallons	$1,250
10,000 to 99,999 gallons	$4,500
100,000 to 999,999 gallons	$10,000
1 million or more gallons	$15,000

C. For purposes of this Paragraph 39, when a Discharge subject to a stipulated penalty as set forth above is reported by someone other than a member of Baltimore County's inspection crews, and Baltimore County, upon inspection, determines that a Discharge is occurring, the Discharge shall be considered to have commenced at the date and time that Baltimore County first received the report of the Discharge for purposes of calculating the volume of the Discharge.

D. Notwithstanding Paragraphs 39.A. & B. above, Baltimore County shall not be liable for stipulated penalties for Discharges where such Discharges are from Non-Pump Station SSO Structures identified in Appendix A2 that have not been certified as eliminated pursuant to Paragraph 7.C.iv., are caused by wet weather events, and occur within six (6) years of the Effective Date. Baltimore County shall demonstrate that a Discharge was caused by a wet weather event using flow

monitoring records or other engineering data.

40. Stipulated civil penalties shall automatically begin to accrue on the first day after performance is due, or on the day a violation occurs, whichever is applicable, and shall continue to accrue until the violation or deficiency is corrected. Stipulated penalties shall accrue simultaneously for separate violations of the Consent Decree.

41. Following written demand by EPA or MDE, stipulated penalties incurred by Baltimore County under this Consent Decree shall be paid fifty percent (50%) to the United States and fifty percent (50%) to the State of Maryland. All stipulated penalties payable to the United States shall be paid in accordance with the procedures set forth in Paragraph 28, and all stipulated penalties payable to the State of Maryland shall be paid in accordance with the procedures set forth in Paragraph 29.

42. Stipulated penalties incurred under this Consent Decree shall be tendered within thirty (30) days of Baltimore County's receipt of a demand for payment of such penalties by EPA and/or MDE, unless Baltimore County contests the demand in accordance with the dispute resolution provisions of this Consent Decree. If Baltimore County invokes the dispute resolution provisions in Section XIII of this Consent Decree, it shall deposit any disputed penalty in an interest-bearing escrow account within ten (10) days of invoking dispute resolution. The stipulated penalties that are the subject of the dispute, as well as interest earned thereon, shall be released in a manner consistent with the terms of the resolution of the dispute within sixty (60) days after the dispute is resolved. Stipulated penalties for any continuing violation shall accrue during the resolution of any dispute.

43. The stipulated civil penalties set forth above shall be in addition to any other rights or remedies which may be available to the United States and the State of Maryland or their agencies by reason of Baltimore County's failure to comply with the requirements of this Consent Decree, and all applicable federal, state or local laws, regulations, or permits.

44. In the event that a stipulated civil penalty is not paid when due, the stipulated civil penalty owed to the United States shall be payable with interest from the original due date to the date of payment at the statutory judgment rate set forth at 28 U.S.C. § 1961(a).

45. The United States or Maryland may, in their own behalf and in their unreviewable exercise of discretion, reduce or waive stipulated penalties otherwise due that sovereign under this Consent Decree.

XII. FORCE MAJEURE

46. "Force Majeure" for the purposes of this Consent Decree is defined as an event arising from causes beyond the control of Baltimore County or the control of any entity controlled by Baltimore County, including its agents, consultants and contractors, which delays or prevents the performance of any obligation under this Consent Decree. Unanticipated or increased costs or expenses associated with implementation of this Consent Decree and changed financial circumstances shall not, in any event, be considered "force majeure" events. Baltimore County shall adopt all reasonable measures to avoid or minimize such delay.

47. When Baltimore County knows or if Baltimore County should have known, by the exercise of reasonable diligence, of an event that might delay completion of any requirement of this Consent Decree, whether or not the event is a "force majeure" event, Baltimore County shall notify EPA and MDE, in writing, within thirty (30) days after Baltimore County first knew, or in the exercise of reasonable diligence under the circumstances, should have known of such event. The notice shall provide a description of the event and an explanation of the reasons for the delay, the anticipated duration of the delay, all actions taken or to be taken to prevent or mitigate the delay or the effect of the delay, the timetable by which those measures will be implemented, whether Baltimore County claims that the delay should be excused as a "force majeure" event, and its rationale for attributing such delay to a "force majeure" event if it intends to assert such a claim. Baltimore County shall include all

available documentation supporting its claim that the delay was attributable to a "force majeure" event. Further, where a contractor or subcontractor has not completed a construction project on time, Baltimore County shall state what steps it is taking to ensure performance by the contractor or subcontractor in question, and shall supply any documentation available to show the steps it has taken.

48. **Permits**. Where any compliance obligation under this Section requires Baltimore County to obtain a federal, state, or local permit or approval, Baltimore County shall submit timely and complete applications and take all other actions necessary to obtain all such permits or approvals. Baltimore County may seek relief under the provisions of this Section XII (Force Majeure) of this Consent Decree for any delay in the performance of any such obligation resulting from a failure to obtain, or a delay in obtaining, any permit or approval required to fulfill such obligation, if Baltimore County has submitted timely and complete applications and has taken all other actions necessary to obtain all such permits or approvals.

49. Failure to provide the required written notice to EPA and MDE shall render this Section void and of no effect as to the event in question, and shall be a waiver of Baltimore County's right to obtain an extension of time for its obligations based on such event.

50. If EPA and MDE find that a delay in performance is, or was, caused by a "force majeure" event, the time for performance of the specific obligation(s) under this Consent Decree that are caused by the "force majeure" event shall be extended for a period to compensate for the delay resulting from such event, and stipulated penalties shall not be due for such period. EPA and MDE will notify Baltimore County in writing of the length of the extension for performance of the obligation(s) caused by the "force majeure" event. An extension of one compliance date based on a particular event shall not automatically extend any other compliance date. Baltimore County shall make an individual showing of proof by a preponderance of the evidence that the "force majeure" event was the cause of the delay in performance for each requirement or compliance date for which an extension is sought.

51. In the event of a dispute regarding application of these provisions to a delay in performance, the dispute resolution provisions of Section XIII (Dispute Resolution) shall apply, and Baltimore County shall have the burden of proving by a preponderance of the evidence that the delay is, or was, caused by a "force majeure" event, and that the amount of additional time requested is necessary to compensate for that event. Baltimore County shall not be liable for stipulated penalties for any period of delay which was excused by the Court or EPA and MDE pursuant to this "Force Majeure" Section.

XIII. DISPUTE RESOLUTION

52. Unless otherwise expressly provided for in this Consent Decree, the dispute resolution procedures of this Section shall be the exclusive mechanism to resolve disputes between Baltimore County and EPA/MDE arising under or with respect to this Consent Decree. However, the procedures set forth in this Section shall not apply to actions by the United States and the State of Maryland to enforce obligations of Baltimore County that have not been disputed in accordance with this Section.

53. **Informal Dispute Resolution**. Any dispute which arises under or with respect to this Consent Decree shall in the first instance be the subject of informal negotiations between Baltimore County, EPA and MDE. The period for informal negotiations shall not exceed twenty (20) days from the time Baltimore County sends EPA and MDE a written Notice of Dispute, unless that period is modified by written agreement of Baltimore County, EPA and MDE. The Notice of Dispute shall state clearly the matter in dispute. If the parties cannot resolve their dispute within the informal negotiation period, then the position advanced by EPA and MDE shall be considered binding unless, within thirty (30) days of the conclusion of the informal negotiation period, Baltimore County invokes the formal dispute resolution procedures as set forth below.

54. **Formal Dispute Resolution**. Baltimore County shall invoke formal dispute resolution procedures, within the time period provided in the preceding Paragraph, by serving on the United States and Maryland a written Statement of Position regarding the matter in dispute. The Statement of Position

shall include, but may not necessarily be limited to, any factual data, analysis, or opinion supporting Baltimore County's position and any supporting documentation relied upon by Baltimore County.

55. The United States and Maryland shall serve a Statement of Position within forty-five (45) days of receipt of Baltimore County's Statement of Position. The United States' and Maryland's Statement of Position shall include, but may not necessarily be limited to, any factual data, analysis, or opinion supporting that position and all supporting documents relied upon by the United States and Maryland. The United States' and Maryland's Statement of Position will be binding on Baltimore County unless, within thirty (30) days of its receipt, Baltimore County serves on the United States and Maryland a motion for judicial review setting forth the matter in dispute, the efforts made to resolve it, the relief requested, and the schedule, if any, within which the dispute must be resolved to ensure orderly implementation of this Consent Decree.

56. The United States and Maryland shall respond to Baltimore County's motion within the time period allowed by the Local Rules of this Court, unless the parties stipulate otherwise. Baltimore County may file a reply memorandum, to the extent permitted by the Local Rules or the parties' stipulation, as applicable.

57. In any dispute under this Paragraph, Baltimore County shall bear the burden of demonstrating that Baltimore County's position best complies with the terms and conditions of, and furthers the objectives of, this Consent Decree. The United States and Maryland may argue that their position is reviewable only on the administrative record and must be upheld unless arbitrary and capricious or otherwise not in accordance with law.

58. Submission of any matter to the Court for resolution shall not extend any deadline set forth in this Consent Decree unless the Parties agree to such extension in writing or the Court grants an order extending such deadline. Stipulated penalties with respect to the disputed matter shall continue to accrue but payment shall be stayed pending resolution of the dispute as provided in Section XI

(Stipulated Penalties). Notwithstanding the stay of payment, stipulated penalties shall accrue from the first day of noncompliance with any applicable provision of this Consent Decree. In the event that Baltimore County does not prevail on the disputed issue, stipulated penalties shall be assessed and paid as provided in Section XI (Stipulated Penalties) and consistent with the Court's ruling.

XIV. EFFECT OF SETTLEMENT

59. Upon the Effective Date, this Consent Decree shall resolve the United States' and the State of Maryland's civil claims for violations of Section 301 of the Clean Water Act, 33 U.S.C. § 1311, and Sections 9-322 and 9-323 of the Environment Article, Annotated Code of Maryland, as alleged in the Complaint filed in this matter, through the Date of Lodging of this Consent Decree.

XV. NON-WAIVER PROVISIONS

60. The Parties agree that Baltimore County is responsible for achieving and maintaining complete compliance with all applicable federal and state laws, regulations, and permits, and that compliance with this Consent Decree shall be no defense to any actions commenced pursuant to said laws, regulations, or permits, except as otherwise expressly specified in the Consent Decree.

61. The United States and the State of Maryland, do not, by their consent to the entry of this Consent Decree, warrant or aver in any manner that Baltimore County's complete compliance with this Consent Decree will result in compliance with the provisions of the Clean Water Act, 33 U.S.C. §§ 1251 et seq. or with Maryland's water pollution control laws. Notwithstanding EPA's and MDE's review or approval of any plans, reports, policies, or procedures formulated pursuant to this Consent Decree, or any delay in such review or approval, Baltimore County shall remain solely responsible for any non-compliance with the terms of this Consent Decree, the Clean Water Act and regulations promulgated under that Act, and Maryland's Environment Article and implementing regulations.

62. The Parties reserve any and all legal and equitable remedies available to enforce the provisions of this Consent Decree.

63. This Consent Decree shall not limit any authority of EPA and MDE under the Clean Water Act or any applicable statute, including the authority to seek information from Baltimore County or to seek access to the property of Baltimore County.

64. Performance of the terms of this Consent Decree by Baltimore County is not conditioned on the receipt of any federal, state or local funds. Application for construction grants, state revolving loan funds, or any other grants or loans, or delays caused by inadequate facility planning or plans and specifications on the part of Baltimore County shall not be cause for extension of any required compliance date in this Consent Decree.

65. It is the intent of the Parties hereto that the clauses hereof are severable, and should any clause(s) be declared by a court of competent jurisdiction to be invalid and unenforceable, the remaining clauses shall remain in full force and effect.

66. The United States and the State of Maryland reserve all remedies available to them for violations of the Clean Water Act and the Maryland water pollution control laws by Baltimore County which are not alleged in the Complaint or which occur after the Date of Lodging of this Consent Decree.

67. This Consent Decree does not resolve criminal liability, if any, that any person might have for violations of the Clean Water Act.

68. Nothing in this Consent Decree shall be construed to limit the authority of the United States or the State of Maryland to undertake any action against any person, including Baltimore County, in response to conditions that may present an imminent and substantial endangerment to the health of persons or to the welfare of persons where such endangerment is to the livelihood of such persons. 33 U.S.C. § 1364.

69. Nothing in this Consent Decree shall limit Baltimore County's ability to modify its program for the design, planning, construction, operation and maintenance of its Collection System in any fashion not inconsistent with the Consent Decree.

XVI. NOT A PERMIT/ COMPLIANCE WITH OTHER STATUTES/REGULATIONS

70. This Consent Decree is not and shall not be construed as a permit issued pursuant to Section 402 of the Clean Water Act, 33 U.S.C. § 1342, nor as a modification of any existing permit so issued, nor shall it in any way relieve Baltimore County of its obligations to comply with permits, if any, otherwise required for any portion of its Collection System or related sanitary sewage treatment facilities, and with any other applicable federal or state law or regulation. Baltimore County must comply with any new permit, or modification of existing permits, in accordance with applicable federal and state laws and regulations.

71. Nothing herein shall be construed as relieving Baltimore County of the duty to comply with the Clean Water Act and the Maryland water pollution control laws, the regulations promulgated under those acts, and all applicable permits issued under those acts and regulations.

XVII. COSTS OF SUIT

72. Each party shall bear its own costs and attorney's fees with respect to matters resolved by this Consent Decree. Should Baltimore County subsequently be determined by the Court to have violated the terms and conditions of this Consent Decree, Baltimore County may be liable to the United States and the State of Maryland for any costs and attorney's fees incurred by the United States and the State of Maryland in prosecuting actions against Baltimore County for non-compliance with this Consent Decree.

XVIII. RECORD KEEPING

73. A. Baltimore County shall maintain copies of any reports, plans, permits and documents, submitted to EPA and MDE pursuant to this Consent Decree, including any underlying research and data, for a period of five (5) years from date of submission, except that all underlying research and data relating to any SRRR Plan shall be maintained until termination of the Consent Decree. Baltimore County shall require any independent contractor operating any portion of the

Baltimore County Collection System or implementing any portion of this Consent Decree to also retain such materials as set forth in this Paragraph 73.A. Baltimore County shall submit such supporting documents to EPA and MDE upon request.

B. In addition to the reports and documentation required to be provided by Baltimore County under the terms of this Consent Decree, Baltimore County shall also provide, upon the reasonable demand of EPA or MDE, any analytical data or any other documents requested by EPA or MDE to review work done, or to be done, by Baltimore County or to determine Baltimore County's compliance with the terms of this Consent Decree.

74. Baltimore County shall notify EPA and MDE thirty (30) days prior to the disposal or destruction of such records at the end of this five year period and shall, upon EPA's and MDE's request, make such records available to EPA and MDE prior to such disposal or destruction.

XIX. FORM OF NOTICE

75. Unless otherwise specified, all reports, notices, or any other written communications required to be submitted under this Consent Decree shall be sent to the respective Parties at the following addresses:

As to the United States:

Chief, Environmental Enforcement Section
Environment and Natural Resources Division
U.S. Department of Justice
1425 New York Avenue, N.W.
Washington, D.C. 20005
(Reference DOJ Case No. 90-5-1-1-4402/2)

As to EPA:

Deane Bartlett (3RC20)
Senior Assistant Regional Counsel
United States Environmental Protection Agency
Region III
1650 Arch Street
Philadelphia, PA 19103

Chief, NPDES Branch (3WP31)
Water Protection Division
United States Environmental Protection Agency
Region III
1650 Arch Street
Philadelphia, PA 19103

As to State of Maryland:

Principal Counsel
Office of the Attorney General
Maryland Department of the Environment
1800 Washington Boulevard
Baltimore, MD 21230

Chief,
Enforcement Division, Compliance Program
Water Management Administration
Maryland Department of Environment
1800 Washington Boulevard
Baltimore, MD 21230

As to Baltimore County:

Edward C. Adams, Jr. (or his successor), Director
Department of Public Works
111 W. Chesapeake
Towson, MD 21204

Jay L. Liner (or his successor), County Attorney
Office of Law
400 Washington Avenue
Towson, MD 21204

Notifications to or communications with any party shall be deemed submitted on the date they are received.

XX. MODIFICATION

76. This Consent Decree contains the entire agreement of the Parties and shall not be modified by any prior written agreement, representation or understanding. The Consent Decree may be modified by written consent of all of the Parties or, if the Parties cannot agree, by written Order of this Court. All modifications, with the exception of modifications deemed non-material by mutual

agreement of EPA, MDE, and Baltimore County, shall be in writing and must be filed with the Court before such modification will be deemed effective.

XXI. LODGING AND OPPORTUNITY FOR PUBLIC COMMENT

77. This Consent Decree shall be lodged with the Court for a period of thirty (30) days for public notice and comment, pursuant to the requirements of 28 C.F.R. § 50.7. The United States and the State of Maryland reserve the right to withdraw or withhold their consent if the comments regarding the Consent Decree disclose facts or considerations which indicate that this Consent Decree is inappropriate, improper, or inadequate. Baltimore County consents to the entry of this Consent Decree without further notice.

78. If for any reason this Court should decline to approve this Consent Decree in the form presented, this agreement is voidable at the sole discretion of any Party and the terms of the agreement may not be used as evidence in any litigation between the Parties.

XXII. EFFECTIVE DATE

79. The Effective Date of this Consent Decree shall be the date upon which this Consent Decree is entered by the Court.

XXIII. RETENTION OF JURISDICTION

80. This Court shall retain jurisdiction of this matter for the purposes of implementing and enforcing the terms and conditions of this Consent Decree and for the purpose of adjudicating all disputes among the Parties that may arise under the provisions of this Consent Decree, to the extent that this Consent Decree provides for resolution of disputes by the Court. Such jurisdiction shall not terminate until all requirements of this Consent Decree have been fulfilled and all disputes arising under this Consent Decree have been resolved.

XXIV. TERMINATION

81. The Consent Decree shall terminate when all of the following events have occurred:

A. Baltimore County certifies that it has completed all obligations under Section V (Remedial Measures) and Section X (Supplemental Environmental Projects) of this Consent Decree, and that it has maintained compliance with all other requirements of the Consent Decree for a period of one year following completion of its obligations under Section V. For purposes of this Paragraph 81.A., the obligations under Paragraph 11 (Fat, Oil and Grease Program), Paragraph 12 (Illegal Storm Water Discharges), Paragraph 13.I. (Pump Station Preventive Maintenance), Paragraph 15 (Collection System Operation and Maintenance), and Paragraph 17 (Emergency Response Plan) shall be considered to be completed provided that Baltimore County has developed and fully implemented the plans or programs required by those Paragraphs in accordance with the schedules approved by EPA and MDE up to the date of the filing of the Joint Motion for Termination.

B. Baltimore County has paid all civil penalties, costs, damages, stipulated penalties, and other sums due under this Consent Decree; and

C. the Parties file a Joint Motion to Terminate the Consent Decree with the Court and the Court grants the Motion.

82. The Consent Decree shall not terminate if, following certification by Baltimore County of compliance pursuant to Paragraph 81.A. above, the United States or the State of Maryland assert in writing that full compliance has not been achieved. If the United States or the State of Maryland dispute Baltimore County's full compliance, this Consent Decree shall remain in effect pending resolution of the dispute by the Parties or the Court in accordance with the Dispute Resolution provisions of this Consent Decree.

XXV. SIGNATORIES/SERVICE

83. The Acting Assistant Attorney General on behalf of the United States and the undersigned representatives of Baltimore County and the State of Maryland certify that they are fully authorized to enter into the terms and conditions of this Consent Decree and to execute and legally bind

such party to this document.

84. Baltimore County hereby agrees not to oppose entry of this Consent Decree by the Court or to challenge any provision of this Consent Decree unless the United States has notified Baltimore County in writing that it no longer supports entry of the Consent Decree.

85. Baltimore County agrees to accept service of process by mail with respect to all matters arising under or relating to this Consent Decree and to waive the formal service requirements set forth in Rule 4 of the Federal Rules of Civil Procedure and any applicable Local Rules of this Court including, but not limited to, service of a summons.

XXVI. INTEGRATION/APPENDICES

86. This Consent Decree and its Appendices constitute the final, complete, and exclusive agreement and understanding among the Parties with respect to the settlement embodied in the Decree and supercede all prior agreements and understandings, whether oral or written. Other than the Appendices, which are attached to and incorporated into this Decree, no other document, nor any representation, inducement, agreement, understanding, or promise, constitutes any part of this Decree or the settlement it represents, nor shall it be used in construing the terms of this Decree.

87. The following Appendices are attached to and incorporated into this Decree:

"Appendix A1" is the list of Pump Station SSO Structures

"Appendix A2" is the list of Non-Pump Station SSO Structures

"Appendix B" is the list of Collection System Construction Projects

"Appendix C" is the list of Pump Station Rehabilitation, Repair, and Replacement Projects

"Appendix D" is the list of Pump Stations by Tier

"Appendix E" is the Pump Station Inspection Checklist

"Appendix F" is the Pump Station Priority Ranking

"Appendix G" is the Utilities Management Application Contract

"Appendix H" is the list of Deliverables

"Appendix I" is the description of the Patapsco BNR/ENR Design SEP

"Appendix J" is the description of the Back River Debris Removal SEP

"Appendix K" is the description of the Stream Restoration SEPs

XXVII. FINAL JUDGMENT

88. Upon approval and entry of this Consent Decree by the Court, this Consent Decree shall constitute a final judgment between the United States, the State of Maryland, and Baltimore County. The Court finds that there is no just reason for delay and therefore enters this judgment as a final judgment under Fed. R. Civ. P. 54 and 58.

SO ORDERED this _____ day of _____ 200__.

Plaintiffs,	)	
v.	)	**Civil Action No.**
BALTIMORE COUNTY, MARYLAND,	)	
Defendant.	)	

COMPLAINT

The United States of America ("United States"), by the authority of the Attorney General of the United States and through its undersigned counsel, acting at the request and on behalf of the Administrator of the United States Environmental Protection Agency ("EPA"), and the State of Maryland, acting by the authority of the Attorney General of Maryland and through its undersigned counsel, and acting at the request and on behalf of the Maryland Department of the Environment ("Department" or "MDE"), file this complaint and allege as follows:

NATURE OF THE ACTION

1. This is a civil action brought pursuant to Section 309(b) and (d) of the Federal Water Pollution Control Act, as amended by the Clean Water Act of 1977 and the Water Quality Act of 1987 (the "Clean Water Act" or "the Act"), 33 U.S.C. § 1319(b) and (d), for injunctive relief and the assessment of civil penalties against Baltimore County, Maryland ("Baltimore County"), for the discharge of pollutants in violation of Section 301(a) of the Act, 33 U.S.C. § 1311(a). Baltimore County has violated Section 301(a) of the Act by discharging pollutants without permit authority.

2. Plaintiff State of Maryland also brings supplemental state claims for violations of Sections 9-322 and 9-323 of the Environment Article, Annotated Code of Maryland.

JURISDICTION, VENUE, NOTICE, AND AUTHORITY

3. This Court has jurisdiction over the subject matter of this action pursuant to Section 309(b) of the Act, 33 U.S.C. § 1319(b), and 28 U.S.C. §§ 1331, 1345, and 1355. This Court has jurisdiction over the claims of the State of Maryland asserted under the Environment Article pursuant to 28 U.S.C. § 1367 (supplemental jurisdiction).

4. Venue is proper in the District of Maryland pursuant to 28 U.S.C. § 1391(b), and Section 309(b) of the Act, 33 U.S.C. § 1319(b), because it is the judicial district where Baltimore County is located and where the alleged violations occurred.

5. Pursuant to Section 309(b) of the Act, 33 U.S.C. § 1319(b), notice of the commencement of this action has been given to the State of Maryland, which joins in this action as a co-plaintiff.

6. Authority to bring this action is vested in the United States Department of Justice by 28 U.S.C. §§ 516, 519, and Section 506 of the Clean Water Act, 33 U.S.C. § 1366.

7. Authority to bring the supplemental claims identified in this action is vested in the Office of the Attorney General of Maryland by § 9-344 of the Environment Article, Annotated Code of Maryland.

DEFENDANT

8. Defendant Baltimore County is a political subdivision of the State of Maryland, formed under the laws of the State of Maryland, and is a "municipality" within the meaning of Section 502(4) of the Act, 33 U.S.C. § 1362(4), and a "person" within the meaning of Section 502(5) of the Act, 33 U.S.C. § 1362(5).

FEDERAL STATUTES AND REGULATIONS

9. Section 301(a) of the Act, 33 U.S.C. § 1311(a), prohibits the "discharge of pollutants" into navigable waters except in compliance with a National Pollutant Discharge Elimination System ("NPDES") permit issued by U.S. EPA or an authorized state pursuant to Section 402 of the Act, 33 U.S.C. § 1342.

10. The term "discharge of pollutants" is defined in Section 502(12) of the Act, 33 U.S.C. § 1362(12), to mean "any addition of any pollutant to navigable waters from any point source . . . ."

11. The term "navigable waters" is defined in Section 502(7) of the Act, 33 U.S.C. § 1362(12) to mean "the waters of the United States, including the territorial seas."

12. The term "point source" is defined in Section 502(14) of the Act, 33 U.S.C. § 1362(14), to mean "any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel . . . from which pollutants are or may be discharged."

13. Section 309(b) of the Clean Water Act, 33 U.S.C. § 1319(b), authorizes EPA to commence a civil action for appropriate relief, including a permanent or temporary injunction, when any person is in violation of, inter alia, Section 301 of the Clean Water Act, 33 U.S.C. § 1311.

14. Section 309(d) of the Clean Water Act, 33 U.S.C. § 1319(d), as modified by 40 C.F.R. Part 19, provides that any person who violates, inter alia, Section 301 of the Clean Water Act, 33 U.S.C. § 1311, shall be subject to a civil penalty not to exceed $27,500 per day for each such violation occurring after January 31, 1997 through and including March 15, 2004, or not to exceed $32,500 per day for each such violation thereafter.

MARYLAND STATUTES AND REGULATIONS

15. Section 9-253 of the Environment Article, Annotated Code of Maryland, confers upon the Secretary of MDE all powers that are necessary to comply with and represent the State of Maryland (referred to throughout the Environment Article as "this State") under the federal

Clean Water Act.

16. Pursuant to Section 9-322 of the Environment Article, "a person may not discharge any pollutant into waters of this State" except in compliance with certain provisions of the Environment Article, including Section 9-323.

17. Section 9-323 of the Environment Article requires a person to hold a discharge permit issued by the Department before the person may, among other things, operate any disposal system the operation of which could cause or increase the discharge of pollutants to waters of this State.

18. The term "discharge" is defined in Section 9-101(b) of the Environment Article as "(1) The addition, introduction, leaking, spilling, or emitting of a pollutant into the waters of this State; or (2) The placing of a pollutant in a location where the pollutant is likely to pollute."

19. The term "pollutant" means: " (1) Any waste or wastewater that is discharged from: (i) A publicly owned treatment works; or (ii) An industrial source; or (2) Any other liquid, gaseous, solid, or other substance that will pollute any waters of this State." Environment Article § 9-101(g).

20. The term "waters of this State" is defined by Section 9-101(l) to include "(1) both surface and underground waters within the boundaries of this State subject to its jurisdiction, including parts of the Atlantic Ocean within the boundaries of this State, the Chesapeake Bay, and its tributaries, and all ponds, lakes, rivers, streams, public ditches, tax ditches, and public drainage systems within this State, other than those designed to collect, convey, or dispose of sanitary waste; and (2) the flood plain of free-flowing waters determined by the Department of Natural Resources on the basis of the 100-year flood."

21. Section 9-339 of the Environment Article authorizes MDE to bring an action for an injunction against any person who violated any provision of Title 9, Subtitle 3 of the Environment Article or any rule, regulation, order or permit adopted or issued by the Department thereunder.

22. Section 9-342(a) of the Environment Article provides that a person who violates any provision of Title 9, Subtitle 3 of the Environment Article or any rule, regulation, order or permit

adopted or issued by the Department thereunder, is subject to a civil penalty of up to $10,000 per violation, with each day a violation occurs constituting a separate violation.

GENERAL ALLEGATIONS

23. Baltimore County owns and operates a municipal wastewater collection system that includes almost 3,000 miles of sewer lines and over 100 pump stations (hereinafter, the "Collection System"). The Collection System conveys wastewater generated by Baltimore County residents and businesses, as well as wastewater from neighboring Anne Arundel and Howard Counties, to the border Baltimore County shares with Baltimore City.

24. At various locations along the County/City border, Baltimore County's wastewater enters connecting sewage lines owned by Baltimore City and is conveyed for treatment at the Back River and Patapsco Waste Water Treatment Plants owned and operated by Baltimore City.

25. Baltimore County does not hold a National Pollutant Discharge Elimination System (NPDES) permit or a State discharge permit authorizing it to discharge wastewater from the Collection System to navigable waters or waters of the State.

26. At all times relevant to this Complaint, Baltimore County has discharged and continues to discharge untreated wastewater containing raw sewage from the Collection System through "point sources" to navigable waters and waters of the State, including, inter alia, Lynch Cove, Mardella Branch, Towson Run, Stemmers Run, Back River, Lake Roland, Patapsco River, North Point Creek, Bear Creek, Merrymans Branch, Loch Raven, White Marsh Creek, White Marsh Run, Northeast Creek, Bens Run, Gunpowder Falls, Herring Run, Jones Falls, Gwynns Falls and Jones Creek.

27. Wastewater collected by and transported through the Collection System is a "pollutant" as that term is defined at Section 502(6) of the Clean Water Act, 33 U.S.C. § 1362(6), and at Section 9-101(g) of the Environment Article.

28. The waters identified in Paragraph 26, above, as well as other such surface waters to which pollutants have been discharged, are "navigable waters" within the meaning of Section 502(7) of the Clean Water Act, 33 U.S.C. § 1362(7), and "waters of this State" within the meaning of Section 9-101(l) of the Environment Article.

29. The waters identified in Paragraph 26, above, are tributaries to the Chesapeake Bay. The Chesapeake Bay is the nation's largest estuary, "a national treasure and a resource of worldwide significance," and for that reason accorded special recognition under Section 117 of the Clean Water Act, 33 U.S.C. § 1267.

30. Between July 1997 and the present, Baltimore County has discharged tens of millions of gallons of untreated wastewater containing raw sewage from its Collection System without NPDES permit authority. Unpermitted discharges from Baltimore County's Collection System have resulted from multiple causes including, inter alia, inadequate flow capacity, inadequate pumping capacity, inadequate maintenance of the collection system including pumping stations, and excessive infiltration and inflow to the sanitary sewers.

31. Untreated wastewater containing raw sewage can carry bacteria, viruses, parasitic organisms, intestinal worms, and borroughs (inhaled molds and fungi) and may cause a number of diseases in those persons who may come in contact with such wastewater. These diseases include, but are not limited to, highly communicable enteric diseases such as gastroenteritis, dysentery, and cholera.

32. Unpermitted discharges of raw sewage from the Collection System to certain receiving water bodies in and around Baltimore County have caused and/or contributed to the presence of elevated levels of coliform bacteria in these water bodies. Coliform bacteria is an indicator that unacceptable levels of disease-causing organisms may be present in receiving water bodies.

FIRST CLAIM FOR RELIEF (CLEAN WATER ACT)

33. Paragraphs 1 through 14 and 23 through 32 are re-alleged and incorporated herein by reference.

34. On various dates from July 8, 1997, and continuing periodically to the present, Baltimore County has discharged pollutants from its Collection System into navigable waters without the authorization of a NPDES permit in violation of Section 301(a) of the Act, 33 U.S.C. § 1311(a).

35. Each day of each unpermitted discharge of pollutants is a separate violation of Section 301(a) of the Act, 33 U.S.C. § 1311(a).

36. Unless enjoined by the Court, Baltimore County will continue to discharge pollutants to navigable waters in violation of Section 301(a) of the Act, 33 U.S.C. § 1311(a).

37. Pursuant to Sections 309(b) and (d) of the Act, 33 U.S.C. §§ 1319 (b) and (d), as modified by 40 C.F.R. Part 19, Baltimore County is liable for injunctive relief and civil penalties of up to $27,500 per day for each such violation occurring after January 31, 1997 through and including March 15, 2004, and up to $32,500 per day for each such violation thereafter.

STATE OF MARYLAND'S FIRST SUPPLEMENTAL CLAIM FOR RELIEF

38. Paragraphs 1 through 32 are re-alleged and incorporated herein by reference.

39. At least since July 1997, Baltimore County has discharged, and on occasion continues to discharge, pollutants from its Collection System into waters of this State without the authorization of a State discharge permit.

40. The unpermitted discharges include, without limitation, the unpermitted discharges identified in Paragraph 26, above.

41. Each day of each unpermitted discharge of pollutants is a separate violation of Sections 9-322 and 9-323 of the Environment Article, Annotated Code of Maryland.

42. Pursuant to Section 9-342(a) of the Environment Article, Plaintiff State of Maryland is entitled to a civil penalty of up to $10,000 for each day of each of Baltimore County's violation of Sections 9-322 and 9-323 of the Environment Article.

43. Unless enjoined by the Court, Baltimore County will continue to discharge pollutants to waters of this State without a permit in violation of Sections 9-322 and 9-323 of the Environment Article.

PRAYER FOR RELIEF

WHEREFORE, Plaintiffs, the United States of America and the State of Maryland, respectfully pray that this Court provide the following relief:

1. A permanent injunction enjoining Baltimore County from any further violations of, and directing Baltimore County to take all steps necessary to come into permanent, consistent compliance with, the Clean Water Act and Title 9, Subtitle 3 of the Environment Article, and the regulations promulgated thereunder.

2. A judgment assessing civil penalties against Baltimore County of up to $27,500 per day for each violation of the Clean Water Act occurring after January 31, 1997 through and including March 15, 2004, and up to $32,500 per day for each such violation thereafter;

3. A judgment awarding the United States and the State of Maryland the costs of this action; and

4. Such further relief as this Court may deem appropriate.

Respectfully submitted,

FOR THE UNITED STATES OF AMERICA

Executive Summary

Baltimore County entered into a Consent Decree (CD) on September 20, 2005 with the United States Environmental Protection Agency (EPA), the State of Maryland Department of the Environment (MDE), and the Department of Justice (DOJ). The objective of Paragraph 10 of the CD was to prepare a Sewershed Repair, Replacement, and Rehabilitation (SRRR) Plan that describes the deficiencies identified through Collection System Inspection and the Long Term Capacity/Peak Flow Management Evaluation (LTC/PFME), and recommends repair, replacement, rehabilitation, or other corrective actions necessary to address those deficiencies. This SRRR Plan is for the Jones Falls Sewershed.

The Jones Falls Sewershed is located in the north-central portion of Baltimore County along the City-County line from the northwest corner to York Road. Adjacent sewersheds include the Texas Sewershed to the north, the Longquarter and Herring Run Sewersheds to the east and the Gwynns Falls Sewershed to the west. Baltimore County's portion of the Jones Falls Sewershed drains to the south entering the City of Baltimore's Jones Falls Sewershed at seven (7) separate locations, before ultimately being treated at the Back River Wastewater Treatment Plan. The sewershed measures approximately 13,440 acres in size and is primarily composed of residential properties, with some areas of industrial, commercial, educational and institutional development. The sanitary collection system includes over 1,124,000 linear feet (LF) of circular gravity sewer piping, ranging in size from 6 to 48-inches in diameter; approximately 6,200 manholes and/or other sewer structures; and approximately 19,000 LF of force main and pressure sewer. The sewershed contains four (4) pumping stations. These are the Buchanan Road Pumping Station, the Stanton Woods Pumping Station, the Templegate Pumping Station, and the Stevenson Pumping Station.

Data analysis, evaluation, and decision-making criteria were utilized to identify collection system defects and deficiencies and prioritize the corrective actions. The recommended Corrective Action Plan consists of various structural and hydraulic corrective actions that are needed to address the deficiencies that were identified during the sewershed collection system inspection work. The plan also identifies specific rehabilitation and other corrective actions needed to eliminate model predicted sanitary sewer overflows (SSOs) that were determined by the simulations completed during the Long-Term Capacity/Peak Flow Management Evaluation (LTC/PFME). These condition related corrective action recommendations were defined based on review of field inspection and SSES data that was completed, which included sewer and manhole inspections, smoke and dyed-water testing and night-time flow isolation investigations. The hydraulic corrective actions were determined by model simulations and the inflow and infiltration (I/I) analysis. Some identified structural and condition related corrective actions to correct defects were superseded by the hydraulic corrective action recommendations, and these defects will be corrected when the hydraulic corrective actions are completed.

The County's approach to addressing model-predicted SSOs is to:

1. Complete I/I reduction improvements based on the 10-year/6-hour SCS Type II storm event.
2. Complete select capacity improvements based on the 10-year/6-hour SCS Type II storm event and model-confirmation flow monitoring data.
3. Correct structural deficiencies through collection system rehabilitation or replacement.
4. Complete post-construction flow monitoring and analysis to confirm the effectiveness of the RDII reductions.
5. Confirm model simulations and revise or recalibrate the hydraulic model accordingly, if needed.
6. Determine if additional improvements are needed based on the updated hydraulic model.

Baltimore County has implemented several remedial measures to eliminate SSOs as required by Paragraph 7 of the CD within the Jones Falls Sewershed. The sewershed contains three (3) non-pumping station SSOs. These include SSO 31A (Rider Avenue), SSO 113 (Marnat Road), and SSO 120 (Charles Street Avenue). SSO 31A was eliminated on May 11, 2007 and post elimination flow monitoring of the overflow was conducted in accordance with the CD. There has been no evidence of activity in this SSO since February of 2004. In November of 2009, the County began work on an extensive collection system rehabilitation contract located upstream of SSO 113 aimed at eliminating this SSO. The rehabilitation project was completed in June 2012 and post-rehabilitation flow monitoring of the SSO is currently being conducted. Monitoring of the overflow shows that SSO 113 remains active during wet-weather events. As determined by the LTC/PFME, the overflow is believed to activate as a result of capacity restrictions in the downstream sewers in the City of Baltimore's collection system. The County continues to coordinate with the City of Baltimore regarding capacity improvements that are needed to several of the City's receiving sewers. In June 2010, the County began a rehabilitation contract upstream of SSO 120 aimed at removing I/I from the collection system and eliminating the SSO. The work was completed in July of 2011 and SSO 120 was eliminated on September 20, 2011. The County continues to monitor flow in the sewer to verify that the wet-weather flow is not surcharging the collection system.

The capacity improvements that address items 1 and 2 above, and the structural condition improvements that will address item 3 in the Jones Falls Sewershed are graphically shown on **Map 6-1** and the specific corrective actions defined by meter basin are presented in **Tables 6-5.3** and **6-6.1**. The estimated cost to implement the collection system improvements is $28,300,000, which contains a 40% contingency cost for engineering, construction inspection and estimating.

The recommended schedule for completing the corrective actions within the Jones Falls

Sewershed's collection, pumping and transmission system will be within six (6) years of the EPA and MDE's approval of the Plan per Paragraph 10.B. of the CD.

In accordance with Paragraphs 9, 10, and 11 of the CD, the County will also implement several continuous programs to determine the effectiveness of the corrective actions when completed, and enhance the collection system's operation and maintenance efforts. These programs will include a long-term corrective action flow monitoring and evaluation plan, a sewer cleaning program, and root and grease control programs. The County will also evaluate data collected through post-rehabilitation closed-circuit television (CCTV) inspection of the collection system and review of record drawings, work orders and reported complaints to evaluate the effectiveness of the completed corrective actions, update the collection system model, and determine any subsequent work that is needed as appropriate.

END OF SECTION

Section 1

Introduction

1.0 Introduction (CD Ref. P10.A-C)

1.1 Background

On September 20, 2005, Baltimore County entered into a Consent Decree (CD) with the United States Environmental Protection Agency (EPA), the State of Maryland Department of the Environment (MDE), and the Department of Justice (DOJ). Paragraph 10 of the CD requires the County to prepare a Sewershed Repair, Replacement, and Rehabilitation (SRRR) Plan that describes the deficiencies identified through collection system inspections and the Long Term Capacity/Peak Flow Management Evaluation (LTC/PFME), and provides for the determination of any repair, replacement, rehabilitation, or other corrective actions necessary to correct identified deficiencies. This SRRR Plan is for the Jones Falls Sewershed.

Flow monitoring, Inflow and Infiltration (I/I) analysis, modeling, and inspection of manholes and sanitary sewers were performed in the Jones Falls Sewershed from 2008 through 2012. The County performed all Sewer System Evaluation Survey (SSES) tasks in accordance with Paragraph 8 of the CD. These included closed circuit television (CCTV) inspection of the sanitary sewers, manhole inspections, smoke testing, dyed-water testing and night-time flow isolation testing.

The SRRR Plan addresses each of the criteria defined in Paragraph 10.C of the CD. This criteria is as follows:

i. Evaluate the effectiveness of the projects completed or proposed to be completed pursuant to Paragraph 7.D for the relevant Sewershed. Baltimore County shall use rainfall and flow monitoring data collected in accordance with requirements of Paragraphs 7.D and 9 of the Consent Decree, and shall use the Model developed in accordance with Paragraph 14 of the Consent Decree, to demonstrate the effectiveness of the construction projects.

ii. Identify all deficiencies in the relevant Sewershed discovered during the Collection System Inspection conducted pursuant to Paragraph 8.

iii. Identify all corrective actions taken (including date completed), or to be taken, by Baltimore County (including but not limited to preventive maintenance, repair, replacement, or rehabilitation) to address deficiencies identified during inspection of the relevant Sewershed.

iv. Describe the priority scheme used to set priorities for correcting identified deficiencies within each Sewershed, including any decision not to correct an identified deficiency.

v. Describe the decision-making criteria used to select future corrective action.

vi. Propose a plan and schedule for implementing rehabilitation and other corrective action determined necessary to correct deficiencies in the relevant Sewershed identified during the inspections required by Paragraph 8, taking into consideration the Long-Term Capacity/Peak Flow Management analysis performed for the relevant Sewershed pursuant to Paragraph 9; the prioritization scheme to be applied to correction of these

deficiencies; and an estimate of the cost necessary to complete any proposed rehabilitation and other corrective actions.

vii. Propose a plan and schedule for eliminating those physical connections (i.e. cross connections) between the Collection System and the storm water collection system that allow or have the potential to allow sanitary waste to be discharged to the storm water collection system.

viii. Present the results of the Long-Term Capacity/Peak Flow Management Evaluation conducted pursuant to Paragraph 9.C.ii, and determine for each Sewershed the range of storm events as specified in Paragraph 9.C.ii(b) for which the Collection System in its existing condition can convey peak flows without the occurrence of SSOs. As part of its analysis, Baltimore County shall identify all modeled Collection System Components and Pump Stations that cause or contribute to flow restrictions or that have the potential to cause or contribute to overflows.

ix. Consistent with the results of the Long-Term Capacity/Peak Flow Management Evaluation conducted pursuant to Paragraph 9.C.ii, project for each Sewershed the range of storm events as specified in Paragraph 9.C.ii(b) for which the Collection System will be able to convey peak flows without occurrence of SSOs. Such projection shall assume completion of the construction projects required by Paragraph 7 of this Consent Decree and completion of the proposed rehabilitative or other corrective action projects recommended by the SRRR Plan required by Paragraph 10. As part of its analysis, Baltimore County shall identify all modeled Collection System components and Pump Stations that cause or contribute to flow restrictions or that have the potential to cause or contribute to overflows.

x. Present the results of the rainfall and flow monitoring conducted in the Sewershed, including a map that depicts all monitored locations, dates of monitoring, a description of the quality assurance and quality control analyses performed for samples collected and data analyzed and the results of those analyses (i.e., summarize data quality assurance and data "lost" or "qualified"), and present the results of the I/I evaluation performed pursuant to Paragraph 9.C.i., including a description of the smoke testing and dye testing activities performed in the Sewershed, a summary of the results of such testing, a quantification of the rates of I/I for the Sewershed and the portions of the Sewershed's Collection System impacted by I/I, and any identified sources of I/I to the Collection System located in the Sewershed.

xi. Incorporate into each SRRR Plan a description of additional data collection activities that will be implemented after completion of rehabilitative and other corrective action(s) proposed pursuant to Paragraphs 10.B and 10.C to evaluate their effectiveness consistent with Paragraph 10.E (Performance Assessment).

1.2 Sewershed Meter Basin Summary

As shown in **Map 1-1**, the Jones Falls Sewershed is located in the north-central portion of Baltimore County along the City-County line from the northwest corner to York Road. Adjacent sewersheds include the Texas Sewershed to the north, the Longquarter and Herring Run

Sewersheds to the east and the Gwynns Falls Sewershed to the west. The Jones Falls Sewershed measures approximately 13,440 acres and is primarily composed of residential properties, with some areas of industrial, commercial, educational and institutional development. The sanitary sewer collection system includes over 1,124,000 linear feet (LF) of circular gravity sewer conveyance piping ranging in size from 6- to 48-inches in diameter; approximately 6,200 manholes and other sewer structures; and approximately 19,000 LF of force main and pressure sewer. The Jones Falls Sewershed has four (4) existing pumping stations:

The **Buchanan Road Pumping Station**, located at the terminus of Buchanan Road, is designed to pump flows of 200 gallons per minute (GPM) under existing and ultimate capacity conditions.

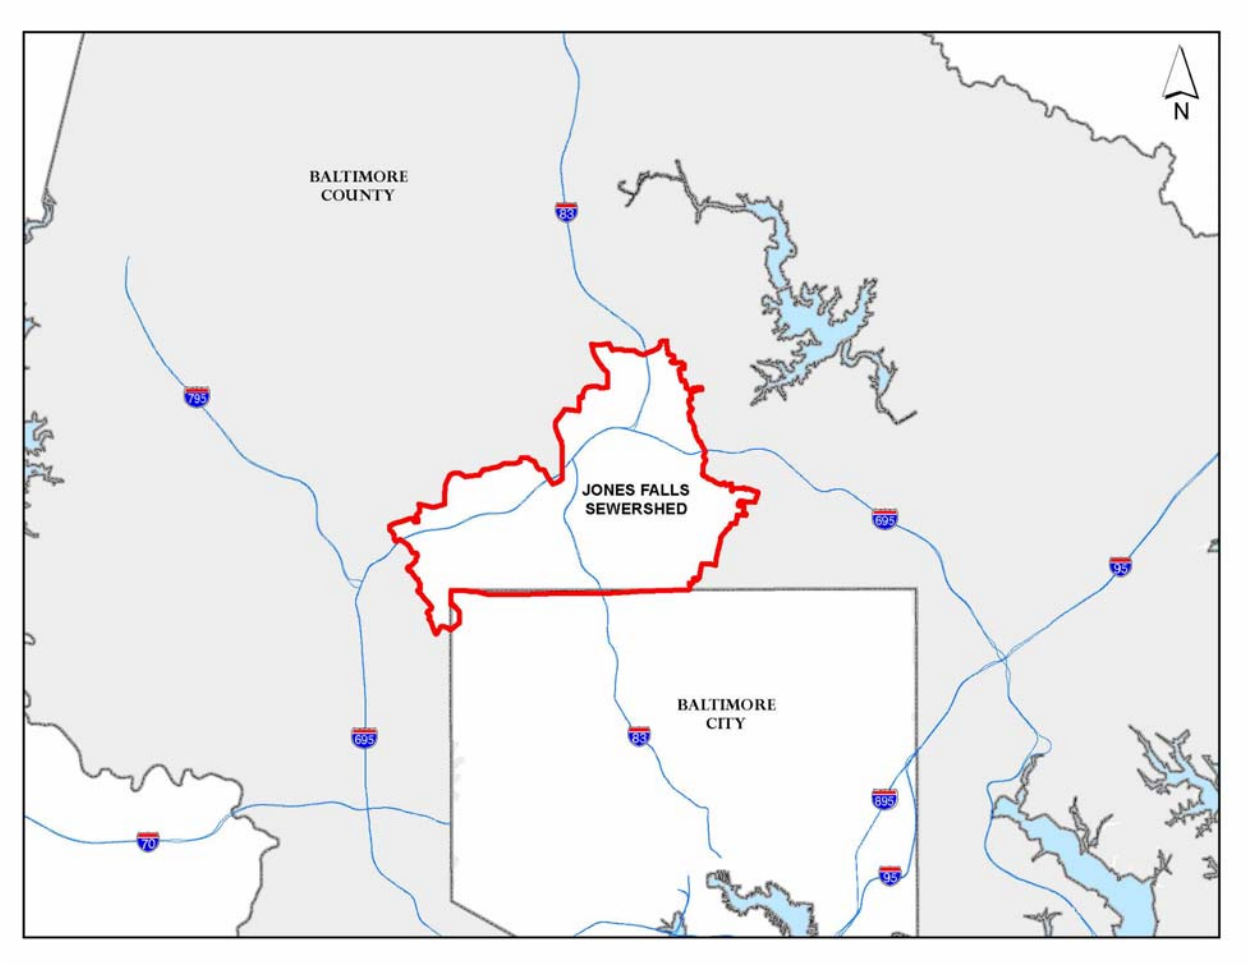
The **Stanton Woods Pumping Station**, located at the terminus of Topping Road, is designed to pump 252 GPM under existing and ultimate capacity conditions.

The **Templegate Pumping Station**, located at the terminus of E Court, which is between Breton Way and Woodvalley Drive has an ultimate capacity of 300 GPM, which is an increase from the existing capacity of 118 GPM.

The **Stevenson Pumping Station**, which was reconstructed in May 2011, is located off the intersection of Keyser Road and Windsong Court. This station is designed to pump 180 GPM, which is a slight increase from the previous capacity of 170 GPM.

The Buchanan Road, Stanton Woods and Templegate Pumping Stations are currently being evaluated in separate engineering evaluation and condition assessment (EE/CA) studies and future improvements will be recommended for those pumping stations.

The sanitary collection system in the Jones Falls Sewershed conveys wastewater to the City of Baltimore's Jones Falls Sewershed at seven (7) separate locations, before ultimately being treated at the Back River Wastewater Treatment Plant.

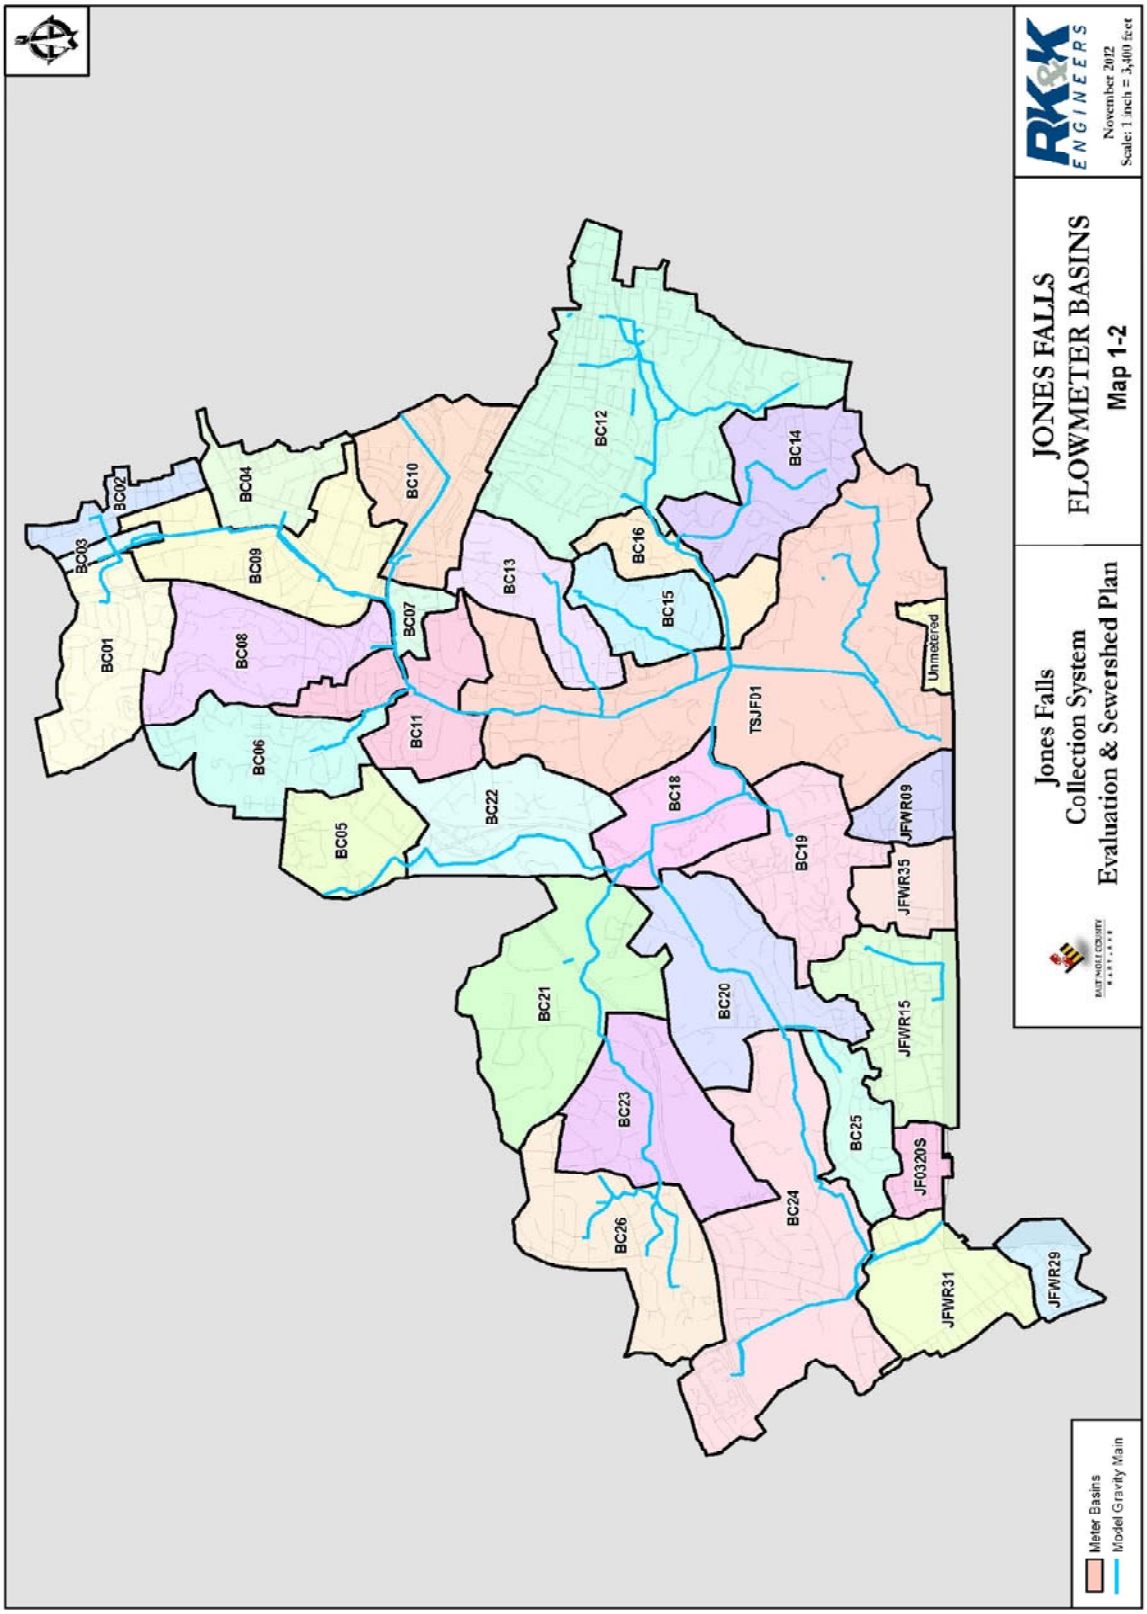


Map 1-1 Jones Falls Sewershed Location Map

During the flow monitoring, the Jones Falls Sewershed was divided into thirty-two (32) flow meter basins as shown in **Map 1-2**, and as described below. The flow meter basin boundaries are generally defined by their associated tributary area, logical division locations within the collection system and at locations where the County's sanitary sewer collection system enters the City of Baltimore's sanitary sewer system.

BC01

Meter Basin BC01 is located in the northern corner of the Jones Falls Sewershed, north of Timonium Road. This meter basin measures approximately 428 acres and is primarily composed of residential with some commercial development. The wastewater collection system in this meter basin consists of approximately 54,543 LF of sewers ranging in size between 8- and 16-inches in diameter and contains 363 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC03. The flow exiting BC01 was measured by a flow meter installed in MH 37990.



Map 1-2 – Jones Falls Sewershed Flow Meter Basins

BC02

Meter Basin BC02 is located in the northeast corner of the Jones Falls Sewershed, north of Timonium Road and east of the Baltimore Light Rail Line. This meter basin measures approximately 138 acres and is primarily composed of commercial development with some residential development. The wastewater collection system in this meter basin consists of approximately 16,434 LF of sewers ranging in size between 8- and 12-inches in diameter and contains 64 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC03. The flow exiting BC02 was measured by a flow meter installed in MH 7253.

BC03

Meter Basin BC03 is located in the northeastern area of the Jones Falls Sewershed. This meter basin measures approximately 43 acres and is primarily composed of industrial and commercial development. This meter basin is south of Timonium Road along the Baltimore Light Rail corridor. The wastewater collection system in this basin consists of approximately 4,440 LF of sewers ranging in size between 8- and 30-inches in diameter and contains 24 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC09. The flow exiting BC03 was measured by a flow meter installed in MH 33463.

BC04

Meter Basin BC04 is located in the northeastern area of the Jones Falls Sewershed, south of W. Ridgely Road between the Baltimore Light Rail and York Road. This meter basin measures approximately 228 acres and is primarily composed of residential and commercial properties. The wastewater collection system in this meter basin consists of approximately 21,558 LF of sewers ranging in size between 8- and 10-inches in diameter and contains 102 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC09. The flow exiting BC04 was measured by a flow meter installed in MH 6977.

BC05

Meter Basin BC05 is located in the northwest area of the Jones Falls Sewershed, in the Brooklandville area. This meter basin measures approximately 294 acres and is primarily composed of residential with some commercial development. The wastewater collection system in this meter basin consists of approximately 22,661 LF of 8-inch diameter sewers and 130 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC22. The flow exiting BC05 was measured by a flow meter installed in MH 43791.

BC06

Meter Basin BC06 is located in the northwest area of the Jones Falls Sewershed, from Timonium Road to south of Interstate I-695, east of Interstate I-83. This meter basin measures approximately 414 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 40,680 LF of sewers ranging in size between 8- and 18-inches in diameter and contains 289 manhole structures.

Gravity flow from this meter basin is conveyed to Meter Basin BC11. The flow exiting BC06 was measured by a flow meter installed in MH 38526.

BC07

Meter Basin BC07 is located in the northeast area of the Jones Falls Sewershed, south of Interstate I-695 near the Interstate I-83/I-695 interchange. This meter basin measures approximately 74 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 8,785 LF of sewers ranging in size between 8- and 24-inches in diameter and contains 53 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC11. The flow exiting BC07 was measured by a flow meter installed in MH 18586.

BC08

Meter Basin BC08 is located in the northern area of the Jones Falls Sewershed, west of Interstate I-83 from Timonium Road to south of Interstate I-695. This meter basin measures approximately 467 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 42,155 LF of sewers ranging in size between 8- and 24-inches in diameter and contains 284 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC07. The flow exiting BC08 was measured by a flow meter installed in MH 19873.

BC09

Meter Basin BC09 is located in the northeast area of the Jones Falls Sewershed, in the Lutherville area. This meter basin measures approximately 539 acres and is primarily composed of residential and commercial properties. The wastewater collection system in this meter basin consists of approximately 56,559 LF of sewers ranging in size between 6- and 30-inches in diameter and contains 272 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC07. The flow exiting BC09 was measured by a flow meter installed in MH NS1079.

BC10

Meter Basin BC10 is located in the eastern area of the Jones Falls Sewershed, along Interstate I-695 from Charles Street to York Road. This meter basin measures approximately 430 acres and is primarily composed of residential with some commercial development. The wastewater collection system in this meter basin consists of approximately 48,902 LF of sewers ranging in size between 8- and 24-inches in diameter and contains 256 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC07. The flow exiting BC10 was measured by a flow meter installed in MH 42231.

BC11

Meter Basin BC11 is located in the northwestern area of the Jones Falls Sewershed, in the Riderwood area. This meter basin measures approximately 404 acres and is primarily composed of residential with some institutional development. The wastewater collection system in this meter basin consists of approximately 41,649 LF of sewers ranging in size between 8- and 27-inches in diameter and contains 235 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin TSJF01. The flow exiting BC11 was measured by a flow meter installed in MH 6944.

BC12

Meter Basin BC12 is located in the eastern area of the Jones Falls Sewershed, in the vicinity of Towson University. This meter basin measures approximately 1,296 acres and is primarily composed of residential, institutional and commercial development. The wastewater collection system in this meter basin consists of approximately 140,464 LF of sewers ranging in size between 6- and 21-inches in diameter and contains 689 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC16. The flow exiting BC12 was measured by a flow meter installed in MH 22222.

BC13

Meter Basin BC13 is located in the eastern area of the Jones Falls Sewershed, from Bellona Avenue to Charles Street, south of Joppa Road. This meter basin measures approximately 315 acres and is primarily composed of residential and commercial properties. The wastewater collection system in this meter basin consists of approximately 30,486 LF of sewers ranging in size between 8- and 12-inches in diameter and contains 192 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin TSJF01. The flow exiting BC13 was measured by a flow meter installed in MH 18456.

BC14

Meter Basin BC14 is located in the southeast area of the Jones Falls Sewershed, and includes the Sheppard-Pratt Health System and St. Joseph's Medical Center. This meter basin measures approximately 445 acres and is primarily composed of residential and institutional properties. The wastewater collection system in this meter basin consists of approximately 27,154 LF of sewers ranging in size between 6- and 12-inches in diameter and contains 153 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC16. The flow exiting BC14 was measured by a flow meter installed in MH 34177.

BC15

Meter Basin BC15 is located in the southeastern area of the Jones Falls Sewershed, from Bellona Avenue to Charles Street. This meter basin measures approximately 254 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 13,638 LF of sewers ranging in size between 8- and 12-inches

in diameter and contains 92 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin TSJF01. The flow exiting BC15 was measured by a flow meter installed in MH 22456.

BC16

Meter Basin BC16 is located in the southeastern area of the Jones Falls Sewershed, between Bellona Avenue and Charles Street, south of Rolandvue Road. This meter basin measures approximately 210 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 20,705 LF of sewers ranging in size between 8- and 36-inches in diameter and contains 107 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin TSJF01. The flow exiting BC16 was measured by a flow meter installed in MH 61947.

BC18

Meter Basin BC18 is located in the southwestern area of the Jones Falls Sewershed, west of Lake Roland and includes Robert E. Lee Park. This meter basin measures approximately 343 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 11,815 LF of sewers ranging in size between 8- and 30-inches in diameter and contains 29 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin TSJF01. The flow exiting BC18 was measured by a flow meter installed in MH 20755.

BC19

Meter Basin BC19 is located in the southwestern area of the Jones Falls Sewershed, along Interstate I-83 north of the City-County line. This meter basin measures approximately 445 acres and is primarily composed of residential with some commercial development. The wastewater collection system in this meter basin consists of approximately 41,580 LF of sewers ranging in size between 6- and 12-inches in diameter and contains 274 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC18. The flow exiting BC19 was measured by a flow meter installed in MH 33711.

BC20

Meter Basin BC20 is located in the southwestern area of the Jones Falls Sewershed, west of Interstate I-83 and north of Old Pimlico Road. This meter basin measures approximately 590 acres and is primarily composed of residential with some institutional development. The wastewater collection system in this meter basin consists of approximately 44,098 LF of sewers ranging in size between 8- and 18-inches in diameter and contains 250 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC18. The flow exiting BC20 was measured by a flow meter installed in MH 20770.

BC21

Meter Basin BC21 is located in the western area of the Jones Falls Sewershed, between Interstate I-83 and Greenspring Avenue, south of Interstate I-695. This meter basin measures approximately 721 acres and is primarily composed of residential with some institutional development. The wastewater collection system in this meter basin consists of approximately 16,989 LF of sewers ranging in size between 8- and 18-inches in diameter and contains 98 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC18. The flow exiting BC21 was measured by a flow meter installed in MH 36912.

BC22

Meter Basin BC22 is located in the western area of the Jones Falls Sewershed, between Interstate I-83 and Falls Road, near Interstate I-695. This meter basin measures approximately 464 acres and is primarily composed of residential and institutional development. The wastewater collection system in this meter basin consists of approximately 23,854 LF of sewers ranging in size between 8- and 24-inches in diameter and contains 122 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC18. The flow exiting BC22 was measured by a flow meter installed in MH 34385.

BC23

Meter Basin BC23 is located in the western area of the Jones Falls Sewershed, west of Greenspring Avenue and north of Interstate I-695. This meter basin measures approximately 542 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 28,858 LF of sewers ranging in size between 8- and 15-inches in diameter and contains 159 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC21. The flow exiting BC23 was measured by a flow meter installed in MH 36930.

BC24

Meter Basin BC24 is located in the western area of the Jones Falls Sewershed, between Park Heights Avenue and Greenspring Avenue, north of Smith Avenue. This meter basin measures approximately 1,071 acres and is primarily composed of residential, commercial and institutional development. The wastewater collection system in this meter basin consists of approximately 87,268 LF of sewers ranging in size between 6- and 16-inches in diameter and contains 522 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC20. The flow exiting BC24 was measured by a flow meter installed in MH 33527.

BC25

Meter Basin BC25 is located in the southwestern area of the Jones Falls Sewershed, between Park Heights Avenue and Greenspring Avenue, north of Smith Avenue. This meter basin measures approximately 227 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 17,895 LF of sewers

ranging in size between 8- and 12-inches in diameter and contains 126 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC20. The flow exiting BC25 was measured by a flow meter installed in MH 32254.

BC26

Meter Basin BC26 is located in the western area of the Jones Falls Sewershed, north of Interstate I-695 and east of Park Heights Avenue. This meter basin measures approximately 575 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 52,871 LF of sewers ranging in size between 8- and 15-inches in diameter and contains 321 manhole structures. Gravity flow from this meter basin is conveyed to Meter Basin BC23. The flow exiting BC26 was measured by a flow meter installed in MH 36951.

The Stanton Woods, Stevenson and Templegate Wastewater Pumping Stations are located in Meter Basin BC26. Wastewater from the Stanton Woods Pumping Station is conveyed through a 6-inch diameter force main to gravity MH 45855 located in Meter Basin BC26. Wastewater from the Stevenson Pumping Station is conveyed through a 6-inch diameter force main to gravity MH 41040 located in Meter Basin BC26, and the wastewater from the Templegate Pumping Station is conveyed through a 6-inch diameter force main to gravity MH 46749 located in Meter Basin BC26.

TSJF01

Meter Basin TSJF01 is located in the southern area of the Jones Falls Sewershed, north of the City-County line from Interstate I-83 to York Road. This meter basin measures approximately 1,817 acres and is primarily composed of residential with some institutional development. The wastewater collection system in this meter basin consists of approximately 80,001 LF of sewers ranging in size between 6- and 42-inches in diameter and contains 442 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity system. The flow exiting TSJF01 was measured by a flow meter installed in manhole S19II2017MH (County MH TCM27).

The Buchanan Road Wastewater Pumping Station is located in Meter Basin TSJF01. Wastewater from this pumping station is conveyed through a 6-inch diameter force main to gravity MH 48253 located in Meter Basin TSJF01.

JF0320S

Meter Basin JF0320S is located in the southern area of the Jones Falls Sewershed, north of the City-County line from Seven Mile Lane to Labyrinth Road. This meter basin measures approximately 83 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 9,283 LF of sewers ranging in size between 8- and 10-inches in diameter and contains 68 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JF0320S was measured by a flow meter installed in Baltimore City manhole S04II2004MH.

JFWR09

Meter Basin JFWR09 is located in the southern area of the Jones Falls Sewershed, north of the City-County line west of Interstate I-83. This meter basin measures approximately 204 acres and is primarily composed of residential and commercial properties. The wastewater collection system in this meter basin consists of approximately 11,616 LF of 8-inch diameter sewers and contains 23 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JFWR09 was measured by a flow meter installed in Baltimore City manhole S17GG2004MH.

JFWR15

Meter Basin JFWR15 is located in the southern area of the Jones Falls Sewershed, north of the City-County line from Labyrinth Road to Greenspring Avenue. This meter basin measures approximately 234 acres and is primarily composed of residential with some commercial and institutional development. The wastewater collection system in this meter basin consists of approximately 33,853 LF of sewers ranging in size between 8- and 15-inches in diameter and contains 297 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JFWR15 was measured by a flow meter installed in Baltimore City manhole S05II2003MH.

JFWR29

Meter Basin JFWR29 is located in the southwestern area of the Jones Falls Sewershed, west of the City-County line and west of Reisterstown Road. This meter basin measures approximately 268 acres and is primarily composed of residential, institutional and commercial development. The wastewater collection system in this meter basin consists of approximately 24,983 LF of sewers ranging in size between 8- and 10-inches in diameter and contains 60 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JFWR29 was measured by a flow meter installed in Baltimore City manhole S04EE2004MH.

JFWR31

Meter Basin JFWR31 is located in the southwestern area of the Jones Falls Sewershed, near the northwest corner of the City-County line, and east of Old Pimlico Road. This meter basin measures approximately 398 acres and is primarily composed of residential with some institutional development. The wastewater collection system in this meter basin consists of approximately 53,415 LF of sewers ranging in size between 6- and 15-inches in diameter and contains 101 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JFWR31 was measured by a flow meter installed in Baltimore City manhole S06II2012MH.

JFWR35

Meter Basin JFWR35 is located in the southern area of the Jones Falls Sewershed, north of the City-County line, east of Old Pimlico Road. This meter basin measures approximately 216 acres and is primarily composed of residential development. The wastewater collection system in this meter basin consists of approximately 25,684 LF of sewers ranging in size between 6- and 10-inches in diameter and contains 134 manhole structures. Gravity flow from this meter basin is conveyed to Baltimore City's gravity sewer system. The flow exiting JFWR35 was measured by a flow meter installed in Baltimore City manhole S13GG2016MH.

Section 2

Effectiveness of Paragraph 7 Projects

2.0 Effectiveness of Remedial Corrective Actions Required by Paragraph 7 Projects (CD Ref. P10.C.i)

Paragraph 10.C of Baltimore County's Consent Decree (CD) requires that the effectiveness of the projects completed in accordance with Paragraph 7 be evaluated. The purpose of the corrective actions completed in accordance with Paragraph 7 was to eliminate Pumping Station and Non-Pumping Station Sanitary Sewer Overflows (SSOs) in the sewershed. An "SSO Structure", as defined in Section IV AA of the County's CD, is any structure constructed in Baltimore County for the purpose of allowing discharge from the separate sanitary sewer collection system at a point prior to the systems connection with the City of Baltimore's collection system or the head works of either the Patapsco or Back River Wastewater Treatment Plants. Three (3) Non-Pumping Station SSOs existed in the Jones Falls Sewershed. These SSOs include: SSO 31A (Rider Avenue), SSO 113 (Marnat Road) and SSO 120 (Charles Street Avenue). Information pertaining to these SSOs is detailed below:

2.1 SSO Locations

SSO 31A (Rider Avenue) was located at 8206 Rider Avenue in the Riderwood area of Baltimore County. This SSO contained an 18-inch diameter overflow pipe that was located in MH 6954 in SSA 45-59-16-01 (Meter Basin BC11) and discharged to Roland Run.

SSO 113 (Marnat Road) is located at the intersection of Marnat Road and Hattan Road in the Pikesville area of Baltimore County. This SSO contains a 12-inch diameter overflow pipe constructed in MH 793 in SSA 45-10-22-01 (Meter Basin JF0320S). The SSO discharges to a storm drain, which ultimately drains to the Western Run branch of the Jones Falls.

SSO 120 (Charles Street Avenue) was located at 442 Charles Street Avenue in the Towson area of Baltimore County. This SSO contained an 8-inch diameter overflow pipe constructed in MH 2402A in SSA 45-58-06-02 (Meter Basin BC12). This manhole is located 600-feet downstream of MH 2402 and the overflow discharged into Towson Run.

Figure 2-1 below shows the manholes containing SSOs 31A, 113 and 120.

Figure 2-1

SSO 31A (MH 6956) SSO 113 (MH 793) SSO 120 (MH 2402A)

2.2 Elimination Plan and Implementation

Baltimore County has implemented remedial measures to eliminate these SSOs. The following is an overview of the remedial measures including the elimination plans that have been implemented for SSO 31A, SSO 113 and SSO 120.

SSO 31A

Flow monitoring of SSO 31A began on February 12, 2004. No overflows were recorded since the overflow monitoring device was installed. The County's elimination plan for the Rider Avenue non-pumping station SSO 31A, consisted of sealing the 18-inch diameter overflow pipe. SSO 31A was sealed on May 11, 2007. Post elimination flow monitoring of the overflow was conducted in accordance with Section V.7.C.v of the CD and there has been no evidence of SSO activity since February of 2004. No additional field work was performed at this location.

SSO 113

Flow monitoring associated with SSO 113 began on February 12, 2004. Since the flow monitoring program began, thirteen (13) recorded overflow events have occurred. The County's elimination plan for the Marnat Road non-pumping station SSO 113, consists of implementing a rehabilitation program in the SSO 113 meter basin for the sanitary sewers and manhole structures that were identified as exhibiting defects that could contribute to wet-weather sources of peak flow. In support of the SSO elimination efforts, the County inspected 14,713 linear feet (LF) of 8-inch and 300 LF of 10-inch diameter sanitary sewer in the vicinity of SSO 113. In November 2008, RK&K completed a comprehensive review of this information and prepared rehabilitation documents to address the system deficiencies identified in an attempt to eliminate wet-weather sources contributing to peak flows to SSO 113. As part of Contract 09124 SXO, forty-four (44) sanitary manholes were rehabilitated; approximately 7,149 LF of sanitary collector sewer was lined and seventy-two (72) sewer house connection seals were installed to address sewer connection defects. Rehabilitation of the SSA was completed in June 2012. Post rehabilitation flow monitoring of SSO 113 is being conducted in accordance with Section V.7.C.v of the CD and shows that SSO 113 still remains active during wet-weather events. The current SSO elimination date is September 20, 2016. The County continues to coordinate with the City of Baltimore regarding the capacity improvements of the sewers located downstream of the SSO in the City, and is evaluating options for design and construction of a County relief sewer.

SSO 120

Flow monitoring for SSO 120 also began on February 12, 2004. During the flow monitoring program, six (6) overflows occurred. The County's elimination plan for the Charles Street Avenue non-pumping station SSO 120 consisted of placing a 6-inch diameter siphon, located immediately downstream of the SSO, on a "special" cleaning and maintenance list. This requires that the siphon be cleaned a minimum of once every six (6) months. This siphon was identified during inspections as having maintenance issues and creating surcharge conditions in

the sewer and activating SSO 120. In addition, in December 2009, Baltimore County replaced a collapsed segment of collector sewer that was located downstream of SSO 120 (MH 901893 to MH 16595). This was also believed to be creating a restriction in the conveyance system. Completion of this work assisted in reducing flow levels; however, it did not eliminate activation of the SSO. In June 2010, Baltimore County bid Contract 10034 SX0 – Charles Street Avenue, SSO No. 120 – Sanitary Sewer Rehabilitation to address wet-weather sources of peak flow contribution that resulted in the continued activation of SSO 120. As part of Contract 10034 SXO, forty-eight (48) manholes were rehabilitated, seven (7) point repairs were completed, approximately 13,826 LF of sanitary collector sewer was rehabilitated using CIPP lining and 323 sewer house connections were air tested and chemically sealed to address house connection defects. The work was substantially complete in July of 2011. SSO 120 was sealed on September 20, 2011 and the County continues to monitor flow in the sewer in accordance with Section V.7.C.v of the CD to evaluate the collection system response to wet-weather flow and to evaluate the impacts of elimination of SSO 120 on the collection system.

2.3 Post–Construction Flow Monitoring

Per Section V.7.C.v of the CD, the County is required to monitor and evaluate impacts of the elimination of an SSO structure for 18 months following elimination. The County eliminated SSO 31A in May of 2007 following no recorded overflow activity since metering activities began at the overflow manhole in February 12, 2004. The County continues to monitor SSO 113, which remains active with several wet-weather discharges occurring in 2012. The County also continues to monitor SSO 120 to evaluate the impacts of elimination of SSO 120 on the collection system.

2.4 Evaluation of Construction Projects

At the time of this report, sanitary sewer and manhole rehabilitation in SSA 45-10-22-01 (SSO 113 – Marnat Road) and SSA 45-58-06-02 (SSO 120 - Charles Street Avenue) have been completed and the rehabilitation work and the SSO pipes removed and incorporated into the Long-Term Capacity/Peak Flow Management Evaluation (LTC/PFME) modeling simulations. The modeling simulations incorporated the reduction of RDII volume, RDII peak flow and base infiltration (BI). Also, the friction coefficient of the rehabilitated sewers has been revised to match that of a smoother pipe surface (reduced Manning's "n" value) that is a result of the CIPP lining installed in these sewers.

This methodology was only applied to the modeling simulations to verify the effectiveness of the rehabilitation work under future flow conditions. In the baseline flow conditions (the conditions during flow monitoring), the non-pumping station SSOs were modeled as open without rehabilitation in the SSA where the SSOs are located. The following is a summary of the evaluation of the SSOs in the Jones Falls Sewershed:

SSO 31A

Baltimore County eliminated SSO 31A in May of 2007 following no evidence of SSO activity in more than three (3) years. Further evaluation of the SSO was not required.

SSO 113

SSO 113 continues to activate following a comprehensive rehabilitation effort completed in early 2012 to remove wet-weather sources of Inflow and Infiltration (I/I) from the collection system. Based on post-rehabilitation flow metering results, I/I was reduced in the collection system in this SSA as a result of the rehabilitation; however, downstream restrictions in the City sewers continue to impact the collection system associated with SSO 113. RK&K provided analysis of the overflows at SSO 113. The analysis included comparison of the monitored flow data for the September 7, 2011 storm (peak intensity of 2.88 in/hr) to the model predicted post-rehabilitation results for the SSO 113 area. Using the model, it was determined that if the SSO 113 overflow pipe was eliminated, the collection system would be able to store and convey the additional flow generated by the September 7, 2011 storm; however, the Hydraulic Grade Line (HGL) would be elevated above the SSO and could potentially cause sewer backups in the basements of nearby homes located along the sewer's alignment. An alternative to prevent elevation of the HGL would be to add capacity to the collection system by constructing relief sewers or increasing the size of the existing sewers that are located in the City's collection system downstream of SSO 113. The following manhole to manhole sewer segments would require additional capacity:

- MH 793 – MH TCM85 (Baltimore City Sewer)
- MH TCM85 – MH SO4II2004MH (Baltimore City Sewer)
- MH S04II2004MH – MH S04II2008MH (Baltimore City Sewer)

These existing sewers have a diameter of 8-inches and replacement of the sewers with approximately 596 LF of new 12-inch diameter sewer is expected to add sufficient capacity to reduce the HGL compared to the existing system, allowing the SSO to be eliminated.

The County is also contemplating a diversion of flow away from the SSO. The County believes that because of the basement elevations of the properties located nearest to the SSO, a diversion of the upstream flow away from the SSO manhole may create a more effective solution with less system maintenance requirements. A time of performance extension was granted by the regulators for elimination of SSO 113. The revised elimination date for removal of the SSO is September 20, 2016.

SSO 120

Baltimore County closed SSO 120 on September 20, 2011, following implementation of a specialized sewer cleaning program and rehabilitation activities completed within the SSA. The County continues to monitor this SSO in accordance with Section V.7.C.v of the CD to verify

that the flow is not surcharging during wet-weather events. The hydraulic model simulations of the 10-year/6-hour synthetic design storm indicate that the HGL does not exceed the top of the sewer and the manholes do not surcharge.

Model simulations predict that the expected discharge, resulting from the implementation of the corrective actions completed for SSO 113 and SSO 120, will be reduced and the corrective actions have been effective in reducing overflows by reducing wet-weather sources of I/I from the collection system.

Section 3

Infiltration and Inflow Analysis

3.0 Infiltration and Inflow Analysis (P.9.C.i)

Paragraph 9 of the CD requires that the County perform rainfall and flow monitoring with the purpose of: (i) quantifying inflow and infiltration, (ii) evaluating the impact of inflow and infiltration on the collection system, and (iii) completing a Long-Term Capacity/Peak Flow Management Evaluation, including development of a hydraulic model.

Meter basins that were noted as exhibiting excessive I/I, were included in County Sanitary Sewer Evaluation Survey (SSES) investigations.

3.1 Overall Description

To characterize flows within the sewage collection system and correlate rainfall to inflow and infiltration (I/I), the County completed a flow monitoring program within the Jones Falls Sewershed. The monitoring program consisted of the installation of twenty-six (26) flow meters within the sewershed that were installed from February 1, 2008 through November 30, 2008. These flow meters are referred to as the County Meters. In addition to the flow meters installed by the County, data from six (6) flow meters installed as part of the City of Baltimore's Jones Falls flow monitoring program were also utilized. These flow meters were located along or near the City-County line and are referred to as the Boundary Meters. The metering period for these six (6) flow meters was from May 9, 2006 through May 18, 2007. RK&K utilized rainfall data from six (6) rain gauges located in the vicinity of the Jones Falls Sewershed. **Table 3-1.1** provides a list of all Jones Falls Sewer Service Areas (SSA's), their assigned meter basins, and the associated flow monitoring sites.

3.2 Rain Gauge Monitoring Program (CD Ref. P9.B.i, P10.C.x)

Rainfall within the County was measured using a network of forty-five (45) separate rain gauge stations with a minimum coverage of one (1) rain gauge station per ten (10) square miles as well as data compiled by Doppler radar for the project area, as required by the CD, utilizing a minimum resolution of one (1) pixel per four (4) square kilometers. Calamar software was used to create calibrated radar rainfall images for storm events that exceeded 0.5-inches. Rain gauges BC40RG, BC41RG, BC42RG, BC49RG, GF11RG and JF14RG were used for the I/I analysis of the data gathered within the flow meter basins in the Jones Falls collection system. **Map 3-1** depicts the locations of the rain gauges.

The rain gauges were installed as part of the County's overall rainfall monitoring program. Each rain gauge records 0.01-inch increments of precipitation at 5-minute intervals. For the purposes of analysis, a qualifying rainfall event was defined as a minimum of 0.50-inches of rain occurring without a break of more than 300 minutes.

There were a total of twenty (20) storm events exceeding 0.5-inches that occurred during the flow monitoring period for the County Meters. The dates of these storm events and the average rainfall measured at the rain gauge stations are listed in **Table 3-2.1**. The storm of September 27, 2008 was the most significant storm event that occurred during the flow monitoring period, measuring over 6-inches of rain at one (1) of the rain gauge stations and averaging 4.62 inches. There were also three (3) other storm events within the monitoring period that measured an average of at least 2-inches of rainfall.

There were twenty-seven (27) storm events exceeding 0.5-inches that occurred during the metering period of the Boundary Meters. The dates of these storm events and the average rainfall measured at the rain gauge stations are listed in **Table 3-2.2**. The storm of June 25, 2006 resulted in the highest rainfall, with a rainfall amount of 5.24-inches. There were also four (4) additional storm events that generated rainfall amounts between 2- and 3-inches.

3.3 Flow Monitoring Program (CD Ref. P9.B.ii, P10.C.X)

The flow monitoring program consisted of installing twenty-six (26) flow meters within the County's collection system. The flow meters measured both depth and velocity, from which, flow was calculated at consistent 15-minute intervals.

Data Quality Control/Quality Assurance is discussed in the Inflow and Infiltration Evaluation Report, found in **Appendix B** of this report.

Figure 3-1 depicts a schematic of the Jones Falls Sewershed flow monitoring plan and **Table 3-3.1** provides a list of the flow monitors, including the location and installation period. See **Appendix A** for site reports of the flow meter locations.

3.4 Weather Analysis (CD Ref. P9.C.ii)

Dry-weather flow (DWF) is defined as flow in a sanitary sewer during periods of dry-weather in which the sanitary sewer is under minimum influence of I/I. DWF consists of base sanitary flow

(BSF) and base infiltration (BI). BSF is comprised of residential, commercial, and institutional wastewater discharges as well as wastewater discharges from industrial properties. BI is flow that enters the sanitary sewer system through pipe joints, sewer pipe defects and defective manhole walls, benches, and pipe seals. Sources of data used in determining the dry-weather flows included water consumption records; the rainfall/flow monitoring data; population estimates; estimates of the collection system tributary to each flow monitor; and estimates of the sewershed area tributary to each flow monitor.

Using Sliicer, an analysis tool developed by ADS® Environmental Services, Inc., RK&K established parameters to generate flow components for analysis of I/I in the Jones Falls Sewershed's collection system. The flow analyses obtained using the Sliicer.com™ software provided estimates of the components of the DWF, which consists of the BSF and the BI rate. Typically, minimum sewer flows occur during the summer and during the night, between the hours of 2 a.m. and 4 a.m. During these hours, it is assumed that most of the sewer flow is due to BI. The Stevens/Schutzbach equation was used to estimate BI. The Stevens-Schutzbach Method is an iterative regression technique used to fit the Manning Equation to flow monitoring data. The Stevens/Schutzbach equation used to estimate BI is as follows:

*BI = (0.4*Min. Daily Flow)/(1-0.6(Min. Daily Flow/Average Daily Flow)^(Min. Daily Flow^0.7)).*

The BSF was then estimated as the DWF rate less the BI estimate. Dry days were defined according to the following criteria:

Number of Prior Days	Cumulative Antecedent Rain (Inches)
1	0.1
3	0.4
5	1.0

For meter basins that exhibited negative or zero net BI, the BI was calculated as 90 percent of the minimum flow. Negative BI could be due to a difference in dry-weather days selected between cumulative flow meters and a possible blockage in the collection system. The following flow meters had the BI computed as 90 percent of the minimum flow: BC07; BC11; BC18; BC21; BC22; and TSJF01. **Table 3-4.1** summarizes the BI and average DWF calculated during the dry-weather analysis for each meter basin.

* For Meter Basins that exhibited negative or zero net BI, the BI was calculated as 90 percent of the minimum flow.

3.4.1 Infiltration Analysis

The BI was normalized based on gallons per day per inch-diameter mile (gpd/in/d/m) to compare the meter basins and to identify those with severe infiltration. The inch-diameter miles of a meter basin are determined by multiplying the length of sewer pipes in miles. The criteria to determine if a meter basin exhibited excessive BI comes from the EPA handbook Facilities Planning, 1982. This criteria is defined below:

CRITERIA FOR NORMALIZED BI	
Size of Basin(LF)	Non-Excessive Rate (gpd/in/d/m)
> 100,000	< 3,000
10,000-100,000	< 6,000
< 10,000	< 10,000

For summer weekdays, there are two (2) meter basins which exceed the criteria for normalized BI: Meter Basins BC03 and BC14. For winter weekdays, Meter Basins BC03, BC09 and BC14 exceed the BI criteria. None of the Boundary Meters exceed the criteria for either summer or winter. The dry-weather results indicate that the meter basin draining to Meter BC03 has higher than expected rates of wastewater production and BI during the summer season. This is likely due to the valve controlling the flow from the Texas Pumping Station was probably not completely closed during most of the flow monitoring. This valve is normally in the closed position and flow from the Texas Pumping Station travels to the Longquarter Pumping Station outside of the Jones Falls Sewershed.

Occasionally the County will open the by-pass valve, which allows the flow from the Texas Pumping Station to enter into the Jones Falls Sewershed upstream of Flow Meter BC03. From the metering data, it appears that flow was passing through this valve during the monitoring period prior to September of 2008. Beginning in early September 2008, the flow rates measured at BC03 drop considerably and BI is not considered high for the winter months. Meter Basin BC14 shows excessive BI for both summer and winter.

Map 5 contained in the Inflow and Infiltration Evaluation Report depicts the severity of the BI for the summer season, normalized by gpd/in/m. **Map 6** contained in the Inflow and Infiltration Evaluation Report depicts the BI for the winter season. The infiltration rate was divided into three (3) different ranges. As shown, the BI doesn't change drastically between the two seasons and the BI in the west side of the sewershed is relatively low. Refer to the Inflow and Infiltration Evaluation Report for the Jones Falls Sewershed, which is contained in **Appendix B** of this report, for a more detailed description of the infiltration analysis and the referenced maps.

3.5 Wet-Weather Analysis (CD Ref. P9.C.ii)

Wet-weather analysis was used to quantify the rainfall-dependent infiltration and inflow (RDII) in the Jones Falls Sewershed. Each qualified storm from **Tables 3-2.1** and **3-2.2** were analyzed for each flow meter using the Sliicer.com software. For each storm, a pre-composition period (typically 24-hours prior to the storm event) was established to adjust the dry-day hydrograph to match the actual hydrograph immediately prior to the start of the storm. This either raises or lowers the dry-day hydrograph so that the calculated RDII is a result of only the storm event. To estimate RDII, the Sliicer program overlays the typical dry-day hydrograph on the storm's hydrograph. The difference between the two hydrographs represents the RDII.

3.5.1 Inflow Analysis

The RDII was normalized by linear feet (LF) of pipe and inches of rainfall. For RDII, a criterion of 10 gallons per linear foot of pipe, per inch of rainfall (gal/lf/in of rainfall) was selected for identifying meter basins exhibiting excessive rates of RDII. The County Meter basins with a normalized RDII rate greater than 10 gal/lf/in of rainfall are Meter Basins BC03, BC07, BC09, BC16, BC18 and TSJF01. The Boundary Meter basins with a normalized RDII rate greater than 10 gal/lf/in of rainfall are Meter Basins JF0320S, JFWR09 and JFWR29. The RDII severity for the Jones Falls Sewershed is depicted in **Map 7**, which is contained in the Inflow and Infiltration Evaluation Report in **Appendix B** of this report.

Although Meter Basins BC03 and BC07 show a normalized RDII rate of greater than 10 gal/lf/in of rainfall, it is believed that the results for these relatively small meter basins are highly influenced by the flow that was by-passed from the Texas Pumping Station, and therefore the consideration as basins exhibiting excessive I/I is questionable. To be conservative, both of these meter basins are shown as having excessive RDII in **Map 7**. Furthermore, although BC09 shows a normalized RDII rate less than 10 gal/lf/in, the normalized RDII (8.44 gal/lf/in) is close to the criteria threshold, and because BC09 is located on a main interceptor sewer comprising a significant area (approximately 539 acres), BC09 is a meter basin considered as exhibiting excessive I/I. However, in **Map 7**, BC09 will be included in the "5–10 gal/lf/in of rain" category and not in the ">10 gal/lf/in of rain" category due to the normalized RDII being 8.44 gal/lf/in.

The RDII was also analyzed using capture coefficient. The criteria for this metric are derived from the Interim Inflow and Infiltration Report, West and Cadden, 1994. This report indicates that meter basins with a capture coefficient of 10 percent or greater are considered to exhibit excessive RDII, meter basins between 5 and 10 percent possibly exhibit excessive RDII, and meter basins with less than 5 percent are considered as not exhibiting excessive RDII. Using this metric, the only meter basins with a capture coefficient greater than 10 percent are BC03 and BC07. Based on the preceding discussion, Meter Basins BC03, BC07, BC09, BC16, BC18, TSJF01, JF0320S, JFWR09 and JFWR29 are considered to exhibit excessive RDII. Results of the wet-weather analysis are summarized in **Table 3-5.1**. Refer to **Appendix B,** Inflow and Infiltration Evaluation Report for the Jones Falls Sewershed, for a more detailed discussion of the inflow analysis.

Table 3-5.1

The scattergraphs developed for each meter basin show that the flow, in most meter basins, is contained within 50 percent of the pipe's diameter. Nine (9) of the twenty-five (25) County Meters experienced surcharging at some period during the flow monitoring. Of the nine (9) flow monitoring sites, five (5) experienced surcharging on more than one occasion. The nine (9) metering sites that experienced surcharging are: BC02; BC04; BC05; BC06; BC07; BC08; BC09; BC11 and BC12. Surcharging occurred when flow was by-passed from the Texas Pumping Station and during storm events. The storm events that caused surcharging were the February 1, 2008, July 23, 2008, and the September 27, 2008 storms. Flow by-passing from the Texas Pumping Station that caused surcharging occurred on the following dates: April 9, 2008; May 7, 2008; July 31, 2008; and August 26, 2008. Although none of the flow monitoring sites recorded overflows, non-pumping station SSO 120, located along Charles Street Avenue, overflowed during the September 27, 2008 storm.

3.6 Infiltration/Inflow Evaluation (CD Ref. P9.C.ii)

For dry-weather flow, the criteria for identifying meter basins with excessive BI rates were based upon gallons per day per inch-diameter mile (gpd/in/d/m) using the table from the EPA Handbook - Facilities Planning, 1982, which is shown in Section 3.4.1. Using the established criteria, the meter basins that exhibit excessive BI rates are BC03, BC09 and BC14.

For wet-weather flow, a criterion of 10 gallons/linear foot per inch of rain (gal/lf/in) was selected for identifying meter basins exhibiting excessive normalized rates of RDII. A capture coefficient criterion of 10 percent was also used. Using this criteria, meter basins that exhibit excessive RDII are BC03, BC07, BC09, BC16, BC18, TSJF01, JF0320S, JFWR09 and JFWR29.

Meter basins that exhibited excessive I/I were investigated further by sanitary sewer evaluation surveys (SSES).

For the complete Inflow and Infiltration Evaluation Report, see **Appendix B** of this report.

END OF SECTION

Section 4

Collection System Inspection

4.0 Collection System Inspection (CD Ref. P8 & P10.C.ii)

4.1 Overview

Baltimore County's portion of the Jones Falls Sewershed measures approximately 13,440 acres in size and contains over 1,124,000 linear feet (LF) of gravity sewer pipe ranging in size from 6-inches to 48-inches in diameter. The sewershed also contains approximately 6,200 manhole structures; 19,000 LF of force main and pressure sewer, and four (4) pumping stations. The sewershed's collection system conveys wastewater from Baltimore County to the City of Baltimore's Jones Falls Sewershed at seven (7) separate locations before being treated at the City of Baltimore's Back River Wastewater Treatment Plant.

In accordance with Paragraph 8 of the Consent Decree (CD) and the approved inspection plan, the sanitary collection system piping, 8-inches in diameter and larger and associated manhole structures were identified for inspection in the Jones Falls Sewershed. From March 2006 through September 2012, sanitary sewers and manholes in 177 Sewershed Service Areas (SSA's) in thirty-one (31) flow meter basins were inspected. All inspections were completed in accordance with Baltimore County's standard closed-circuit television (CCTV) and manhole inspection protocols.

Review of the data collected as part of this inspection effort was completed in accordance with the criteria set forth in Paragraph 8 of the CD. Reviews included all Paragraph 8.C.ii, 8.C.ia, and 8.C.iv sanitary sewers and manholes that had condition rankings of either 4 or 5, and all Paragraph 8C.ii, 8.C.ia, 8.C.iv and 15.B.ib sanitary sewers and manholes that were located within SSA's that were identified by analysis as exhibiting excessive inflow and infiltration (I/I). The inspection data collected by Baltimore County's Bureau of Utilities was accessed for review utilizing Baltimore County's Consent Decree Web Portal. This data included CCTV inspections of sanitary collection system piping 8-inches in diameter and larger, manhole inspection data, including inspection photographs and other Sanitary Sewer Evaluation Survey (SSES) type data including night-time flow isolation testing, and smoke and dyed-water testing information. Review of this data, in concert with the modeling and Inflow and Infiltration (I/I) evaluation information, will allow development of a comprehensive rehabilitation and corrective action plan to address collection system defects and deficiencies that contribute to model predicted collection system Sanitary Sewer Overflows (SSO) in the Jones Falls Sewershed.

The collection system and SSES investigation work that was reviewed in accordance with Paragraph 8 of the CD included:

- 715 manhole inspections
- 251,000 LF of CCTV sewer inspections
- Four (4) pumping stations inspections
- 3,176 LF of force main inspections
- 132,008 LF of smoke testing
- 121 night-time flow isolation tests in 18 SSA's
- 66 scheduled dyed-water tests to be completed in 21 SSA's

4.2 Manhole Inspections

Manhole inspection characterizes the condition and connectivity of a sanitary collection system. Manholes were inspected as required by Paragraph 8 of the CD. The manhole inspection data reviewed typically served multiple purposes, which included characterizing the general condition of the structure, identifying collection system connectivity, assisted in defining the general condition of the sewer segments that were connected to the structure, provided defect observation data required for condition assessment, identified potential sources of I/I to the collection system, and allowed development of subsequent repair recommendations.

Manhole inspections were completed by Baltimore County's Bureau of Utilities and recorded on standard manhole inspection forms in accordance with the County's standard manhole inspection protocols. To avoid manned-entry of the manholes for inspection and possible safety risks, the inspections were completed using specialized pole mounted manhole inspection cameras.

715 manhole inspections were reviewed in accordance with the CD requirements; however, three (3) of manholes included in this review were not assigned a rating by the original inspection crews. The inspection data reviewed was contained on the County's Consent Decree Web Portal and included inspection forms and condition photographs taken during the inspections. Each manhole was defined by a specific County manhole ID, SSA location and the CD paragraph reference. The inspection forms also indicated the date when the inspection was completed and the manhole's structural condition rating.

Map 4-1 – Sewer and Manhole Inspections Completed - shows the collection system manholes that were inspected and reviewed in accordance with the priority identification scheme described in Section 6 of this report.

Table 4-2.1 – Manhole Defect Summary Table provides an overview of the common defects that were observed in the manholes that were reviewed.

Map 4-1
Sewer and Manhole Inspections Completed

Table 4-2.2 – Summary of Manhole Defects by Manhole provided in **Appendix E** of this report identifies all manholes contained in the Jones Falls Sewershed by meter basin and SSA, and identifies the specific defects that were contained in each manhole reviewed and if corrective action is required.

4.3 Closed Circuit Television (CCTV) Inspections (CD Ref. P10.C.ii)

CCTV inspection is a process of internally inspecting sewers in the collection system to assess the condition of the piping and identify conditions that require action. Baltimore County's Bureau of Utilities conducted CCTV inspections of all sewers that were required to be inspected under Paragraph 8.ci or Paragraph 8.cii of the CD. In addition, sewers in meter basins that were located within SSA's that were identified by analysis as exhibiting excessive I/I and/or model predicted SSOs were also inspected and included in the review.

The CCTV inspection data reviewed served multiple purposes, which included characterizing the general condition and maintenance requirements of the sewers, identifying system connectivity, identifying potential sources of I/I to the collection system, and allowing development of subsequent repair and/or maintenance recommendations.

The collection system inspections were completed in accordance with the National Association of Sewer Service Companies (NASSCO) utilizing the Pipeline Assessment Certification Program (PACP) coding requirements. Where field conditions precluded the use of standard CCTV inspection equipment, specialized equipment or heavy cleaning was utilized to complete the work. Approximately 46,977 LF of sewers inspected required heavy cleaning to remove roots, grease and/or other heavy debris that initially precluded the inspection of these sewers.

CCTV inspections were completed in thirty-one (31) of the thirty-two (32) flow meter basins within the Jones Falls Sewershed. A total of 251,000 linear feet (LF) of CCTV inspection was reviewed by NASSCO PACP certified technicians using inspection data contained on the County's Web Portal. The CCTV inspection data archived on the portal was cataloged by SSA and manhole to manhole sewer segment number for ease of access. The portal also provided the status of the pipe segments (i.e. active or inactive), the utility owner (i.e. public or private), type of sewer (i.e. collector, force main, etc.), pipe size, length, date of sewer installation, CD Paragraph reference number and any pertinent repair or maintenance history.

Map 4-1 – Sewer and Manhole Inspections Completed - shows the collection system sanitary sewers that were inspected and reviewed in accordance with the priority identification scheme described in Section 6 of this report.

Table 4-3.1 – **Summary of CCTV Inspections** contained in **Appendix C** of this report provides an overview of the CCTV inspection reviews performed in each SSA of the Jones Falls Sewershed. The Table identifies the SSA and flow meter basin where the sewer is located, the sewer segments CD Paragraph reference number, identification of sewers that are located in areas identified by evaluation as high I/I SSA's, the total length of the sewer as

contained in the County's GIS, and the length of sewer that was actually inspected and reviewed.

Table 4-3.2 – Sewer Defect Summary Table categorizes the defects recorded during the CCTV inspections and identified during subsequent review of the data. **Table 4-3.3 – Summary of Sewer Defect PACP Codes** contained in **Appendix D** of this report details each specific defect type, whether the defect is classified as a constructional, structural or operation and maintenance related, PACP inspection codes recorded, a brief description of the defect, the number of defects that occurred and the number of affected sewer segments.

Table 4-3.4 – Summary of Sewer Defects by Sewer Segment contained in **Appendix E** of this report identifies all sewer segments contained in the Jones Falls Sewershed by meter basin and SSA, and details each specific defect that was contained in the sewer segment reviewed and if corrective action is required.

Table 4-3.2
Jones Falls SRRR: Collection System Investigation
SEWER DEFECT SUMMARY TABLE

Defect Type	Quantity of Defects	Percent
Break-in Tap/Connections	699	5.2%
Broken Pipe	398	3.0%
Collapsed Pipe	3	0.0%
Cracks in Pipe	1,109	8.3%
Defective Joints	2,645	19.8%
Deformed Pipe	17	0.1%
Deposits	103	0.8%
Pipe Fractures	1,424	10.7%
Grease	2,064	15.5%
Hole in Pipe	167	1.3%
Infiltration	503	3.8%
Missing Wall	24	0.2%
Roots	612	4.6%
Surface Deterioration	3,559	26.7%

Defects were considered to be structural deficiencies that existed in the collection system manholes and sewers, which either, had the potential to contribute I/I to the collection system, cause an SSO, or could jeopardize the continuity or conveyance of flow through the collection system.

4.4 Smoke Testing (CD Ref. P10.C.ii)

Smoke tests were completed as part of the SSES work in forty-eight (48) of the SSA's in the Jones Falls Sewershed and the results from these tests recorded in accordance

with the County's standard smoke testing protocols. 132,008 LF of the smoke testing was completed within the sewershed and the results contained on the County's web portal for review. The results of these reviews are outlined in **Table 4-4.1 – Smoke Testing Critical Defect Summary**. The locations selected for smoke testing were based on the I/I evaluation, which is described in Section 3 of the SRRR Plan.

Smoke testing observations that were identified at manhole covers and clean-out locations were generally considered insignificant contributors of I/I to the collection system. These sources are not indicative of significant sources of inflow to the collection system that smoke testing seeks to identify. For example, if smoke is emitted from a house connection lateral's clean-out that has a missing or damaged cover, it is typically not indicative of a significant inflow source to the collection system, unless the clean-out is located in a low lying area and subject to significant ponding or run-off during a wet-weather event. Smoke that originates through pick holes in a manhole cover were also not considered significant contributors of I/I to the collections system.

Smoke testing observations that were identified at illicit down spout and drain connections; storm drain inlets or from mainline sewer defects were considered significant and likely sources of I/I to the collection system. Defects identified through smoke testing were either forwarded to the County's plumbing inspection division for correction or recommended for additional confirmatory testing utilizing dyed-water.

Table 4-4.1 - **Smoke Testing Critical Defect Summary Table** summarizes the defects that were identified during the review of the smoke testing data.

Table 4-4.1
Jones Falls SRRR: Collection System Investigation
SMOKE TESTING CRITICAL DEFECT SUMMARY TABLE

Source Type	Quantity of Defects	Percent

Foundation Drain	2	5%
Mainline Sewer	2	5%
Verizon Box Smoking	1	2%

4.5 Dyed-Water Testing

Potential defects that were identified during the smoke testing or other field inspections were put on a list for confirmatory dyed-water testing. The County is currently completing dyed-water testing at sixty-six (66) separate locations throughout the Jones Falls Sewershed. These

tests will be used to better isolate and identify collection system defects and sources of I/I. All dyed-water tests are being completed in accordance with the County's standard testing protocols and the results recorded and forwarded to the County's Bureau of Utilities for corrective action.

Table 4-5.1 – Dyed-Water Testing Summary Table summarizes the defects that were identified during the review of the smoke testing data and scheduled for dyed-water testing. **Appendix F** of this report contains the complete listing of locations scheduled for dyed-water testing.

Mainline Sewer	5	7%
Storm Drain Inlet	3	4%
Unknown	1	1%

4.6 Night-Time Flow Isolation Testing

Night-time Flow isolation testing was performed by Baltimore County in eighteen (18) SSA's within the Jones Falls Sewershed. Night-time flow isolation was used to identify and measure possible Base Infiltration (BI) that exists in the sewer segments tested and identify areas where additional SSES inspection work should be completed. The objective of the testing is to isolate specific sewer segments and measure flow that occurs during early morning hours, typically between midnight and 5:00 a.m. Flow in the isolated sewer segment should be minimal at that time and observed flow is typically found to be infiltration in the sewer. **Table 4-6.1 – Night-Time Flow Isolation Testing Summary Table** summarizes the meter basins that exhibited elevated levels of BI and were recommended for additional SSES investigations. **Appendix G** of this report contains a complete listing of the locations where night-time flow isolation tests were performed and the results of the testing.

Table 4-6.1
Jones Falls SRRR: Collection System Investigation
NIGHT-TIME FLOW ISOLATION TESTING SUMMARY TABLE

4.7 Force Main Condition Assessment

The Jones Falls Sewershed contains four (4) force mains. These include the 6-inch diameter ductile iron pipe (DIP) force main from the Buchanan Road Pumping Station, which was constructed in 1980 and is 1,076 linear feet (LF) in length; the 6-inch diameter Cast Iron (CI) force main from the Stanton Woods Pumping Station, which was constructed in 1974 and is 2,100 LF in length; the 6-inch diameter CI force main from the Templegate Pumping Station, which was constructed in 1975 and is 1,270 LF in length; and the 6-inch diameter CI force main from the Stevenson Pumping Station, which was constructed in 1970 and is 1,788 LF in length.

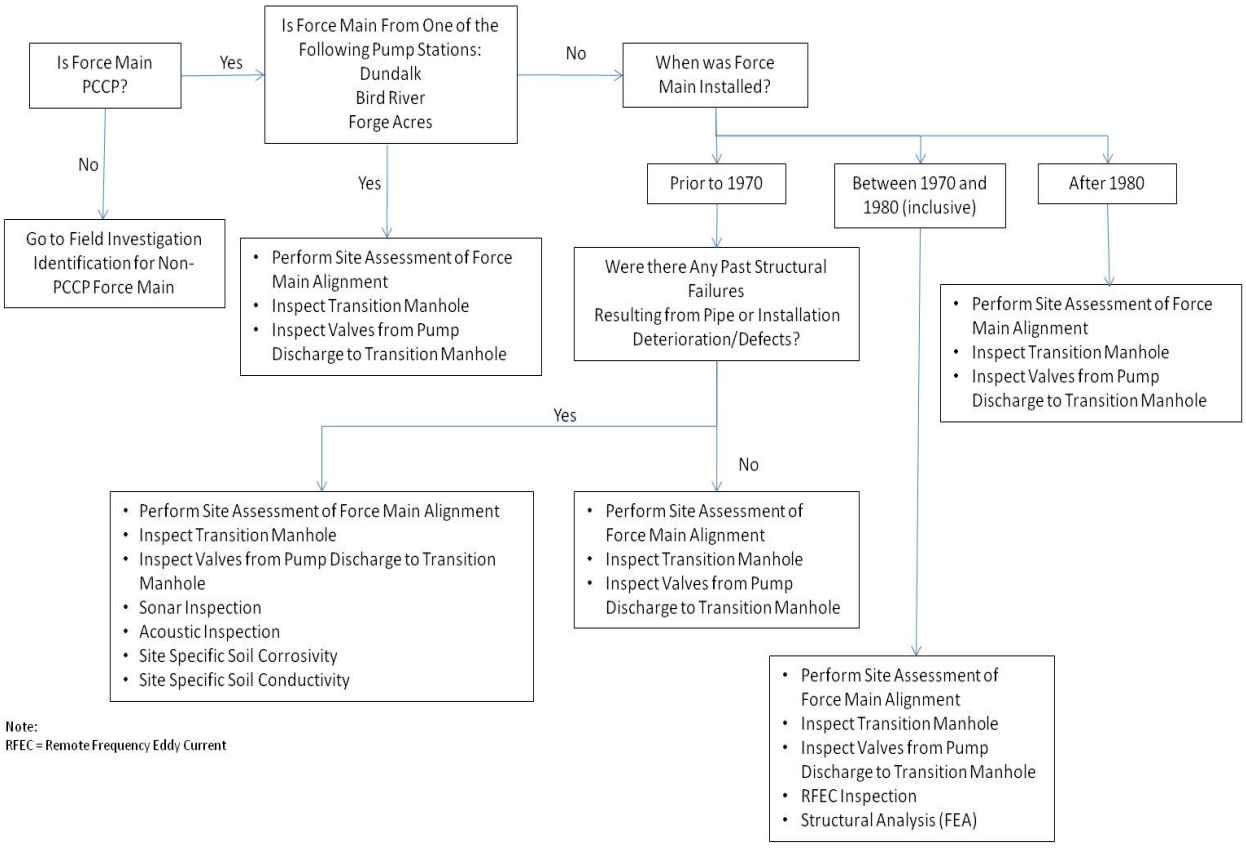
In accordance with Paragraph 8D.ii.of the CD, the County developed a standard process to determine the appropriate inspection/evaluation methodology to be used to adequately assess the condition of each force main in their collection system. The process was developed for two main pipe material categories: pre-stressed concrete cylinder pipe (PCCP) and non pre-stressed concrete cylinder pipe. A separate process was developed specifically for PCCP force mains due to the possibility of sudden and catastrophic structural failure that is typically associated with this type of pipe material. The review process is based upon the following risk assessment criteria:

1. Pipe Material
2. Age
3. Break History
4. Consequence of Failure
5. Current Available Technology

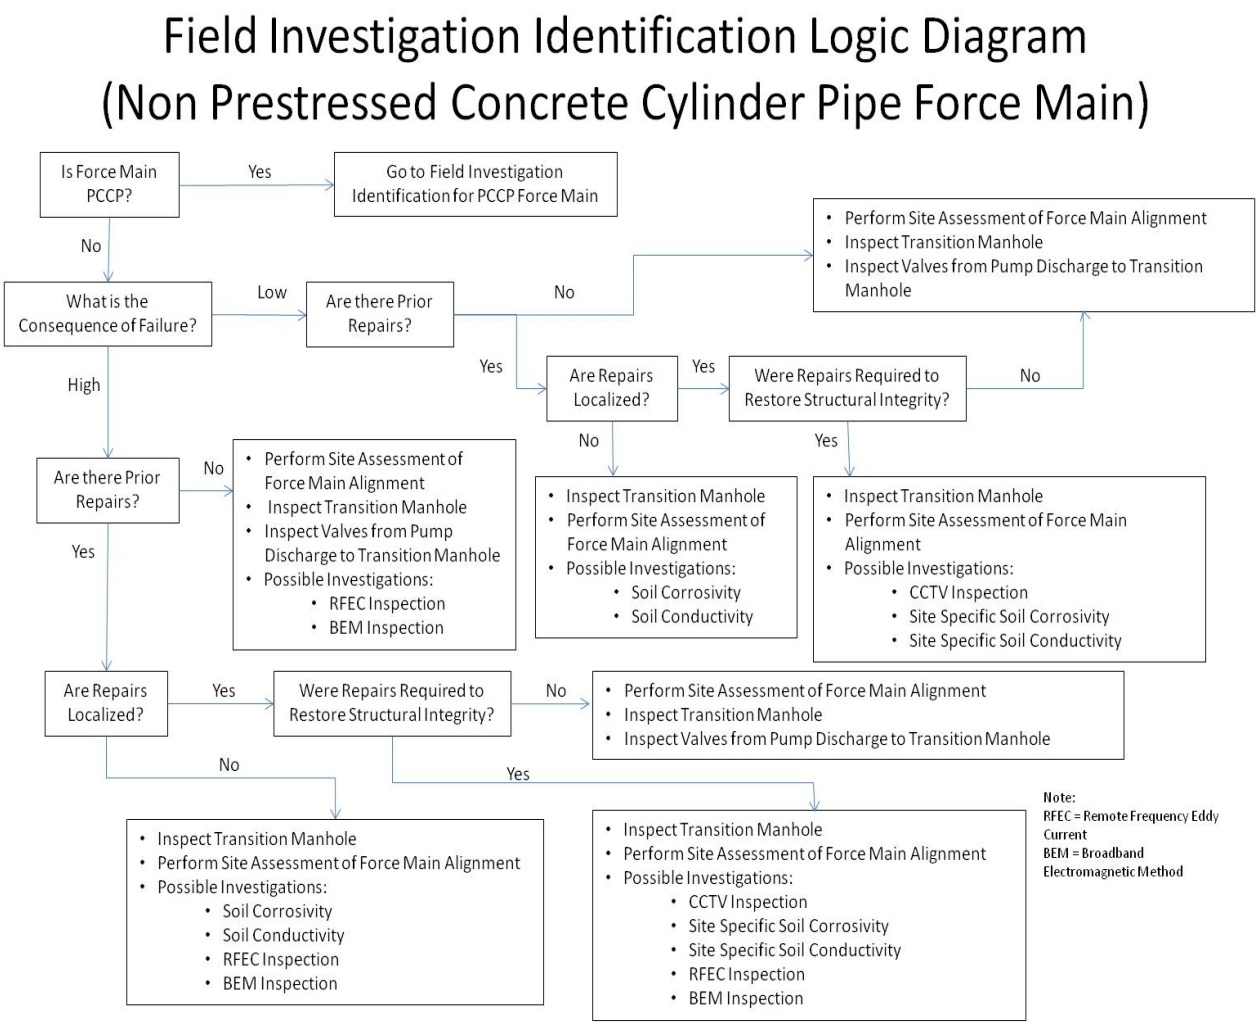
Equipment availability, supplemental information, existing site conditions and/or pumping station operating conditions may require an inspection method that differs somewhat from those identified by the County's standard process.

The two inspection identification/evaluation methodologies are summarized in the logic diagrams provided on the following pages. Since the force mains in the Jones Falls Sewershed are 6-inches in diameter and smaller and constructed of either CI or DIP, the process used for review was based on the non pre-stressed concrete cylinder pipe criteria.

Field Investigation Identification Logic Diagram (Prestressed Concrete Cylinder Pipe Force Main)



Note:
RFEC = Remote Frequency Eddy Current



Consequence of Failure

The consequence of force main failure is determined based on the following criteria:

1. Accessibility (i.e. surface features such as a stream or highway that would delay the repair of a broken force main)
2. Pipe Diameter (SSO volume from a broken force main is a function of pipe diameter)
3. Response time (i.e. the maximum time required to fill the pumping station wet well and surcharge the collection system without causing a sanitary sewer overflow or basement backup)

Each criterion is assigned a weighted value and a Relative Importance Factor as summarized in **Table 4-7.1 – Force Main Consequence of Failure Index Rating** to calculate the Consequence of Failure Index Rating.

Table 4-7.1
Force Main Consequence of Failure Index Rating

Criteria	Weighting	Normalized Weighting	Relative Importance Factor
Accessibility			
Accessible	0	0.00	2
Inaccessible	1	1.00	
Diameter			
≤ 6"	1	0.2	
7" to 11"	2	0.4	3
12" to 16"	3	0.6	
17" to 24"	4	0.8	
≥ 25"	5	1.00	
Response Time			
Response Time > Inspection Time	0	0.00	1
Retention Time < Inspection Time	1	1.00	

Force Main Inspections

Condition assessment investigations were performed for the Buchanan Road, Stanton Woods, Templegate and Stevenson Force Mains and associated transition manholes. These inspections consisted of the following activities:

1. Site assessment of the force main's alignment
2. Inspection of existing appurtenances
3. Inspection of the force main's transition manhole

Additionally the following information was reviewed:

1. Force main break history
2. Pumping station operating conditions (current and future)
3. Record drawings

The results of the force main investigations in the Jones Falls Sewershed can be found in the individual Force Main Condition Assessment Reports included in **Appendix H** of this report. A summary of these reports are provided below:

Buchanan Road Force Main: A survey of the 6-inch diameter DIP force main associated with this pumping station was conducted on April 11, 2011. Review of the information and investigation findings shows that this force main is in good structural and operational condition and there were no improvements recommended for continued use of the force main.

The force main's transition manhole inspection was performed on April 29, 2011. Based on the review of the inspection findings, the force main's transition manhole is in good structural condition.

Stanton Woods Force Main: A survey of the 6-inch diameter CI force main associated with this pumping station was conducted on April 11, 2011. Review of information and investigation findings shows that this force main is in good structural and operational condition and there were no improvements recommended for continued use of this force main.

The force main's transition manhole inspection was performed on April 29, 2011. Based on the review of the inspection findings, the force main's transition manhole is in good structural condition.

Templegate Force Main: A survey of the 6-inch diameter CI force main associated with this pumping station was conducted on April 11, 2011. Review of information and the investigation findings shows that this force main is in good structural and operational condition and there were no improvements recommended for continued use of this force main.

The force main's transition manhole inspection was performed on April 29, 2011. Based on a review of available information and investigation findings, the force main's transition manhole is in good structural and operational condition.

Stevenson Force Main: A survey of the 6-inch diameter DIP force main associated with this pumping station was conducted on April 11, 2011. Review of information and the investigation findings shows that this force main is in good structural and operational condition and there were no improvements recommended for the continued use of the force main.

The force main's transition manhole inspection was performed on April 29, 2011. Based on a review of available information and investigation findings, the force main's transition manhole is in good structural and operational condition.

4.8 Pumping Station Review and Assessment

The Jones Falls Sewershed collection pumping and transmission system contains four (4) pumping stations. These include the Buchanan Road Pumping Station, which is located at the terminus of Buchanan Road and designed to pump flows of 200 gallons per minute (GPM) under existing and ultimate capacity conditions; the Stanton Woods Pumping Station, which is located at the terminus of Topping Road and designed to pump 252 GPM under existing and ultimate capacity conditions; the Templegate Pumping Station, which is located at the terminus of E Court, between Breton Way and Woodvalley Drive and designed to pump 300 GPM under ultimate capacity conditions; and the Stevenson Pumping Station, which is located at the intersection of Keyser Road and Windsong Court and designed to pump 180 GPM under existing and ultimate capacity conditions.

Map 4-2 – Flow Meter Basins & Pumping Stations shows the location of the pumping stations within the Jones Falls Sewershed.

BALTIMORE COUNTY MARYLAND

Jones Falls Collection System Evaluation & Sewershed Plan

Map 4-2
FLOWMETER BASINS & PUMPING STATIONS

Baltimore County is currently undertaking, or has previously completed all of the measures set forth in Paragraph 13 of the CD. Baltimore County is in the process of ensuring that adequate backup power systems are installed and maintained for each of the pumping stations in accordance with Paragraph 13.C, installing a Supervisory Control and Data Acquisition (SCADA) system for remote monitoring of each of the pumping stations in accordance with Paragraph 13.D, and conducting inspections of the pumping stations in accordance with Paragraph 13.E of the CD.

Baltimore County has also completed an Engineering Evaluation and Condition Assessment (EE/CA) of all four (4) of the pumping stations in the Jones Falls Sewershed as required by Paragraph 13.F of the CD. The reports have been submitted under separate cover for review and approval in accordance with Paragraph 13.F.iii of the CD. The Stevenson Pumping Station was designated as a Tier 2 station in Appendix D of the CD. The County completely replaced this pumping station with a new station, which included backup power and a SCADA system. Construction was completed in 2011. The Buchanan Road, Stanton Woods and the Templegate Pumping Stations were designated as Tier 3 pumping stations. Improvements to these pumping stations to correct all Priority 1 and 2 ranked deficiencies, as defined in Paragraph 13.F.iv of the CD, and outlined in the EE/CA reports are intended to be completed in accordance with specific schedules as approved

Baltimore County has also completed a pumping station equipment inventory, transferred its pump maintenance record keeping system into an electronic information management system, and implemented a pumping station preventative maintenance program in accordance with Paragraphs 13.G-I of the CD. In addition, the County has ensured that an updated operation and maintenance manual is being maintained, at the Stevenson Pumping Station in accordance with Paragraph 13.J. of the CD.

Section 5

Collection, Pumping & Transmission System Modeling

5.0 Collection, Pumping and Transmission System Modeling (CD Ref. P.10.C.viii/ix)

5.1 Background

Paragraph 14A of the Consent Decree (CD) requires Baltimore County to develop and maintain a computerized collection, pumping and transmission system model for each sewershed to evaluate the impact of recommended corrective actions including I/I rehabilitation projects, proposed system modifications, upgrades and expansions to the transmission system's capacity and assess the capacity of and performance of the collection system during dry- and wet-weather. Furthermore, Paragraph 10 of the CD requires that the SRRR Plan present the results of the Long-Term Capacity/Peak Flow Management Evaluation (LTC/PFME) using the collection, pumping and transmission system model.

Paragraphs 10.C.viii and ix of the CD require the following be included in the SRRR Plan:

- Determine for each Sewershed the range of storm events as specified in Paragraph 9.C.ii(b) for which the collection system in its existing condition can convey peak flows without the occurrence of SSOs.
- Project for each Sewershed, the range of storm events as specified in Paragraph 9.C.ii(b) for which the collection system will be able to convey peak flows without the occurrence of SSOs. Such projection shall assume completion of the construction projects required by Paragraph 7 of the CD, and completion of the proposed rehabilitative or other corrective action projects recommended by the SRRR Plan required by Paragraph 10 of the CD.
- Identify all modeled collection system components and pumping stations that cause or contribute to flow restrictions or that have the potential to cause or contribute to overflows.

This section summarizes the development of the collection, pumping and transmission system model for the Jones Falls Sewershed, the calibration of this model, the hydraulic capacity analysis and the LTC/PFME.

5.2 Hydraulic Model Development

The collection, pumping and transmission system model of the Jones Falls Sewershed includes:

- All gravity sewers 10-inches in diameter and larger.
- All 8-inch diameter sewers included as necessary for system connectivity or to improve the accuracy of the model.
- All gravity sewers that have caused or contributed, or that are likely to cause or contribute, to capacity related SSOs.
- All manholes, junctions and sewer structures located along the modeled sewers.
- All gravity sewers that convey wastewater from one pumping station service area to another sewer service area.

- Two (2) weir structures.
- Two (2) non-pumping station SSOs.
- Four (4) existing pumping stations.
- The force mains that convey wastewater from the four (4) existing pumping stations.
- The gravity sewers that convey wastewater through the Texas by-pass valve into the Jones Falls Sewershed.

The developed model is capable of predicting the following:

- Rate of wastewater and temporal variation of rate of flow in the force mains and the major gravity sewers.
- Hydraulic pressure (psig) or hydraulic grade line (HGL) of wastewater at any point in force mains and the major gravity sewers.
- Flow capacity of each of the pumping stations in the collection system.
- Flow capacity of each pumping station with its back-up pump out-of-service.
- Peak flows to and/or from each pumping station during storm events of a magnitude of up to 20 years.
- Likelihood and location of SSOs within those portions of each sewershed modeled under high flow conditions, including pumping station service areas where the pumping station's back-up pump is out-of-service, and considering available wet-well capacity, existing functional off-line storage capacity, and normal in-line storage capacity.
- If adequate capacity exists for future growth.
- Performance of planned system improvements.

The hydraulic model also includes the diurnal flow pattern and base infiltration (BI) for each flow meter basin. There are 1,410 separate nodes and links and approximately 328,000 LF of sewer pipe contained in the calibrated model. The two (2) weir structures that were incorporated into the model are located along the Towson Run Interceptor at Manhole 33296 and at Manhole 37986 in the main trunk sewer within Meter Basin BC03. Pipe sediment and debris has also been accounted for in the model based on review of sonar and laser profiling data provided by Baltimore County. The County's wastewater geodatabase was used as the initial source of information for populating the pipes and node networks of the hydraulic model. Data was also used from field survey efforts, along with record and as-built documents to make editing changes to the hydraulic model. The invert and rim elevations of manholes, and location coordinates from the field survey data was used to supplement the GIS data. Data obtained from the record documents included: incoming and outgoing pipe sizes, shapes and types; invert elevations; manhole locations; and pumping station data, which included the number of pumps and their respective capacities. This data was utilized if field survey data was not available for a particular manhole. Where necessary, elevations from record drawings were adjusted to NAVD 88 datum. Additionally, field investigations were also conducted to confirm pump curve data and performance.

The model is also:

- Configured based on representative, accurate and verified system attribute data (i.e., pipe sizes and invert elevations, manhole rim elevations, etc.).
- Calibrated using spatially and temporally representative rainfall data and flow data, either existing or obtained under this CD pursuant to Paragraph 9.
- Verified using spatially and temporally representative rainfall data and flow data independent of the data used to calibrate the model.

Refer to **Appendix I** in this report for the Model Development and Calibration Report for the Jones Falls Sewershed, for a complete description of the development and calibration of the model.

5.3 Model Calibration (CD Ref P14.B.ii)

The model calibration consisted of two steps; dry-weather calibration and wet-weather calibration.

5.3.1 Dry-Weather Calibration

The dry-weather calibration process consisted of adjusting sub-catchment parameters until the model predictions closely match the results of the flow monitoring. Dry-weather flow consists of base sanitary flow (BSF) and base infiltration (BI).

The criteria established for the dry-weather calibration are:

- The modeled peak flow rate should be within -10 to +20 percent of the observed peak flow rate.
- The modeled volume of flow should be within -10 to +20 percent of the observed flow volume.
- Simulated diurnal pattern and hydrograph shape should reasonably match the observed.
- The timing of the peaks should be within one hour.

5.3.2 Wet-Weather Calibration

Following completion of the dry-weather calibration, wet-weather calibration was performed. The wet-weather flow component in sanitary sewers is referred to as rainfall-dependent infiltration and inflow (RDII). Simulation of wet-weather flow uses the SWMM RUNOFF routine in the InfoWorks CS program as a synthetic storm hydrograph generator. Several sub-catchment parameters, including the runoff coefficient, basin slope, runoff routing value and basin width, were adjusted to yield observed-simulated comparisons within calibration parameters noted below.

The following seven (7) storms were selected for calibrating the model for the County Meters (the County and Boundary Meters are defined in Section 1 of the SRRR Plan):

- February 1, 2008
- March 4, 2008
- March 7, 2008
- March 19, 2008
- April 3, 2008
- April 28, 2008
- May 8, 2008

For the model including the Boundary Meters, the following six (6) storms were used for calibrating the model:

- June 24, 2006
- July 5, 2006
- October 5, 2006
- October 17, 2006
- October 19, 2006
- October 27, 2006

These storms, selected for calibration for both the County and Boundary Meters provide a range of durations, intensities and volumes.

The following guidelines were used for the wet-weather calibration:

- The modeled peak flow rate should be within -10 percent and +25 percent of the observed peak flow rate.
- The modeled volume of flow should be within -10 percent and +20 percent of the observed.
- The shape and timing of the hydrographs should be similar.
- The modeled depth of flow at surcharged and non-surcharged pipe segments is similar to the observed depths of flow.

Storms that occurred during the winter season show a greater response to rainfall, resulting in greater RDII than storms that occur during the summer, and would provide more conservative model predictions. The model, calibrated using winter storms, is accurate for winter storms; however, it will likely over-predict for summer storms. Since a design storm could occur at any time during the year, the winter storms were deemed sufficient and used to calibrate the model. Summer storms typically are of shorter duration and higher intensity than winter storm events. In addition, the ground is typically dryer and the water table is lower in the summer than the winter season. This leads to less runoff per rain volume compared to winter storms. Winter storms are typically longer in duration, but lower in intensity than summer storm events. When the ground is saturated and the water table higher, more runoff occurs per the same amount of rain for winter storms compared to the summer storms.

The calibrated model of the Jones Falls Sewershed is capable of reproducing the dry-weather and wet-weather flow at each meter. A detailed description of the model development and calibration is provided in the Model Development and Calibration Report for the Jones Falls sewershed, which is included in **Appendix I** of this report.

Table 5-3.1 provides a summary of the dry- and wet-weather calibration at each meter. This table provides a comparison between observed and simulated values for dry- and wet-weather conditions. It also provides a description of the classification of the vulnerability and lists reasons for instances where the model results do not fall within the desired range for calibration.

TABLE 5-3.1 MODEL CALIBRATION SUMMARY TABLE

Meter Basin ID	Meter Manhole No.	Identified as Exhibiting High I/I (yes/no)[1]	Contributing Meter Basin(s)		Dry-Weather Calibration Percent Difference between Observed vs. Calibrated		Summer Wet-Weather Calibration Percent of Storms Outside Acceptable Range[2]		Winter Wet-Weather Calibration Percent of Storms Outside Acceptable Range[2]		Vulnerability and Reason for Over/Under Prediction in Basin [3]	
			Meter Basin ID	Identified as Exhibiting High I/I (yes/no)[1]	Total Volume	Peak Flow	RDII Volume	Peak Flow	Peak Flow	RDII Volume		
BC01	37990	No	None	N/A	-1%	-16%	22% (2 under-predict by as much as -27%, 0 over-predict)	44% (3 under-predict, 1 over-predicts, from -37% low to +38% high)	43% (3 under-predict from -12% to -20%)	0%	Low - No SSOs for storms up to and including a 20-year storm	For the 3 storms where the model under-predicts the peak, the observed data has a higher response to the event than the other storms
BC02	7253	No	None	N/A	-1%	-22%	33% (3 under-predict as much -65%, 0 over predict)	89% (5 over-predict, 3 under-predict from -73% low to +69% high)	14% (1 over-predicts 29%)	43% (3 over-predict from 21% to 52%)	Significant - Model predicts SSOs beginning with the 2-yr storm	For the 2 storms where the model over-predicts the volume and the one storm where the model over-predicts the peak, the observed data does not have much of a response to the event as the other storms
BC03	33463	Yes	BC01, BC02	No	14%	-18%	57% (2 under-predict, 2 over-predict, from -28% low to +52% high)	43% (1 under-predicts, 2 over-predict, from -30% low to +41% high)	29% (2 over-predict from 33% to 56%)	57% (4 under-predict from -13% to -33%)	Significant - Model predicts SSOs beginning with the 2-yr storm	Monitored data may be questionable due to over and under-predictions in the model. This irregularity is potentially impacted by the Texas Bypass.
BC04	6977	No	None	N/A	-3%	-15%	45% (2 under-predict, 2 over-predict, from -29% to +71%)	78% (5 under-predict, 2 over-predict from -49% low to +80% high)	43% (2 under-predict from -14% to -11% & 1 over-predict 29%)	29% (1 under-predicts -15% & 1 over-predicts 27%)	Low - No SSOs for storms up to and including a 20-year storm	For the 2 storms where the model under-predicts the peak & the 1 storm where the model under-predicts the volume, the observed data has a higher response to the event than the other storms. For the 1 event where the volume over-predicts and the 1 event where the peak over-predicts the monitored data does not have much of response to the event
BC05	43791	No	None	N/A	-4%	-19%	25% (2 under-predicted by as much -17% low, 0 over-predict)	50% (four under-predict by as much as - 53%)	43% (3 under-predict from -13% to -35%)	0%	Low - No SSOs for storms up to and including a 20-year storm	For the 3 storm events were the model peak under-predicts, the observed data has a higher response to the event
BC06	38526	No	None	N/A	0%	-12%	38% (2 under-predict, 1 over-predicts, from -15% low to +23% high)	62% (2 under-predict, 3 over-predict, from -23% low to + 54% high)	29% (2 under-predict from -13% to -15%)	0%	Low - No SSOs for storms up to and including a 20-year storm	For the 2 storm events were the model peak under-predicts, the observed data has a slightly higher response to the event
BC07	18586	No	BC01 thru BC04, BC08 thru BC10	BC03 & BC09 Only	8%	-7%	75% (5 over predict, 1 under-predicts from -37% low to +111% high)	62% (5 over predict, 0 under predict, with 4 >= +77%)	33% (1 over-predicts 27%)	0%	Significant - Model predicts SSOs beginning with the 2-yr storm	There appears to be some irregularity in this meter basin. For most of the storm used for calibration, the model over-predicts. Irregularity can be attributed to the Texas bypass.
BC08	19873	No	None	N/A	1%	-6%	44% (2 under-predict, 2 over-predict from -39% low to +48% high)	44% (3 under-predict, 1 over-predicts, from -29% to +74%)	57% (1 under-predict -20% & 3 over-predict from 42% to 54%)	71% (4 over-predict from 32% to 36% and 1 under-predicts -22%)	Low - No SSOs for storms up to and including a 20-year storm	For the storms where the model under-predicts the peak and/or volume, the observed data has a slightly higher response to the events. For the 2 storms where the model over-predicts the peak and/or volume, the observed data doesn't have much of a response to the event to the rainfall event.
BC09	NS1079	Yes	BC01 thru BC04	BC03 Only	-14%	-14%	44% (1 under-predicts, 3 over-predict, from -45% low to +106% high)	89% (over predicts >100% for 4 of 9 storms)	43% (3 over-predict from 25% to 46%)	43% (3 under-predict from -12% to -24%)	Low - No SSOs for storms up to and including a 20-year storm	There appears to be some irregularity in this meter basin. For most of the storm used for calibration, the model will under-predict the volume but over-predict the peak and vice versa. Irregularity can be attributed to the Texas bypass.
BC10	42231	No	None	N/A	-3%	-6%	11% (1 under-predicts 12%, 0 over-predict)	22% (2 under-predict as much as 34%, 0 over-predict)	14% (1 under-predicts -17%)	14% (1 under-predicts -25%)	Low - No SSOs for storms up to and including a 20-year storm	For the 1 storm where the model under-predicts the peak and the volume, the observed data shows a higher response to the event
BC11	6944	No	BC01 thru BC04, BC06 thru BC11	BC03 & BC09 Only	-12%	-6%	75% (1 under-predicts, 5 over-predict from -11% low to +108% high)	75% (over-predicts > 76% on 4 of 9 storms)	33% (2 over-predict from 41% to 46%)	17% (1 over-predicts 23%)	Significant - Model predicts SSOs beginning with the 2-yr storm	For the 2 storms where the model over-predicts the peak, the observed data does not have much of a response to the event as the other storms.
BC12	22222	No	None	N/A	-4%	-13%	11% (1 under-predicts by 16%, 0 over-predict)	22% (1 under-predicts by -21%, 1 over-predicts by +39%)	50% (3 under-predict from -16% to -20%)	17% (1 under-predicts 14%)	Moderate - Model predicts SSOs beginning with the 20-yr storm	For the 3 storms where the model under-predicts the peak and 1 storm where the model under-predicts the peak and volume, the observed data has a higher response to the event than the other storms

TABLE 5-3.1 MODEL CALIBRATION SUMMARY TABLE

Meter Basin ID	Meter Manhole No.	Identified as Exhibiting High I/I (yes/no)[1]	Contributing Meter Basin(s)		Dry Weather Calibration Percent Difference between Observed vs. Calibrated		Summer Wet Weather Calibration Percent of Storms Outside Acceptable Range[2]		Winter Wet Weather Calibration Percent of Storms Outside Acceptable Range[2]		Vulnerability and Reason for Over/Under Prediction in Basin

[1] Based on Jones Falls Inflow/Infiltration Report
[2] Acceptable Range is defined as: +25/-15% (peak flow) and +20/-10% (total volume)
[3] Winter Wet-Weather Calibration discussion focus (more conservative approach)

TABLE 5-3.1 MODEL CALIBRATION SUMMARY TABLE

Meter Basin ID	Meter Manhole No.	Identified as Exhibiting High I/I (yes/no)[1]	Contributing Meter Basin(s)		Dry-Weather Calibration Percent Difference between Observed vs. Calibrated		Wet-Weather Calibration Percent of Storms Outside Acceptable Range[2]		Vulnerability and Reason for Over/Under Prediction in Basin	
			Meter Basin ID	Identified as Exhibiting High I/I (yes/no)[1]	Total Volume	Peak Flow	Peak Flow	RDII Volume		
JF0320S	S04II2004	Yes	None	N/A	-23%	0%	67% (2 under-predict -35% to -20% and 2 over predict 36% to 45%)	33% (1 under-predicts -17% and 1 over-predicts 30%)	Significant - Model predicts SSOs beginning with the 2-yr storm	Monitored data flow appears to be impacted differently by each storm event, causing the model to over and under predict.
JFWR09	S17GG2004	Yes	None	N/A	-6%	1%	67% (2 under-predict from -40% to -14% and 2 over-predicts 20% to 191%)	50% (1 under-predicts -20% and 2 over-predict 60% to 25%)	Low - No SSOs for storms up to and including a 20-year storm	Monitored data flow appears to be impacted differently by each storm event, causing the model to over and under predict.
JFWR15	S05II2003	No	None	N/A	-13%	6%	17% (1 over-predict 525%)	33% (1 under-predicts -21%, 1 over-predicts 99%)	Low - No SSOs for storms up to and including a 20-year storm	Model over-predicts drastically only during the 7/5/2006 storm. The only other volume under-prediction is slightly outside criteria which could have been caused by rounding.
JFWR29	S04EE2004	Yes	None	N/A	-13%	9%	16% (1 over-predict from 203%)	50% (3over-predict 31% to 51%)	Significant - Model predicts SSOs beginning with the 2-yr storm	The only over-prediction in the peak is during the 7/5/2006 storm. The volume over-prediction (besides the one caused by the 7/5/2006 storm) is close to the volume tolerance and could have been impacted by less flow being recorded during the storms in question by the flow monitor
JFWR31	S06II2012	No	None	N/A	-17%	-7%	50% (3 over-predict 52% to 287%)	83% (2 under-predict -15% and 3 over-predict 34% to 42%)	Significant - Model predicts SSOs beginning with the 2-yr storm	Monitored data flow appears to be impacted differently by each storm event, causing the model to over and under predict.
JFWR35	S13GG2016	No	None	N/A	-28%	9%	50% (2 under-predict -47% to -28% and 1 over-predicts 679%)	22% (1 under-predicts -27% and 1 over-predicts 113%)	Low - No SSOs for storms up to and including a 20-year storm	Model over-predicts drastically only during the 7/5/2006 storm. The model under-predicts peak and volume during the 10/19/2006 storm but it is slightly outside of the criteria. The flow monitored could have recorded additional flow during that particular storm only. The over model under-prediction could have also been impacted by flow monitoring recording additional flow.

**In the 7/5/2006 storm all the boundary meters monitored data (listed above) did not respond to the storm causing significant over-predictions in the model

5.4 Baseline Capacity Analysis (CD Ref P10.C.viii)

An evaluation and assessment of the existing and future capacity of the collection, pumping and transmission system is required using the calibrated model. The calibrated model was used to analyze the response of the collection system under dry-weather flow and during five (5) design storm events under baseline and future (Year 2025) flow conditions and to evaluate the ability of the collection, pumping and transmission system to convey peak flows under both dry- and wet-weather conditions. These design storms include the following:

DESIGN STORM DATA					
Design Storm	2-Year/ 6-Hour Storm	2-Year/ 24-Hour Storm	10-Year/ 6-Hour Storm	10-Year/ 24-Hour Storm	20-Year/ 24-Hour Storm
Total Rainfall (in.)	2.37	3.38	3.50	5.19	5.80
*Peak Intensity (in/hr)	1.84	4.63	2.71	7.11	7.95
**Average Intensity (in/hr)	0.39	0.14	0.58	0.22	0.24

*Peak Intensity based on 0.1 hour increment
**Average Intensity based on entire duration of the storm

The rainfall distribution used is the SCS Type II distribution developed by the U.S. Natural Resources Conservation Service (NRCS).

As stated in the CD, Paragraph 9, the baseline condition is defined as the conditions in effect at the time flow metering is completed.

Boundary conditions were applied in the model at the model's connection points with the City of Baltimore. These boundary conditions are time series data for each design storm event that were provided by the City of Baltimore based on the City's modeling of the Jones Falls collection system. The boundary conditions represent the flow level expected at the connection points between the City of Baltimore and Baltimore County. The boundary conditions were provided on June 9, 2011 and were applied for both baseline and future conditions. The boundary conditions received from the City of Baltimore are provided in **Appendix J** of this report.

The baseline and future conditions differ in several parameters:

- Population and employment will increase from the baseline conditions (Year 2008) to the future conditions (Year 2025). Based on population and employment projections provided by Baltimore County, the population will increase approximately 4.7 percent from the baseline to future conditions and employment will increase by approximately 2.9 percent.

- Non-Pumping Station SSOs 113 (Marnat Avenue) and 120 (Charles Street Avenue) were open during the flow metering period and were included in the baseline model. A third SSO, SSO 31A (Rider Avenue), was eliminated by Baltimore County prior to the start of the flow metering and was therefore not included in the baseline model. SSO 120 (Charles Street Avenue) was sealed on September 20, 2011 and SSO 113 (Marnat Avenue) will be eliminated in the future. None of the Non-Pumping Station SSOs are included in the future conditions model.
- The future conditions model includes the rehabilitation of sewers and manholes in SSA's 45-10-22-01 and 45-58-06-02, which are located upstream of SSOs 113 and 120, respectively. Following the Baltimore County SRRR guidelines, the modeling of rehabilitated pipes included a 35 percent reduction of RDII and a 23 percent reduction of the BI. Additionally, the friction coefficient was revised to match that of a smoother pipe surface (reduced Manning's "n" value) that is the result of installation of the cured-in-place pipe lining (CIPP).
- Pumping station capacities under baseline conditions reflect the conditions that existed during the flow metering period. The future (Year 2025) conditions model incorporates the ultimate pumping station capacities.

Capacity Analysis Results

There are no model-predicted overflows or surcharges that occur during dry-weather conditions in the baseline model. Furthermore, the model predicts that none of the non-pumping station SSOs would activate during dry-weather.

Under baseline conditions, the model predicts SSOs for design storms beginning with the 2-year/24-hour storm. The model predicts that Non-Pumping Station SSOs 113 and 120 become active during wet-weather under baseline conditions. SSO 113 becomes active during the 2-year/6-hour storm and SSO 120 becomes active during the 10-year/24-hour storm. A summary of the model results under baseline conditions is presented in **Table 5-4.1**:

Table 5-4.1
Jones Falls SRRR: Corrective Action Recommendation Plan
SUMMARY OF BASELINE MODEL ANALYSIS

Storm Event	Total Number of SSOs	Total Volume of Overflows (MG)
2-Year/6-Hour Storm	8	0.1111
2-Year/24-Hour Storm	14	0.5258
10-Year/6-Hour Storm	14	0.8483
10-Year/24-Hour Storm	29	3.5005
20-Year/24-Hour Storm	38	5.1425

The model-predicted overflows listed in the Hydraulic Capacity Assessment Report, provided in **Appendix K** of this report and in **Table 5-4.1**, were reduced by the incorporation of additional 8-inch diameter collection system piping and revisions to the flow loading locations into the model. The addition of these 8-inch diameter pipes eliminate falsely predicted SSOs in the model that were caused by isolated flow loading points rather than actual collection system deficiencies.

Table 5-4.2 lists the manhole number and volume of overflow for each design storm event under baseline conditions. A complete description of the capacity analysis is presented in the Jones Falls Hydraulic Capacity Assessment Report, included in **Appendix K** of this report.

5.5 Future Condition Capacity Analysis (CD Ref P10.C.ix)

Future conditions are defined as the expected hydraulic conditions that would exist in Year 2025, using population and employment projections. Section 5.4 describes the differences between the baseline and the future conditions. For future conditions, it has been assumed that the BI due to pipe deterioration will be minimal, so the same value for BI is used for baseline and future conditions, except in those areas where pipe and manhole rehabilitation is planned or has been completed.

Boundary conditions were applied in the model at the model's connection points with the City of Baltimore. These boundary conditions are time series data for each design storm event that were provided by the City of Baltimore based on the City's modeling of the Jones Falls collection system. The boundary conditions represent the flow level expected at the connection points between the City of Baltimore and Baltimore County. The boundary conditions were provided on June 9, 2011 and were applied for both baseline and future conditions. The boundary conditions received from the City are provided in **Appendix J** of this report.

Capacity Analysis Results

Similar to the baseline conditions model, there are no model-predicted overflows or surcharges during dry-weather conditions for the future conditions model. A summary of the model results under future conditions is presented in **Table 5-5.1**:

Table 5-5.1 Jones Falls SRRR: Corrective Action Recommendation Plan SUMMARY OF FUTURE MODEL ANALYSIS		
Storm Event	Total Number of SSOs	Total Volume of Overflows (MG)
2-Year/6-Hour Storm	9	0.1356
2-Year/24-Hour Storm	15	0.5609
10-Year/6-Hour Storm	15	0.8773
10-Year/24-Hour Storm	30	3.3431
20-Year/24-Hour Storm	37	4.9449

The model-predicted overflows listed in the Hydraulic Capacity Assessment Report, provided in **Appendix K** of this report and in **Table 5-5.1**, were reduced by the incorporation of additional 8-inch diameter collection system pipes and revisions to the flow loading locations into the model. The addition of these 8-inch diameter pipes eliminate falsely predicted SSOs that were caused by isolated flow loading points in the model rather than actual collection system deficiencies.

Table 5-5.2 lists the manhole number and the volume of overflow for each design storm event under future conditions. A complete description of the capacity analysis is presented in the Jones Falls Hydraulic Capacity Assessment Report, included in **Appendix K** of this report.

[1] Model-predicted SSOs eliminated by inclusion of additional network and revisions to flow loading locations

5.6 Long Term Capacity/Peak Flow Management Evaluation (CD Ref P10.C.ii)

In accordance with Paragraph 9 of the CD, calibrated model simulations and analyses were conducted to identify, evaluate and recommend the corrective actions necessary to eliminate model-predicted SSOs for each of the five (5) design storms. The future conditions (Year 2025) model was used for this alternative analysis.

The expanded model network and revisions to the flow loading locations discussed in Sections 5.4 and 5.5 impacted the model results for the five (5) synthetic design storm simulations. For the 2-year/6-hour design storm, the expanded model network and revisions to the flow loading locations eliminated all the model-predicted SSOs and therefore no corrective actions are necessary for this design storm. The LTC/PFME Report provided in **Appendix L** of this report summarizes the recommended corrective actions for each design storm.
A description of the complete alternative analysis results and cost estimates is included in the

Jones Falls Sewershed's LTC/PFME Report, which is provided in **Appendix L** of this report.

5.6.1 SSO Control Improvement

Paragraph 9.C.ii.d of the CD indicates that improvements to the collection system to ensure adequate capacity must be identified and the improvements considered should include:

- Increasing pumping station capacity
- Rehabilitation of sewers and manholes to reduce I/I
- Installation of larger replacement pipes or relief sewers

The future conditions model incorporates the closure of Non-Pumping Station SSOs 31A, 113 and 120, and the completion of Paragraph 7 projects for rehabilitation of SSA's 45-10-22-01 and 45-58-06-02, which drain to SSOs 113 and 120, respectively. Rehabilitation of SSA 45-10-22-01 (SSO 113) was completed under Contract 09124 SXO in early 2012 and rehabilitation of SSA 45-58-06-02 (SSO 120) was completed under Contract 10034 SXO in July 2011. Two (2) of the three (3) non-pumping station SSOs have already been eliminated. These include Non-Pumping Station SSO 31A, which was closed on May 11, 2007 and Non-Pumping Station SSO 120, which was sealed on September 20, 2011. The County continues to coordinate with the City of Baltimore regarding the capacity improvements of the sewers located downstream of SSO 113 in the City, and is evaluating options for design and construction of a County relief sewer to eliminate activation of this SSO.

5.6.2 Assumptions

The following assumptions were made during the analysis of the LTC/PFME:

- Following the Baltimore County SRRR Guidelines, it was assumed that rehabilitation would reduce BI by 23 percent, the total RDII volume by 35 percent and the peak RDII flow by 37 percent when possible. Due to the complexity of the collection system, in some cases a reduction of 36 percent of the capture coefficient was implemented.
- BI due to pipe deterioration will be minimal, so the same value for BI is used for baseline and future conditions, except in those areas where pipe and manhole rehabilitation is planned or has already been completed.
- The ultimate pumping station capacities were used.

5.6.3 Cost Estimation

To estimate the corrective action costs for elimination of model-predicted SSOs, Table 4-5 from the Baltimore County SRRR Plan Guidelines was used. This table includes unit costs for corrective actions including: in-situ (in-place) sewer repairs; lateral connection repairs; sewer lining; pipe replacement; pipe bursting; sewer point repairs; sliplining; installation of manhole frame seals; manhole inflow inserts; manhole lining and manhole replacement. Cost estimates were prepared for each design storm event.

A complete description of the corrective action analyses is presented in the Jones Falls Sewershed LTC/PFME Report, which is included in **Appendix L** of this report.

END OF SECTION

Section 6

Corrective Action Recommendation Plan

6.0 Corrective Action Recommendation Plan (CD Ref. P.10.C.iii-vii)

6.1 Overview

The Corrective Action Recommendation Plan discussed in this section consists of various structural and hydraulic corrective action recommendations needed to address the deficiencies identified during the collection system investigations and modeling activities for the Jones Falls Sewershed. The Plan also identifies specific rehabilitation and other corrective actions needed to eliminate model predicted sanitary sewer overflows (SSOs) that were determined by the Long-Term Capacity/Peak Flow Management Evaluation (LTC/PFME). Previous chapters of this SRRR Plan present detailed discussions of the various investigations that were completed, and provide a summary of the deficiencies that were identified. The condition related corrective action recommendations were defined based on review of field inspection and SSES data such as sewer and manhole inspections, smoke and dyed-water testing and night-flow isolation investigations as discussed in Section 4 of this report. As discussed in Sections 3 and 5 of this report, the hydraulic corrective actions were determined by modeling and the inflow and infiltration (I/I) analysis. Data analysis and evaluation was utilized to identify the necessary corrective actions required to address the deficiencies identified within the collection system. Some identified condition corrective actions were superseded by hydraulic corrective action recommendations. As an example, a recommended sewer insitu spot repair (repair to correct a specific defective area in a segment of pipe) would not be necessary if the sewer segment was recommended for cured-in-place (CIPP) lining to address hydraulic capacity deficiencies.

This section provides a brief discussion of the corrective actions that have or is in the process of being completed within the Jones Falls Sewershed to address collection system deficiencies, followed by the recommended corrective actions. Estimates of probable construction costs required to implement the recommended corrective actions have also been provided.

6.2 Completed Corrective Actions (CD Ref. P.10.Ciii)

Baltimore County has completed several remedial corrective actions within the Jones Falls Sewershed as required by Paragraph 7 of the Consent Decree (CD). These include I/I reduction and pumping station and force main assessment and upgrade projects. The County has also eliminated several Non-Pumping Station SSO structures.

The total cost of the projects implemented to date by Baltimore County in the Jones Falls Sewershed is approximately $6.35 Million. The following is an overview of the corrective actions that have been completed in the Jones Falls Sewershed to date.

6.2.1 Pumping Station Improvements

As detailed in Section 4, the Jones Falls Sewershed contains four (4) pumping stations. These include the Buchanan Road Pumping Station; the Stanton Woods Pumping Station; the Templegate Pumping Station and the Stevenson Pumping Station. The County is currently undertaking, or has previously completed, measures set forth in Paragraph 13 of the CD for

these pumping stations. The County has completed an Engineering Evaluation and Condition Assessment (EE/CA) for all four (4) of the pumping stations as required by Paragraph 13.F of the CD. Reports have been submitted for review and approval in accordance with Paragraph 13.F.iii of the CD. All deficiencies defined in Paragraph 13.F.iv of the CD, and outlined in the EE/CA reports for the Buchanan Road, Stanton Woods and the Templegate Pumping Stations are being completed in accordance with Paragraph 13.F.iv.(a) of the CD. The work and costs associated with these pumping stations is summarized below:

- Buchanan Road Pumping Station - The conceptual cost estimate for the upgrades to the Buchanan Road Pumping Station is $1,580,525.
- Stanton Woods Pumping Station - The conceptual cost estimate for the upgrades to the Stanton Woods Pumping Station is $1,135,000.
- Templegate Pumping Station - The conceptual cost estimate for the upgrades to the Templegate Pumping Station is $1,687,033.
- Stevenson Pumping Station - Construction of the new Stevenson Pumping Station was completed in May of 2011. The cost for the upgrades to this station was $921,000.

6.2.2 Sewer/Manhole Rehabilitation for Non-Pumping Station SSO Structure Elimination

As detailed in Section 2, the Jones Falls Sewershed contains three (3) Non-Pumping Station SSOs. These include SSO 31A (Rider Avenue), located in Meter Basin BC11; SSO 113 (Marnat Road), located in Meter Basin JF0320S; and SSO 120 (Charles Street Avenue), which is located in Meter Basin BC12. The County has completed sewer and manhole rehabilitation projects in several of the SSA's that are tributary to these SSOs to eliminate overflows. This work is summarized below:

- Rider Avenue Non-Pumping Station **SSO 31A** – The SSO was eliminated on May 11, 2007 by the County at nominal cost, and post elimination flow monitoring of the SSO was conducted in accordance with Section V.7.C.v of the CD.

- Marnat Road Non-Pumping Station **SSO 113** – Under Contract 09124 SXO, forty-four (44) manholes were rehabilitated, 7,149 linear feet (LF) of sewer was lined and seventy-two (72) sewer house connections were sealed. The work was completed in June 2012 at a cost of $442,928 and post-rehabilitation flow monitoring of the SSO is currently being conducted in accordance with Section V.7.C.v of the CD.

- Charles Street Avenue Non-Pumping Station **SSO 120** – Under Contract 10034 SX0, forty-eight (48) manholes were rehabilitated, seven (7) point repairs were completed, 13,826 LF of sewer was lined and 323 sewer house connections were sealed. The work was completed in July of 2011 at a cost of $585,022 and the SSO was eliminated on September 20, 2011. The County continues to monitor the SSO in accordance with Section V.7.C.v of the CD.

6.3 Priority Scheme Identification

For the purpose of prioritizing defects identified through the collection system investigations, the County prioritized the inspection data review to address sewer and manhole defects that may contribute to SSOs in the collection system. This prioritization process included review of the CCTV and manhole inspection data in accordance with the criteria set forth in Paragraph 8 of the CD. Reviews included all Paragraph 8.C.ii, 8.C.ia, and 8.C.iv sanitary sewers and manholes that had Bureau of Utilities (BU) or National Association of Sewer Service Companies (NASSCO) Pipeline Assessment and Certification Program (PACP) ratings of 4 or 5. The PACP ratings were used when a BU rating was not available. Manholes were rated by the inspection crews and review of the data prioritized using the structural and I/I ratings to develop pertinent corrective actions to address the deficiencies identified.

Reviews were also completed for all sewers and manholes that were located in meter basins that exhibited excessive I/I identified through the I/I analysis, regardless of CD Paragraph designation or rating. These priority basins included: BC02, BC03, BC04, BC05, BC07, BC09, BC14 and BC16.

The County has also identified specific sewer defects that, based on the County's experience, may compromise the structural integrity of the sewer. **Table 6-3.1 – Critical Defect Summary** provides a listing of these specific defects. Sewers with critical defects were also reviewed.

6.4 Structural Deficiency Corrective Action Plan

Structural defects identified in the sewers and manholes in the County's Priority Scheme Identification Plan as described in Section 6.3 of this report may contribute to a SSO, and therefore will be addressed by the County.

Table 6-4.1 – Manhole Condition Rating Summary summarizes the condition ratings of the manholes that were reviewed in support of the Jones Falls Sewershed SRRR Plan.

Table 6-4.6 – Sewer Condition Rating Summary By SSA contained in **Appendix N** of this report defines and summarizes the ratings of the sanitary sewers that were reviewed by SSA.

6.5 Recommended Collection System Improvements

After the manhole, sewer and capacity deficiencies were determined, rehabilitation methods were reviewed and pertinent rehabilitation and repair technologies and corrective actions were selected to address the specific manhole and sanitary sewers that contained defects.

6.5.1 Recommended Manhole Improvements

The following manhole repair or rehabilitation methods were selected to address structural and/or operational and maintenance (O&M) deficiencies identified in the manhole structures:

- Clean Manhole was recommended for manholes that contained excess debris and/or root intrusion that would not be addressed under the manhole lining work or when additional repair work was not specified for the manhole.
- Frame Seals were recommended when infiltration was identified in either the frame and cover adjustment area or at the interface between the structure and the frame and cover. The frame seal could be either internally or externally installed.
- Inflow Inserts were recommended when inflow was observed around the manhole cover or when the cover was subject to ponding.
- Manhole Lining was recommended for manholes with significant cracks, fractures, infiltration defects, or surface damage (chemical and mechanical)
- Replacement of the Manhole was recommended for manholes that were so severely deteriorated that rehabilitation was not an option.
- Replacement of the Frame and Cover was recommended for manholes that contained defective manhole frame and covers. This could also be referenced to install water-tight frames and covers when sealing of the manhole was required to prevent an SSO.
- Resetting of the Frame and Cover was recommended when the existing frame and cover was in serviceable condition, but dislodged and not affixed to the structure.

Table 6-5.1 contained in **Appendix O** of this report lists all recommended manhole improvements.

6.5.2 Recommended Sanitary Sewer Improvements

The following sewer repairs and/or sewer rehabilitation methods were selected to address structural and/or O&M type deficiencies that were identified in the sanitary sewers:

- Sewer Lining (CIPP) was recommended for pipes containing cracks, fractures or infiltration defects. CIPP lining was also recommended for pipes that contained encrustations or root defects because encrustation indicates infiltration and roots are a source of infiltration. This is a trenchless method that reinstates the structural integrity of the sewer and reduces infiltration in a pipe segment. As part of the lining process, lateral reinstatements shall be air tested and grouted to provide a watertight connection to the liner system.

- Insitu (in-place) Repairs were recommended when short sections of pipe contained holes, fractures of other isolated defects that could be addressed without the need for excavation. Spot repairs are a modified form of CIPP pipe lining, which can be used for

localized pipe repairs (3 to 20 feet in length) instead of open cut excavation.

- Point Repairs ("Excavate and Replace") were recommended for pipe segments that contained holes, offset joints, breaks, multiple fractures or pipe ovality that was greater than 10% and could not be rehabilitated using a CIPP liner. This work typically involves open-cut excavation to replace the damaged pipe with a new pipe segment. In open-cut situations, PVC pipe of the same or larger diameter as the existing pipe will be installed and reconnected to existing service laterals.

  It should be noted, that a combination of defects may require the use of several repair methods to correct the deficiencies identified in a pipe segment. This could include completing a "Dig-Up and Replace Point Repair, an Insitu (in-place) Spot Repair and CIPP Lining of the entire sewer segment. For example, if a pipe segment was identified to have a break and significant (40%) loss of cross-sectional area in addition to other structural defects, an open-cut point repair may be required to repair the break prior to CIPP lining the sewer segment to address the remaining defects in the sewer segment.

- Lateral Connection Repairs were recommended for each defective or leaking service connection to reduce infiltration. The sewer house connection repair consisted of the CIPP lining of the first 2 to 3 feet of the lateral pipe and the full circumference of the mainline sewer at the connection with a one-piece sewer house connection seal. Depending on the condition of the lateral connection at the time of design, CIPP lining, chemical or structural grouting or open-cut lateral connection replacement are also options that should be considered. All defective connections should be assessed during the design phase to determine the most appropriate method of repair/rehabilitation.

Table 6-5.2 in **Appendix O** contains all of the recommended mainline sewer repairs by sewer segment.

A summary of the recommended sewer and manhole corrective action improvements by flow meter basin are shown in **Table 6-5.3 – Recommended Sewer and Manhole Condition Improvements By Meter Basin**.

A summary of the recommended sewer and manhole improvements by SSA are shown in **Table 6-5.4 – Recommended Sewer and Manhole Condition Improvements By SSA** in **Appendix O** of this report.

6.5.3 Recommended Pumping Station Improvements

As previously indicated, the Jones Falls Sewershed contains four (4) pumping stations. These include the Buchanan Road Pumping Station; the Stanton Woods Pumping Station; the Templegate Pumping Station and the Stevenson Pumping Station.

As described in Sections 4 and 6.2.1, the County is currently undertaking, or has previously completed all of the measures set forth in Paragraph 13 of the CD for the pumping stations in the Jones Falls Sewershed.

The County is in the process of ensuring that adequate backup power systems are installed and maintained for each of the pumping stations in accordance with Paragraph 13.C, installing a Supervisory Control And Data Acquisition (SCADA) system for remote monitoring of each of the pumping stations in accordance with Paragraph 13.D, and conducting inspections of the pumping stations in accordance with Paragraph 13.E of the CD.

The County has completed EE/CA inspections of all four (4) of the pumping stations as required by Paragraph 13.F of the CD. The reports have been submitted for review and approval in accordance with Paragraph 13.F.iii of the CD. The County has also completely replaced the Stevenson Pumping Station with a new station, which includes backup power generation and a SCADA system. Construction of the Stevenson Pumping Station was completed in 2011. The Buchanan Road, Stanton Woods and the Templegate Pumping Stations were designated as Tier 3 pumping stations. Improvements to these pumping stations to correct all Priority 1 and 2 ranked deficiencies, as defined in Paragraph 13.F.iv of the CD, and outlined in the EE/CA reports will be completed in accordance with the approved schedules.

The County has also completed a pumping station equipment inventory, transferred its pump maintenance record keeping system into an electronic information management system, and implemented a pumping station preventative maintenance program in accordance with Paragraphs 13.G-I of the CD. In addition, the County has ensured that an updated operation and maintenance manual is being maintained, at the new Stevenson Pumping Station in accordance with Paragraph 13.J. of the CD.

All pumping stations are currently being addressed in accordance with the CD requirements and are of adequate capacity to handle peak flows resulting from a 20-year/24-hour design storm based on the results of the LTC/PFME.

6.5.4 Recommended Force Main Improvements

The Jones Falls Sewershed contains four (4) pumping station force mains. These include a 6-inch diameter ductile iron pipe (DIP) force main from the Buchanan Road Pumping Station; a 6-inch diameter Cast Iron (CI) force main from the Stanton Woods Pumping Station; a 6-inch diameter CI force main from the Templegate Pumping Station; and a 6-inch diameter CI force main from the new Stevenson Pumping Station.

In accordance with Paragraph 8D.ii. of the CD, Baltimore County developed a standard process to inspect and evaluate the condition of the force mains in their collection system. The results of the force main investigations can be found in the individual Force Main Condition Assessment Reports located in **Appendix H** of this report. No corrective actions are recommended for the force mains in the Jones Falls Sewershed.

6.6 Recommended Sewer Capacity Improvements

Baltimore County's method to evaluate the collection system's capacity deficiencies and identify and evaluate proposed corrective actions focuses on eliminating model-predicted SSOs by reducing sources of wet-weather induced I/I and improving collection system maintenance. This process includes completion of the following:

1. Identify SSA's exhibiting excessive I/I.
2. Identify model-predicted SSOs.
3. Complete SSES investigations in SSA's exhibiting excessive I/I that contribute to model-predicted SSOs to locate wet-weather sources of I/I.
4. Complete model-verification flow monitoring at model-predicted SSO locations.

   The goal of the flow monitoring is to:

   - Confirm model simulation results.
   - Quantify wet-weather flow contributing to model-predicted SSOs.
5. Complete comprehensive collection system improvements that focus on:
   - Dry-weather flow I/I reduction (i.e. excessive base inflow).
   - Wet-weather flow I/I reduction.
   - Dry-weather flow capacity relief (i.e. undersized pipes).
   - Wet-weather flow capacity relief (i.e. undersized pipes).
   - Dry-weather flow preventive maintenance (i.e. cleaning, root control, etc.).
   - Wet-weather flow preventive maintenance (i.e. cleaning, root control, etc.).
6. Complete post-construction flow monitoring to determine the effectiveness of the system improvements/corrective actions.
7. Based on the post-construction flow monitoring data, update and recalibrate the collection system model as necessary.

Based on extensive and continuing pre- and post-construction I/I reduction flow monitoring and analysis, the County estimates that I/I can be significantly reduced as a result of a comprehensive sewer/manhole rehabilitation program of the public collection system. Conservatively, the model simulations completed to fulfill the LTC/PFME requirements included in Section 5 of this report assume a 35-percent reduction in peak inflow and a 23-percent reduction in groundwater infiltration.

Comprehensive I/I reduction rehabilitation in an area consists of rehabilitating all sewer pipes, including grouting of service connection reinstatements to the mainline sewer, and complete rehabilitation of all manholes.

A detailed description of the basis of I/I reduction and model-predicted capacity corrective actions is provided in the Long Term Capacity/Peak Flow Management Evaluation Report, provided in **Appendix L** of this report. A summary of the recommended capacity improvements by meter basin is shown in **Table 6-6.1 – Recommended Sewer and Manhole Capacity Improvements By Meter Basin**. The capacity improvements that will be implemented by the County in Meter Basins BC02, BC03, BC04, BC09, BC22, JFWR31 and TSJF01 are shown on **Map 6-1**.

Table 6-6.1
Jones Falls SRRR: Corrective Action Rehabilitation Plan
RECOMMENDED SEWER AND MANHOLE CAPACITY IMPROVEMENTS BY METER BASIN

Meter Basin	Pipe Rehabilitation	Manhole Rehabilitation	
	Sewer Lining All Sizes, Including Service Reinstatement Sealing (LF)	Manhole Lining (EA)	Seal Manholes (EA)
BC02	16,434	64	
BC03	5,311	28	
BC04	21,475	101	
BC09	62,891	291	
BC22			3
TSJF01			1
JFWR31			7

6.7 Alternative Storm Distribution

In accordance with Paragraph 9.C.ii(b) of the CD, model simulation results for the 2, 10 and 20-year/24-hour SCS Type II stom1 events are presented in the Capacity Assessment and Long Term Capacity/Peak Flow Management Evaluation report. However, as stipulated in Paragraph 9.C.ii(b) of the CD, the County may utilize an alternative rainfall distribution. The County has reviewed various rainfall distribution methodologies and believes the recommendations outlined in the Maryland Hydrology Panel's *Application of Hydrologic Methods in Maryland* report are more representative of actual storm events experienced in Baltimore County and will result in more accurate predictions of the synthetic design events compared to the SCS Type II storm events.

The Maryland Hydrology Panel, convened by the Maryland State Highway Administration and the Maryland Department of Environment, prepared the report to present "a set of hydrologic modeling procedures that are designed to ensure optimal balance between preserving the environmental quality of Maryland streams and (infrastructure) hydraulic performance and

safety. "In Section 3.6 of the report, the Panel details their experiments, which indicate that "the 2-, 5-, and 10-year flood peaks generated by the TR-20 model using the 24-hour design storm duration are often significantly higher than those predicted by the USGS-based equations. " Based on their analysis, the Panel recommends that the "10-, 5-, and 2-year storm events should be derived using either the 6-hour or 12-hour design storm duration."

Based on a review of the Panel's analysis, the County recognizes that deficiencies exist in the synthetic design storm procedure and concurs that the 2- and 10-year/6-hour design storms are more representative of actual County rainfall patterns. Additionally, an analysis of the County's sewersheds indicated that the largest sewersheds (i.e. Gwynns Falls, Patapsco and Jones Falls) all have times of concentration less than six (6) hours. The majority of the County's sewersheds are smaller and will have times of concentration that are significantly less than six (6) hours.

Figure 3.22 of the Panel's report indicates spatial distribution adjustments required based on sewershed area. Since most of the County sewersheds are less than 10 square miles in area and in accordance with the SCS National Engineering Handbook, Section 4, the County has not applied the distribution adjustment.

6.8 Baltimore City/County Boundary Conditions

This Recommendation Plan to eliminate the model-predicted SSOs is based on boundary conditions agreed upon by the City of Baltimore and Baltimore County. A copy of the City's hydraulic condition at each boundary location for the 10-year/6-hour storm event is provided in **Appendix J** (Boundary Conditions Time Series) of this report. The County may re-analyze and/or revise this Corrective Action Recommendation Plan if there is any deviation from these boundary conditions or delay in implementing the boundary conditions.

6.9 Wastewater/Storm Water Cross Connection Elimination (CD Ref. P.10.C.vii)

In accordance with Paragraph 9.C of the CD, the County must develop a plan for elimination of physical cross connections between the sanitary sewer collection system and the storm water collection system that allows, or has the potential to allow, sanitary waste to be discharged to the storm water collection system.

SSO 113 (Marnat Road) is the remaining non-pumping station SSO in the Jones Falls Seweshed's collection system. This SSO consists of a 12-inch diameter overflow pipe constructed in MH 793 in SSA 45-10-22-01 (Meter Basin JF0320S). When active, the SSO discharges to a storm drain that enters the Western Run branch of the Jones Falls.

As indicated in Section 2, the County began work on Contract 09124 SXO in November of 2009, which consisted of completing an extensive rehabilitation program upstream of SSO 113 aimed at reducing I/I in the collection system that contributes to the activation of this SSO. As part of this contract, forty-four (44) sanitary manholes were rehabilitated, 7,149 linear feet (LF) of sewer was lined and seventy-two (72) sewer house connection seals were installed. The project was

completed in June 2012 and post-rehabilitation flow monitoring of the SSO is currently being conducted in accordance with Section V.7.C.v of the CD. Monitoring shows that SSO 113 remains active during wet-weather events and the County continues to coordinate with the City of Baltimore regarding capacity improvements that are needed to several of the receiving sewers located downstream of the SSO in the City. The County has filed a time of performance extension request with the EPA and committed to completing additional investigations and developing system improvements to correct collection system deficiencies required to eliminate this SSO. The additional investigations that the County has completed include CCTV, SSES investigations, cleaning and capacity analysis and modeling. The County continues to work to determine how the collection system surrounding this SSO functions during wet- and dry-weather to determine the cause of the continued activation of this SSO during wet-weather.

6.10 Performance Assessment Program (CD Ref. P.10.E)

In accordance with Paragraph 10.E of the CD, the County must conduct a performance assessment of the work performed in the Jones Falls Sewershed to determine the effectiveness of the corrective action work that has been performed.

The following additional data collection activities may be implemented after completion of the rehabilitation and corrective action work per CD Reference Paragraph 10.c.xi:

- Rainfall Monitoring
- Flow Monitoring
- Post-Rehabilitation CCTV
- Review of Record Drawings
- Review of Reported Complaint Data
- Review of Work Orders

Post-rehabilitation flow monitoring is recommended to be performed in areas in which rehabilitation projects have already been completed by the County and in those meter basins that have been recommended for rehabilitation upon completion of the rehabilitation work.

Flow monitoring should preferably be performed at the same locations where flow monitoring was previously performed for this study. Collection of data at the same locations will allow for pre- and post-rehabilitation flow comparisons and recalibration of the hydraulic model to post-rehabilitation conditions if necessary. An I/I analysis should be performed subsequently to quantify the reduction of I/I in the rehabilitated areas. Per Baltimore County's SRRR Guidelines, it is recommended that post-rehabilitation flow monitoring capture at least six (6) measurable rain events of varying intensity and duration for the I/I analysis.

The County will evaluate the data collected at each location to determine the effectiveness of the completed corrective actions and to determine the subsequent work as appropriate.

6.11 Sewer Cleaning Program (CD Ref. P.10.C.iii)

The County's approved Collection System O&M Plan, dated January 12, 2006, requires the County to clean all gravity sewers that are 8-inches in diameter or larger on a seven (7) year cycle, subject to future cleaning frequency re-evaluations.

In addition to the O&M Plan, the County's Bureau of Utilities maintains a recurring specials cleaning list, which identifies specific sewer segments that require routine cleaning. A copy of this specials list, including a map which shows specific SSA's that are cleaned on a regular basis is contained in **Appendix P** of this report. The recurring specials list is reviewed and revised on a regular basis based on historical customer complaints, recorded historical O&M defects/observations and sewer location.

This cleaning program typically addresses conditions, which cause or contribute to water quality concerns or public health degradation, occur in high public use or public access areas or can be avoided through preventive maintenance.

6.12 Fats, Oils and Grease Control Program (CD Ref. P.10.C.iii)

The County's Fats, Oils and Grease (FOG) control program is detailed in the approved revised FOG Program Modification Plan, dated August 21, 2009. In accordance with the Plan, the County inspects FOG generating facilities using the risk scoring system and FOG generator identification evaluation developed by the County for the program. The inspection findings and FOG generating facility enforcement history is recorded in the County's FOG database for use in the County's annual FOG control program effectiveness evaluation. Program/analysis revisions that are identified by the effectiveness evaluation are addressed accordingly.

In addition to the FOG program, the County's Bureau of Utilities maintains a recurring specials cleaning list, which identifies specific sewer segments that experience grease deposition and require routine cleaning. A copy of this specials list, including a map showing the SSA's that require frequent cleaning, is contained in **Appendix P** of this report. The recurring specials list is reviewed and revised on a regular basis based on historical customer complaints, recorded historical O&M defects/observations and FOG control program inspection findings.

On September 16, 2010, the County posted on its Department of Environmental Protection & Sustainability website, a FOG manual to be used by local Food Service Facilities as a guide for complying with the County's revised Food Service Facilities Regulations. The County continues inspecting FOG generating facilities using the revised risk scoring system and the FOG generator identification evaluation. To address residential FOG generators, the County will develop informational material that describes the effects of FOG on the wastewater collection system. The material will also be distributed to residential property owners.

The regular cleaning associated with the FOG program will aid in addressing conditions which cause or contribute significantly to water quality or public health degradation, occur in high public use or public access areas or can be avoided through preventive maintenance.

6.13 Root Control Program (CD Ref. P.10.C.iii)

The County's Bureau of Utilities maintains a root control program as detailed in the approved Collection System Operation and Maintenance Plan, dated January 12, 2006. The root control program consists primarily of mechanical root cutting and the application of chemical root inhibitors to treat root growth in the sewers on an as-needed basis. Additionally, the Bureau of Utilities maintains a specials list, which identifies specific sewer segments that require routine root control. The specials list is reviewed and revised by the County on a regular basis, based on historical customer complaints, recorded historical O&M defects/observations and sewer location. A copy of the specials cleaning list is contained in **Appendix P** of this report.

Regular root cutting and/or chemical root treatment and maintenance will be applied to these sewers to prevent continued root intrusion as outlined in the approved County O&M Plan. The root control program will assist in addressing conditions that cause or contribute significantly to water quality or public health degradation, occur in high public use or public access areas or can be avoided through preventive maintenance.

6.14 Corrective Action Recommendation Plan

The County believes the most logical approach to addressing model-predicted SSOs in the Jones Falls Sewershed is to:

1. Complete comprehensive I/I reduction rehabilitation of public manholes and sewers within SSA's exhibiting excessive I/I or other areas that contribute to model predicted SSOs determined by model simulations using the 10-Year/6-Hour SCS Type II storm event.
2. Complete select capacity improvements based on a model simulation of the 10-Year/6-Hour SCS Type II storm event.
3. Correct identified structural deficiencies through rehabilitation or replacement.
4. Complete post-construction flow monitoring and analysis to confirm the I/I reduction effectiveness.
5. Confirm model simulations or revise the collection system model, if necessary.
6. Determine if additional improvements are needed based on the updated collection system model.

Areas selected for comprehensive I/I reduction in the Jones Falls Sewershed include Meter Basins BC02, BC03, BC04 and BC09. These meter basins and all structural recommendations are shown on **Map 6-1**.

The capacity improvements that address Items 1 and 2 above will be implemented by the County are described as follows:

- I/I reduction through rehabilitation - Perform comprehensive I/I rehabilitation of the public collection system in Meter Basins BC02, BC03, BC04 and BC09.

- In-Line Storage – Seal manholes and increase the hydraulic grade line (HGL) in the sewer segments upstream of the sealed manholes.

6.15 Corrective Action Implementation Schedule (CD Ref. P.10.Cvi)

The recommended improvements to the Jones Falls Sewershed's collection system which are contained in this SRRR Plan are estimated to be completed within six (6) years of the EPA and MDE's approval of this Plan per Paragraph 10.B. of the CD.

6.16 Corrective Action Recommendation Plan Cost Estimate (CD Ref. P.10.C.vi)

To estimate the corrective action costs, unit costs for the recommended corrective actions were utilized from Table 4-5 from the Baltimore County SRRR Plan Guidelines to develop the estimates provided in this report.

The estimated cost to implement the corrective actions identified in this report is $28,300,000. **Table 6-16.1 – Cost Estimate For All Corrective Action Improvements** summarizes these corrective action costs for the Jones Falls Sewershed. Detailed cost estimates by Meter Basin are provided in **Table 6-16.2** in **Appendix Q** of this report.

Table 6-16.1
Jones Falls SRRR: Corrective Action Recommendation Plan
COST ESTIMATE FOR ALL CORRECTIVE ACTION IMPROVEMENTS

Item	Total Cost
Capacity Recommendations (Basins 02, 03, 04, 09)	
Pipe Rehabilitation	$ 8,110,964.00
Manhole Rehabilitation	$ 2,144,092.00
Subtotal:	$ 10,255,056.00
Structural Recommendations	
Pipe	$ 5,842,586.00
Lateral	$ 2,808,960.00
Manholes	$ 1,249,145.00
Subtotal:	$ 9,900,691.00
Engineering, Construction Inspection, Administration, Contingency (40%):	$ 8,062,298.80
Total Estimated Cost:	$ 28,218,045.80
Cost:	$ 28,300,000.00

Map 6-1 shows the collection system improvements that have been completed in the Jones Falls Sewershed as well as the corrective actions that have been recommended in this report.

EXECUTIVE SUMMARY

The Long Term Capacity/Peak Flow Management Evaluation (LTC/PFME) Report provides the analysis of results from the model simulations of the Jones Falls Sewershed's collection system in response to dry- and wet-weather flows under existing and projected 2025 population and employment. The report also outlines the corrective actions necessary to eliminate capacity deficiencies and sanitary sewer overflows (SSOs) predicted by the hydraulic model simulations developed for the sewershed. This report also includes cost opinions for correcting model-predicted SSOs. Corrective actions and the associated cost estimates were developed for the 2-year/6-hour; 2-year/24-hour; 10-year/6-hour; 10-year/24-hour and the 20-year/24-hour design storms.

Before the corrective actions were implemented, each of the model-predicted SSOs was analyzed to determine if the limited network of conveyance system piping impacted the results. It was determined that a few of the model-predicted SSOs would be eliminated by adding additional collection system piping to the hydraulic model than were required by the Consent Decree (CD). The additional network of collection system nodes and piping impacted the modeling results of the five (5) design storms, but for the 2-year/6-hour design storm, the inclusion of the additional network eliminated all the model-predicted SSOs and therefore no corrective actions were necessary to accommodate that storm.

For the 2-year/24-hour design storm simulation, the recommended corrective actions include rehabilitation of sixteen (16) sewershed service areas (SSA) that exhibit excessive Inflow and Infiltration (I/I). It is also recommended to add capacity to the collection system by increasing the diameter of 1,377 LF of 10-inch diameter sewer to 18-inches and for five (5) manholes to be sealed to eliminate the model-predicted SSOs. The estimated cost for completing the recommendations made for the 2-year/24-hour design storm is approximately $9,601,000 in 2012 dollars.

For the 10-year/6-hour design storm simulation, in addition to the recommendations made for the 2-year/24-hour design storm, it is also recommended that 2,046 LF of 27-inch diameter relief sewer be constructed and six (6) additional manholes be sealed to eliminate all model-predicted SSOs for this design storm. The estimated cost for completing the recommendations made for the 10-year/6-hour design storm is approximately $10,753,000 in 2012 dollars.

For the 10-year/24-hour design storm simulation, in addition to the recommendations made for the 10-year/6-hour design storm, it is recommended that 11,577 LF of 10-inch to 30-inch diameter relief sewer be constructed and eighty-nine (89) additional manholes be sealed. The estimated cost for implementing the recommendations made for the 10-year/24-hour design storm is approximately $16,364,000 in 2012 dollars.

For the 20-year/24-hour design storm, in addition to the recommendations made for the 10-year/24-hour design storm, it is recommended that 1,915 LF of 21-inch to 30-inch diameter relief sewer be constructed and twenty-two (22) additional manholes be sealed. The estimated cost for completing the recommendations made for the 20-year/24-hour design storm is approximately $17,258,000 in 2012 dollars.

A table summarizing the recommended improvements for each design storm is provided below:

SUMMARY OF RECOMMENDED HYDRAULIC IMPROVEMENTS

Design Storm	Meter Basins to be Rehabilitated	SSAs to be Rehabilitated	Length of Relief Sewer (LF)	Length of Upsized Sewer (LF)	Manholes to be Sealed	Cost Estimate
2-year/6-hour	0	0	0	0	0	$0
2-year/24-hour	4	16	0	1,377	5	$9,601,027
10-year/6-hour	4	16	2,046	1,377	11	$10,753,255
10-year/24-hour	4	16	13,603	1,377	100	$16,364,322
20-year/24-hour	4	16	15,518	1,377	122	$17,257,718

During the five (5) design storms previously mentioned, the pumping stations (Buchanan, Stanton Woods, Templegate and Stevenson) and the force mains which convey the flow from these pumping stations to the gravity collection system where the pumping stations discharge into the Jones Falls Sewershed's collection system are capable of handling the dry- and wet-weather flows under both baseline and future flow conditions.

Boundary conditions, which represent the flow level expected, have been applied to the model at the model's connection points with the City of Baltimore's collection system. The existing boundary conditions were used for the baseline and future flow scenarios.

The Jones Falls Sewershed has two non-pumping station SSOs, SSO 113 and SSO 120, which were modeled as being open during baseline conditions and closed with the rehabilitation improvements in future flow conditions during all five (5) design storms.

1.0 INTRODUCTION

1.1 Sewershed Information

The Jones Falls Sewershed encompasses approximately 21 square miles, as depicted on **Map 1.1**. The Jones Falls Sewershed is located in the north-central portion of Baltimore County. The boundaries of the sewershed are roughly York Road to the east, Reisterstown Road to the west, the City-County line to the south, and Seminary Avenue and Greenspring Valley Road to the north. The development within the Jones Falls Sewershed is primarily residential with some areas of industrial, commercial and institutional development. The most significant area of commercial and institutional development is located along York Road corridor, between Timonium Road and Seminary Avenue. Areas of institutional development include Towson University, Saint Joseph's Medical Center, the Sheppard Pratt Health System and the Greater Baltimore Medical Center.

Sanitary flow generated in the County's Jones Falls Sewershed flows into the City of Baltimore's Jones Falls Sewershed at several locations as shown on **Map 1.1**. The current sewershed population within the County is approximately 90,000 residents and the projected population for Year 2025 is expected to increase slightly to approximately 99,000 residents, representing an increase of approximately 10 percent. The current sewershed employment is approximately 104,000 and the projected employment for Year 2025 is also expected to increase slightly to approximately 107,000 workers.

The Jones Falls Sewershed includes over 1,124,000 linear feet (LF) of circular gravity sewer ranging in size from 6- to 48-inches in diameter; approximately 6,200 manholes and other sewer structures; and approximately 19,000 LF of force main and pressure sewer. Four (4) pumping stations are also located within the sewershed. These stations include: the Buchanan Road Pumping Station; the Stanton Woods Pumping Station; the Templegate Pumping Station; and the Stevenson Pumping Station. The locations of these pumping stations are depicted on **Map 1.1**.

There are two (2) non-pumping station SSOs constructed in the Jones Falls Sewershed collection system: SSO 113 (Marnat Road) and SSO 120 (Charles Street Avenue). The location of these non-pumping station SSOs are depicted on **Map 1.1.**

2.0 HYDRAULIC MODELING SUMMARY

2.1 Model Development and Calibration

Dry-weather flow and wet-weather flow conditions were input into the calibrated model and were based on the data gathered during two (2) separate flow monitoring programs. One monitoring period consisted of the installation of twenty-six (26) flow meters that were installed in the collection system from February 1, 2008 through November 30, 2008. These flow meters are referred to as "County Meters". In addition to the flow meters installed by the County, data from six (6) flow meters installed as part of the City of Baltimore's Jones Falls Sewershed flow monitoring program were also utilized. These meters were located along or near the City-County line. The second monitoring period for these flow meters was from May 9, 2006 through May 18, 2007. These flow meters are referred to as the "Boundary Meters". Refer to **Map 1.1** for locations of the County and Boundary Meters.

The calibrated model was used to evaluate the County's collection, pumping and transmission systems to determine where improvements are needed to eliminate SSOs and prevent model-predicted SSOs from occurring.

The Model Development and Calibration Report for the Jones Falls Sewershed Hydraulic Model includes a detailed discussion of the calibration criteria. The dry-weather calibration criteria was met for volume for all but one of the flow meters and the peak flow criteria was met for twenty-seven (27) of the thirty-two (32) flow meters. For the wet-weather calibration, the criteria for volume was met for 84 percent of the modeled storms and the peak flow criteria met for 70 percent of the modeled storms. The model's calibration was impacted by the discovery of a diversion of flow into the Jones Falls Sewershed through the valve controlling flow from the Texas Pumping Station. This valve was not closed completely during most of the flow monitoring. This valve is normally in the closed position and flow from the Texas Pumping Station travels to the Longquarter Pumping Station and does not enter the Jones Falls Sewershed. Occasionally, Baltimore County's maintenance staff will open this valve allowing flow from Texas Pumping Station to enter the Jones Falls Sewershed upstream of where Flow Meter BC03 was installed. From review of the flow metering data, it appears that flow was being by-passed through this connection during most of the flow metering period. The Texas bypass could have caused the monitored flow data to be interpreted as having higher levels of base infiltration (BI) than was actually occurring. This BI was used to develop the per capita flow and diurnal flow patterns for the hydraulic model. Therefore, the hydraulic model can potentially be over-estimating the flow in the collection system

resulting in model predicted SSOs. The hydraulic model development and calibration is discussed in more detail in the Model Development and Calibration Report for the Jones Falls Sewershed Hydraulic Model.

Boundary conditions have been applied to the model at the model's connection points with the City of Baltimore. These boundary conditions are time series data for each design storm event that were provided by Baltimore City based on the City's modeling of the Jones Falls collection system. The boundary conditions represent the flow level expected at the connection points between the City of Baltimore and Baltimore County. The boundary conditions were provided on June 9, 2011 and were applied for both baseline and future flow conditions. The boundary conditions time series used in the hydraulic model for each of the five (5) design storms can be found in Appendix HCAR-3, Boundary Conditions Time Series.

2.2 Dry-Weather Flow Capacity Assessment Summary

Dry-weather flow simulations were run under both baseline and future (Year 2025) flow conditions to assess the collection system's performance. Baseline conditions are defined as the conditions that were in effect at the time of completion of the flow monitoring. No model predicted overflows or surcharges occur during dry-weather under either baseline or future conditions; however, some pipe segments are flowing more than 50 percent full during dry-weather conditions. For details of the model-predicted performance of the collection system under dry-weather conditions, please refer to the Model Development and Calibration Report for the Jones Falls Sewershed Hydraulic Model.

Data used in modeling the pumping stations include system and pump curves; wet-well storage; pump on and off elevations; and the force main data from the pumping station to the gravity collection system. The flow from the contributing SSAs was directed into the pumping station's wet-well. The future pumping station capacities are capable of passing, at a minimum, the flows under ultimate build-out of the area draining to the pumping station. In the case of the Stevenson Pumping Station, the capacity was set by the flow necessary to maintain a minimum velocity of 2-feet per second in the force main. The Buchanan Road, Stanton Woods and Templegate Pumping Stations are currently being evaluated in separate engineering evaluation and condition assessment (EE/CA) studies and future improvements will be recommended for those pumping stations. In the hydraulic model, the baseline and the future conditions were modeled with the existing pump curve and pump information. The pumping stations are capable of handling the dry- and wet-weather flows under both baseline and future flow conditions. A summary of the pumping station data is presented in the following table:

TABLE 2.1
PUMPING STATION SUMMARY

	Buchanan Road P.S.	Templegate P.S.	Stevenson P.S.	Stanton Woods P.S.
SSA Draining to PS	45-55-04-02	45-68-16-02	45-68-16-02	45-68-15-03
Meter Basin	TSJF01	BC26	BC26	BC26
Year 2025 Population	261	569	383	347
Baseline P.S. Capacity (GPM)	200	118	170	252
Future P.S. Capacity (GPM)	200	300	180	252
Pump On Elevation	318.50	468.50	450.87	451.75
Pump Off Elevation	315.50	465.50	447.37	448.25
Type of Pump - Baseline	Constant Speed	Constant Speed	Constant Speed	Constant Speed
Type of Pump - Future	Constant Speed	VFD or Constant Speed	Constant Speed	Constant Speed
Baseline Design Point	200 GPM at 78 Ft	118 GPM at 82 Ft	180 GPM at 54 Ft	252 GPM at 90 Ft

There are no current plans to upgrade force mains within the Jones Falls collection system. The force mains which convey flow from the pumping stations to the gravity collection system where the pumping stations discharge are capable of handling the dry- and wet-weather flows in the hydraulic model.

During the baseline conditions scenarios, non-pumping station SSOs 113 and 120 have been modeled as being open, without rehabilitation, which were the conditions in effect during the flow monitoring. However, both non-pumping station SSOs were removed during all future flow conditions scenarios. Also, rehabilitation to the SSAs where non-pumping station SSOs 113 and 120 are located, have only been applied during the future flow conditions scenarios. Neither of the non-pumping station SSOs activate during dry-weather flow conditions. Under baseline conditions, the population estimate is approximately 90,000 residents and the Year 2025 employment estimate is approximately 104,000 workers.

Future (Year 2025) flow conditions incorporate the increased projections in population and employment. The Year 2025 population estimate is approximately 99,000 residents and the Year 2025 employment estimate is approximately 107,000 workers. The future conditions also account that Non-Pumping Stations SSOs 113 (Marnat Road) and 120 (Charles Street Avenue) will be closed. The Paragraph 7 projects for the rehabilitation of SSAs 45-10-22-01 and 45-58-06-02, which drain to SSOs 113 and 120 respectively, are incorporated in the future flow conditions model.

Appendices HCAR-4A, HCAR-4B, HCAR-5A and HCAR-5B lists each pipe segment in the model and the simulated peak flow, full pipe capacity, percent of capacity used under baseline and future (Year 2025) flow conditions.

An analysis was conducted to determine the maximum flow from the Texas Pumping Station that the collection system could convey without causing a model-predicted SSO under dry-weather flow conditions. It was determined that approximately 13 MGD could be by-passed into the Jones Falls Sewershed without causing a dry-weather model-predicted SSO. The flow from the Texas Pumping Station was input as a constant flow and the model simulations were completed using several days of dry-weather. When the model simulation is completed with a flow of 14 MGD from the Texas Pumping Station, an SSO is predicted to occur at MH 22012.

2.3 Wet-Weather Flow Capacity Assessment Summary

Model simulations using the calibrated model were completed for five (5) synthetic rain events to provide an understanding of the collection system's response and performance during wet-weather flow. As part of the hydraulic capacity assessment, a Return Period Analysis (RPA) was conducted for both baseline and future flow conditions. The RPA identified the minimum storm that can potentially cause a model-predicted SSO within a portion of the collection system. The RPA simulation was completed using five (5) design storm events: the 2-year/6-hour storm; 2-year/24-hour storm; 10-year/6-hour storm; 10-year/24-hour storm and the 20-year/24-hour storm. The RPA is discussed in detail in the Hydraulic Capacity Assessment Report for the Jones Falls Sewershed Hydraulic Model.

Components of the wastewater collection system that exhibit hydraulic restrictions have also been identified for both baseline and future (Year 2025) flow conditions. This analysis is performed by InfoWorks, where the slope of each sewer segment is compared to the slope of the hydraulic grade line at peak flow. A surcharged sewer with a pipe slope that is flatter than the slope of the hydraulic grade line indicates that the sewer is restricting flow. In addition to the hydraulic grade line and pipe slope comparison, the pipe capacity is taken into account to classify segments of pipes as having hydraulic

restrictions. The hydraulic capacity assessment is discussed in detail in the Hydraulic Capacity Assessment Report for the Jones Falls Sewershed Hydraulic Model. A Pipe Capacity and a Manhole Surcharge Summary under wet-weather flow conditions is provided in Appendix LTC-1.

3.0 MODELING APPROACH FOR DETERMINING CORRECTIVE ACTIONS

3.1 Procedure and Assumptions

In determining the corrective actions recommended to eliminate model-predicted SSOs, several alternatives have been considered. The preferred method to eliminate model-predicted SSOs is to reduce inflow and infiltration (I/I) in the collection system(s) impacting an SSO by completing a comprehensive rehabilitation program of the public sanitary sewers and manholes within the identified SSAs. Rehabilitation of the sewers and manholes were modeled by reducing the Manning's "n" value of the pipe roughness coefficient to 0.01, assuming sewer rehabilitation was completed using cured-in-place-pipe (CIPP). Rehabilitation would also reduce the BI and the rainfall-dependent inflow and infiltration (RDII). Following the Baltimore County SRRR Guidelines, it was assumed that rehabilitation would reduce the BI by 23 percent, the total RDII volume by 35 percent and the peak RDII flow by 37 percent. Because of the complexity of the sanitary sewer systems, reduction of 35 percent in total RDII volume and reduction of 37 percent of the peak RDII flow were not always achieved. In these cases, a reduction of 36 percent of the capture coefficient (R value) was then used. The reduction in the R value will not always impact peak and volumes the same. For instance, when the entire sewer network within an SSA is rehabilitated using CIPP lining, the friction losses are reduced and therefore an increase in the velocity and reduction in the time of concentration of the sewerage can often be experienced. The increased velocities will sometimes correlate to a lesser extent in the decrease of peak flows than compared to the RDII volume.

Under all future flow condition scenarios, non-pumping station SSOs 113 and 120 are modeled as closed, and the Paragraph 7 projects for the rehabilitation of SSAs 45-10-22-01 and 45-58-06-02, which drain to SSOs 113 and 120 respectively, are incorporated in the future conditions model. Additionally, the pumping stations have been modeled with the ultimate pumping capacities under future conditions.

If rehabilitation of the wastewater collection system was not sufficient to eliminate model-predicted SSOs, then providing additional corrective actions within the collection system was considered. The following corrective actions were considered, listed in order of preference:

- In-line storage (i.e. seal manholes and increase the hydraulic grade line (HGL) in the pipe segments upstream of the sealed manholes)
- Increase pipe capacity and system storage by increasing the size of the sewer pipe.
- Construction of a relief sewer to add capacity and temporarily store peak wet-weather flow in the collection system

- Off-line storage (i.e. construction of a wastewater equalization storage facility)

Additionally, relevant Sanitary Sewer Evaluation Survey (SSES) data for the collection system was reviewed, including CCTV videos, the results of SSES investigations, smoke and dyed-water testing results, night-time flow isolation monitoring and sonar and laser profiling data to identify areas of sedimentation, sources of I/I and pipe defects.

3.2 Design Storm Events

One of the requirements of the CD is to complete a corrective actions analysis for each of the five (5) synthetic design storms. These design storms include the following:

TABLE 3.1
DESIGN STORM DATA

Design Storm	2-Year/ 6-Hour Storm	2-Year/ 24-Hour Storm	10-Year/ 6-Hour Storm	10-Year/ 24-Hour Storm	20-Year/ 24-Hour Storm
Total Rainfall (in)	2.37	3.38	3.50	5.19	5.80
*Peak Intensity (in/Hour)	1.84	4.63	2.71	7.11	7.95
**Average Intensity (in/Hour)	0.39	0.14	0.58	0.22	0.24

*Peak Intensity based on 0.1 hr increment
**Average Intensity based on entire duration of the storm

The Soil Conservation Service (SCS) Type II rainfall distribution, developed by the U.S. Natural Resources Conservation Service (NRCS), was used. Distribution increment is important in the representation of the peak intensity even if the same rainfall distribution is implemented. For instance, a peak intensity computed using a 0.1 hour increment will be higher than the peak intensity computed using a 0.5 hour increment. During a larger increment (0.5 hour) the peak is averaged over a larger period which will result in a lower peak intensity than that derived using a 0.1 hour time increment. Both increments will use the same amount of total rainfall and will have the same average rainfall and therefore the results will be comparable.

4.0 MODEL-PREDICTED CORRECTIVE ACTION SUMMARY (2-YEAR/6-HOUR DESIGN STORM EVENT)

4.1 Corrective Action Summary

Using future (Year 2025) flow conditions for the collection system, the model predicts that there will be only two (2) overflows during the 2-year/6-hour design storm. All of the other model-predicted overflows listed in the Hydraulic Capacity Assessment Report were eliminated by including additional 8-inch diameter collection system pipes to the model and by revising the flow loading points. The addition of these 8-inch diameter pipes and revisions to the flow loading points eliminate most false SSOs that were caused by isolated loading points rather than actual collection system deficiencies. The two (2) model-predicted SSOs that remain are located upstream of Non-Pumping Station SSO 113. These model-predicted SSOs are judged to be false SSOs, caused by a hydraulic restriction within the City of Baltimore's collection system and partly by having only one (1) loading point within this SSA, causing an over-prediction of flow in one (1) sewer segment included in the model. Refer to the Hydraulic Capacity Assessment Report for a discussion of the collection system performance under baseline and future flow conditions.

5.0 MODEL-PREDICTED CORRECTIVE ACTION SUMMARY (2-YEAR/24-HOUR DESIGN STORM EVENT)

5.1 Corrective Action Summary

Using future (Year 2025) flow conditions, the model predicts that seven (7) manholes overflow during the 2-year/24-hour design storm. The combined overflow volume is approximately 0.4105 MG. **Table 5.1** shows the model-predicted overflow volumes and the manholes where SSOs are predicted to occur for the 2-year/24-hour design storm simulation. Refer to the Hydraulic Capacity Assessment Report for a discussion of the collection system performance under baseline and future conditions. The longitudinal profiles for the model-predicted SSOs of the 2-year, 6-hour; 10-year, 6-hour and 20-year 24-hour design storm events that caused a model-predicted SSO are provided in Appendices HCAR-8A and HCAR-8B.

TABLE 5.1
FUTURE CONDITIONS MANHOLE PREDICTED SSO VOLUMES (MG) – 2-YEAR/24-HOUR DESIGN STORM

Manhole No.	SSA	Meter Basin ID	Overflow Volume
1583	45-10-22-02	JFWR31	0.0053
1585	45-10-22-02	JFWR31	0.0030
6954	45-59-16-01	BC11	0.0374
22010	45-59-18-00	BC07	0.1235
22012	45-59-19-00	BC07	0.1455
22013	45-59-19-00	BC07	0.0802
44219	45-71-00-00	BC22	0.0156
TOTAL			0.4105

After several model-predicted SSOs were eliminated after the additional collection system network was included into the model, the remaining SSOs were investigated. Two (2) model-predicted SSOs located upstream of Non-Pumping Station SSO 113 are judged to be false SSOs, caused by a hydraulic restriction within the City of Baltimore's collection system and partly by having only one loading point within this SSA, causing an over-prediction of flow in the one (1) sewer segment included in the model.

Except for the overflow at Manhole (MH) 44219, the model-predicted overflows in BC02, BC03, BC07 and BC11 listed in **Table 5.1** could be eliminated by simulating the rehabilitation of the wastewater collection system within four (4) Flow Meter Basins identified as exhibiting excessive I/I. The Meter Basins identified as exhibiting excessive I/I that have been simulated with rehabilitation are: BC02, BC03, BC04 and BC09. The cost of rehabilitation of these four (4) meter basins is approximately $8,920,025 in 2012 dollars.

Those four (4) meter basins are composed of the following sixteen (16) SSAs:

Flow Meter Basin	SSA
BC02	45-59-34-00
BC03	45-59-33-00
BC04	45-59-30-01 45-59-30-02 45-59-30-03
BC09	45-59-21-00 45-59-22-00 45-59-23-00 45-59-24-00 45-59-25-00 45-59-26-00 45-59-27-00 45-59-28-00 45-59-29-00 45-59-31-00 45-59-32-00

To eliminate the model-predicted overflow at MH 44219, it is recommended to increase the sewer size of five (5) sewer segments in Meter Basin BC22 from 10-inches to 18-inches in diameter, totaling 1,377 LF from MH 44216 to MH 44212, as shown on **Map 5.1**. The estimated cost for the pipe replacement is approximately $674,730 in 2012 dollars.

The model-predicted SSOs within Meter Basin JFWR31 can be eliminated by sealing five (5) manholes. These manholes include: MH1582; MH1583; MH1584; MH1585 and MH 29858.

The proposed hydraulic improvements for the 2-year/24-hour design storm are depicted on **Map 5.1**. The meter basins and SSAs to be rehabilitated are listed in Appendix LTC-2A, and the manholes to be sealed are listed in Appendix LTC-2B. Sewer segments where capacity improvements are recommended are listed in Appendix LTC-2C.

5.2 Corrective Action Cost Estimate Summary

The total estimated cost for the rehabilitative and capacity improvements required to eliminate model-predicted SSOs during the 2-year/24-hour design storm under future

(Year 2025) flow conditions is approximately $9,601,000 in 2012 dollars, as indicted in **Table 5.2**. A detailed breakdown of the cost estimate is provided in Appendix LTC-3A.

TABLE 5.2
FUTURE CONDITIONS MODEL-PREDICTED CORRECTIVE ACTION COST ESTIMATE FOR THE 2-YEAR/24-HOUR DESIGN STORM

6.0 MODEL-PREDICTED CORRECTIVE ACTION SUMMARY (10-YEAR/6-HOUR DESIGN STORM EVENT)

6.1 Model-Predicted Corrective Actions

In the future (Year 2025) flow conditions, the model predicts that seven (7) manholes overflow during the 10-year/6-hour design storm. The combined overflow volume is approximately 0.6526 MG. **Table 6.1** shows the model-predicted overflow volumes and the manholes where the SSOs are predicted to occur for the 10-year/6-hour design storm simulation.

TABLE 6.1
FUTURE CONDITIONS MANHOLE PREDICTED SSO VOLUMES (MG) – 10-YEAR/6-HOUR DESIGN STORM

Manhole No.	SSA	Meter Basin ID	Overflow Volume (MG)
1583	45-10-22-02	JFWR31	0.0089
1585	45-10-22-02	JFWR31	0.0063
6954	45-59-16-01	BC11	0.0597
22010	45-59-18-00	BC07	0.1909
22012	45-59-19-00	BC07	0.2238
22013	45-59-19-00	BC07	0.1286
44219	45-71-00-00	BC22	0.0344
TOTAL			0.6526

After several model-predicted SSOs were eliminated by adding the additional network of collection system nodes and piping into the model, the remaining SSOs were investigated. Two (2) model-predicted SSOs located upstream of Non-Pumping Station SSO 113 are judged to be false SSOs caused by a hydraulic restriction within City of Baltimore's collection system and partly by having only one (1) loading point within this SSA, causing an over-prediction of flow in the one (1) sewer segment included in the model.

To eliminate the remaining model-predicted SSOs during the 10-year/6-hour design storm simulation, it is recommended that 2,046 LF of 27-inch diameter relief sewer be installed and that six (6) manholes be sealed, in addition to the recommendations made for the 2-year/24-hour design storm. The recommended relief sewer would parallel the sewer between manholes 22009 and 6950. The manholes to be sealed are 1580, 1581, 6883, 44212, 44213 and 53270.

The proposed hydraulic improvements for the 10-year/6-hour design storm are depicted on **Map 6.1** and the details can be found in Appendices LTC-2A, LTC-2B, LTC-2C and LTC-2D.

6.2 Corrective Action Cost Estimate Summary

The total estimated cost for the hydraulic improvements required to eliminate model-predicted SSOs during the 10-year/6-hour design storm for future flow conditions is approximately $10,753,000 in 2012 dollars, as indicated in **Table 6.2**. A detailed breakdown of the estimated cost to complete this work is provided in Appendix LTC-1B.

TABLE 6.2

7.0 MODEL-PREDICTED CORRECTIVE ACTION SUMMARY (10-YEAR/24-HOUR DESIGN STORM EVENT)

7.1 Model-Predicted Corrective Actions

Using future (Year 2025) flow conditions, the model predicts that nineteen (19) manholes overflow during the 10-year/24-hour design storm. The combined overflow volume is approximately 2.8663 MG. **Table 7.1** shows the model-predicted overflow volumes and the manholes where the SSOs are predicted to occur for the 10-year/24-hour design storm simulation.

TABLE 7.1
FUTURE CONDITIONS MANHOLE PREDICTED SSO VOLUMES (MG) – 10-YEAR/24-HOUR DESIGN STORM

53270	45-69-00-00	BC22	0.0087
TOTAL			2.8663

After several model-predicted SSOs were eliminated by adding additional collection system network of nodes and piping to the model, the remaining SSOs were investigated. Two (2) model-predicted SSOs located upstream of Non-Pumping Station SSO 113 are judged to be false SSOs caused by a hydraulic restriction within the City of Baltimore's

collection syatem and partly by having only one (1) loading point within this SSA, causing an over-prediction of flow in the one (1) sewer segment included in the model.

To eliminate the remaining model-predicted SSOs during the 10-year/24-hour design storm, improvements are recommended in addition to those recommendations made for the 10-year/6-hour design storm. Construction of relief sewers totaling 11,557 LF ranging in size from 10- to 30-inches in diameter and sealing of eighty-nine (89) manholes are recommended in addition to the recommendations made for the 10-year/6-hour design storm.

The proposed rehabilitative and capacity improvements for the 10-year/24-hour design storm are depicted on **Map 7.1** and the details can be found in Appendices LTC-2A, LTC-2B, LTC-2C and LTC-2D.

7.2 Corrective Action Cost Estimate Summary

The total estimated cost for the hydraulic improvements to eliminate model-predicted SSOs during the 10-year/24-hour design storm is approximately $16,364,000 in 2012 dollars, as indicated in **Table 7.2**. A detailed breakdown of these costs is provided in Appendix LTC-3C.

8.0 MODEL-PREDICTED CORRECTIVE ACTION SUMMARY (20-YEAR/24-HOUR DESIGN STORM EVENT)

8.1 Model-Predicted Corrective Actions

In the future (Year 2025) flow conditions, the model predicts that twenty-four (24) manholes overflow during the 20-year/24-hour design storm. The combined overflow volume is approximately 4.2631 MG. **Table 8.1** shows the model-predicted overflow volumes and the manholes where the SSOs are predicted to occur for the 20-year/24-hour design storm simulation.

TABLE 8.1
FUTURE CONDITIONS MANHOLE PREDICTED SSO VOLUMES (MG) – 20-YEAR/24-HOUR DESIGN STORM

After several model-predicted SSOs were eliminated by adding the additional collection system network nodes and piping into the model, the remaining SSOs were investigated. Two (2) model-predicted SSOs located upstream of Non-Pumping Station SSO 113 are judged to be false SSOs caused by a hydraulic restriction within the City of Baltimore's collection system and partly by having only one (1) loading point within this SSA, causing an over-prediction of flow in the one (1) sewer segment included in the model.

To eliminate the remaining model-predicted SSOs during the 20-year/24-hour design storm, improvements are recommended in addition to those made for the 10-year/24-hour design storm. Construction of relief sewers totaling 1,915 LF ranging from 21- to 30-inches in diameter and sealing of twenty-two (22) manholes are recommended in addition to the recommendations made for the 10-year/24-hour design storm. The additional cost for the 20-year/24-hour storm improvements above the improvements for the 10-year/24-hour storm is approximately $893,000 in 2012 dollars.

The proposed hydraulic improvements for the 20-year/24-hour design storm are depicted on **Map 8.1** and the details can be found in Appendices LTC-2A, LTC-2B, LTC-2C and LTC-2D.

8.2 Corrective Action Cost Estimate Summary

The total estimated cost for hydraulic improvements to eliminate model-predicted SSOs during the 20-year/24-hour design storm is approximately $17,258,000 in 2012 dollars, as indicated in **Table 8.2**. A detailed breakdown of these costs is provided in Appendix LTC-1D.

9.0 SUMMARY OF CORRECTIVE ACTION ANALYSES

This report evaluates the corrective actions necessary to eliminate model-predicted SSOs within the Jones Falls Sewershed. This report also provides the analysis of results from the model simulations of the collection system in response to dry- and wet-weather flows under existing and proposed 2025 population and employment. Also included are cost opinions to complete the recommended improvements for each model-predicted overflow condition. Corrective actions and the associated costs were determined for the 2-year/6-hour; 2-year/24-hour; 10-year/6-hour; 10-year/24-hour and the 20-year/24-hour synthetic design storm simulations under future (Year 2025) conditions.

For the 2-year/6-hour design storm, there are no model-predicted SSOs. For the 2-year/24-hour design storm, the recommendations include rehabilitation of sixteen (16) SSAs that exhibit excessive I/I, adding capacity to the collection system by increasing the size of 1,377 LF of 10-inch diameter sewer to 18-inches in diameter, and sealing of five (5) manholes. The estimated cost for completing the recommendations for the 2-year/24-hour design storm is approximately $9,601,000 in 2012 dollars.

For the 10-year/6-hour design storm, in addition to the recommendations made for the 2-year/24-hour design storm, it is also recommended that 2,046 LF of 27-inch relief sewer be constructed and six (6) additional manholes sealed to eliminate all of the model-predicted SSOs for this design storm. The estimated cost for completing the recommendations for the 10-year/6-hour design storm is approximately $10,753,000 in 2012 dollars.

For the 10-year/24-hour design storm, in addition to the recommendations made for the 10-year/6-hour design storm, it is recommended that 11,577 LF of 10-inch to 30-inch diameter relief sewer be constructed and eighty-nine (89) additional manholes be sealed. The estimated cost for implementing the recommendations made for the 10-year/24-hour design storm is approximately $16,364,000 in 2012 dollars.

For the 20-year/24-hour design storm, in addition to the recommendations made for the 10-year/24-hour design storm, it is recommended that 1,915 LF of 21-inch to 30-inch diameter relief sewer be constructed and twenty-two (22) additional manholes be sealed. The estimated cost for completing the recommendations for the 20-year/24-hour design storm is approximately $17,258,000 in 2012 dollars.

Table 9.1 summarizes the recommended improvements for each design storm. A summary of the hydraulic improvement by meter basin is provided in Appendix LTC-4.

TABLE 9.1
SUMMARY OF RECOMMENDED HYDRAULIC IMPROVEMENTS

Baltimore County Department of Public Works
Design Manual

WASTEWATER COLLECTION AND PUMPING

I. GENERAL

A. Purpose and Scope

This document contains the minimum design criteria, information and guidance to properly design the components of the Baltimore County sanitary sewer system. This information outlines the approach, requirements, considerations and hydraulic calculations used in the design of the components of the gravity sewers and pumping stations. The Baltimore County Department of Public Works has the complete authority for the design, construction, operation, and maintenance of the public sewer collection system within its political boundaries.

B. Applicability

While the requirements described for the various components of sewer design will include and cover the majority of the conditions encountered, there is no intention to relieve the Engineer of responsibility to recognize when conditions are not favorable for the application of standards. In the preparation of the contract documents, the Engineer shall take into account such matters as constructability, system maintenance, and environmental impacts. The Engineer shall be continually alert to conditions that cannot be satisfied by the application of the standard criteria.

C. References

All construction plans and specifications for the extension or rehabilitation of the sanitary sewer system within the State of Maryland are subject to the guidelines contained in the latest edition of the *Maryland Department of the Environment's Design Guidelines for Sewerage Facilities*. It is the responsibility of the Engineer to refer to this document.

D. Glossary

The following abbreviations and definitions are beneficial in the reading and understanding of this design section.

Abbreviations

ACI	American Concrete Institute
ACP	Asbestos Cement Pipe
ANSI	American National Standards Institute
ASTM	American Society for Testing and Materials

BGE	Baltimore Gas and Electric Company
CAD	Computer-aided Drafting
CIP	Cast Iron Pipe
COMAR	Code of Maryland Regulations
DIP	Ductile Iron Pipe
GIS	Geographic Information System
GPAD	Gallons Per Acre Per Day
GPCD	Gallons Per Capita Per Day
GPM	Gallons Per Minute
HDD	Horizontal Directional Drilling
HDPE	High Density Polyethylene
HS-20, H-20	Truck Loading Designations
LPSS	Low Pressure Sewer System
MCC	Motor Control Center
MDE	Maryland Department of the Environment
MGD	Million Gallons Per Day
MOSH	Maryland Occupational Safety and Health
NSF	National Sanitation Foundation
NPSHR	Net Positive Suction Head Required
OSHA	Occupational Safety and Health Administration
PCCP	Prestressed Concrete Cylinder Pipe
PLC	Programmable Logic Controller
PRV	Pressure Reducing Valve
PSI	Pounds Per Square Inch
PVC	Polyvinyl Chloride
RCP	Reinforced Concrete Pipe
SCADA	Supervisory Control and Data Acquisition
SDR	Standard Dimension Ratio
SHA	State Highway Administration
SHC	Sewer House Connection
USGS	United States Geological Survey
VCP	Vitrified Clay Pipe
VFD	Variable Frequency Drive
WWTP	Waste Water Treatment Plant

Definitions

Engineer: A professional engineer, registered in the State of Maryland, who is responsible for the design of the project.

E. Design Objectives

The objective of these design standards is to provide a sanitary sewer system that safely collects and transports wastewater without harm to human health or environment; requires a minimal amount of maintenance; provides reliable service; and is cost effective.

F. Special Wastes

The Baltimore County sanitary sewer system is designed to collect and transport domestic wastewater. Any waste that differs in physical, biological, or chemical composition from normal domestic wastewater will not be allowed to be discharged into the sanitary sewer without written approval from the Department of Public Works, Bureau of Utilities, Engineering and Regulation Division.

G. Limitations

It is not possible to include in these guidelines all features of design that are necessary to accomplish the development of construction documents for all projects. The topics addressed are limited to those that will help the Engineer perform most tasks in an efficient manner while complying with County practice.

H. Alternative to Gravity Systems

It is the policy of the Department of Public Works to promote the use of gravity sewer systems to the extent possible due to the reliability and low maintenance associated with gravity sewer systems. All proposals to use grinder pumps/low pressure sewer systems shall be approved by the Director of Public Works in accordance with approved policies.

II. PRELIMINARY DESIGN CONSIDERATIONS

A. Existing Conditions

An important initial step in the design process is to obtain all existing maps, drawings, surveys, boring logs, and other data containing pertinent information on existing conditions in the area being served. Possible sources of such information include the following:

- Baltimore County Department of Public Works
- Local, State, and Federal Agencies, such as: Soil Conservation Service and USGS
- Public Utilities
- Commercial Businesses and Private Companies
- Planning Board

B. Field Investigations

1. Field Surveys*:* Field surveys shall be performed. Depending on the magnitude and complexity of the project, subsurface information, such as soil borings, may be required. Topographic information shall show locations of all streets, buildings, pavements, sidewalks, vegetation, drainage channels, and other land surface features, such as utility manholes or structures, which may influence the design and layout of the collection or conveyance system. Information on existing utilities shall include the location of underground water lines, sanitary sewers, storm drains, gas mains, electric conduit, and similar facilities.

    a. Items to Include in Topographic Surveys:
        1) All buildings and other structures, within and immediately adjacent to the project limits, together with all improvements including wells, springs, septic tanks, drain fields, dry wells, etc.
        2) Property and right-of-way lines (proposed and existing) including right-of-way widths and identifying road names.
        3) Property information:
            - owner name(s)
            - deed and recording references including parcel number, lot number, subdivision name and record plat reference(s)
            - property pipes, monuments or markers
            - street address
        4) Roadway pavements, curb lines, driveway entrances, walkways, fences, walls, etc., including types of materials, widths, heights, and all other descriptive data.
        5) Guardrails, sign posts, retaining walls, traffic lights, and other features related to the roadway safety.
        6) Horizontal and vertical location of existing utilities, including but not limited to, water mains, valves, cap and blow-offs, vaults, fire

hydrants, water meters, cub stops, sewer mains, manholes, cleanouts, storm drains, storm drain inlets, culverts, gas mains, utility poles, telecommunication utilities, and other located utilities. These utilities shall include those that are overhead, surface and subsurface.

7) Trees:
   - Trees, 12-inches in diameter and larger within proposed rights-of-way, shall be individually located and identified by type.
   - For existing developed properties, all trees, regardless of size, shall be located and identified by size and type that exist on the landscaped area of the property including hedges, shrubs, flower beds, gardens, planting boxes, etc.
   - For trees whose foliage overhangs the right-of-way or construction strip, the extent and diameter of the foliage (fall line) shall also be shown.
   - The tree line shall be located, and general characteristics of the wooden area shall be given including approximate average size of the trees, density, and general type of trees represented.
8) Water courses, such as streams, springs, swales and ditch areas shall be shown and located including edge of water and bottom of stream/ditch elevations at the deepest section.
9) Vehicular access routes for off-road or undeveloped areas shall be identified for use during construction.
10) Mail boxes.
11) Curb cuts.
12) Railroad tracks, bridges and ballast.
13) In addition to the above items, the following shall also be shown in conjunction with the topography:
   - 100-year floodplain
   - Natural Resources District Boundary
   - wetlands
   - 25-foot wetland buffer
   - traverse points and references (capital projects)
   - existing and proposed drainage and utility easements
   - Chesapeake Bay Critical Area Boundary
14) Identify and reference construction drawing numbers of all existing and proposed water and sewer utilities within and adjacent to the project limits.
15) On projects requiring permanent structures (i.e., pumping stations, water booster stations, etc.), the extent of the area shown outside of the anticipated property or right-of-way shall be determined by the Engineer on a case-by-case basis but shall not be less than 100 feet.
16) In new developments, where the terrain is being transformed, most of the information shall be obtained directly from approved plans prepared to satisfy proposed improvements including curbs, storm drains, street rights of-way and lots, as taken from the record plat and

construction plans and shall show all existing features that are to remain undisturbed.

b. Method of Locating Topography:
   1) The method of locating topography shall be by field surveys utilizing the radial survey method, the GPS Real-Time Kinematic (RTK) method or the cross-section method.
   2) Aerial photogrammetry may not be used for the preparation of construction plans. The Baltimore County topographic information shown on the County geographical information system (GIS) shall not be utilized as topography for contract drawings.
   3) Surveys may not be performed while snow cover is present on the ground.

c. Existing and Proposed Contour Lines:
   For capital projects, existing and proposed contour lines shall be shown on the plans. Sufficient information shall be obtained in order to allow the contours to be shown at 2-foot intervals or less. In areas of steep slopes (greater than 20%), contours may be shown at 5-foot intervals with the approval of the Sewer Design Section. For developer projects, contours do not need to be shown within the proposed road right-of-way; however, the above requirements for capital projects apply to all other areas.

2. Survey Controls:

   a. All surveys shall be in accordance with *The Maryland Standards of Practice for Professional Land Surveyors and Property Line Surveyors,* as adopted March 3, 1995 and as amended.

   b. Control points shall be referenced to the Maryland Coordinate System (NAD83/1991) horizontally and based on the County's survey control system. All other control points, whether National Geodetic Survey or State Highway Administration, shall be permitted as long as they are in the National Geodetic Survey database and are either first or second order points. All control loops to sites shall have a minimum closure of 1:15,000. For capital projects, all control points shall be referenced in the field to three (3) fixed objects that will not be disturbed during the construction of the project. These objects shall be well identifiable points (such as a tack in a 36" *oak* tree in lieu of a 36" tree). Also, it is desirable that these reference points be within 100 feet of the control station where possible. All control points, with their corresponding coordinate values, shall be shown upon the plan sheets in their relative position to the project by scale. Values may be shown at the corresponding location of the point or in tabular form

   c. Vertical control shall be referred to the National Geodetic Vertical Datum of 1988 (NGVD '88) with local reference to the County's survey control

system or other designated bench marks available in the National Geodetic Survey database. A closed level loop shall be used to establish benchmarks on the site using a minimum of two known benchmarks to verify the elevations clearly shown and referenced in detail on the plans. For capital projects, a minimum of two (2) benchmarks shall be shown on each plan sheet. As the vertical datum has changed over the years, the Engineer shall not use elevations from as-built plans without field verification.

d. Survey baselines shall be extended for the full length of the project and a minimum of 200-linear feet beyond anticipated limits of work. Station equalities shall be shown for all common intersecting control points. Bearings and distances between control points shall be shown. Coordinates of all control points shall be either shown at the control point in a neat manner or in tabulation form on each plan sheet for which the control points occur.

3. Soil Conditions: For larger projects, the character of the soil in which sewers or pumping stations will be constructed should be determined. The presence of rock, unfavorable soil conditions, or high groundwater table should be clearly established. The soil bearing capacity should be determined as needed for designing footings. Soil tests used to determine the need for corrosion control include earth resistivity, ph, oxidation-reduction potential, and relative moisture content and shall be completed if required.

4. Corrosion: If metal pipe, structures, or appurtenances are to be buried, the need for corrosion control must be assessed. The need for corrosion control should be based on data obtained from corrosion surveys, operating records, visual observations, inspections, and tests of existing facilities in the area and from manufacturers recommendations.

5. Construction Survey:

   a. General: The County shall provide the necessary stakeout controls on the plans for setting the alignment, both horizontally and vertically, to construct the proposed public utility. The Developer shall provide the necessary stakeout controls on the plans for setting the alignment, both horizontally and vertically, to construct the proposed private utility.

   b. Sewer Mains: Dimensioning shall be shown for gravity sewers by providing a table listing the manholes with their respective numbers and coordinate values. Dimensioning shall be shown for sewer force mains and appurtenances in the same manner as for water mains.

C. Layout

1. Service Area: The requirement that an area be served by a gravity collection, conveyance system, or a pumping system will, in most cases, be determined by topography. Building and grade elevations shall be evaluated for gravity drainage to an existing or proposed sewer collection system. In addition to topographic considerations, natural boundaries (like waterways, rivers, streams, etc.), and property lines of Federal, State, and local property also play a role in determining the size and limits of service areas.

2. Sewer System: The development of final sewer plans must await a final site plan, the completion of field surveys, and, to some extent, the establishment of floor grades. However, the development of economical site plans often requires concurrent preliminary planning of the sewer system. The location of building and lateral sewers will depend not only upon topography, but also upon the type and layout of the buildings to be served. Main, trunk, and interceptor sewers will follow the most feasible route to the point of discharge. The following general criteria will be used where possible to provide a layout that is practical, economical, and meets hydraulic requirements:

    - follow slopes of natural topography for gravity sewers
    - check existing maps or field surveys along prospective sewer routes to assure that adequate slopes are available
    - avoid routing sewers through heavily wooded areas and areas which require extensive restoration after construction and which limit access for future maintenance
    - check subsurface investigations for groundwater levels and types of subsoil encountered; if possible, avoid areas of high groundwater and the placement of sewers below the groundwater table
    - locate manholes at changes in direction, size, or slope of gravity sewers
    - sewer sections between manholes should be straight; the use of curved sewer alignments are not recommended
    - manholes should be located at intersections of streets when possible
    - avoid placing manholes adjacent to watercourses and in locations where the tops will be submerged or subject to surface water inflow
    - designer shall evaluate alternative sewer routes where applicable
    - verify that final routing selected is the most cost effective alternative that meets service requirements

3. Geographic Information System: Information on existing utilities may be available on the County's GIS system; and the new design and the as-built drawings must be incorporated into the GIS system. A CAD/GIS standard has been adopted and shall be used for all designs.

D. Summary of Procedure

1. The person desiring to provide sewer facilities shall engage the services of a Registered Professional Engineer in the State of Maryland skilled in designing sewer facilities.

2. The Engineer should evaluate the situation and shall prepare a preliminary report and design. The design shall conform to the standards herein.

3. The Engineer shall hold a preliminary engineering conference with representatives of the Bureau of Engineering and Construction to insure that the proposed design will conform to the requirements of the Bureau.

4. Based upon the results of the conference, the Engineer may proceed to the preparation of a final report, plans, and specifications.

E. Preliminary Engineering Conference

1. When Conference is Necessary: A preliminary conference with the Engineer will, in general, be required for the more important projects. A conference will not be required in cases of minor extensions to existing sewer systems or where prior provision has been made for such extension when conditions have not materially changed since such approval. The County will decide when a preliminary engineering conference or preliminary report will or will not be required. It is important that proper consideration of comprehensive planning be given to a project early in the development stages. The aspects of a project should be discussed with the County to assure that all Department planning requirements will be met.

2. Project Proposal: At the preliminary engineering conference, the Engineer is expected to set forth the sewerage problem and the proposed solution in such a manner as to support the recommendations made and the conclusions reached.

3. Plans: Location maps, layout sketches, and other illustrative material shall be presented. A summary of the major topics for discussion is given below:
    - locations, origin, and purpose and scope of the project
    - existing project conditions
    - County population projections
    - design analysis, including all design criteria employed
    - design computations
    - function, layout and siting requirements of the proposed facilities
    - evaluation of alternatives (feasibility, construction restraints, project costs, environmental constraints, non-economic factors, ease of operation and maintenance and maintenance costs)

- cost estimates and comparison of alternatives, including rights-of-way requirements
- if required, present worth cost determination and comparison based on engineering economics methods
- required permits and approvals of other agencies
- conclusions and recommendations
- schedule for implementation
- project illustrations
- additional subject matter, as required by DPW, whenever the specifics of each project dictates

A more detailed list of important design criteria is given in other chapters of this document. A review of the criteria outlined in this document as they relate to the particular project will be done. It is understood that at the time of this preliminary engineering conference, many of the criteria may not have been determined for a particular project.

4. Scope of Conference: Subjects appropriate to the project should be covered in the conference.

5. Preliminary Report: Copies of sketches, computations, and other written notes referred to by the Engineer at a preliminary conference shall be provided to the County. Supplementing the conference in cases of larger and more complicated works, the County may require submission of a written preliminary report detailing the agreement reached or elaborating on any of the subjects or design criteria discussed.

6. Scope of Advice From the County: Advice provided by the County is advisory only and does not constitute final approval by DPW. Favorable consideration of design data submitted at a preliminary engineering conference or in a preliminary report in no manner waives the legal requirement for the submission of final plans and an Engineer's report. DPW reserves the right to require modifications to the plans that do not conform to good engineering practice.

F. Designer's Report

The purpose of the report is to record for permanent reference the controlling assumptions made and factors used in the functional design of the sewerage works. Two copies of the report shall be submitted.

G. Drainage and Utility Easements

1. Legal Depictions:

a. New Subdivisions: Sewer mains within new subdivisions are typically located within the proposed County road right-of-way within the subdivision. When sewer mains within new subdivisions must be extended outside of the proposed County road right-of-way, the utility shall be placed within a drainage and utility easement. These easement areas shall be shown on the record plat for the proposed subdivision. The Bureau of Development Plans Review in the Department of Permits and Development Management will review and approve the proposed record plat after the contract drawings have been approved. The record plat shall meet the requirements of the Department of Permits and Development Management. Record plats shall be prepared on mylar.

b. SHA Road Right-of-Way: Longitudinal alignments and perpendicular crossings within the State Highway Administration road right-of-way are discussed in Chapter V.

c. Existing Subdivision: Sewer mains traversing property within the area of an existing recorded record plat which require new easements or modification of existing easements will require a revised record plat. The Bureau of Engineering & Construction will not approve sewer contract drawings until the revised record plat has been recorded and a copy is submitted to the Sewer Design Section. Temporary construction easements shall not be shown on a revised record plat but, instead, shall require the preparation of a standard drainage and utility easement plat. Revised record plats shall be prepared on mylar.

d. Private Property: Sewer mains traversing private property that is not recorded by record plat nor within any road right of way shall be placed within drainage and utility easements. Information depicting the exact location of the easement shall be presented on an 8½" x 14" standard drainage and utility easement plat or mylar. A written deed of easement shall accompany the plat for submission to the Bureau of Engineering & Construction for review and comment prior to the property owner signing the easement documents. For developers' projects, a deed of easement shall be prepared by an attorney. For a developer's project, once the plat and deed have been reviewed and approved, they will be returned to the developer's engineer for acquiring the necessary signatures. It will be the developer's responsibility to obtain the necessary signatures on the easement documents and to record them. Construction drawings for developer projects will not be approved until all necessary easement documents have been recorded and copies have been submitted to the Bureau of Engineering & Construction. For capital projects, once the drainage utility easement plat has been reviewed and approved, the Bureau of Land Acquisition will prepare the deed of easement and will be responsible for obtaining the necessary signatures and subsequent recordation.

In all cases, the deed of easement shall state the grantor as the property owner and the grantee as Baltimore County, Maryland.

Standard drainage and utility easement plats shall be prepared in accordance with the Bureau of Land Acquisition standards and will be subject to the review and approval of the Bureau of Land Acquisition.

2. Purpose: The legal depiction of drainage and utility easements and the documents associated with them provide permission for the construction, reconstruction, maintenance, repair and ownership of the proposed utility within the area designated on the plat. The property owner retains ownership of the land in all cases; however, the placement of landscaping and permanent structures within the easement areas is restricted.

3. Location:

   a. The location of drainage and utility easements shall be determined, in general, by the location and depth of the sewer main to be placed within the easement. Before establishing the location of the easement and associated sewer, the Engineer shall consider the property owner's interests in positioning the easement within the property. Easements which split or angle across the property's building envelope shall be avoided. Easement locations shall be fixed by surveys.

   b. Drainage and utility easements may not be located within landscape buffer areas, forest retention areas, forest mitigation areas, stormwater management areas including, but not limited to, stormwater management ponds, water quality traps, water quality swales, rain gardens, recharge areas, embankments, riprap areas, spillway, outfall channel or fenced-in areas, or ingress/egress easements unless prior approval is obtained by the Bureau of Engineering & Construction.

4. Width: The width of drainage and utility easements shall be large enough to ensure that they are adequate to construct, access, repair and/or replace the sewer. The topography of the sewer alignment, anticipated soil conditions, and required excavation depths shall be taken into consideration when easements are required. Additionally, other considerations include size of equipment and material required for the excavation and repair of the sewer. Consideration also shall be given to the requirement of future pipeline installations within the same easement.

   The following minimum easement widths shall be provided:

   a. Sanitary sewers and force mains shall be centered within a minimum twenty-foot (20') wide easement. For any larger pipe sizes and special

circumstances (such as depth nearing 20'), the width shall be determined on a case-by-case basis by the Bureau of Engineering & Construction. Sewers located adjacent and parallel to lot lines shall be centered within a thirty-foot (30') wide easement.

b. For longitudinal alignments along, but outside of, the SHA and County road rights-of-way, generally the centerline of sewers shall be no less than five feet (5') from the edge of a road right-of-way. The easement boundary line opposite of the road right-of-way shall be no less than ten feet (10') from the utility centerline. In all cases, the easement shall extend to the edge of the right-of-way for access.

c. Centerline of sewers shall be no closer than fifteen feet (15') from the edge of easements that are within the building envelope.

d. For utilities over ten feet (10') in depth, the easement width shall be equal to twice the depth of the sewer with the sewer centered within the easement.

5. Access: Adequate access shall be provided to the easement for both construction and maintenance purposes. In determining adequate access, the Engineer shall evaluate the contractor's and the County's abilities to deliver the required materials and equipment to every location along the pipeline alignment without traversing through private properties. The maximum distance between access points shall be 1,500 feet unless otherwise directed by the Bureau of Engineering & Construction. In selecting points of access, the Engineer shall avoid environmentally sensitive areas such as: wetlands, slopes over 10%, and heavily wooded areas. Access shall be provided by means of a drainage and utility easement no less than twenty feet (20') wide. For developer projects, if the contractor requires access through private property during construction, the developer shall be required to obtain – in writing – all rights of entry for temporary access.

III. ENGINEERING REPORTS AND FACILITY PLANS

A. General

The Engineering Report or Facility Plan

- identifies and evaluates wastewater related problems
- assembles basic information
- presents criteria and assumptions
- examines alternate projects with preliminary layouts and cost estimates
- describes financing methods
- sets forth anticipated charges for users
- offers a conclusion with a proposed project for consideration
- outlines official actions and procedures to implement the project

The planning document must include sufficient detail to demonstrate that the proposed project meets the applicable criteria.

The concept, factual data, and controlling assumptions and considerations for the functional planning of facilities are presented. These data form the continuing technical basis for the detailed design and preparation of construction plans and specifications.

Sketches may be provided to aid in presentation of a project. Outline specifications of special materials or equipment are occasionally included.

Engineering Reports must be completed for collection system, pump station, and interceptor projects. Comprehensive Facility Plans must be completed or have been completed for projects involving new, expanded, upgraded, or rehabilitated wastewater treatment facilities and major collection, interceptor, and pump station projects. The determination of classification as major or minor collection, interceptor, and pump station projects will be made by DPW.

B. Engineering Reports

Engineering Reports for minor sewer extension and pumping stations shall contain the following and other pertinent information as required by DPW:

1. Problem Definition: The description of the existing system should include an evaluation of the conditions and problems requiring correction.

2. Design Flow: The anticipated design average and design peak flows for the existing and ultimate conditions must be established. The basis of the projection of initial and future flows must be included, and must reflect, the existing or initial service area and the anticipated future service area. Flow data needed for design of new facilities is included in Chapter V.

3. Impact on Existing Wastewater Facilities: The impact of the proposed project on all existing wastewater facilities, including gravity sewers, left stations, and treatment facilities must be evaluated.

4. Project Description: A written description of the project is required.

5. Drawings: Drawings identifying the site of the project and anticipated location and alignment of all the proposed facilities are required.

6. Engineering Criteria: Engineering criteria to be used in design of the project shall be included.

7. Site Information: Project site information should include topography, soils, geologic conditions, depth to bedrock, groundwater level, floodplain considerations, and other pertinent site information.

8. Alternative Selection: The reasons for selection of the proposed alternative, including any lift station sites, feasibility, and how the project fits into a long-term plan, shall be discussed.

C. Facility Plans

1. General: Facility plans must be completed for wastewater treatment facilities, major collection systems, and those interceptor sewers and pumping stations serving major areas. Facility Plans shall contain the following and other pertinent information as required by DPW:

   a. Problem Evaluation and Existing Facility Review
      - descriptions of existing system, including condition and evaluation of problems requiring correction
      - summary of existing and previous local and regional wastewater facility and related planning documents

   b. Planning and Service Area: Planning area and existing and potential future service area.

   c. Population Projection and Planning Period: Present and predicted population shall be based on a 20-year planning period. Phased construction of wastewater facilities shall be considered in rapid growth areas. Sewers, and other facilities, with a design life in excess of 20 years shall be designed for the extended period.

   d. Hydraulic Capacity: The flows for the design year shall be identified and used as a basis for design of sewers, pumping stations, wastewater treatment plants, treatment units, and other wastewater handling facilities. The various design flows have been defined in Chapter V.

e. Hydraulic Capacity to Serve Existing Collection Systems:

1) Projections shall be made from actual flow data to the extent possible.

2) The accuracy of data and projections shall be evaluated. This reliability estimation shall include an evaluation of the accuracy of existing data as well as an evaluation of the reliability of estimates of flow reduction anticipated due to infiltration/inflow reduction or flow increases due to elimination of sewer bypasses and backups.

3) Critical data and methodology used shall be included. It is recommended that graphical displays of critical peak wet weather flow data be included for a wet weather flow period of significance to the project.

f. Hydraulic Capacity to Serve New Collection Systems:

1) The sizing of wastewater facilities receiving flows from new wastewater collection systems shall be based on an average daily flow of ninety (90) gallons per capita per day (gpcd) plus wastewater from industrial plants and institutional and commercial facilities, as outlined in Chapter V, unless water use data or other justification upon which to better estimate flow is provided.

2) The 90 gpcd figure shall be used which, in conjunction with the peaking factor from the Maryland Department of the Environment (MDE) curves shown in the Appendix, is intended to include infiltration for systems built with modern construction techniques.

3) If the new collection system is to serve existing development, the likelihood of infiltration/inflow contributions from existing service lines, and non-wastewater connections to those service lines, shall be evaluated; and wastewater facilities designed accordingly.

g. Initial Alternative Development: The process of selection of wastewater collection system alternatives for detailed evaluation shall be discussed. All alternatives, including no action, and the basis for the engineering judgement for selection of the alternatives chosen for detailed evaluation, shall be included.

h. Detailed Alternative Evaluation: The following shall be included for the alternatives to be evaluated in detail:

1) Sewer System Revisions: Proposed revisions to the existing sewer system, including the adequacy of portions of the system not being changed by the project, must be provided.

2) Wet Weather Flows: Facilities to transport and treat wet weather flows in a manner that complies with Local, State, and Federal regulations must be provided.

i. Final Project Section: The project selected from the alternatives considered under "h," shall be set forth in the final facility plan document to be forwarded to DPW for review and approval including the financing considerations and recommendations for implementation of the plan.

IV. ENGINEERING PLANS AND SPECIFICATIONS

A. Plans and Supporting Documents

Submissions to DPW shall include sealed plans, design criteria, the appropriate construction permit applications, review forms, and permit fees, if required.

1. General

   a. Plan Title: All plans for wastewater facilities shall bear a suitable title showing the name of the project. They shall show the scale in feet, a graphical scale, the North arrow, State plane grids, date, name of the Engineer with the certificate number and imprint of the registration seal. A space should be provided for signature by the appropriate County agencies. The County standard title block for all drawings is available electronically or from the Engineering Records Office.

   b. Plan Format: The plans shall be clear and legible (suitable for scanning). They shall be drawn to scale that will permit all necessary information to be plainly shown. The size of plans should be 24” x 36”. The datum used shall be indicated. Locations and logs of test borings, when required, shall be shown on the plans.

   c. Plan Contents: Detail plans shall consist of: plan views, profiles, elevations, sections, and supplementary views which, together with the specifications and general layouts, provide the working information for the Contract and construction of the facilities. They also shall include: dimensions and relative elevations of structures, the location and outline of equipment, location and size of piping, water levels, and ground elevations.

   d. Design Criteria: Design criteria shall be included with all plans and specifications, and a hydraulic profile shall be provided for force mains and all wastewater treatment facilities.

   e. Operation During Construction: Project construction documents shall specify the procedure for operation during construction.

2. Plans of Sewers

   a. General Plan: A comprehensive plan of existing and proposed sewers shall be submitted for projects involving new sewer systems and substantial additions to existing systems. This plan shall show the following:

      1) Geographical Features:

a) Topography and elevations – existing or proposed streets and all streams or water surfaces shall be clearly shown. Contour lines, at suitable intervals, should be included.

b) Streams – the direction of flow in all streams and high and low water elevations of all water surfaces shall be shown.

c) Boundaries – the boundary lines of the County and the area to be sewered shall be shown.

2. Sewers: The plan shall show the location, size, and direction of flow of all existing and proposed sanitary sewers.

b. Detailed Plans: Detailed plans shall be submitted. Profiles shall have a horizontal scale of not more than 50 feet to the inch, and a vertical scale of not more than 5 feet to one inch. Plan views shall be drawn to a corresponding horizontal scale and must be shown on the same sheet. Plans and profiles shall show:

- location of streets and sewers
- line of ground surface, size, material, and type of pipe
- length between manholes
- invert and surface elevation at each manhole
- grade of sewer between each two adjacent manholes (all manholes shall be numbered on the profile)
- elevation and location of the basement floor shall be plotted on the profile of the sewer which is to serve the house in question; the Engineer shall state that all sewers are sufficiently deep to serve adjacent basements except where otherwise noted on the plans
- locations of all special features, such as inverted siphons, concrete encasements, elevated sewers, etc.
- all known existing structures and utilities (above and below ground) which might interfere with the proposed construction or require isolation setback, particularly water mains and water supply structures (wells), gas mains, storm drains, and telephone and power conduits
- special detail drawings, made to scale to clearly show the nature of the design, shall be furnished to show the following:
  - all stream crossings and sewer outfalls with elevations of the streambed and normal and extreme high and low water levels
  - details of all special sewer joints and cross sections
  - details of all sewer appurtenances, such as manholes, inspection chambers, vaults, inverted siphons, and elevated sewers

3. Plans of Pumping Stations

a. Location Plan: A location plan shall be submitted for projects involving construction or revision of pumping stations. This plan shall show the following:
   - the location and extent of the tributary area
   - any boundaries within the tributary area
   - the location of the pumping station and force main and pertinent elevations

b. Detailed Plans: Detailed plans shall show the following, where applicable:
   - topography of the site
   - existing pumping station
   - proposed pumping station, including provisions for installation of future pumps
   - elevation of high water at the site and maximum elevation of wastewater in the collection system upon occasion of a power failure
   - maximum hydraulic gradient in downstream gravity sewers when all installed pumps are in operation
   - test borings and groundwater elevations

B. Specifications

Complete, sealed, technical specifications shall be submitted for the construction of sewers, wastewater pumping station, and all other appurtenances and shall accompany the plans.

The Specifications accompanying construction drawings shall include, but not be limited to:

- specifications for the approved procedures for operation during construction in accordance with this Chapter
- all construction information not shown on the drawings which are necessary to inform the builder in detail of the design requirements for the quality of materials, workmanship, and fabrication of the project.

The Specifications shall also include:

- the type, size, strength of operating characteristics and rating of equipment
- the complete requirements for all mechanical and electrical equipment, including machinery, valves, piping, and jointing of pipe
- electrical apparatus, wiring, instrumentation and meters
- laboratory fixtures and equipment, operating tools, construction materials
- special filter materials, such as: stone, sand, gravel, or slag
- miscellaneous appurtenances
- chemicals when used
- instructions for testing materials and equipment, as necessary, to meet the design standards

- performance tests for the completed works and component units (it is suggested that these performance tests be conducted at design load conditions wherever practical)

C. Revisions to Approved Plans

Any deviations from approved plans or specifications affecting capacity, flow, operation of units, or point-of-discharge shall be approved, in writing, before such changes are made. Plans or specifications so revised should, therefore, be submitted well in advance of any construction work that will be affected by such changes to permit sufficient time for review and approval. Structural revisions or other minor changes not affecting capacities, flows, or operation will be permitted during construction without written approval. “As Built” plans, clearly showing such alterations, shall be submitted to the reviewing agency at the completion of the work.

D. Standard Details

All work shall be completed in accordance with the *Standard Details for Construction*, latest revision. The Engineer shall refer to these details during the design of the project and during the preparation of the construction drawings.

V. DESIGN OF SEWERS

A. Approval of Sewers

In general, the Bureau of Engineering and Construction will approve construction plans for new sewer systems, extensions to new areas or replacement sewers. Separate systems are required for sanitary sewers and storm drains. Storm water runoff from roofs, streets, and other areas, including groundwater drains and foundation drains, must be excluded from sanitary sewers.

Constructed overflows shall not be permitted at any time.

B. Design Capacity and Design Flow

1. General

   a. The sizing of major components of the County's collection, conveyance, and pumping systems, such as major pumping stations, force mains, and interceptor sewers, are generally the responsibility of the Bureau of Engineering and Construction.

   b. The Master Plan generally shows the major existing and planned wastewater collection, conveyance, and pumping system components. The Engineer shall be familiar with design facilities in accordance with the Master Plan.

   c. The sewer design guidelines presented herein shall apply to Developer and Capital Projects.

   d. In general, sewer capacities shall be designed for the estimated ultimate tributary population except in considering parts of systems that may be readily increased in capacity. Consideration shall be given to the maximum anticipated capacity of institutions, industrial parks, etc. Where future relief sewers are planned, economic analysis of alternatives must accompany designs.

2. Design Period

   In general, sewer systems shall be designed for the design life of the pipeline material.

3. Design Factors and Design Flow

   a. General: The anticipated design average and design peak flows for the existing and ultimate conditions must be established. The basis of the

projection of initial and future flows must be provided and must reflect the existing or initial service area and the anticipated future service area.

b. Flow Definitions and Identification*:* The following flows for the design year shall be identified and used as a basis for design of sewers, pumping stations, lift stations, wastewater treatment plants, treatment units, and other wastewater handling facilities.

   Where any of the terms defined in this section are used in these design standards, the definition contained in this section applies.

   1) Design Average Flow*:* The design average flow is the average of the daily volumes to be received for a continuous 12-month period expressed as a volume per unit time. However, the design average flow for facilities having critical seasonal high hydraulic loading periods (eg, recreational areas, campuses, industrial facilities) shall be based on the daily average flow during the seasonal period.

   2) Design Maximum Day Flow: The design maximum day flow is the largest volume of flow to be received during a continuous 24-hour period expressed as a volume per unit time.

   3) Design Peak Hourly Flow*:* The design peak hourly flow is the largest volume of flow to be received during a one-hour period expressed as a volume per unit time.

   4) Design Peak Instantaneous Flow: The design peak instantaneous flow is the instantaneous maximum flow to be received.

c. Quantity of Wastewater: For any segment of the proposed sewer system the design wastewater flow must be determined. Sanitary or domestic wastes based on the population served by a given sewer segment, extraneous infiltration/inflow, and contributing commercial and industrial flows must be added to produce the design flow. The design flow rate shall be the sum of the peaked residential, peaked institutional, peaked commercial and industrial flow rates for the service area plus the corresponding infiltration and inflow components within the service area. The methods and criteria outlined below shall be used to develop design flows:

   1) Tributary Area: This is the area contributing wastewater to a particular sewer segment.

   2) Sanitary or Domestic Wastes:

a) Contributing Population: Domestic wastewater quantities normally are to be computed on a contributing population basis except as noted in the subparagraphs below. The population to be used in design depends upon the zoning of the area that the sewer serves. If the area contains residential zoning, the design population is based on full occupancy of all housing to be served at the population density shown on the following table. If the area contains non-residential zoning, the design contributing population for non-residential areas is based on the population per acre and dwelling units per acre densities in the following table:

Zoning Classification	Dwelling Units per Acre	Population per Acre
RC 2		
RC 5	0.667	2.33
DR 1	1.0	3.5
DR 2	2.0	7.0
DR 3.5	3.5	12.25
DR 5.5	5.5	19.25
DR 10.5	10.5	36.75
DR 16	16.0	56.0
R 0	5.5	19.25
BL	--	12.0
BM	--	10.0
BR	--	12.0
MR	--	10.0
ML	--	10.0
MLR	--	10.0
MH	--	16.0

b) Average Daily Flow:

1. Residential: The average daily per capita wastewater quantity for residential areas shall be 90 gallons per capita per day. The average daily residential flow rate shall be determined by multiplying the applicable population densities by the average daily per capita wastewater quantity of 90 gpcd.

2. Commercial and Institutional: The average daily wastewater quantities for commercial and institutional areas are given in the following table. The average daily commercial and institutional flow rate shall be determined by multiplying the applicable annual water use shown in the table by the selected parameter for the particular type of establishment.

Type of Establishment or Institution	Selected Parameter	Annual Water Use (gpd/unit)
Apartments		
High Rise	Gpd/occupied unit	218
Garden Type	Gpd/occupied unit	213
Banks	Gpd/gross sq. foot	0.04
Barber Shops	Gpd/chair	54.6
Beauty Salons	Gpd/station	269
Boarding Houses	Gpd/person	40
Car Washes	Gpd/sq. foot	4.78
Churches	Gpd/member	0.138
Clubs		
Golf Clubs	Gpd/membership	66.1
Swimming Clubs	Gpd/membership	16.5
Boating Clubs	Gpd/membership	10.5
Colleges		
Students in residence	Gpd/student	106
Non-resident students	Gpd/student	15.2
Department Stores	Gpd/sq. foot of total sales area	0.216
Shopping Centers	Gpd/sq. foot of total sales area	0.16
Drug Stores	Gpd/gross sq. foot	0.13
Hospitals	Gpd/bed	346
Hotels	Gpd/sq.foot	0.256
Laundries		
Commercial Laundries and Dry Cleaners	Gpd/sq. foot	0.253
Laundromats	Gpd/sq.foot	2.17
Motels	Gpd/sq. foot	0.224
Movie Theaters	Gpd/seat	5
Nursing Homes and Institutions	Gpd/bed	133
Office Buildings		
General Office	Gpd/gross sq. foot	0.093
Medical Office	Gpd/gross sq. foot	0.62
Primary and Secondary Schools		
Public Elementary	Gpd/student	5.38
Public Junior High	Gpd/student	5.64
Public Senior High	Gpd/student	6.63
Private Elementary	Gpd/student	2.27
Private Senior High	Gpd/student	10.4
Combined (grades 1-12)	Gpd/student	8.49
Restaurants		
Drive Ins (parking only)	Gpd/car space	109
Drive Ins (seating and parking)	Gpd/seat	40.6
Conventional Restaurants	Gpd/seat	24.2
Retail Stores	Gpd/gross sq. foot	0.16
Rooming Houses	Gpd/person	40
Service Stations	Gpd/sq.foot of garage and office space	0.251
Supermarkets	Gpd/gross sq. foot	0.20
Warehouses	Gpd/gross sq. foot	0.03

3. Industrial: The average daily wastewater quantities for industrial steady flow are given in the following table. The average daily flow rate shall be determined by multiplying the applicable gallons/acre per day by the total acres of industrially zoned area. This flow represents the design contributing population that includes the population employed at any time. Industrial flow cannot be computed on a population basis. Flows from industrial facilities depend upon the type and extent of the activities. Industrial waste sewers and sanitary sewers will be designed for the peak industrial flow as determined for the particular industrial process or activity involved.

Acres	Gallons per Acre
0-25	4,000
26-100	3,000
101-200	2,000
201-500	1,500
Over 500	1,000

c) Average Hourly Flow: When designing sewers to serve small areas and where the majority of wastewater is generated by commercial, institutional, or industrial users or other short term wastewater generators, the average hourly flow rate shall be used. The average hourly flow rate shall be computed based on the actual period of waste generation.

d) Peak Diurnal Flow Rate: The normal daily range of flow, or the diurnal pattern, is from approximately 40% to 250% of the average daily flow. The peak daily, or diurnal, flow rate is an important factor in sewer design especially when minimum velocities are to be provided on a daily basis. The peak diurnal flow rate shall be one half of the extreme peak flow rate.

e) Peak Residential Flow: The peak residential wastewater flow is determined by the peaking factor as shown in the empirical curves published by the Maryland Department of the Environment (MDE) formerly the Maryland State Department of Health and Mental Hygiene.

4. Infiltration and Inflow

a. General: Extraneous flows from groundwater infiltration enter the sewer system through defective pipe, joints, fittings, and manhole walls. Sources of inflow include connections from roof leaders, yard drains,

storm drains, cooling water discharges and foundation drains in addition to submerged manhole covers.

b. Design Allowance for New Sewers*:* Where infiltration and inflow must be calculated for an area that is currently served by a collection system, the allowance for infiltration and inflow will be provided by the Bureau of Engineering and Construction and is based on flow records.

C. Hydraulic Design of Sewers

1. General

a. Hydraulic Design: As discussed in previous sections, the Bureau of Engineering and Construction reserves the right to determine the size of major wastewater conveyance and pumping facilities. Sewers shall be designed to discharge the wastewater flows as required by Section V,B. Generally, it is desirable to design sewers for full flow, even at the peak rates. Flows above 90-95% of full depth are considered unstable and may result in a sudden loss of carrying capacity with surcharging at manholes. In addition, large trunk and interceptor sewers laid at flat grades are less subject to wide fluctuations in flow; and if designed to flow full, may lack sufficient air space above the liquid to assure proper ventilation. Adequate sewer ventilation is a desirable method of preventing the accumulation of explosive, corrosive, or odorous gasses, and of reducing the generation of hydrogen sulfide. Therefore, trunk and interceptor sewers shall be designed to flow at depths not exceeding 90% of full depth; laterals and main sewers, 80%; and building connections, 70%. However, regardless of flow and depth, the minimum sizes to be used are 6-inch for building connections and 8-inch for all other sewers. Industrial applications shall use the same design criteria as sanitary sewers, except pipe material that is resistant to the waste, shall be specified. The following formula, charts, procedures and criteria shall be used for design.

b. Design Formula and Charts:

1) The Manning Formula shall be used for design of gravity flow sewers.

2) Roughness: In all cases, Manning's "n" shall be 0.013. Due to uncertainties in design and construction and a desire to provide a margin of safety, "n" values smaller than 0.013 will not permitted. Variation of "n" with depth may be considered in designing sewers to flow partially full.

3) Velocity: Sewers will be designed to provide a minimum velocity of 2.0 feet per second at the average daily flow, or average hourly flow rate, and a minimum velocity of 2.5 – 3.5 feet per second at the peak

diurnal flow rate. When velocities drop below 1.0 foot per second during periods of low flow, organic solids suspended in the wastewater can be expected to settle out in the sewer. Sufficient velocity (2.5 – 3.5 feet per second) must be developed regularly, once or twice daily as a minimum, to re-suspend and flush out solids that may have been deposited during low flows. A velocity of 2.5 feet per second is required to keep grit and sand suspended. However, new sewers that are properly designed and constructed should contain only minor quantities of grit or sand. Maximum velocity is set at 10.0 feet per second in the event that grit becomes a problem.

4) Slope: The minimum slopes for sewers of various sizes shall be as follows:

Pipe Size (inches)	*Minimum Slope (feet per 100 feet)*
8	0.60
12	0.40
15	0.25
18	0.18
21	0.12
24	0.10
36	0.10

Assuming uniform flow, the value of "S" in the Manning Formula is equivalent to the sewer invert slope. Pipe slopes must be sufficient to provide required minimum velocities and depths of cover on the pipe. Although it is desirable to install large trunk and interceptor sewers on flat slopes to reduce excavation and construction costs, the resulting low velocities may cause objectionable solids to be deposited in the pipe creating a buildup of hydrogen sulfide.

Laying pipes on slopes that provide minimum velocities shall be avoided whenever possible. Minimum velocities have been outlined in Section C.

Pipeline slopes exceeding 20% are permitted only with the approval of the Bureau of Engineering and Construction. Special anchor requirements for steep slope pipelines are required, and these requirements are outlined in other sections of these guidelines.

If practical, suitable drop manholes or other structures or methods to dissipate energy and reducing erosive velocities shall be provided as approved by the Bureau of Engineering and Construction.

In instances where the Bureau of Engineering and Construction approves slopes less than the allowed minimum slopes, the Engineer

shall add the following notes to the respective profile(s) in **bold** lettering:

"NOTE: The Contractor shall assure that the minimum slope of the sewer main shown on the above profile to be no less than designed. The slope shall be computed by using the actual constructed distances between manholes and elevation differences of the manhole inverts. The survey rod must be completely plumb during readings.

If the manhole cone section prevents a plumb reading of each pipe invert, then a level must be used within the manhole to project the invert for a plumb rod reading. The Contractor shall have each manhole run surveyed by a Maryland Registered Land Surveyor, and the results shall be submitted in writing to the County Inspector. A second copy shall be submitted to the Sewer Design Section for verification. The Sewer Design Section shall approve the information submitted by the Contractor's surveyor prior to constructing any subsequent manhole runs. Constructed slopes, which result in a pipe capacity less than the design flow rate or result in velocities less than scouring velocity to naturally cleanse the sewer, shall be reconstructed to the proper slope before constructing any subsequent manhole runs."

5) Cover: Adequate cover must be provided for frost protection. Generally, a minimum of three and one-half feet (3.5') of earth will be required to protect the sewer against freezing. Where frost penetrates to a considerably greater depth and lasts for an appreciable period of time, the waste may not contain sufficient heat to prevent the gradual cooling of surrounding earth and the buildup of an ice film inside the pipe. Under these conditions, greater cover shall be required. Sufficient cover also must be provided to protect the pipe against structural damage due to superimposed surface loadings. Concentrated and uniformly distributed loads are discussed in this chapter.

c. Design Procedure: After a preliminary layout has been made, a tabulation will be prepared, in convenient form, setting forth the following information for each sewer section:
   - designation of manhole by numerals
   - contributing populations – residential and non-residential
   - design flows – average, daily peak, and extreme peak
   - length of sewer
   - invert elevations
   - invert slope or gradient

- pipe diameter and roughness coefficient
- flow depths at design flows
- velocities at design flows
- depths of cover on the pipe – maximum and minimum

d. Hydraulic Profile: In most situations where small or medium-sized gravity sewers are installed in long runs, it will be safe to assume uniform flow throughout the entire length of conduit. However, in cases where larger sewers (24-inch diameter and above) are constructed in runs of less than 100 feet and with a number of control sections where non-uniform flow may occur, a plot of the hydraulic profile is recommended. Methods used to calculate and plot hydraulic profiles, including backwater curves, drawdown curves, and hydraulic jumps, will conform to those presented in standard textbooks.

e. Critical Flow: Gravity sewers ordinarily will be designed to maintain subcritical flow conditions in the pipe throughout the normal range of design flows. However, there are exceptions in which supercritical flow may be required and will be justified. Minimum sized sewers, 6 and 8-inch designed to discharge very low flows, must occasionally be placed on slopes steeper than critical in order to provide minimum velocities. In addition, small to medium sized sewers, when required to discharge unusually large flows, may necessitate super-critical slopes. Finally, steep slopes may be unavoidable due to natural topography and ground conditions. Where super-critical flow will occur, care must be taken in the design to insure that downstream pipe conditions do not induce a hydraulic jump or other flow disturbance. Depths of flow within 10-15% of critical are likely to be unstable and will be avoided where pipes will flow from 50-90% full. Critical depths for various flows and pipe diameters may be obtained from standard hydraulic textbooks.

f. Computer Programs: Numerous commercial computer programs are available for modeling, data management (such as location, diameter, depth, slope, and capacity of each component), design, and analysis of sewer systems. As well as being used to design new collection systems, these programs are able to assist with assessing the impacts of changes and additions to existing collection systems thus helping to optimize designs.

D. Details of Design and Construction

1. Gravity Sewer Design

a. General: The layout of a gravity sewer system of collectors and interceptors is a function of the topography. Collector and interceptor sewers shall be designed to serve all areas up to the drainage area limits

within the current development envelope. The plan and profile alignments of the sewer system shall provide for future connections within the drainage area limits while minimizing both expense and modifications to the existing system.

Consideration shall be given to space requirements for future utilities, particularly water and storm drains. In the absence of water and storm drain design, the Engineer shall recommend the space requirements for future water or drainage facilities and shall provide the necessary clearances. This requirement is particularly important at roadway intersections. When plans of existing facilities are insufficient to accurately locate existing underground obstructions that may alter the final design, the Engineer shall perform test pit excavations during the design to uncover the subject facilities so that horizontal and vertical positions of existing utilities may be accurately determined. During test pitting, the Engineer shall be responsible for providing all traffic control and public safety measures necessary to locate the utilities and shall be responsible for restoring the surface. The Engineer shall coordinate the test pit operations and shall provide a field survey crew to physically locate the subject facility.

In general, sewers 24-inches in diameter or less shall be laid with straight alignment between manholes. Use a laser beam to check for straight alignment.

Curvilinear alignment of sewers larger than 24 inches may be considered on a case-by-case basis, provided compression joints are specified and ASTM or specific pipe manufacturer's maximum allowable pipe joint deflection limits are not exceeded. Curvilinear sewers shall be limited to simple curves that start and end at manholes. When curvilinear sewers are proposed, minimum slopes indicated in Section V-C-4 must be increased accordingly to provide a recommended minimum velocity of 2.0 feet per second when flowing full.

b. Horizontal Alignment – Location: The horizontal alignment shall take into account the following general alignment guidelines. Pipelines greater than 12 inches in diameter may have other limitations and requirements that alter these general alignment guidelines.

    1) Due to the greater depth of the sewer in relation to most other utilities, the location for the sewer main shall be given first priority.

    2) Sanitary sewer shall be designed with a straight horizontal alignment between manholes.

3) For Developer's projects, the design of the public water, sewer force mains, and storm drain utilities within proposed developments, shall be prepared concurrently to ensure compatibility of the utilities.

4) In new developments where sewers are constructed in advance of the road pavements, the sewer shall be placed on the lower side of the street, seven feet (7') from the street centerline. On curved streets, this location must be compromised since straight horizontal alignments are required between manholes.

   For road widths 24 feet or less, sewer mains shall be designed five feet (5') from the road right-of-way centerline in lieu of the seven feet (7') stated above.

   In all cases, manholes must be placed within the pavement area wherever possible. Within closed section roadways, manholes shall not be closer than three feet (3') from the face of the curb; the manhole cone section shall be rotated away from the face of the curb. Manholes shall not be located within designated parking areas within townhouse and condominium subdivisions.

5) If public water and sewer mains cannot be located within the paved roadway section, the Engineer shall request a waiver of these design standards from the Bureau of Engineering and Construction, providing reasons why the standards cannot be met.

6) For developer projects, whenever the system is planned to be extended by either future phases within the subdivision or by other parties, the sewer main shall be extended beyond the edge of paving by means of a manhole to avoid future cutting of the pavement.

7) In existing development with curbs, the sewer mains shall be generally located as in new subdivisions.

8) Where sewers in residential developments are constructed between or across lot lines, the centerline of the pipe shall be constructed on the lot line between lots or along the rear property line. Generally, the sewers or required easements shall not cut across building envelopes. In cases where sewer mains are between or behind lots where access from public roads is limited, access easements from the nearest public roadway shall be provided between lots. All such easements shall allow adequate access to the seer by maintenance personnel and equipment. See the section entitled, *Rights-of-Way, Easements and Construction Strips,* within this design manual for additional information regarding easement and access requirements.

9) In proposed subdivisions where easements are required between two adjacent lots for the extension of the sewer system, a sewer main shall be provided within the easement between the adjacent lots. The sewer main shall extend the full length of the easement between the lots.

   In cases where a utility easement is required to be extended to the limits of the property being developed through a lot or open space to provide future service to an adjacent property, that easement shall be cleared of trees and otherwise shall be prepared for the future extension of the main. For Developer Projects, whenever the proposed sewer system is planned to also serve an adjoining future service area, drainage and utility easements shall be provided to enable the future sewer extension.

10) Within private roads, public sewer mains shall be located within the paved roadway sections. When a sewer main cannot be located within the private road, the Engineer shall obtain prior approval by the Sewer Design Section for its location.

11) When sewer mains are proposed for locations adjacent to existing buildings, the minimum distance away from the building foundation shall be fifteen feet (15') as long as the sewer depth is not greater than the bottom of the building foundation. The horizontal distance to the building shall be no greater than the depth of sewer.

12) Generally, all sewers crossing waterways shall be encased in concrete, a minimum of six inches (6") thick. Limits of concrete encasement shall extend from top of bank to top of bank. The entire manhole run, which encompasses the encasement, shall consist of ductile iron pipe. The design shall incorporate restoration with riprap placed from bottom of stream to top of bank. Although in many cases MDE guidelines require Class I riprap, Baltimore County has found this size of riprap to be insufficient to withstand the stream velocities encountered during rainfall events. Therefore, the minimum size riprap shall be Class II.

13) Sewer mains shall not be located within stormwater management facilities. Likewise, any drainage and utility easement for a sewer main shall not be located within stormwater management facilities. These areas include, but are not limited to, stormwater management ponds, water quality traps, swales, rain gardens, and recharge areas and the associated embankments, riprap areas, spillway outfall channel, fenced-in areas or other features associated with the stormwater management facility.

14) When a sewer main is proposed parallel to or adjacent to a stream or other waterway, it shall be located so that future movement of the waterway due to streambank erosion will not encroach upon the sewer main. Generally, this shall be accomplished by locating the sewer main away from the outside meander bend of the stream. If it is not possible to locate the sewer main away from the outside meander bend, the Sewer Design Section will only reconsider the sewer main location if the Engineer incorporates permanent streambank stabilization measures which satisfies the Sewer Design Section.

15) The alignment within existing roadways shall avoid high traffic volume roads if other options are available. The alignment shall be designed to allow the construction of the pipeline without the need to have road closings. When a sewer main is required to cross a Baltimore County road right-of-way, after considering the type and condition of the road, traffic volumes, disruption to traffic and possible conflicts with existing utilities, the Engineer shall recommend to open cut, tunnel, or jack and bore the utility across the roadway on a case-by-case basis. Baltimore County DPW's Bureau of Engineering and Construction shall make the final decision as to the method used. The approval method shall be noted on the plans and profile.

16) Longitudinal alignments within the State Highway Administration road right-of-way shall be avoided. Approval on such longitudinal alignments must receive prior written approval from the Sewer Design Section and the State Highway Administration.

17) In existing road rights-of-way, the alignment shall try to avoid the removal of trees or landscaped areas. In parks and public rights-of-way where the alignment will require the removal of trees, the Engineer shall obtain the approval of the appropriate agency or agencies for tree removal. When the alignment is located outside of rights-of-way, it shall minimize disturbance to environmental features. In addition to trees, the alignment shall attempt to avoid wetlands, steep slopes, and other sensitive/difficult areas to work within. The alignment shall follow property lines to the extent practical and feasible.

18) When existing roadways are involved with the alignment, the horizontal alignment of the road must be evaluated for acceptable geometry; and the sewer main must be designed with respect to possible roadway improvements to avoid costly relocations. The Engineer shall evaluate the plane geometry of the road with respect to movement of traffic and available right-of-way width for the accommodation of the sewer main.

19) Sewer mains proposed to cross State Highway Administration or County road rights-of-way must be placed within a tunnel or sleeve if required by the appropriate agencies. DIP shall be used for the entire manhole run in applications where a tunnel or sleeve is required. The design and construction of the carrier pipe and casing pipe within railroad rights-of-way shall be designed in accordance with the requirements of the railroad being crossed. Manholes shall be no closer than ten feet (10') from both ends of the sleeve.

20) Sewer mains may not be located within existing or proposed wetland mitigation areas, forest retention areas, or reforestation areas.

21) If the Master Water and Sewer Plan identifies a proposed interceptor or collector sewer within a proposed subdivision, the Developer shall construct the proposed sewer as part of the onsite utility construction. If the sewer main must be increased in size to accommodate the remaining drainage area above and beyond that required for the subdivison, the larger size sewer main shall be constructed. If a larger size sewer main is constructed, the PWUA will discuss potential recoupments to recover the cost of the pipe size increase.

22) Sewers on twenty percent (20%) slopes or greater, if permitted, shall be anchored in accordance with the following schedule and in accordance with the Standard Specifications. Drop manholes are not allowed. The Engineer shall ensure that an inflatable plug can be fully inserted within the pipe.

- Grades 20% - 35%
  20 ft. length pipe – anchor at each joint
  13 ft. length pipe – anchor at every other joint
  Anchor spacing shall not exceed 36 feet.

- Grades 35% - 50%
  20 ft. length pipe – anchor at each joint
  13 ft. length pipe – anchor at each joint
  Anchor spacing shall not exceed 24 feet.

- Grades >50%
  Custom Design
  Anchor spacing shall not exceed 16 feet.

23) The Engineer shall show a detail on how the pipe will enter manholes for sewer slopes twenty percent (20%) or greater. The detail shall demonstrate that an inflatable plug will be capable of being inserted into the sewer with the brick channel in place. The length of sewer plugs is as follows:

6 –10-inch diameter plug: 24-inch length
8 –12-inch diameter plug: 25.5-inch length
12 –18-inch diameter plug: 27-inch length

24) If locating sewers in roadways is deemed impractical by Baltimore County, the following criteria will be met:

a. Maximum Slope above the pipe is 15%
b. Cross slope is to be a minimum of 2% and a maximum of 5%

c. Vertical Alignment – Location

Grades: The vertical position of gravity sewers is determined by the rate of fall between the unit to be served and the collector sewer, by the rate of fall of the ground along the course of the pipeline, and by the existence of obstructions that cannot be economically relocated. All sewer grades shall be established to require the least excavation while satisfying minimum and maximum velocity requirements, design flow conditions, clearances, and depth requirements. All sanitary sewers shall be designed on a continuous grade between manholes.

The minimum slopes are presented in Section V-C-4 herein.

Sewer house connections (SHCs) shall have the minimum slopes as discussed in Section VI-C, *Building Connections*, in these design guidelines.

For gravity systems, the pipeline layout is directly affected by the minimum acceptable fluid velocities as determined by the design flow, pipe size, slope and Manning roughness “n” coefficients. (See Section V-C, Hydraulic Design of Sewers.)

Where different diameter pipes meet at manholes, the crown of all upstream pipes shall be set at the same elevation as the crown of the downstream pipe unless hydraulic gradient computations require a higher setting.

d. Sewer Depths – General*:* The collector sewer shall be designed at a sufficient depth to provide gravity sewer service to the basement or lowest floor level of all buildings and to cross streams and waterways with a minimum 3.5-feet depth of cover unless otherwise directed by the Sewer Design Section. The minimum cover over any sewer shall be three and one-half feet (3.5’). Sewers greater than twenty feet (20’) deep will require written approval from the Sewer Design Section.

1) Sewer Depths at Stream Crossings: Where a sewer parallels a water course, the Designer shall ensure that the proposed sewer depth will

be adequate to facilitate future crossings of the stream while maintaining a minimum 3.5-feet of cover over any future stream crossings. Where sewer mains cross streams, the crossing angle shall be as close to ninety degrees (90°) as possible, and the crossing pipe shall be set at an elevation to provide a minimum of 3.5 feet of cover over the pipe measured from the bottom of the deepest section of the stream channel to the top of the pipe.

2) Sewer Depths Adjacent to Buildings: As previously noted, if sewers are parallel to an existing building, they shall be located no closer than fifteen feet (15') from an existing building foundation. This distance must increase if the building has a basement and the sewer depth is beneath the basement foundation. The horizontal distance to the building shall be no greater than the depth of the sewer.

e. Buoyancy: Buoyancy of sewers shall be considered, and flotation of the pipe shall be prevented where high groundwater conditions are expected.

f. Flow Depth-Minimum: Slopes slightly less than those required in Section V.C.1.b.4 may be permitted when approved by DPW. Such decreased slopes only will be considered when the depth of flow will be 0.3 of the diameter, or greater, for design average flow.

g. Minimize Solids Deposition: The pipe diameter and slope shall be selected to obtain the greatest practical velocities to minimize settling problems. Oversized sewers will not be approved to justify using flatter slopes. If the proposed slope is less than the minimum slope of the smallest pipe which can accommodate the design peak hourly flow, the actual depths and velocities at minimum, average, and design maximum day and peak hourly flow for each design section of the sewer shall be calculated by the Design Engineer to be included with the information submitted with the preliminary report at the preliminary engineering conference or shall be included with the plans if a conference is not required.

h. High Velocity Protection: Where velocities greater than fifteen feet (15') per second are attained, special provision shall be made to protect against displacement by erosion and impact.

2. Sewer Mains – Plan:

a. Sewer main plans shall be drawn to a scale of 1" = 50' or 1" = 30'.

b. All proposed pipes shall be shown and symbolized as noted in the Standard Details. More specifically, the pipe is to be identified by two (2) parallel lines with shading in between. Pipe lines 24 inches in diameter

and smaller shall be shown symbolically as two feet (2') wide as a minimum based on a scale of 1" – 50'. Pipe lines over 24 inches in diameter shall be shown to scale.

c. The plan location of the pipeline and appurtenances shall be carefully dimensioned so that its route is clearly identified. Dimensioning of the proposed pipeline, including appurtenances, shall be as noted in *Control, Topographic and Construction Surveys.* Appurtenances shall be called by symbols and notes and dimensioned both in respect to pipeline arrangements and in respect to required positions in relation to surface features.

d. Manholes shall not be shaded. Manholes shall be numbered in consecutive order with the numbers placed within a standard circle. The numbering shall start with the connection to existing sewer. The slope of frames and covers that are proposed to be flush with grade shall conform to the proposed finished grade. The type of manhole shall conform to the Standard Details.

e. All pipe sizes shall be clearly identified together with flow directional arrows.

f. The 100-year floodplain NRD, wetlands, and the 25-foot wetland buffer shall clearly be shown on the plans.

g. Sewer Service Chart: The following tabulated data shall be shown for all house and building connections:

SEWER SERVICE
(Example Only)

Lot No.	Sewer Main Station (EX MH1-MH2)	Invert at Main	Drop House Connec-tion	Length of Service	Slope of Service	Inv. @ RW Line	Prop. Fin. Grade @ RW Line	Depth of Service @ RW Line
79	0+23	267.98	--	20	2%	268.38	275.00	7.0
78	0+27	268.41	--	11	2%	268.63	274.13	5.5
77	1+01	276.38	--	42	2%	277.22	288.75	11.5
76	1+10	277.35	287.96	51	2%	288.68	292.68	4.0
75	@ MH2	278.47	--	53	2%	279.53	284.53	5.0

3. Sewer Mains: Profile

a. Profiles shall be drawn for all public sewer mains at a scale of 1" = 50' horizontal and a scale of 1" = 5' vertical.

b. Profiles shall be shown below the sewer plan view.

c. Manholes in profile shall be numbered to correspond to the manhole numbering on the plan. The numbers shall be within a standard circle together with the manhole top elevation. The type of manhole with a reference to the Standard Detail shall be called out. The type of frame and cover also shall be called out. The top of manhole elevation and ground elevation also shall be called out. Manholes shall be numbered in consecutive order and shall start with the connection to existing sewer and shall be oriented in the same direction as the plan.

d. Profile match lines shall correspond to centerline of manhole locations.

e. When a proposed sewer is located on a lot line between two lots, the limits and lot numbers shall be designated in the profile along with the street name to which the lot fronts.

f. Profiles Not Within Proposed Roads*:* In developing the profile information within or outside existing roads, the centerline of the sewer main in plan shall be used for the profile stationing which will provide true length profiles.

g. For minimum vertical clearances, see Section V-D-8-a-*4*, *Crossings* on page 44*.*

h. Utilities that cross sewer mains with the minimum vertical clearance shall be plotted to horizontal and vertical scale and identified in order to advise the contractor of their specific locations. For these utilities, stations and invert elevations shall be provided at every pipeline crossing for each pipe shown. If the elevation of the existing pipeline to be crossed is unknown or when the proposed clearance between an existing utility and the proposed utility is one foot (1') or less, the Engineer shall arrange to have a test pit excavated to determine the exact horizontal and vertical location of the existing utility or utilities prior to submission of preliminary construction drawings.

i. When a proposed or existing storm drain parallels a proposed sewer main, the storm drain shall be shown dashed in the background of the profile.

j. For existing developed properties, the finished floor or basement elevation of the dwelling to be served shall be projected on the profile along with the elevation relative to the house connection and to the correct vertical scale.

k. Sewer house connections into manholes shall only be permitted for terminal manholes. The connections to terminal manholes will be shown with the appropriate invert and lot number shown. All services within terminal manholes shall have the invert match top of bench.

l. The following information as minimum requirements shall be shown on the profile:
   - first floor and basement elevations for existing developed properties
   - road names
   - existing and proposed utilities, including storm drains
   - existing ground elevation line
   - proposed ground elevation line
   - bottom of stream or swale that parallels proposed sewer
   - 100-year flood elevation line with elevations
   - relocations of conflicting utilities
   - proposed finished road grade line
   - centerline of existing and proposed road crossings
   - date of topographical survey
   - centerline and name of intersecting street
   - limits of proposed fill and certified compaction

   The Engineer shall clearly note that the construction of the proposed sewer may not occur until the grade is within ± 0.2 feet of finished grade.

4. Pipeline Materials

   a. General: Pipeline design practices and materials used in the Baltimore County Sewer System are employed to ensure maximum service capacity with the least costs of installation and maintenance.

      The Engineer must be aware of the particular properties of each type of pipe so as to include or exclude the possibility of its employment under the greatest range of applications, leaving the construction contractor as many options as possible for the selection of the type of pipe to be installed. Any special design features and/or special materials required due to the specific nature of the project shall be submitted for approval to the Sewer Design Section.

      The following table presents the pipe materials that are acceptable to Baltimore County for interceptor and collector sewer construction. These materials are acceptable when supplied in conformance with the material and installation requirements of the Standard Specifications and this Design Manual.

PIPE TYPE MATERIAL	SPECIFICATION	SIZE ALLOWED
Polyvinyl Chloride (PVC) SDR35	ASTM D 3034 ASTM F 1336	6 thru 15-inch
Polyvinyl Chloride (PVC)	ASTM F 679 T-1 wall thickness ASTM 1336	18 thru 24-inch
Ductile Iron Class 52	AWWA C151	6 inches and larger
Reinforced Concrete Pipe (RCP)	ASTM C76	24 inches and larger
Prestressed Concrete Cylinder Pipe	AWWA C301	24 inches and larger

b. Special Circumstances

1) In addition to the types of pipe shown above, other pipe materials may be considered on a case-by-case basis when recommended by the Engineer and approved in writing by the Sewer Design Section.

2) The Sewer Design Section will require the use of DIP under the following circumstances:
   - for all open cut stream crossings (see *Pipeline Design in Wetlands, Stream Crossings and Tree Protection* for additional considerations for stream crossings)
   - sewers within casing pipes or tunnels shall be DIP
   - sewers greater than eighteen feet (18') deep
   - sewers proposed in fill areas

3) In areas where significant hydrogen sulfide concentrations are expected to exist, such as downstream from a pumping station or pressure sewer discharge, hydrogen sulfide resistant pipe materials, such as PVC, shall be used if available in the required diameter. If PVC is not an option in the required diameter, the Engineer shall investigate other solutions, such as special protective linings.

c. Underdrains: If groundwater conditions exist at the site which will be above the sewer main, the Engineer shall incorporate underdrains into the design if opportunities exist to drain the groundwater to storm drains, stormwater management ponds, or existing grades.

5. Change in Pipe Size

a. When a smaller sewer joins a larger one, the invert of the larger sewer should be lowered sufficiently to maintain the same energy gradient.

b. Sewer extensions shall be designed for projected flows even when the diameter of the receiving sewer is less than the diameter of the proposed extension at a manhole constructed in accordance with Section VI – A, *Manholes*, with special consideration of an appropriate flow channel to minimize turbulence when there is a change in sewer size. A schedule for construction of future downstream sewer relief must be provided.

6. Installation

a. Standards: Installation specifications shall contain appropriate requirements based on the criteria, standards, and the requirements established by industry in its technical publications. Requirements shall be set forth in the specifications for the pipe and methods of bedding and backfilling thereof so as not to damage the pipe or its joints, impeded cleaning operations and future connections, nor create excessive side fill pressures and ovulation of the pipe nor seriously impair flow capacity.

b. Trenching: The width of the trench shall be ample to allow the pipe to be laid and jointed properly and to allow the bedding and hunching to be placed and compacted to adequately support the pipe. Appropriate trench widths are shown in the Baltimore County Standard Details. The trench sides shall be kept as nearly vertical as possible. When wider trenches are specified, appropriate bedding class and pipe strength shall be used.

   In unsupported unstable soil, the size and stiffness of the pipe, the stiffness of the embedment and insitu soil, and the depth of cover shall be considered in determining the minimum trench width necessary to adequately support the pipe.

   Ledge rock, boulders, and large stones shall be removed to provide a minimum clearance of four inches (4”) below and on each side of the pipe(s).

c. Bedding, Haunching and Initial Backfill: Bedding classes A, B, C, or crushed stone, as described in ASTM C12, shall be used and carefully compacted for all rigid pipe provided the proper strength pipe is used with the specified bedding to support the anticipated load based on the type of soil encountered and potential groundwater conditions.

   Embedment materials for bedding, haunching, and initial backfill, Classes I, II, or III, as described in ASTM D2321, shall be used and carefully compacted for all flexible pipe provided the proper strength pipe is used with the specified bedding to support the anticipated load based on the type of soil encountered and potential groundwater conditions.

   All water entering the excavations or other parts of the work shall be removed until all the work has been completed. No sanitary sewer shall be used for the disposal of trench water unless specifically approved by the Engineer, and then only if the trench water does not ultimately arrive at existing pumping or wastewater treatment facilities.

d. Final Backfill: Final backfill shall be of a suitable material removed from the excavation except where other material is specified. Debris, frozen material, large clods or stones, organic matter, or other unstable materials shall not be used for final backfill with two feet (2') of the top of the pipe. Final backfill shall be placed in such a manner as not to disturb the alignment of the pipe.

e. CCTV Inspection: CCTV inspection must be performed in accordance with the Standard Specifications and *Specification Guidelines: Wastewater Collection Systems Maintenance and Rehabilitation* prepared by the National Association of Sewer Service Companies (NASSCO) and the *Handbook: Sewer Infrastructure Analysis and Rehabilitation,* EPA/625/6-91/030, October 1991.

7. Joints and Infiltration

a. Joints: The installation of joints and the materials used shall be included in the Specifications. Sewer joints shall be designed to minimize infiltration and to prevent the entrance of roots throughout the life of the system.

b. Leakage Tests: Leakage tests shall be specified. This may include appropriate water or low pressure air testing. The testing methods selected should take into consideration the range in groundwater elevations during the test and anticipated during the design life of the sewer.

c. Water (Hydrostatic) Test: The leakage exfiltration or infiltration shall not exceed 200-gallons per inch of pipe diameter per mile per day for any section of the system. An exfiltration or infiltration test shall be performed with a minimum positive head of two feet (2').

d. Air Test: The air test shall, as a minimum, conform to the test procedure described in ASTM C924 for concrete pipe; and for other materials, procedures approved by DPW.

8. Protection of Water Supplies

General: When wastewater systems are proposed in the vicinity of any water supply facilities, requirements of these design guidelines shall be used to maintain acceptable isolation distances. The following requirements shall also be followed:

a. Cross Connections Are Prohibited: There shall be no physical connections between a public or private potable water supply system and a sewer or appurtenance thereto which would permit the passage

of any wastewater or polluted water into the potable supply. No water pipe shall pass through or come into contact with any part of a sewer manhole.

b. Relation to Water Works Structures: While no general statement can be made to cover all conditions, it is generally recognized that sewers shall meet the requirements of these guidelines and the Maryland Department of the Environment (MDE) *Design Guidelines for Sewerage Facilities* with respect to the minimum distances from public water supply wells or other water supply sources and structures.

c. Relation to Water Mains: Sewers shall be laid at least ten feet (10') horizontally from any existing or proposed water main. The distance shall be measured from the outside diameter of each pipeline. In cases where it is not practical to maintain a 10' separation, DPW may allow deviation on a case-by-case basis if supported by data from the Design Engineer. Such deviation may allow installation of the sewer closer to the water main provided that the water main is in a separate trench and at an elevation so that the bottom of the water main is at least eighteen inches (18") above the top of the sewer measured from the outside diameter of both pipelines.

   If it is impossible to obtain proper horizontal and vertical separation, as described above, both the water main and the sewer must be constructed of mechanical joint pipe complying with the Standard Specifications; pipe must be pressure tested to 150 psi to assure watertightness before backfilling.

d. Crossings: Sewers crossing water mains shall be laid to provide a minimum vertical distance of 18" between the outside of the water main and the outside of the sewer. This shall be the case where the water main is either above or below the sewer. The crossing shall be arranged so that the sewer joints shall be equidistant and as far as possible from the water main joints and will not be closer horizontally than 3' to the crossing, unless the joints are fully encased in concrete as required below. Where a water main crosses under a sewer, adequate structural support shall be provided for the sewer to maintain line and grade.

   When it is impossible to obtain proper horizontal and vertical separation as stipulated above, one of the following methods must be specified:

   1) The sewer shall be designed and constructed equal to the water pipe and shall be pressure tested at 150 psi to assure watertightness prior to backfilling.

2) Either the water main or the sewer line may be encased in a watertight carrier pipe that extends 10' on both sides of the crossing, measured perpendicular to the water main. The carrier pipe shall be of materials approved by DPW for use in water main construction.

e. Relation to Wells and Reservoirs: Sewers shall be located no closer than 50' horizontally to water wells or reservoirs to be used for potable water supply.

f. Relation to Force Mains: Force mains will have no joint closer horizontally than 3' to the crossing, unless the joint is encased in concrete. The thickness of the concrete encasement will be a minimum of 4" at pipe joints.

g. Relation to Depressed Sewers: Depressed sewers crossing potable water lines must be installed below the water line with a minimum vertical clearance of 2'. .

E. Hydrogen Sulfide in Sewers

The corrosion of sewers and appurtenances and the impacts of odor and toxic gases are two important problems occurring in wastewater collection systems. Both of these problems can be attributed in large part to the generation of hydrogen sulfide (H_2S) in sewers. The EPA publication, *Process Design Manual for Sulfide Control in Sanitary Sewerage Systems*, contains a complete discussion of this topic.

Sewers shall be designed hydraulically to prevent excessive generations of H_2S. In general, small diameter sewers designed to maintain velocities greater than two feet (2') per second providing sufficient air-to-wastewater contact, normally do not experience a significant buildup of H_2S. Larger sized sewers may be susceptible to H_2S formation, but rates of generation can be reduced through proper design with concentrations limited to less than one (1) milligram per liter.

1. Corrosion Control: Where it is determined that the potential exists for damaging H_2S concentrations that will cause microbiologically induced corrosion, pipe materials must be selected to resist the microbiological corrosion and attack from sulfuric acid. Locations of concern may be where new sewer connections are made to older systems with a history of H_2S problems and deteriorating sewers and outfalls from pressure sewers and force mains. Chapter V lists various pipe materials and applications suitable for sewer use. As indicated, PVC and ABS, fiberglass, and vitrified clay are best suited for corrosive environments whereas concrete, ductile iron, and

cast iron soil pipe should be avoided unless special protective linings, coatings, or treatment are provided.

2. Sewer Gases: In designing the sewer system, consideration shall be given to the possibility of objectionable odors being emitted from manholes and sewers. As noted above, new sewer connections to older systems with a history of H_2S problems will very likely experience similar difficulties. In these cases, sewers and manholes will be located such that emissions of odorous sewer gases, and in particular H_2S, do not create a nuisance or hazard for nearby building occupants.

F. Low Pressure Sanitary Sewer Design

1. Policy
    a. It is the policy of DPW to promote the use of gravity sewer systems to the extent practical and feasible due to the reliability and low maintenance associated with gravity sewer systems. LPSS systems will not be considered as a method of providing sewer service that could otherwise be furnished by conventional gravity sewer systems.
    b. The grinder pump/low pressure sewer system shall be considered as a supplemental method for wastewater collection and not as a replacement for conventional gravity collection systems.
    c. Where the design of the low-pressure sewer system requires the use of pumping stations, the number of pumping stations and linear feet of force mains should be minimized.
    d. Grinder pumps on private property and connecting to County maintained gravity service connections to gravity sewers are privately owned and maintained and are subject to review and approval under the plumbing permit process.
    e. Grinder pump/pressure sewer systems are not to be used on an interim or temporary basis in anticipation of conventional gravity systems being installed in the future except under extraordinary circumstances.

2. Approval Required
    a. Submission to the Department – Requests for grinder pump/low pressure sewer systems must be submitted in writing to the Director of the Department of Public Works.
    b. Requirements for Approval – To receive approval from the Department of Public Works for the installation of a grinder pump/low pressure sewer system, the area to be served must have environmental, topographic or subsurface conditions which make it very difficult for potential users to be served by a gravity collection system or such conditions that make it very difficult or impractical to construct and maintain a gravity system.

c. Evidence Required –When submitting the request to the Department of Public Works, the applicant shall provide overwhelming evidence that gravity sewer installation is not feasible.
d. Review by Director
    1) Requests for grinder pump/low pressure sewer systems will be reviewed on a case-by-case basis and must be approved by the Director.
    2) Determinations of feasibility, difficulty or practicality shall be made by the Director based on the facts of each particular situation and the design of sewer systems must meet the needs of a particular situation.
    3) See Baltimore County Code Title 4, Subtitle 1 for additional information.

3. Design
   Hydraulic Calculation
    a. The design of the low-pressure sewer system shall be based on the probability method using HDPE Pipe (SDR-11) and Progressive Cavity Type Grinder Pump only.
    b. Minimum velocity shall be 2.0 feet per second
    c. Minimum size of pipe is one and one-half inches (1.5”)
    d. The Hazen-Williams friction coefficient (C Factor) shall be 150

4. Low Pressure Sewer Pipe Installation
   The method of pressure sewer pipe installation is the option of the Contractor unless otherwise stated in the Special Provisions or on the plans. Methods of installation allowed are:
    a. Open Cut
    b. Directional Drilling

5. Pipe Material
    a. For low-pressure lines, open trench construction, the material shall be Schedule 40, Schedule 80, SDR-21 polyvinyl chloride (PVC) pipe or high density polyethylene (HDPE) pipe, ASTM D1248, SDR 11.
    b. For low-pressure lines, directional drilling, the materials shall be high density polyethylene (HDPE) pipe, ASTM D1248, SDR-11.

6. Construction Drawings
   Construction drawings shall be drawn at a horizontal scale of 1” = 50’

    a. Grinder Pump
        1) In selecting a suitable location for our grinder pump on an owner’s property, Baltimore County requires that the grinder pump be:
            a) located as close to the road as possible

b) at least eight feet (8') away from any permanent structures
c) not located in the drip line of large trees or where tree roots may be damaged
d) within depth limitations to serve all existing plumbing, including the basement
e) not located in owner's sidewalks, access or driveways
f) if lot size limits grinder pump location to driveways, the grinder pump must be protected by railroad ties or concrete curb stops to prevent damage from vehicles

2) Grinder pumps shall be shown on the drawings and located with coordinates and labeled as simplex or duplex.
3) For each grinder pump, provide existing ground elevation at the grinder pump location and invert of the proposed inlet pipe.
4) The maximum depth of the inlet pipe is ten feet (10') from the existing/proposed ground.
5) All service lines between the grinder pump and low-pressure sewer shall be one and one half inches (1 ½").
6) Duplex grinder pumps, if used, must be located on or near the property line dividing two properties. Two (2), four-inch (4") inlets are required – one for each property.
7) Simplex grinder pumps, if used, must be located a minimum of seven and one half feet (7.5') from the property lines. One (1), four-inch (4") inlet is required.
8) Commercial property shall require a larger duplex grinder pump and must be located a minimum of seven and one half feet (7.5') from the property lines. One (1), six-inch (6") inlet is required.
9) Show the proposed electrical cable between the BGE meter and the grinder pump.
10) The disconnect panel is connected directly to the BGE meter.
11) On all plans in large bold lettering add either:
    - "**COUNTY MAINTAINED GRINDER PUMP**" or
    - "**PRIVATELY MAINTAINED GRINDER PUMP**"
12) The service valve assembly shall be located on the property line between the low-pressure pipe in the road and the grinder pump.
13) Electrical service between the house and the grinder pump shall not exceed two hundred feet (200').
14) All applicable Baltimore County standard grinder pump/low pressure sewer details shall be included on the Construction Drawings.
15) Record Plats
    For Developer projects, the record plat for the subdivision shall clearly and **boldly** identify all lots that will be served by a grinder

pump and shall note that these grinder pumps will be privately owned and maintained by the property owner.

b. Low Pressure Pipes
    1) Proposed low-pressure sewer pipe shall be located a minimum of ten feet (10') horizontally from water lines.
    2) Proposed low-pressure sewer pipe shall be a minimum of six feet (6') from all other utilities.

c. Manholes
    1) Show all manholes on drawings and locate with coordinates.
    2) Label all manholes as one of the following:
        a) Inline Cleanout/Flushing Connection Manhole
        b) Combination Flushing Connection and Air/Vacuum Release Valve Manhole
        c) Terminal Combination Flushing Connection and Air/ Vacuum Release Valve Manhole
        d) Intersection Flushing Connection Manhole

7. Profiles
   Profiles will be drawn with a horizontal scale of 1" = 50' and a vertical scale of 1" = 5'.

    a. Show proposed low-pressure sewer pipe in profile.
    b. Show stations for the low-pressure sewer every fifty feet (50') starting at a manhole with 0+00.
    c. At each fifty-foot (50') station, show the invert of the proposed low-pressure sewer pipe.
    d. Show all manholes, with station, inverts, type and coordinates.
    e. Manholes shall be located as follows:
        1) All high points shall have air/vacuum release valve manhole.
        2) All low points shall have inline cleanout manhole.
        3) All intersections shall intersection flushing connection manhole.
        4) All ends of pipe shall have terminal flushing connection manhole or, if required, a terminal air/vacuum release valve.
        5) At the end of County maintenance and beginning of private maintenance, an inline cleanout shall be required.
    f. The maximum horizontal distance between low-pressure sewer manholes hall be eight hundred feet (800').
    g. All utility crossings must be shown.
    h. All utility crossings shall have a minimum one-foot (1') vertical clearance.
    i. All existing or proposed utilities that parallel the proposed sewer shall be shown.
    j. The depth of proposed low pressure sewers shall be at least:

1) A minimum of six inches (6”) below any parallel water lines and
2) A minimum of four and one half feet (4.5’) below existing or proposed grade.

8. Maintenance of Grinder Pumps
   See Baltimore County Code Title 4, Subtitle 1

9. The Engineer/Designer shall become familiar with Baltimore County Special Provisions Part-B Specifications for the Pressure Sewer System.

VI. SEWER SYSTEM LAYOUT AND APPURTENANCES

A. Manholes

1. General

   a. Manhole Details are shown in the *Standard Details for Construction*. The Engineer shall use these standards as required to meet the design situation and shall designate the type on the profiles.

   b. When the pipe size entering and exiting manholes are the same, a minimum drop between invert in and invert out shall be one tenth of a foot (0.1'), and the maximum drop shall be one foot-eight inches (1'8"). For pipelines of different sizes, the pipeline crowns shall be matched. For interceptor sewers, the invert elevation of collector sewers and services shall match the crown elevation of the interceptor sewer. For manholes where vertical drops are required, see Section VI.A.12, Drop Manholes.

   c. The centerline of the manhole shall be located a minimum of three feet (3') from face of curb.

   d. Generally, manholes located within paved and mowed areas shall be constructed to proposed finished grade. Generally, manholes located within open space areas shall be a minimum of one foot (1') above existing ground.

   e. Manholes shall be placed where waterways are not likely to change direction or erode the area around the manhole, and locating manholes within streams shall be avoided. Manholes located within a floodplain shall be constructed with a watertight frame and cover.

   f. The crown of the outlet pipe from a manhole will be on line with or below the crown of the inlet pipe.

2. Locations

   Manholes shall be constructed at the following locations:
   - changes in alignment
   - changes in grade
   - change in pipe size
   - change in pipe material
   - pipeline junctions or intersections
   - at distances not to exceed 400 feet for sewer 15 inches or less and at distances 500 feet for sewers 18 inches to 30 inches except that distances up to 600 feet may be approved; greater spacing may be

approved in larger sewers provided the velocity is sufficient to prevent solids deposition
- at the terminal end of all sewers
- at locations along the sewer where future extensions are planned
- at locations where there is a change from public to private maintenance

3. Materials of Construction

   Manholes shall be pre-cast or poured-in-place concrete type. Manhole lift holes and grade adjustment rings shall be sealed with non-shrinking mortar or other approved material.

4. Size

   The minimum inside diameter of manholes shall be 48 inches for sewers less than 24 inches in diameter. For sewers 24 inches in diameter and larger, the minimum inside diameter shall be 60 inches. Larger diameter manholes may be required depending upon the locations of the sewers entering and exiting the manhole. A minimum one foot (1') of manhole wall is required between the outside diameters of pipelines where entering or existing the manhole. A minimum access diameter of 24 inches shall be provided as shown on the standard details.

5. Channel and Bench

   a. Typical manhole channels are shown in the standard details. If channeling for standard manholes that differs from what is shown in the standard details is required, the Engineer shall detail the channel on the plans, showing curve data, invert and bench elevations, and bench slopes, etc. This detailed information also shall be provided for all manholes over five feet (5') in diameter, bend structures, and junction chambers.

   b. Manhole channels shall not have a centerline radius of less than 2.5 times the pipe diameter.

   c. A bench shall be provided on each side of any manhole channel when the pipe diameter(s) are less than the manhole diameter.

   d. The diameter of the manhole installed must be large enough to accommodate a 12-inch wide bench on either side of the channel.

   e. The bench shall be sloped no less than one-half inch (½ ") per foot (4%). No lateral sewer, service connection, or drop manhole pipe shall discharge onto the surface of the bench.

f. The channel straight through a manhole shall be made to conform as closely as possible in shape and slope to that of the connecting sewers. The channel walls should be formed or shaped to the full height of the crown of the outlet sewer in such a manner to not obstruct maintenance, inspection, or flow in the sewers.

g. When curved flow channels are required or specified in manholes, including branch inlets, minimum pipe slopes shall be increased to maintain acceptable velocities.

6. Corrosion Protection

Where corrosive conditions exist or are anticipated, corrosion protection on the interior of manholes will be required. When corrosion protection is required by the Bureau of Engineering & Construction, the Engineer shall identify on the sewer profile where special manhole coating materials are to be used. One location where corrosion protection will be required is the discharge manhole for sewage force mains and pressure sewers. For new manholes, the coating shall consist of a minimum 16-mil factory-applied coal tar polyamide epoxy on all interior surfaces. For existing manholes, the manhole shall first be thoroughly cleaned by high-pressure washing (2000 psi minimum). The manhole walls shall then be lined pneumatically with Permacast by APM Permaform, high performance mix by Stron Seal, Sewper Coat by Lafarge Calcium Aluminates, or approved equal.

7. Watertightness

a. Watertight manhole covers are to be used whenever the manhole covers may be flooded by surface water runoff, ponding, or high water to prevent storm water inflow. Manhole top elevations will be set to avoid submergence of the cover.

b. Manholes located within the 100-year floodplain shall extend above existing ground or proposed grade and shall be constructed with a watertight frame and cover as indicated in the Standard Details.

c. A stainless steel insert dish shall be installed within all manholes when the edge of the cover is five feet (5') or less to the face of the curb or center of the gutter flow line. A stainless steel insert dish also shall be installed in all manholes within the vertical sump of roadways, when the manhole is within a swale or ditch, and when the manhole is located between homes on a side lot line. The Engineer shall identify on the construction drawings which manholes will receive an insert dish. A stainless steel insert dish also may be required at other locations that may be determined as necessary by the Bureau of Engineering & Construction

on a case-by-case basis. If an insert dish is installed, then a watertight frame and cover is not required.

d. Inlet and outlet pipes shall be joined to the manhole with a gasketed flexible watertight connection or any watertight connection arrangement that allows differential settlement of the pipe and manhole wall to occur.

e. In areas subject to high groundwater tables, manholes will be constructed of materials resistant to groundwater infiltration.

8. Deep Manholes

The manhole depth is defined from the lowest invert to the top of the frame and cover. Approval of the Bureau of Engineering & Construction is required for manhole depths exceeding thirty feet (30'). If the manhole depth exceeds thirty feet (30'), the Engineer shall take into consideration the following design requirements:

- provide computations from a Professional Engineer indicating that flotation will not occur
- verify that the groundwater pressure on the pre-cast concrete manhole section joints will not exceed the requirements of ASTM C443 latest revision and the standard specifications
- verify that the groundwater pressure on the pipe to manhole connections will not exceed the requirements of ASTM C923 latest revision and the standard specifications
- identify any modifications necessary to the standard manhole details as a result of the manhole depth and groundwater pressure
- where deep manholes are approved by the Bureau of Engineering & Construction, manholes over thirty feet (30') deep shall have a minimum five-foot (5') inside diameter, from invert to the cone section (the inside diameter from the invert to the cone section may be larger depending upon the pipe sizes entering and exiting the manhole as outlined in Section VI.A.4, Size)
- an intermediate landing or platform is required to be installed in all manholes exceeding twenty feet (20') deep; a landing or platform shall be provided for each ten feet (10') of height or fraction thereof

9. Terminal Manholes

a. Terminal manholes shall be constructed at the end of a sewer that will not be extended in the future. Terminal manholes shall meet the requirements of the standard details.

b. A maximum of three (3) sewer service connections shall enter a terminal manhole. A minimum of thirty degrees (30º) shall be provided between each service. The connections shall not spill over the bench.

10. Doghouse Manholes

    Doghouse manholes will be approved by the Bureau of Engineering & Construction only on a case-by-case basis. Doghouse manholes shall meet all requirements of the Standard Details.

11. Drop Manholes

    a. Design details, as well as maximum and minimum allowable drops, are indicated for drop manholes in the Standard Details for various sewer sizes. When the drop required is less than the minimum indicated on the Standard Details, no drop manhole is required. In lieu of a drop manhole, the slopes of the connecting pipelines and manhole channel shall be adjusted and sloped to limit the difference between the invert in and invert out of the manhole to less than one foot eight inches (1' 8").

    b. The channel shall be shaped to prevent solids deposition.

12. Inspection and Testing

    The standard specifications include a requirement for inspection and testing for watertightness and damage to the manhole prior to being placed in service.

B. Siphons

1. General

   Inverted siphons should have not less than two (2) barrels with a minimum size of six inches (6"). They shall be provided with the necessary appurtenances for maintenance, convenient flushing, and cleaning equipment. The inlet and discharge structures shall have adequate clearances for cleaning equipment, inspection, and flushing.

2. Design

   a. Design shall provide sufficient head and appropriate pipe sizes to provide velocities of at least three feet per second (3 fps) for average design flows.

   b. The inlet and outlet details shall be so arranged that the design average flow is diverted to one (1) barrel and so that either barrel may be removed from service for cleaning.

   c. The vertical alignment should permit cleaning and maintenance.

C. Building Connections

1. General

   a. Building connections are to be provided to connect individual buildings to the collector sewer main. Unless otherwise approved, one (1) building connection shall be allowed per lot. Building connections shall be shown on the plan and profile as described in Section V-D, *Details of Design and Construction,* page 29.

   b. Building connections shall be planned to eliminate as many bends are practical and to provide convenience in cleaning. Bends greater than forty-five degrees (45º) made with one (1) fitting should be avoided. Combinations of elbows, such as 45º-45º or 30º-60º, should be used with a cleanout provided. Generally, connections to other sewers will be made directly to the pipe with standard fittings rather than through manholes. However, a manhole must be used if the connection is more than 100 feet from the building cleanout. Normally, the cleanout inside the building will not be adequate for cleaning; thus, outside cleanouts will be provided. Installation of a two-way cleanout at the building connection five feet (5') from the footing is recommended. Manholes will be installed where cleanouts are not feasible.

2. Location

   a. The County-owned and maintained portion of the sanitary sewer building connection shall be built to the property line or edge of the drainage and utility easement, whichever applies.

   b. For Capital Projects, all building connections for improved lots shall be located so as to readily serve the basement or lowest floor of the existing dwellings or buildings in a cost effective manner. If it is not feasible, practical or economical, the Engineer shall propose first floor service in lieu of basement service. Where the location or depth of the sewer main is established by a crucial building house connection, this connection shall be located by the Engineer in the most advantageous position to minimize costs while providing basement service to the lot. In non-critical areas, the actual location of the building connection shall be determined after discussion with the property owner in the field prior to construction as long as the location is compatible with the collection system as designed. However, it shall be the responsibility of the Engineer to propose a feasible location for the building connection based on the location of existing wells, septic tank facilities, topography, and other features.

c. For developer projects, all building connections shall be designed to provide basement service. If it is not feasible or practical, or the building connection will drive the sewer main excessively deep, the Engineer shall propose first floor service in lieu of basement service. All improved properties having frontage on the collector sewer that are not a part of the proposed subdivision, but which may be served by the sewer main, shall be shown on the Contract Drawings. Connections to these lots, whether negotiated by the developer or required by the Bureau Engineering & Construction, shall be installed on the Contract Drawings.

d. Cleanouts are required to be installed on all building connections and must be located and constructed in accordance with the Standard Details.

e. When adjacent to a building connection, the entire stormwater management facility shall be shown on the plan view of the Construction Drawing. The location of the building connection shall not cause the private on-site service to pass through stormwater management facilities.

f. For residentially zoned properties, if the type of dwelling unit changes after design approval, then the building connection shall be revised on the Construction Drawings to meet the configuration of the proposed developments.

g. If a sewer main traverses between two adjacent lots, the building connection shall not be located adjacent to the building.

h. For new subdivisions, all proposed driveways shall be shown in plan view on the Construction Drawings.

i. Connections shall be located on the downstream side of the property.

3. Size

The size of all building connections shall be six inch (6”) or eight inch (8”) in diameter depending on the proposed use and type and the discharge flow requirements established by the Engineer. The size of the building connection for condominiums or apartments shall be no less than eight inches (8”).

4. Grades

Building connections shall be designed for a two percent (2%) minimum grade. The maximum allowable grade for a building connection shall be ten percent (10%). Drop connections shall be laid on a fixed grade of two percent (2%).

5. Depth

   Minimum cover over the building connection at the property line or easement shall be three and one-half feet (3½'). Where storm drains have not been proposed or installed, building connections shall have a minimum cover within the street right-of-way of six and one-half feet (6½'). The maximum depth at the property line shall not exceed twelve feet (12').

6. Type

   Connections for the various types of development shall be as follows:
   - single-family detached and attached – individual sewer services
   - townhouse condominium – individual sewer service
   - multi-family (apartments) – sewer service to the property line with private on-site sewers unless public sewers are required to traverse the property to serve other properties
   - multi-family (apartment style condominiums) – one sewer service to each building; on-site sewers shall be publicly owned only if the sewer mains will provide service to adjoining properties
   - single-family – panhandle lots – individual sewer service connections shall extend to the edge if the road right-of-way unless otherwise approved by the Bureau of Engineering & Construction. Publicly owned sewer mains shall extend within the panhandle lots if the sewer is required to be extended to adjoining properties.
   - boat pump-out facilities – boat pump-out facilities at marinas shall include semi-positive displacement pumps equipped with hour meters. The grinder pump shall be owned and maintained by the property owner. A meter agreement shall be prepared and executed by both Baltimore County and the property owner.

7. Materials

   Building connection materials shall meet the requirements of the Standard Specifications and the approved source of supply.

8. Alignment

   Service connections shall be perpendicular to mains and have no change in direction between the main or manhole and the cleanout at the property line. Services can only be connected to manhole if the structure is a terminal manhole. Services entering a terminal manhole must be placed at an angle ninety degrees (90º) or greater than the outgoing sewer main alignment. In general, services entering a manhole shall be designed so that the crown of the service main matches the crown of the incoming main.

9. Clearance

    a. Crossing Water Main: Clearance shall be measured between outside of pipes. Sewer house and building connections crossing water mains (existing or future) shall have a minimum of twelve inches (12") clearance below water mains. Sewer house and building connections crossing above water mains shall have a minimum of twelve inches (12") clearance and be encased in concrete ten feet (10') each side of water main.

    b. Parallel to Water House Service: Sewer house and building connections shall ordinarily be not less than seven feet (7') horizontally from water house services and a minimum of twelve inches (12") clear below water house services.

    c. Crossing Storm Drains and Other Utilities: Sewer house and building connections crossing storm drains and other utilities (existing or future) shall have a minimum clearance of twelve inches (12") from these utilities.

10. Abandonment

    When a property is developed, all unused service connections shall be abandoned at the property line. Cleanouts shall be removed and watertight caps shall be installed on the service.

D. Cleanouts

1. Cleanouts must be installed on all sewer building connections to provide a means for cleaning the connection. An acceptable cleanout is shown in Standard Detail S-12A.

2. Cleanouts shall not be located within sidewalks, driveways, or steps. If allowed, sewer services placed within a paved area for non-residential properties shall have a frame and cover placed over the cleanout in accordance with the Standard Details.

3. Cleanouts shall not be located any closer to a building than the depth of the building connection at the cleanout. In no case shall the cleanout be closer than fifteen feet (15') from the structure.

E. Sewers in Relation to Streams

1. Cover Depth

    a. The top of all sewers entering or crossing steams shall be at a sufficient depth below the natural bottom of the streambed to protect the sewer line. In general, the following cover requirements must be met:

- Two feet (2') of cover where the sewer is located in rock.
- Three and one-half feet (3½') of cover in other material. In major streams, more than 3½' of cover may be required.
- In paved steam channels, the top of the sewer line should be placed below the bottom of the channel pavement.

b. Less cover may be approved only if the proposed sewer crossing will not interfere with the future improvements to the stream channel. Reasons for requesting less cover shall be provided in any request for deviation from these guidelines.

2. Horizontal Location

Sewers located along streams shall be located outside of the streambed and sufficiently removed to provide for future possible stream widening and to prevent pollution by siltation during construction.

3. Structures

The sewer outfalls, headwalls, manholes, gate boxes, or other structures shall be located so that they do not interfere with the free discharge of flood flows of the stream.

4. Alignment

Sewers crossing streams shall be designed to cross the stream as nearly perpendicular to the stream flow as possible and shall be free from change in grade. Sewer systems shall be designed to minimize the number of stream crossings.

5. Construction

a. Materials

Sewers entering or crossing streams shall be constructed of ductile iron pipe with mechanical joints; otherwise, they shall be constructed so that they will remain watertight and free from changes in alignment or grade. Material used to backfill the trench shall be stone, coarse aggregate, washed gravel, or other materials that will not readily erode, cause siltation damage to the pipe during placement, or corrode the pipe.

b. Siltation and Erosion

Construction methods that will minimize siltation and erosion shall be employed. The design Engineer shall include in the project specifications the method(s) to be employed in the construction of sewers in or near

streams. Such methods shall provide adequate control of siltation and erosion by limiting unnecessary excavation, disturbing or uprooting trees and vegetation, dumping of soil or debris, or pumping silt-laden water into the stream. Specifications shall require that cleanup, grading, seeding, and planting or restoration of all work areas shall begin immediately. Exposed areas shall not remain unprotected for more than seven (7) days.

F. Aerial Crossings

1. General

   Approval from the Bureau of Engineering & Construction is required for the use of aerial crossings.

2. Support

   Support shall be provided for all joints in pipes utilized for aerial crossings. The supports shall be designed to prevent frost heave overturning and settlement.

3. Freezing

   Precautions against freezing, such as insulation and increased slope, shall be provided. Expansion jointing shall be provided between above and below ground sewers. Where buried sewers change to aerial sewers, special construction techniques shall be used to minimize frost heaving.

4. Impact of Flood Waters

   For aerial stream crossings, the impact of floodwaters and debris shall be considered. The bottom of the pipe should be placed no lower than the elevation of the 100-year flood elevation. Ductile iron pipe with mechanical joints is required.

VII. PIPING - Pipe Materials, Fittings, and Joints

A. Factors to be considered in the selection of pipe materials and piping systems for sewers or force mains are:

- flow characteristics or friction coefficient,
- life expectancy and history of use,
- resistance to scour and abrasion,
- resistance to acids, alkalis, high temperature, corrosive wastes and soils,
- ease of handling and installation,
- physical strength and pressure ratings,
- joint water tightness and ease of installation,
- availability of pipe in required sizes, strengths, etc.,
- availability of fittings, connections, and adapters.

Pipe, fittings, and joints serving as part of force mains will be selected to withstand the maximum internal operating pressures, including transient surges. The project specifications will indicate the appropriate pressure class and rating for each pipe application. No pipe manufactured is suitable for all installation requirements and conditions. Each type of pipe will be evaluated to determine its suitability for the particular design. Pipe materials that are determined to be inappropriate for use will be deleted from the project specifications.

B. Where iron or concrete pipe are to be considered, special attention will be paid to subsurface and soil conditions. The characteristics of the soil in which a pipe is placed affect the rates of corrosion, with the most corrosive soils being those having poor aeration and high values of acidity, electrical conductivity, dissolved salts, and moisture content.

C. In areas where problems with root penetration are anticipated, pipe with a joint that will successfully resist root penetration shall be specified. Generally speaking, the more watertight the joint, the greater will be the resistance to root penetration. Rubber-gasketed and compression-type joints are considered to provide the tightest joints. Also, pipe that comes in longer lengths are preferred.

VIII. FORCE MAINS

A. General

The pipeline, which receives wastewater from a pumping station and conveys it to the point of discharge, is called a force main. The design of the force main must be coordinated with the pumping station design. Force mains will be designed as pressure pipe and must be adequate in strength to withstand an internal operating pressure equal to the pump discharge head plus an allowance for transient pressures caused by water hammer. The internal operating pressure is maximum at the pumping station and is reduced by friction to atmospheric pressure, or near atmospheric pressure, at the point of force main discharge. The primary consideration in the hydraulic design of force mains is to select a pipe size that will provide the required minimum velocities without creating excessive energy losses due to pipe friction. The most economical size of force main should be determined on the basis of power costs required for pumping and capital investment costs for piping and equipment. In practice, however, the size usually is governed by the need to maintain minimum velocities at low flows to prevent deposition of solids and to develop sufficient velocity at least once a day to re-suspend any solids that may have settled in the line. Regardless of pipe sizes required for minimum velocities, the minimum diameters to be used are 1½ inches for pressure sewers at grinder pump installations, 4 inches for force mains serving small pump stations and pneumatic ejectors, and 6 inches for all other force mains.

B. Hydraulic Calculations

The system curve for the force main, showing the total energy losses associated with the range of possible pumping rates, shall be developed and shall be shown on the plans. Design velocities in force mains shall generally be between 2 and 6 feet per second. The maximum velocity shall be based on the ultimate design pumping rate.

C. Plan View

1. When installed parallel to a water main, the force main shall be designed per the horizontal and vertical clearances indicated between water and sewer mains in Chapter V.

2. When installed parallel to an existing sewer pipeline, provide 5 feet minimum horizontal clearance as measured from the outside edges of the pipes.

D. Profile

1. The Engineer shall strive to achieve a vertical profile that rises continuously from the pumping station toward the discharge manhole.

2. Ideally, the force main shall be designed without intermediate high points and with the top of the force main below the hydraulic grade line at the minimum pumping rate so that air release valves will not be needed. If the elimination of high points is not feasible, or if the design requires long, relatively flat vertical alignments, the design may require air release and air and vacuum valves.

3. Continuous uphill pumping shall be achieved in order to keep the force main full.

4. Force mains, with intermediate high points above the gravity sewer discharge point, can create partial vacuum conditions in the force main under circumstance such as draining conditions that occur due to intermittent pumping or when the HGL profile drops below the pipeline profile. The Engineer shall provide appropriate air release and air vacuum valves to protect the force main against damage under these conditions.

5. Downhill pumping is prohibited.

6. All force mains shall have a minimum of 3.5 feet of cover. In street rights-of-way, cover shall be measured from the top of the force main to the proposed grade; or in cases when the proposed grade is above the existing ground surface, the depth of cover shall be measured from the existing ground line. In easements across private property, future development in the area shall be given consideration when developing the force main profile and possible future development grades shall be evaluated to ensure that the minimum depth of cover is met. In situations where the force main parallels a water main, the force main depth shall be no less than 4.5 feet to avoid conflicts with water services.

7. The top of the force main and its appurtenances shall generally be designed to be lower than the HGL.

8. The following minimum information shall be shown on the profile:
   - existing and proposed utilities (longitudinal parallel utilities shall be “ghosted” in profile) including storm drains
   - road names
   - existing ground elevation line
   - proposed ground elevation line
   - existing and proposed road grade profile
   - areas requiring fill with certified compaction

- centerline and name of intersecting streets
- limits of restrained joint pipe

E. Appurtenances

1. Air Release and Air and Vacuum Valves: Force mains shall ideally be designed to rise continuously in profile from the pumping station to the point of discharge. To minimize installation and maintenance costs, the Designer shall evaluate the feasibility of eliminating intermediate high points by installing the main deeper below grade. Where this is not practical, the Designer shall include an automatic combination of air and vacuum valves at the intermediate high points to expel accumulated air under pressure to allow air into the force mains to prevent vacuum conditions and to expel larger quantities of air when the mains are filled. Air release and vacuum valves on wastewater force mains shall be specifically manufactured for wastewater service, be sized according to manufacturer's recommendations, and shall be placed in pre-cast manholes per the Standard Details.

2. Discharge Manholes: The connection between the force main and gravity sewer shall be designed with a discharge manhole. The termination of the force main in the discharge manhole shall be designed so that the force main will be flowing full at all times. See the Standard Details for discharge manhole details.

    a. For new manholes, the interior of the discharge manhole shall receive two coats of a factory-applied polyamide coal tar epoxy for a total dry film thickness of 16-mils. Existing manholes shall be lined in accordance with the Sewer Design Section manhole-lining specifications. Additional manholes further downstream also may require coatings. This determination will be made based on pipe slopes, flow and manhole spacing.

    b. Odor control may need to be provided at every discharge manhole.

    c. There shall be no branch laterals or SHCs at a discharge manhole.

F. Pipeline Materials

Force Mains, 6-inches in diameter and larger, shall be DIP, minimum Class 54, or PCCP in accordance with the Standard Specifications.

G. Pipe Restraint

1. Thrust Restraint Design for Buried Pipelines

Force mains shall be restrained to resist thrusts that develop at bends, tees, wye connections, reducers, and plugs in the pipe. The magnitude of such forces can be calculated with the use of formulas found in standard hydraulic textbooks. Required methods of restraint will consist of mechanical joint restraints or concrete thrust blocks and anchors.

Buttresses are shown in the Standard Details and are to be used in all cases compatible with design conditions. The Engineer shall verify that the standard buttresses, shown in the Standard Details, apply to the specific conditions of each particular design. If required, the Designer shall prepare and submit thrust restraint calculations based on internal hydraulic surge pressures and soil bearing capacities as determined by field measurements.

2. Alternate Buttress/Restrained Joint Design

   a. Special or Modified Thrust Blocks: Special or modified thrust block details are to be employed for conditions not covered by the Standard Details. All buttresses shall be designed based on actual soil conditions, groundwater depths, and design pressures.

      Horizontal bends, reducers, tees, tapping sleeves and valves (TS&V), plugs and caps shall be designed using one of the appropriate earth pressure theories available. *Design Method for Vertical Anchor Slabs in Sand* by N. Krebs Oversen and Helle Stormann is recommended. (See Pages 1481 to 1500, *Performance of Earth and Earth-Supported Structures*, Volume 1, Part 2, ASCE, 1972.) A design concept based on bearing capacity shall not be used. For blocks in cohesive soils, the soil resistance shall be evaluated in terms of short and long-term shear strengths. The lowest resistance between the two shall be used for the design. The calculated net soil resistance for the block to be used shall be at least 1.5 times the design thrust force. Design criteria for pipe anchors for vertical bends shall neglect the weight of the earth over the pipe. The weight of the pipe, and water in the pipe, also shall be considered negligible for pipe 16 inches in diameter and smaller.

   b. Restrained Joints: In lieu of special or modified thrust blocks, restrained joint pipe may be allowed in conjunction with the standard thrust blocks.

      All design of restrained joint systems shall be in accordance with the Ductile Iron Pipe Research Association (DIPRA) Thrust Restraint Design for Ductile Iron Pipe (1997) or Concrete Pressure Pipe Manual of Water Supply Practices M9. All restrained joint designs shall have a factor of safety of 1.5. All design parameters for restrained joint designs shall be based on actual field conditions, including soil types, groundwater conditions, design depths, and pipeline pressures.

Computations must be submitted for all restrained joint conditions. The limits of restrained joint pipe shall clearly be shown on the profile. The actual length of restrained joint pipe limits shall be rounded up to the next standard length of pipe or to the nearest fitting, whichever is greater.

H. Water Hammer

1. When the velocity of a fluid is changed, a phenomenon known a water hammer may result leading to fractures of the pipe and fittings and other damage.

2. The Engineer shall prepare a complete study of each force main design in conjunction with related pumping station. A written detailed analysis, along with supporting calculations, shall be submitted to the Sewer Design Section for approval during the engineering report phase of the project. This analysis shall include, and is not necessarily limited to, the following:
   - transient pressures due to water hammer and the effect of these pressures on the entire system
   - investigation of the pipeline profile to determine the possibility of water column separation
   - reverse rotation characteristics of the pumps
   - shut-off characteristics of the proposed pump control valves
   - a computer analysis of the transient pressures combined with the total system characteristics
   - substantiation for the use of surge valves, extraordinary pipe supports and bracing, when necessary, listing recommended size and computed discharge pressures

I. Identification

When force mains are constructed of material that might cause the force main to be confused with potable water mains, the force main shall be appropriately identified.

*Slope of pipe is zero therefore calculated capacity is zero

Hydraulic restrictions will impact capacity and surcharge conditon calculations causing cases where there is capacity in the pipe and there is also a surcharge

*Slope of pipe is zero therefore calculated capacity is zero

Hydraulic restrictions will impact capacity and surcharge conditon calculations causing cases where there is capacity in the pipe and there is also a surcharge

*Slope of pipe is zero therefore calculated capacity is zero

Hydraulic restrictions will impact capacity and surcharge conditon calculations causing cases where there is capacity in the pipe and there is also a surcharge

*Slope of pipe is zero therefore calculated capacity is zero

Hydraulic restrictions will impact capacity and surcharge conditon calculations causing cases where there is capacity in the pipe and there is also a surcharge

*Slope of pipe is zero therefore calculated capacity is zero

Hydraulic restrictions will impact capacity and surcharge conditon calculations causing cases where there is capacity in the pipe and there is also a surcharge

.03-3 Water Quality Criteria Specific to Designated Uses.

A. Criteria for Class I Waters — Water Contact Recreation and Protection of Nontidal Warmwater Aquatic Life.

(1) Bacteriological.

(a) Table 1. Bacteria Indicator Criteria Magnitudes

		Geometric Mean	Statistical Threshold Value
Indicator	Enterococci (fresh or marine) - culturable	35	130
	E. coli (fresh) - culturable	126	410

All Magnitudes in Table 1 are expressed as counts per 100 milliliters

(b) The geometric mean of samples taken over a 90 day period shall not exceed the steady state geometric mean values for the given indicator.

(c) 10 percent of samples taken over a 90 day period shall not exceed the statistical threshold value.

(d) When a sanitary survey and an epidemiological study approved by the Department disclose no significant health hazard, the criteria in Table 1 do not apply.

(2) Dissolved Oxygen. The dissolved oxygen concentration may not be less than 5 milligrams/liter at any time.

(3) Temperature.

(a) The maximum temperature outside the mixing zone determined in accordance with Regulation .05 of this chapter or COMAR 26.08.03.03 —.05 may not exceed 90°F (32°C) or the ambient temperature of the surface waters, whichever is greater.

(b) A thermal barrier that adversely affects aquatic life may not be established.

(c) Ambient temperature is the water temperature that is not impacted by a point source discharge.

(d) Ambient temperature shall be measured in areas of the stream representative of typical or average conditions of the stream segment in question.

(e) The Department may determine specific temperature measurement methods, times, and locations.

(4) pH. Normal pH values may not be less than 6.5 or greater than 8.5.

(5) Turbidity.

(a) Turbidity may not exceed levels detrimental to aquatic life.

(b) Turbidity in the surface water resulting from any discharge may not exceed 150 units at any time or 50 units as a monthly average. Units shall be measured in Nephelometer Turbidity Units.

(6) Color. Color in the surface water may not exceed 75 units as a monthly average. Units shall be measured in Platinum Cobalt Units.

(7) Toxic Substance Criteria. All toxic substance criteria to protect:

(a) Fresh water aquatic organisms apply in waters designated as fresh water in Regulation .03-1B;

(b) Estuarine or salt water aquatic organisms apply in waters designated as estuarine or salt waters as specified in Regulation .03-1B; and

(c) The wholesomeness of fish for human consumption apply in fresh, estuarine, and salt waters.

B. Criteria for Subcategory Class I-P Waters — Water Contact Recreation, Protection of Nontidal Warmwater Aquatic Life and Public Water Supply. The following criteria apply:

(1) The criteria for Class I waters in §A(1)—(6); and

(2) Toxic Substance Criteria. All toxic substance criteria:

(a) For protection of fresh water aquatic organisms apply; and

(b) To protect public water supplies and the wholesomeness of fish for human consumption apply.

C. Criteria for Class II Waters — Support of Estuarine and Marine Aquatic Life and Shellfish Harvesting.

(1) Bacteriological Criteria. These criteria are the same as for Class I, criteria for protection of recreational use, except, in Shellfish Harvest Waters, the following criteria also apply. In Shellfish Harvest waters, there may not be any pathogenic or harmful organisms in sufficient quantities to constitute a public health hazard in the use of waters for shellfish harvesting. A public health hazard for the consumption of raw shellfish will be presumed:

(a) If the most probable number (MPN) of fecal coliform organisms exceeds a median concentration of 14 MPN per 100 milliliters;

(b) If more than 10 percent of samples taken exceed 43 MPN per 100 milliliters for a 5-tube decimal dilution test or 49 per 100 milliliters for a 3-tube decimal dilution test; or

(c) Except when a sanitary survey approved by the Department of the Environment discloses no significant health hazard, §C(1) (a) and (b) do not apply and a public health hazard from the consumption of shellfish will not be presumed.

(2) Classification of Class II Waters for Harvesting.

(a) Approved classification means that the median fecal coliform MPN of at least 30 water sample results taken over a 3-year period to incorporate inter-annual variability does not exceed 14 per 100 milliliters; and:

(i) In areas affected by point source discharges, not more than 10 percent of the samples exceed an MPN of 43 per 100 milliliters for a five tube decimal dilution test or 49 MPN per 100 milliliters for a three tube decimal dilution test; or

(ii) In other areas, the 90th percentile of water sample results does not exceed an MPN of 43 per 100 milliliters for a five tube decimal dilution test or 49 MPN per 100 milliliters for a three tube decimal dilution test.

(b) Conditionally approved classification means that the Department has determined that under certain conditions an area is restricted, but when not restricted, meets the conditions for the approved classification.

(c) Restricted classification means that the median fecal coliform MPN of at least 30 water sample results taken over a 3-year period does not exceed 88 per 100 milliliters or that the Department has determined that a public health hazard exists; and:

(i) In areas affected by point source discharges, not more than 10 percent of the samples exceed an MPN of 260 per 100 milliliters for a five tube decimal dilution test or 300 MPN per 100 milliliters for a three tube decimal dilution test; or

(ii) In other areas, the 90th percentile of water sample results does not exceed an MPN of 260 per 100 milliliters for a five tube decimal dilution test or 300 MPN per 100 milliliter for a three tube decimal dilution test.

(d) Prohibited classification means that the fecal coliform values exceed those required for the restricted classification or is an area designated by the Department as a closed safety zone adjacent to a sewage treatment facility outfall or is an area closed due to a known pollution source.

(3) Temperature — same as Class I waters.

(4) pH — same as Class I waters.

(5) Turbidity — same as Class I waters.

(6) Color — same as Class I waters.

(7) Toxic Substance Criteria. All toxic substance criteria to protect:

(a) Estuarine or salt water aquatic organisms apply in accordance with the requirements of Regulation .03-1B; and

(b) The wholesomeness of fish for human consumption apply.

(8) Dissolved Oxygen Criteria for Class II Waters.

(a) This criteria is the same as for Class I waters, except for the Chesapeake Bay mainstem and associated tidal tributary subcategories.

(b) Seasonal and Migratory Fish Spawning and Nursery Subcategory. The dissolved oxygen concentrations in areas designated as migratory spawning and nursery seasonal use shall be:

(i) Greater than or equal to 6 milligrams/liter for a 7-day averaging period from February 1 through May 31;

(ii) Greater than or equal to 5 milligrams/liter as an instantaneous minimum from February 1 through May 31; and

(iii) Applicable to the open-water fish and shellfish subcategory criteria from June 1 to January 31.

(c) The seasonal shallow-water submerged aquatic vegetation subcategory is the same as for the open-water fish and shellfish subcategory year-round.

(d) Open-Water Fish and Shellfish Subcategory. The dissolved oxygen concentrations in areas designated as open-water fish and shellfish subcategory shall be:

(i) Greater than or equal to 5.5 milligrams/liter for a 30-day averaging period year-round in tidal fresh waters (salinity less than or equal to 0.5 parts per thousand);

(ii) Greater than or equal to 5 milligrams/liter for a 30-day averaging period year-round (salinity greater than 0.5 parts per thousand);

(iii) Greater than or equal to 4.0 milligrams/liter for a 7-day averaging period year-round;

(iv) Greater than or equal to 3.2 milligrams/liter as an instantaneous minimum year-round;

(v) For protection of the endangered shortnose sturgeon, greater than or equal to 4.3 milligrams/liter as an instantaneous minimum at water column temperatures greater than 29°C (77°F); and

(vi) For the Upper Pocomoke River Tidal Fresh (POCTF) and the Maryland portion of the Middle Pocomoke River Oligohaline (POCOH), greater than or equal to 4.0 milligrams/liter for a 30-day averaging period year-round.

(e) Seasonal Deep-Water Fish and Shellfish Subcategory. The dissolved oxygen concentrations in areas designated as seasonal deep-water fish and shellfish subcategory shall be:

(i) Greater than or equal to 3.0 milligrams/liter for a 30-day averaging period from June 1 through September 30;

(ii) Greater than or equal to 2.3 milligrams/liter for a 1-day averaging period from June 1 through September 30;

(iii) Greater than or equal to 1.7 milligrams/liter as an instantaneous minimum from June 1 through September 30;

(iv) The open-water fish and shellfish subcategory criteria apply from October 1 to May 31;

(v) For the dissolved oxygen criteria restoration variance for Chesapeake Bay Mainstem Segment 4 mesohaline (CB4MH) seasonal deep-water fish and shellfish subcategory, not lower for dissolved oxygen in segment CB4MH than the stated criteria for the seasonal deep-water seasonal fish and shellfish use for more than 7 percent spatially and temporally (in combination), from June 1 to September 30; and

(vi) For dissolved oxygen criteria restoration variance for Patapsco River mesohaline (PATMH) seasonal deep-water fish and shellfish subcategory, not lower for dissolved oxygen in segment PATMH than the stated criteria for the deep-water seasonal fish and shellfish use for more than 7 percent spatially and temporally (in combination), from June 1 to September 30.

(f) Seasonal Deep-Channel Refuge Subcategory. The dissolved oxygen concentrations in areas designated as deep-channel seasonal refuge use shall be:

(i) Greater than or equal to 1.0 milligrams/liter as an instantaneous minimum from June 1 through September 30 except for Chesapeake Bay segments subject to variances;

(ii) For dissolved oxygen criteria restoration variance for Chesapeake Bay Mainstem Segment 4 mesohaline (CB4MH) deep-channel refuge subcategory, not lower for dissolved oxygen in segment CB4MH than the stated criteria for the seasonal deep-channel refuge for more than 2 percent spatially or temporally (in combination), from June 1 to September 30;

(iii) For the dissolved oxygen criteria restoration variance for Lower Chester River Mesohaline (CHSMH) seasonal deep-channel refuge subcategory, not lower for dissolved oxygen in segment CHSMH than the stated criteria for the seasonal deep-channel refuge use for more than 16 percent spatially and temporally (in combination), from June 1 to September 30;

(iv) For the dissolved oxygen criteria restoration variance for Eastern Bay Mesohaline (EASMH) seasonal deep-channel refuge subcategory, not lower for dissolved oxygen in segment EASMH than the stated criteria for the seasonal deep-channel refuge use for more than 2 percent spatially and temporally (in combination), from June 1 to September 30; and

(v) The same as for the open-water fish and shellfish subcategory from October 1 to May 31.

(g) Implementation of the Dissolved Oxygen Water Quality Standard. The attainment of the dissolved oxygen criteria that apply to the Chesapeake Bay and tidally influenced tributary waters shall be determined using the guidelines established in the U.S. Environmental Protection Agency publications "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries (EPA 903-R-03-002), Chapter III", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries (EPA 903-R-03-002), Chapter III", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries—2004 Addendum (EPA 903-R-04-005) Chapter V", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries—2007 Addendum (EPA 903-R-07-003), Chapter IV", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries — 2008 Technical Support for Criteria Assessment Protocols Addendum (EPA 903-R-08-001), Chapter III", and "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries — 2010 Technical Support for Criteria Assessment Protocols Addendum (EPA 903-R-10-002), Chapters II and III", which are incorporated by reference.

(h) Restoration Variance. The percentage of allowable exceedance for restoration variances is based on water quality modeling and incorporates the best available data and assumptions. The restoration variances are temporary, and will be reviewed at a minimum every three years, as required by the Clean Water Act and EPA regulations. The variances may be modified based on new data or assumptions incorporated into the water quality model.

(9) Water Clarity Criteria for Seasonal Shallow-Water Submerged Aquatic Vegetation Subcategory.

(a) Water Clarity Criteria Measurement. A Bay segment has attained the shallow water designated use if:

(i) Submerged aquatic vegetation (SAV) acreage meets or exceeds the SAV acreage restoration goal in Table 2 of this regulation;

(ii) The shallow-water acreage that meets or exceeds the water clarity criterion expressed in Secchi depth equivalence from Table 1 of this regulation at the segment specific application depth specified in Regulation .08 of this chapter (excluding SAV no grow zones) is 2.5 times greater than the SAV Acreage Restoration Goal from Table 2 of this regulation; or

(iii) A combination of the actual SAV acreage attained and meeting the applicable water clarity criteria in an additional, unvegetated shallow water surface area equals 2.5 times the remaining SAV acreage necessary to meet the segment's restoration goal.

(a-1) If none of §C(9)(a)(i), (ii), or (iii) applies, the segment has not attained the water clarity designated use.

(b) Table 2. Numerical Water Clarity Criteria (in Secchi Depth Equivalents) for General Application to Shallow Water Aquatic Vegetation Bay Grass Designated Use (Application Depths Given in 0.5 Meter Attainment Intervals[1]).

		Water Clarity Criteria as Secchi Depth (meters)				
Salinity Regime	Water Clarity Criteria as Percent Light through Water	Water Clarity Criteria Application Depths (meters)				Seasonal Application
		0.5	1.0	1.5	2.0	
		Secchi Depth Equivalents for Criteria Application Depth				
Tidal Fresh	13%	0.4	0.7	1.1	1.4	April 1 to October 1
Oligohaline	13%	0.4	0.7	1.1	1.4	April 1 to October 1
Mesohaline	22%	0.5	1.0	1.4	1.9	April 1 to October 1

[1]Based on application if the formula PLW = 100exp(-K_dZ), the appropriate PLW criterion value and the selected application depth (Z) are inserted and the equation is solved for K_d. The generated K_d value is then converted to Secchi depth (in meters) using the conversion factor K_d = 1.45/Secchi depth.

(c) Table 3. SAV Acreage Restoration Goals.

Segment Description[1]	Segment Designator	SAV Acreage Restoration Goal	Secchi Application Depth
Northern Chesapeake Bay	CB1TF2	12,149	2 meters
Northern Chesapeake Bay	CB1TF1	754	1.0 meters
Lower Pocomoke River Mesohaline	POCMH	877[2]	1.0 meters
Manokin River Mesohaline	MANMH1	4,294	2.0 meters
Manokin River Mesohaline	MANMH2	59	0.5 meters
Big Annemessex River Mesohaline	BIGMH1	2,021	2.0 meters
Big Annemessex River Mesohaline	BIGMH2	22	0.5 meters
Tangier Sound Mesohaline	TANMH1	24,683[2]	2.0 meters
Tangier Sound Mesohaline	TANMH2	74	0.5 meters
Middle Nanticoke River Oligohaline	NANOH	12	0.5 meters
Lower Nanticoke River Mesohaline	NANMH	3	0.5 meters
Wicomico River Mesohaline	WICMH	3	0.5 meters
Fishing Bay Mesohaline	FSBMH	197	0.5 meters
Middle Choptank River Oligohaline	CHOOH	72	0.5 meters
Lower Choptank River Mesohaline	CHOMH2	1,621	1.0 meters
Mouth of Choptank River Mesohaline	CHOMH1	8,184	2.0 meters
Little Choptank River Mesohaline	LCHMH	4,076	2.0 meters
Honga River Mesohaline	HNGMH	7,761	2.0 meters
Eastern Bay	EASMH	6,209	2.0 meters
Upper Chester River Tidal Fresh	CSHTF	1	0.5 meters
Middle Chester River Oligohaline	CHSOH	77	0.5 meters
Lower Chester River Mesohaline	CHSMH	2,928	1.0 meters
Chesapeake & Delaware (C&D) Canal	C&DOH	7	0.5 meters
Northeast River Tidal Fresh	NORTF	89	0.5 meters
Bohemia River Oligohaline	BOHOH	354	0.5 meters
Elk River Oligohaline	ELKOH1	1,844	2.0 meters
Elk River Oligohaline	ELKOH2	190	0.5 meters
Sassafras River Oligohaline	SASOH1	1,073	2.0 meters
Sassafras River Oligohaline	SASOH2	95	0.5 meters
Bush River Oligohaline	BSHOH	350	0.5 meters
Gunpowder River Oligohaline	GUNOH2	572	2.0 meters
Mouth of Gunpowder River	GUNOH1	1,860	0.5 meters
Middle River Oligohaline	MIDOH	879	2.0 meters
Back River Oligohaline	BACOH	30	0.5 meters
Patapsco River Mesohaline	PATMH	389	1.0 meters
Magothy River Mesohaline	MAGMH	579	1.0 meters
Severn River Mesohaline	SEVMH	455	1.0 meters
South River Mesohaline	SOUMH	479	1.0 meters

Rhode River Mesohaline	RHDMH	60	0.5 meters
West River Mesohaline	WSTMH	238	0.5 meters
Upper Patuxent River Tidal Fresh	PAXTF	205	0.5 meters
Middle Patuxent River Oligohaline	PAXOH	115	0.5 meters
Lower Patuxent River Mesohaline	PAXMH1	1,459	2.0 meters
Lower Patuxent River Mesohaline	PAXMH2	172	0.5 meters
Lower Patuxent River Mesohaline	PAXMH4	1	0.5 meters
Lower Patuxent River Mesohaline	PAXMH5	2	0.5 meters
Lower Potomac River Tidal Fresh	POTTF	2,142[2]	2.0 meters
Piscataway Creek Tidal Fresh	PISTF	789	2.0 meters
Mattawoman Creek Tidal Fresh	MATTF	792	1.0 meters
Lower Potomac River Oligohaline	POTOH1	1,387[2]	2.0 meters
Lower Potomac River Oligohaline	POTOH2	262	1.0 meters
Lower Potomac River Oligohaline	POTOH3	1,153	1.0 meters
Lower Potomac River Mesohaline	POTMH	7,088[2]	1.0 meters
Upper Chesapeake Bay	CB2OH	705	0.5 meters
Upper Central Chesapeake Bay	CB3MH	1,370	0.5 meters
Middle Central Chesapeake Bay	CB4MH	2,533	2.0 meters
Lower Central Chesapeake Bay	CB5MH	8,270[2]	2.0 meters

[1] The segments West Branch Patuxent River (WBRTF-application depth = 0.5 meters), and Lower Patuxent River Mesohaline Subsegments 3 and 6 (PAXMH3 & PAXMH6-application depths = 0.5 meters), and the Anacostia River Tidal Fresh (ANATF-application depth = 0.5 meters) are not listed above because the SAV Restoration goal for each segment is 0 acres, based on no historical mapped SAV and because the available bathymetry data is too limited to allow for a calculation of an SAV restoration acreage goal using the method described in the U.S. Environmental Protection Agency publication "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its tidal Tributaries—2007 Addendum (EPA 903-R-07-003)". These segments have been assigned a water clarity criteria and application depth. Attainment of the shallow-water designated use will be determined using the method outlined in §C(9)(a)(iii) and (e) of this regulation.

[2]Maryland portion of the segment.

(d) SAV No Grow Zones. Certain Chesapeake Bay segments contain areas designated as shallow water use that are not suitable for growth of submerged aquatic vegetation due to natural conditions and permanent physical alterations. Tables V-1 and Figures V-1 to V-12 in the 2004 U.S. Environmental Protection Agency publication "Technical Support Document for Identification of Chesapeake Bay Designated Uses and Attainability — 2004 Addendum (EPA 903-R-04-006)", which is incorporated by reference, indicate the SAV No Grow Zones. The segments Upper Choptank River (CHOTF), Upper Nanticoke River (NANTD), Upper Pocomoke River (POCTF), and Middle Pocomoke River Oligohaline (POCOH) are entirely SAV no grow zones, therefore, the shallow-water designated use does not apply to these segments.

(e) Implementation. The attainment of the water clarity criteria that apply to the seasonal shallow-water submerged aquatic vegetation use subcategory in the Chesapeake Bay and tidally influenced tributary waters will be determined using the guidelines documented within the U.S. Environmental Protection Agency publications "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries (EPA 903-R-03-002)", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and its Tidal Tributaries — 2004 Addendum (EPA 903-R-04-005)", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and it Tidal Tributaries — 2007 Addendum (EPA 903-R-07-003)", "Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries — 2008 Technical Support for Criteria Assessment Protocols Addendum (EPA 903-R-08-001)", "Technical Support Document for Identification of Chesapeake Bay Designated Uses and Attainability (EPA 903-R-03-004)", and "Technical Support Document for Identification of Chesapeake Bay Designated Uses and Attainability — 2004 Addendum (EPA 903-R-04-006)" which are incorporated by reference.

(10) Chlorophyll a. Concentrations of chlorophyll a in free-floating microscopic aquatic plants (algae) may not exceed levels that result in ecologically undesirable consequences that would render tidal waters unsuitable for designated uses.

(11) Compliance Schedules for Protection of Downstream Uses in Tidal Waters.

(a) The compliance schedule provisions of COMAR 26.08.04.02C are applicable to discharge permits issued to existing dischargers which contain new or revised effluent limitations based on water quality standards contained in §C(8) and (9) of this regulation.

(b) An upstream state issuing discharge permits to existing dischargers which contain new or revised effluent limitations based on the water quality standards contained in §C(8) and (9) of this regulation may apply the compliance schedule provisions of COMAR 26.08.04.02C.

C-1. Criteria for Class II-P Waters—Support of Estuarine and Marine Aquatic Life and Shellfish Harvesting and Public Water Supplies. The following criteria apply:

(1) The criteria for Class II waters in §C(1)—(8), (9)(a)—(c), (10), and (11); and

(2) All toxic substance criteria:

(a) For protection of fresh water and freshwater-adapted estuarine aquatic organisms apply; and

(b) To protect public water supplies and the wholesomeness of fish and shellfish for human consumption.

D. Criteria for Class III Waters — Nontidal Cold Water.

(1) Bacteriological — same as Class I waters.

(2) Dissolved Oxygen. The dissolved oxygen concentration may not be less than 5 milligrams/liter at any time, with a minimum daily average of not less than 6 milligrams/liter.

(3) Temperature.

(a) The maximum temperature outside the mixing zone determined in accordance with Regulation .05 of this chapter or COMAR 26.08.03.03—.05 may not exceed 68°F (20°C) or the ambient temperature of the surface waters, whichever is greater.

(b) Ambient temperature — Same as Class I.

(c) A thermal barrier that adversely affects salmonid fish may not be established.

(d) It is the policy of the State that riparian forest buffer adjacent to Class III waters shall be retained whenever possible to maintain the temperatures essential to meeting this criterion.

(4) pH — same as Class I waters.

(5) Turbidity — same as Class I waters.

(6) Color — Same as Class I-P waters.

(7) Total Residual Chlorine (TRC). Except as provided in COMAR 26.08.03.06, the Department may not issue a permit allowing the use of chlorine or chlorine-containing compounds in the treatment of wastewaters discharging to Class III and Class III-P waters.

(8) Toxic Substance Criteria. All toxic substance criteria to protect:

(a) Fresh water aquatic organisms apply; and

(b) The wholesomeness of fish for human consumption apply.

E. Criteria for Class III-P Waters — Nontidal Cold Water and Public Water Supplies.

(1) Exception. Authorized operation of the Little Seneca Creek Dam means that all operational activities permitted are met under the conditions of a dam operating permit issued by the Department of Natural Resources under Natural Resources Article, §§8-801—8-814, Annotated Code of Maryland, and COMAR 08.05.03. Injury resulting from the authorized operation of Little Seneca Creek Dam to the Class III natural trout fishery recognized in the stream use designation assigned to Little Seneca Creek in Regulation .08 of this chapter is not considered a violation of this chapter.

(2) The following criteria apply:

(a) The criteria for Class III waters in §D(1)—(7); and

(b) All toxic substance criteria to protect:

(i) Fresh water aquatic organisms; and

(ii) Public water supplies and the wholesomeness of fish for human consumption.

F. Criteria for Class IV Waters — Recreational Trout Waters.

(1) Bacteriological — same as Class I waters.

(2) Dissolved oxygen — same as Class I waters.

(3) Temperature.

(a) The maximum temperature outside the mixing zone determined in accordance with Regulation .05 of this chapter or COMAR 26.08.03.03—.05 may not exceed 75°F (23.9°C) or the ambient temperature of the surface waters, whichever is greater.

(b) Ambient temperature — Same as Class I.

(c) A thermal barrier that adversely affects salmonid fish may not be established.

(d) It is the policy of the State that riparian forest buffer adjacent to Class IV waters shall be retained whenever possible to maintain the temperatures essential to meeting this criterion.

(4) pH — same as Class I waters.

(5) Turbidity — same as Class I waters.

(6) Color — same as for Class I waters.

(7) Toxic Substance Criteria. All toxic substance criteria to protect:

(a) Fresh water aquatic organisms apply; and

(b) The wholesomeness of fish for human consumption apply.

G. Criteria for Class IV-P Waters — Recreational Trout Waters and Public Water Supplies. The following criteria apply:

(1) The criteria for Class IV waters in §F(1)—(6); and

(2) Toxic Substance Criteria. All toxic substance criteria to protect:

(a) Fresh water aquatic organisms, and

(b) Public water supplies and the wholesomeness of fish for human consumption.

H. Criteria for Public Water Supply Reservoirs. The following criteria apply in freshwater reservoirs designated Class I-P, III-P or IV-P:

(1) The arithmetic mean of a representative number of samples of chlorophyll a concentrations, measured during the growing season (May 1 to September 30) as a 30-day moving average may not exceed 10 micrograms per liter; and

(2) The 90th-percentile of measurements taken during the growing season may not exceed 30 micrograms per liter.

WELCOME TO LAKE ROLAND

WE HOPE YOU ENJOY YOUR VISIT

SUMMARY OF RULES & REGULATIONS

- OPEN FROM SUNRISE TO SUNSET. PATRONS ARE NOT PERMITTED AT OTHER TIMES UNLESS INVOLVED IN PARK SPONSORED PROGRAMS.
- PETS MUST BE LEASHED, EXCEPT INSIDE PAW POINT DOG PARK. WWW.PAWPOINT.ORG
- PET OWNERS ARE RESPONSIBLE FOR REMOVAL OF ALL PET WASTE.
- HUNTING OR POSSESSION OF FIREARMS IS PROHIBITED.
- POSSESSION OR CONSUMPTION OF ALCOHOLIC BEVERAGES IS PROHIBITED.
- PERMITS ARE REQUIRED FOR GROUPS OF 12 OR MORE.
- HORSES, SWIMMING, ICE SKATING, VENTURING ON FROZEN BODIES OF WATER, THE USE OF METAL DETECTORS, OPEN FIRES, AND UNAUTHORIZED MOTOR VEHICLES ARE PROHIBITED.
- BIKING AND BOATING ALLOWED SUBJECT TO ADDITIONAL REGULATIONS. REGULATIONS AVAILABLE AT WWW.LAKEROLAND.ORG
- PROPANE OR NATURAL GAS GRILLS AND STOVES ARE PROHIBITED.
- REMOTE CONTROLLED VEHICLES OF ANY FORM POWERED BY AN ENGINE, MOTOR, OR BATTERY ARE PROHIBITED. THIS INCLUDES RC CARS, RC AIRCRAFT, RC BOATS AND DRONES. MODEL ROCKETS OF ANY KIND ARE PROHIBITED.
- ALL PERSONS SHALL COMPLY WITH THE SIGNS AND MARKERS INSTALLED BY THE DEPT. OF REC & PARKS.

STREAM SENSE

This location has been identified as having potential for recurring sanitary sewer overflows during and following heavy rainfall.

Storm water runoff from streets, parking lots, fields and lawns, as well as occasional leaks or overflows from the sanitary sewer system, may carry pollutants that negatively affect stream water quality, causing a potential health risk.

Follow these guidelines and use your "Stream Sense" whenever you use our rivers and streams:

- Avoid or minimize contact with natural waters whenever they are cloudy or immediately after storms and heavy rain.
- Do not drink stream water.
- Avoid hand to mouth contact when possible. Wash your hands before eating, after working or playing in a stream.
- Minimize water contact with open wounds or cuts, and wash with soap and water after contact with a stream.

THIS ADVISORY WILL REMAIN IN EFFECT UNTIL FURTHER NOTICE!

Jones Falls Sewershed – Performance Assessment Report

Dear Mr. Bayer:

Enclosed is an electronic copy of the Jones Falls Performance Assessment Draft Report. This report describes the work performed for the Jones Falls Sewershed and provides an analysis on the success of rehabilitation work completed in the Jones Falls basin.

Should you have any questions or require additional information, please feel free to contact me.

Sincerely,

RJN GROUP, INC.

Executive Summary

Baltimore County entered into a Consent Decree (CD) in 2005 with the United States Environmental Protection Agency (EPA) and the State of Maryland Department of the Environment (MDE) to complete a comprehensive collection system evaluation for all 23 County Sewersheds to identify/address deficiencies that contribute to, or are likely to contribute to, sanitary sewer overflows (SSO).

In fulfillment of CD requirements, the County contracted Rummel, Klepper & Kahl, LLP (RK&K), to complete collection system inspection (Paragraph 8), rainfall and flow monitoring (Paragraph 9), collection system modeling (Paragraph 14), and prepare a sewershed repair, replacement, and rehabilitation plan (Paragraph 10) for the Jones Falls Sewershed. The Sewershed Repair, Replacement, and Rehabilitation (SRRR) Plan for Jones Falls (*Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan for the Jones Falls Sewershed*, *Rummel, Klepper & Kahl, LLP, December 2012*) was submitted to the County, and approved by US EPA and MDE, in 2013.

Section 6 of the 2013 SRRR Plan provides detail of the work planned in the Jones Falls sewershed. Targeted rehabilitation to correct structural defects was completed throughout the sewershed. Comprehensive rehabilitation to eliminate sources of I/I was completed in SRRR meter basins BC02, BC03, BC04, and BC09.

Rehabilitation construction in the four meter basins (BC02, BC03, BC04, and BC09) targeted for comprehensive rehabilitation for I/I reduction was performed from 2015 through 2019. Comprehensive rehabilitation construction for I/I reduction in basins BC02 and BC03 began in November 2015 and was completed in September 2018, in basin BC04 construction began in May 2016 and was completed in September 2019, and in basin BC09 construction began in March 2016 and was completed in September 2019. Two relief sewers were also constructed in Jones Falls to increase the capacity of the system, one near Coppermine Terrace and the other relief sewer was constructed within Towson Town Boulevard and will be put in service in the future.

RJN was contracted by the County to complete a Performance Assessment of the work completed in the Jones Falls sewershed per CD Paragraph 10.E. This Performance Assessment details the work completed to meet CD requirements as outlined in Section 6 Corrective Action Recommendation Plan of the 2013 Jones Falls SRRR Plan.

The results of the base infiltration reduction assessment indicate that the completed rehabilitation projects in basins BC02, BC04, and BC09 were effective in reducing groundwater infiltration and exceeded the predicted base infiltration reductions in the 2013 SRRR Plan while basin BC03 showed an increase in base infiltration. The increase in base infiltration in BC03 can be attributed to the small inch diameter mile (idm) and the small net tributary area. This basin's primary purpose appears to act as a flow balance check meter for the upstream meters as they combine into the interceptor. In addition, the only wastewater contribution to the meter basin itself is from the private sewers within the MD Fairground. The results of the RDII reduction assessment indicate that completed rehabilitation projects were effective in reducing RDII into the sewer system in three out of the four rehabilitated basins.

Three Non-Pump Station SSOs were originally constructed in the Jones Falls Sewershed to relieve the sanitary sewer collection system and overflow in the event of surcharge caused by hydraulic capacity limitations during wet weather. SSO elimination plans for these non-pump station SSOs were prepared and the recommended corrective actions were completed. One constructed SSO (31A) was eliminated as of May 2007, prior to the development of the SRRR Plan. Overflow structure SSO 120 was eliminated in 2011 through rehabilitation. SSO 113 has not yet been eliminated and cannot be closed until Baltimore City completes their corrective actions downstream. SSO 131, Alabama Avenue, was discovered and immediately closed in September of 2010.

Pre- and post-rehabilitation flow monitoring data was used to update the hydraulic model based on the monitored flow conditions. The model was then used to simulate pre- and post-rehabilitation hydraulic conditions, respectively, under projected 2025 population and employment conditions as obtained from the hydraulic model used for the 2013 SRRR Plan. Model simulations show that I/I reduction rehabilitation and relief sewer construction in Jones Falls reduced predicted overflow volumes between 89 and 100 percent in total, for those basins where comprehensive I/I reduction rehabilitation was performed, or relief sewers were constructed.

RJN evaluated the effectiveness of the County's preventative and proactive maintenance programs in reducing root, grease, and other blockages. Based on the results, the County's maintenance programs are generally effective in preventing overflows resulting from blockages, defective pipe, and high flows. The County's approved collection system operation and maintenance (O&M) plan outlines the various preventative and proactive maintenance programs the County has implemented in Jones Falls. The County maintains a list of sites that require special cleaning in the Jones Falls Sewershed; these are sites that require recurring cleaning due to grease, roots, or other blockages. From January 2010 through December 2019, the County performed over 4,000 SLRAT O&M field visits including regular maintenance and special cleaning in addition to preventative and investigative work. A total of 20 blockages were recorded in 2019.

Non-constructed overflows trended downward during the overall 2010 – 2019 evaluation period. With the exception of two overflows totaling over 5,000 gallons in 2018 during dry weather conditions, attributed to a defective pipe, discharges from sanitary sewer manholes (non-constructed SSOs) in the Jones Falls sewershed totaled 1,165 gallons during the assessed post rehabilitation period (2019). There were no discharges attributed to high flows during the assessed post-rehabilitation period,

The number of basement backups not attributed to high flows peaked in 2014 and 2018, but otherwise has remained steady around 11 backups each year. The annual number of basement backups (i.e. private property discharges) reached a high of 37 in 2018, including 17 basement backups attributed to high flows. These 17 high flow basement backups are attributed to the record rainfall recorded in throughout Baltimore County in 2018. None of the SSO discharges or basement backups associated with high flows occurred in meter basins where comprehensive rehabilitation for I/I reduction was performed during the post rehabilitation period.

Overall, the results of the performance assessment indicate that the rehabilitation performed, and relief sewers constructed or planned, were effective. Three (3) non-pump station SSOs have been eliminated. SSO 113, Marnat Road, has not been closed. The volume of non-constructed SSOs have begun to decrease in the post rehabilitation monitoring period and the model predicted SSO volumes are projected to decrease 89 and100 percent. The number of recorded basement backups did increase during the evaluation period, but the vast majority of these occurred during the record rainfall year of 2018.

1.0 Introduction

Baltimore County entered into a Consent Decree (CD) in 2005 with the United States Environmental Protection Agency (EPA) and the State of Maryland Department of the Environment (MDE) to complete a comprehensive collection system evaluation for all 23 County Sewersheds to identify/address deficiencies that contribute to, or are likely to contribute to, sanitary sewer overflows (SSO).

In fulfillment of CD requirements, the County contracted Rummel, Klepper & Kahl, LLP (RK&K), to complete collection system inspection (Paragraph 8), rainfall and flow monitoring (Paragraph 9), collection system modeling (Paragraph 14), and prepare a Sewershed Repair, Replacement, and Rehabilitation (SRRR) plan (Paragraph 10) for the Jones Falls Sewershed. The Sewershed Repair, Replacement, and Rehabilitation (SRRR) Plan for Jones Falls was submitted to the County, and approved by US EPA and MDE, in 2013.

Section 6 (Corrective Action Recommendation Plan) of the 2013 SRRR Plan provides detail of the work planned in the Jones Falls sewershed. Targeted rehabilitation to correct structural defects was performed throughout the sewershed. Comprehensive rehabilitation to eliminate sources of I/I was implemented in meter basins BC02, BC03, BC04, and BC09.

Rehabilitation construction in the four meter basins (BC02, BC03, BC04, and BC09) targeted for comprehensive rehabilitation for I/I reduction was performed from 2015 through 2019. Comprehensive rehabilitation construction for I/I reduction in basins BC02 and BC03 began in November 2015 and was completed in September 2018, in basin BC04 construction began in May 2016 and was completed in September 2019, and in basin BC09 construction began in March 2016 and was completed in September 2019. Two relief sewers were also constructed in Jones Falls to increase the capacity of the system, one near Coppermine Terrace and the other was constructed near Towson Town Boulevard.

RJN was contracted by the County to complete a Performance Assessment of the work completed in the Jones Falls sewershed per CD Paragraph 10.E. This Performance Assessment details the work completed to meet CD requirements as outlined in Section 6 of the 2013 Jones Falls SRRR Plan.

The remainder of the report is organized as follows: *Section 2 – Evaluation of SSOs*, *Section 3 – Quantification of Reduction in BI and RDII*, *Section 4 – Effectiveness of Repair, Replacement, and Rehabilitation Projects*, *Section 5 – Effectiveness of Preventative & Proactive Maintenance Programs*, and *Section 6 – Conclusions.*

1.1 Sewershed Meter Basin Summary

The Jones Falls Sewershed, as shown in **Figure 1-1**, is located in the southern region of Central Baltimore County, directly adjacent and north of Baltimore City. The sewershed is approximately 12,577 acres in size and is comprised of residential and commercial properties. The wastewater collection system within the sewershed consists of approximately 1,100,000 linear feet (LF) of gravity sewers ranging in diameter from 6 to 48 inches, 6,200 manholes, 4 pump stations, approximately 6,600 LF of 6-inch force main, and 8,200 LF of low-pressure pipes.

The sewershed intermittently receives flow from the Texas Sewershed from the northeast by a 24-inch force main. The flow from the Texas pump station generally discharges to the Longquarter sewershed, and flow to the Jones Falls sewershed is regulated by a valve that is normally closed. Flow continues to run through the Jones Falls Sewershed via gravity sewers. All force mains transmit flows from pump stations to gravity mains.

The majority of flow from the Jones Falls sewershed flows through a 42-inch interceptor gravity main discharging into the City of Baltimore's sewer system, where the flow is metered by a jurisdictional boundary meter (TSJF01) operated and maintained by the City of Baltimore. Additionally, in the southwestern portion of the sewershed, there are several sewered areas that discharge to the City of Baltimore sewer system through separate jurisdictional boundary connections. All flow from the Jones Falls sewershed is ultimately conveyed to the City's Back River Wastewater Treatment Plant.

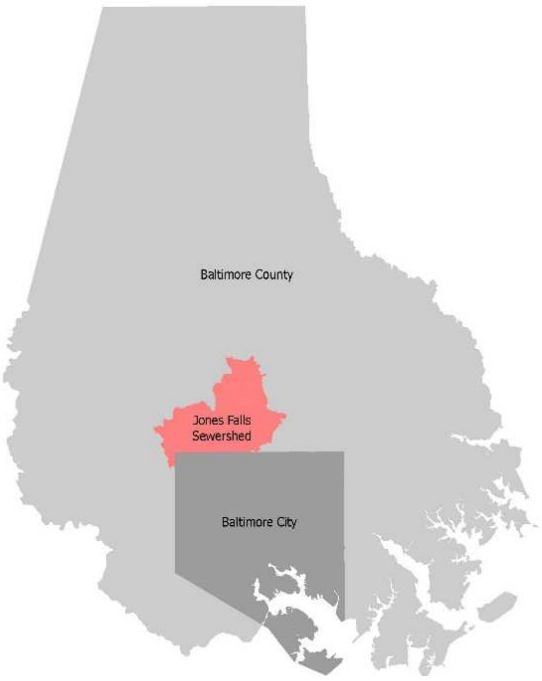

Figure 1-1
Sewershed Location Map

Flow monitoring in support of the 2011 I/I Report and the SRRR Plan for Jones Falls was performed at 26 locations in 2008, supplemented by flow meter data collected separately by the City of Baltimore at seven locations either at the jurisdictional boundary with the County or downstream thereof. Meter Basins were generally delineated to capture flow generated from all SSAs. Post rehabilitation flow meter locations were selected based on the previously (2008) monitored locations, supplemented by additional locations selected to address the County's intent.

Post rehabilitation flows were monitored at 43 locations. The Jones Falls Sewershed was divided into 37-meter basins as shown on **Figure 1-2.** The majority of the target locations were selected based on the 2008 metering locations. Additional meter locations were selected to better characterize the flows in the main and branch interceptors, monitor flows in two parallel lines in the western part of the sewershed, and subdivide select target 2008 meter basins into smaller meter basins to further characterize dry- and wet-weather flows in those meter basins. One location was selected to directly monitor flow discharging to Jones Falls from the Texas Pump Station. In addition to these 37 meter locations, five model-predicted SSO locations as reported in the 2013 Jones Falls SRRR Plan were targeted for flow monitoring to attempt to verify model predictions.

1.2 Pre- and Post-Rehabilitation Flow and Rainfall Monitoring

To assess the effectiveness of rehabilitation projects in reducing I/I, pre- and post-rehabilitation flow monitoring was performed in meter basins where rehabilitation construction was implemented as well as locations with known or suspected sanitary sewer overflow activity. Pre-rehabilitation flow monitoring was completed by RK&K and the flow monitoring data was included in the Inflow and Infiltration Evaluation Report submitted to the County in November 2011 (Inflow & Infiltration Evaluation Report Jones Falls Sewershed, RK&K, November 2011).

Table 1-1 below summarizes the pre- and post-rehab flow monitoring periods, and the purpose of flow monitoring in each basin. Locations of the Jones Falls flow meters are presented in **Figure 1-2**.

Table 1-1 Pre- and Post-Rehabilitation Flow Monitoring Summary

Basin	MH ID	Pre-Rehab FM Period	Post-Rehab FM Period	Flow Monitoring Purpose

*Post Rehab FM occurred in a different manhole than Pre-Rehab flow monitoring.
N/A – No pre-rehab flow monitoring occurred in that basin.
BC01, BC12, and BC19 basins were broken up in the Post-Rehab flow monitoring to isolate problem areas

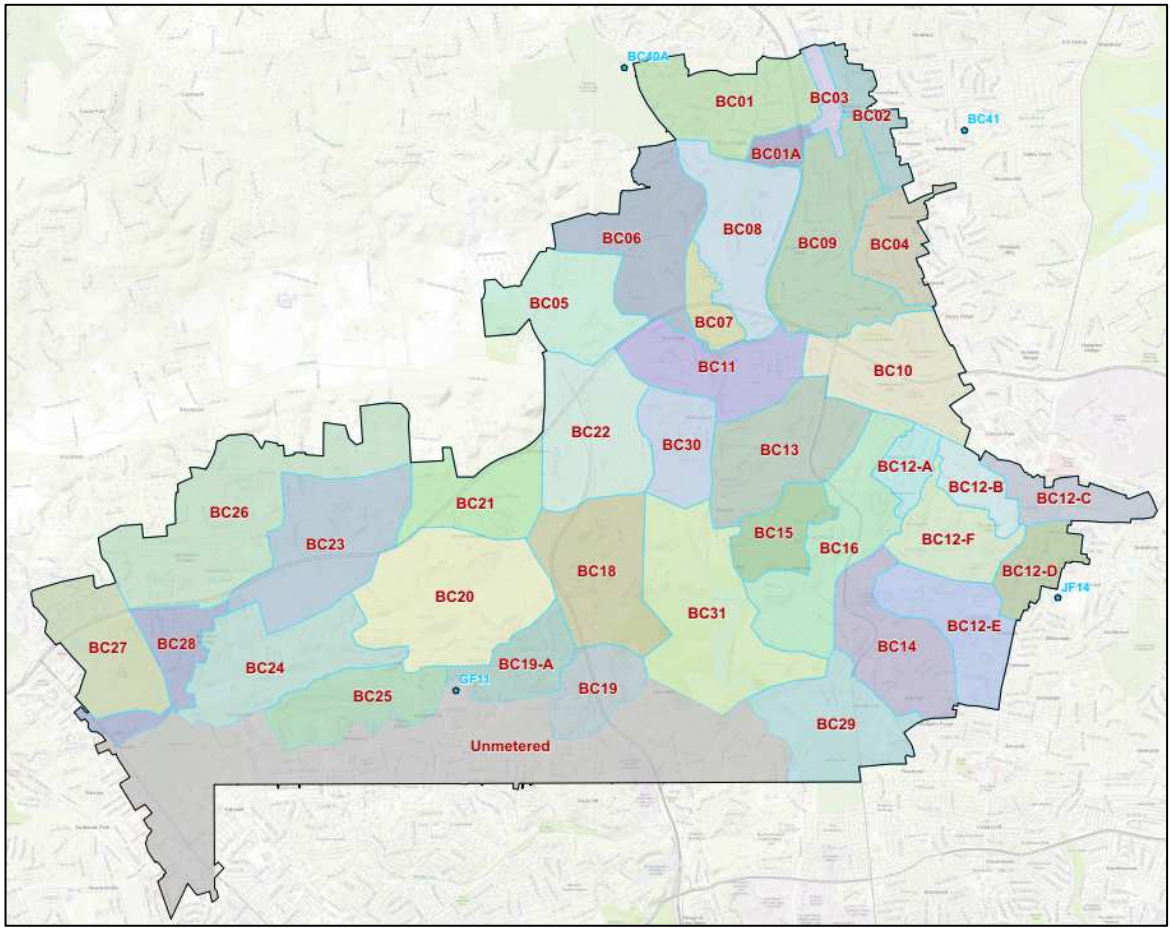

Figure 1-2: Jones Falls Meter and Rain Gauge Locations

Flow monitoring in basins BC02, BC03, BC04, and BC09 was performed to evaluate the effectiveness of comprehensive I/I rehabilitation performed in these four meter basins. The remaining meters listed in **Table 1-1** were installed to evaluate flows at model-predicted SSO locations as identified in support of the 2013 Jones Falls SRRR Plan or to calibrate and verify the model. The control basin (BC26), where no I/I reduction construction was performed, serves as a comparative baseline to evaluate, and assess the effectiveness of I/I reduction where rehabilitation was performed. Monitoring in the control basin was conducted concurrently with BC02, BC03, BC04, and BC09 during the post-rehabilitation period to account for flow differences attributable to rainfall differentials during the pre-and post-rehabilitation monitoring periods, seasonality, groundwater conditions, and other non-rehabilitation related influences on the sanitary sewer flows.

Baltimore County has had a County-wide rain gauge rainfall monitoring program in place continuously since 2006. The County-wide rain gauging program consists of 45 tipping bucket rain gauges located throughout Baltimore County. The rain gauges record 0.01-inch increments of precipitation at 5-minute intervals. Rainfall data collected from four (4) rain gauges was used to correlate rainfall events with inflow responses. The four rain gauges are BC40A, BC41, GF11, and JF14. Locations of the rain gauges are included in **Figure 1-2**.

Annual rainfall totals measured at BC40A, BC41, GF11, JF14, and the average annual totals for Baltimore County's network of 45 rain gauges are presented in **Table 1-2** to provide a general sense of the wet weather variations observed in the Jones Falls Sewershed, and the County as a whole, during the pre- and post-rehabilitation periods under evaluation.

Table 1-2 Jones Falls Sewershed and Baltimore County Rain Summary

Rainfall Monitoring Year	Rehab Period	BC40/BC40A Rainfall (in)	BC41 Rainfall (in)	GF11 Rainfall (in)	JF14 Rainfall (in)	Baltimore County Average (in)
2008	Pre-Rehab	44.3	46.9	46.2	45.5	44.5
2018	Post-Rehab	73.9	67.8	73.0	75.4	71.0
2019	Post-Rehab	51.9	49.5	52.1	52.7	44.2

It is notable that measured rainfall was between 45-66 percent higher in 2018 (post-rehab flow monitoring) than in 2008 (pre-rehab flow monitoring). This differential in rainfall can potentially affect comparative evaluation results because both infiltration and inflow are correlated with rainfall. Measured inflow is directly related to the amount of recorded rainfall, and infiltration is indirectly affected by high rainfall in that sustained high rainfall periods will generally elevate groundwater levels.

In evaluating I/I data from pre- and post-rehabilitation periods, the rainfall differential between the two periods should be accounted for when evaluating the success of rehabilitation performed to reduce I/I sources. Control basin monitoring is intended to assist in the assessment by providing flow monitoring data in a non-rehabilitated basin. The monitored I/I differential in the control basin can then be used to assess the differential in I/I attributable to the differential in rainfall in the pre- and post-rehabilitation monitoring periods, independent of the I/I source rehabilitation that occurred.

2.0 Evaluation of SSOs

This section presents an analysis of the frequency and causes of SSOs that occurred in the Jones Falls Sewershed before and after the implementation of SRRR corrective action recommendations listed in Section 6 of the Jones Falls Sewershed SRRR Plan. SSOs can usually be grouped into one of four categories: constructed overflow structures, pump station & pressure pipe overflows, manhole & sewer overflows, and basement backup overflows.

Section (2.0) assesses the rates, volumes and causes of SSOs that *actually occurred* in Jones Falls between 2010 and 2020.

2.1 Pump Station Improvements

The Jones Falls Sewershed contains four (4) pumping stations. These include the Buchanan Road Pumping Station, the Stanton Woods Pumping Station, the Templegate Pumping Station, and the Stevenson Pumping Station. The County is currently undertaking, or has previously completed, measures set forth in Paragraph 13 of the CD for these pumping stations. The County has completed an Engineering Evaluation and Condition Assessment (EE/CA) for all four (4) of the pumping stations as required by Paragraph 13.F of the CD. Reports have been submitted for review and approval in accordance with Paragraph 13.F.iii of the CD. All deficiencies defined in Paragraph 13.F.iv of the CD, and outlined in the EE/CA reports for the Buchanan Road, Stanton Woods and the Templegate Pumping Stations are being completed in accordance with Paragraph 13.F.iv.(a) of the CD.

2.2 Constructed Overflow Structures

There were three (3) non-pump station SSOs located in the Jones Falls Sewershed. These included SSO 31A (Rider Avenue) located in Meter Basin BC11, SSO 113 (Marnat Road) located in the old Meter Basin JF0320S, and SSO 120 (Charles Street Avenue) located in Meter Basin BC12. A found non-pump station SSO structure, Alabama Ave, SSO 131, was discovered and immediately closed in 2010. The County has completed sewer and manhole rehabilitation projects in several of the SSA's that are tributary to these SSOs to eliminate overflows prior to the implementation of the recommended Jones Falls SRRR Plan corrective

actions. The County implemented the corrective actions contained in the approved elimination plans. This work is summarized below:

- Rider Avenue Non-Pumping Station **SSO 31A** – The SSO was eliminated in May 2007.
- Marnat Road Non-Pumping Station **SSO 113** – Under Contract 09124 SX0, forty-four (44) manholes were rehabilitated, 7,149 linear feet (LF) of sewer was lined and seventy-two (72) sewer house connections were sealed. The project work was completed in June 2012.
- Charles Street Avenue Non-Pumping Station **SSO 120** – Under Contract 10034 SX0, forty-eight (48) manholes were rehabilitated, seven (7) point repairs were completed, 13,826 LF of sewer was lined and 323 sewer house connections were sealed. The SSO was eliminated in September 2011.
- Alabama Avenue Non-Pumping Station **SSO 131 –** The SSO structure was discovered and immediately closed in September 2010.

2.3 Non-Constructed Overflows

Non-constructed overflows are SSOs that occur from a County manhole or gravity sewer that is not an intentionally constructed non-pump stations overflow structure. Non-constructed overflows can occur during dry or wet weather, and can be caused by blockages, defective pipes, or high flows.

Figure 2-1 shows the manhole and sewer overflow volumes recorded in Jones Falls between January 2010 and December 2019 and reported as due to blockages, defective pipes, or high flows. The total volume of SSOs exceeded 7,000 gallons in 2018 and from Figure 2-2 appears to be correlated to the excessive rain that year. In 2016, there was over 6,000 gallons of overflow, making it the second highest overflow year between 2010 and 2019; however, this vast majority (97%) of the 2016 reported volume was caused by two breaks in a force main. Excluding that one event, the total 2016 SSO volume was 150 gallons, none of which was attributed to high flows.

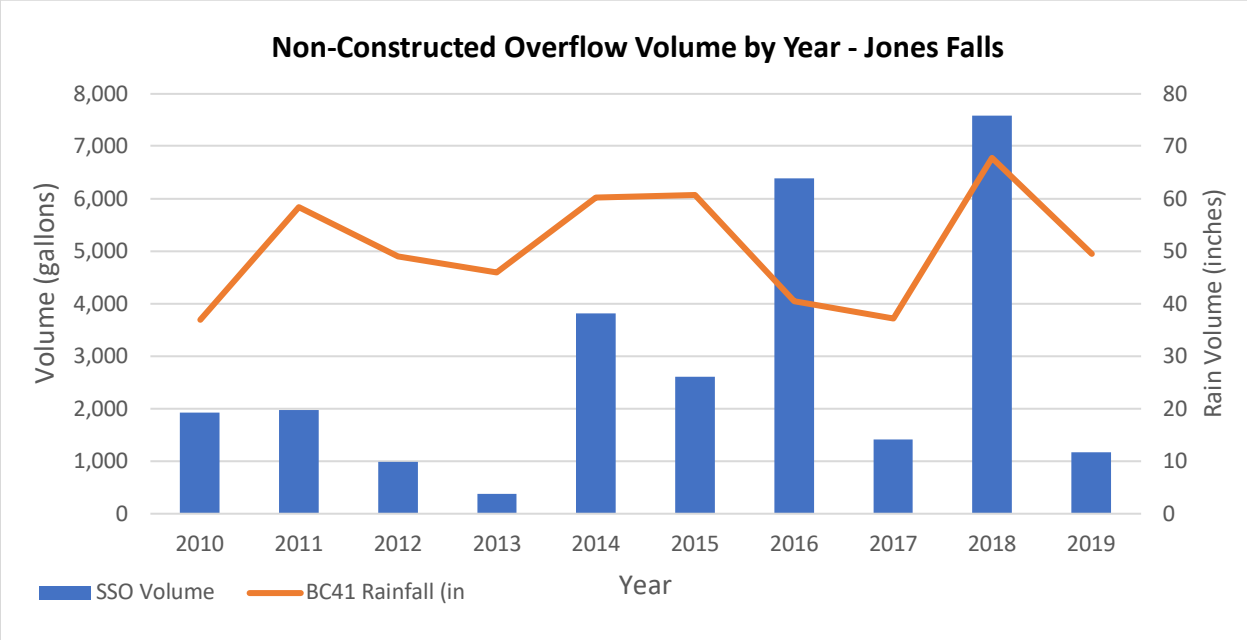

Figure 2-1: Total Overflow Volume Observed at Non-Constructed SSOs in Jones Falls

2.4 Basement Backups

Similar to SSOs observed in manholes and sewers, basement backup conditions occur when the sanitary sewer system becomes inundated as a result of blockages or high flows. Any basement backups that occurred due to defective pipes have been excluded from the analysis. While it is difficult to quantify the overflow volume in basement backup occurrences, comparing the number and causes of basement backup conditions before and after the construction process can provide a measure of the effectiveness of repair, rehabilitation, and replacement projects.

The County provided basement backup records, which were analyzed by comparing the number of basement backups that occurred during the pre-rehabilitation period with the number that occurred after construction. **Table 2-1** summarizes the total number of basement backup occurrences in the Jones Falls Sewershed between January 2010 and December 2019. The results are also graphically shown in **Figure 2-2**.

Table 2-1 Basement Backups in Jones Falls

Cause of Backup	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Blockage	7	4	12	18	28	11	13	15	20	12
High Flow		3	1		5	1	2		17	
Total	**7**	**7**	**13**	**18**	**33**	**12**	**15**	**15**	**37**	**12**
BC41 Rainfall (in)	37.01	58.4	49	45.9	60.2	60.7	40.4	37.2	67.8	49.5

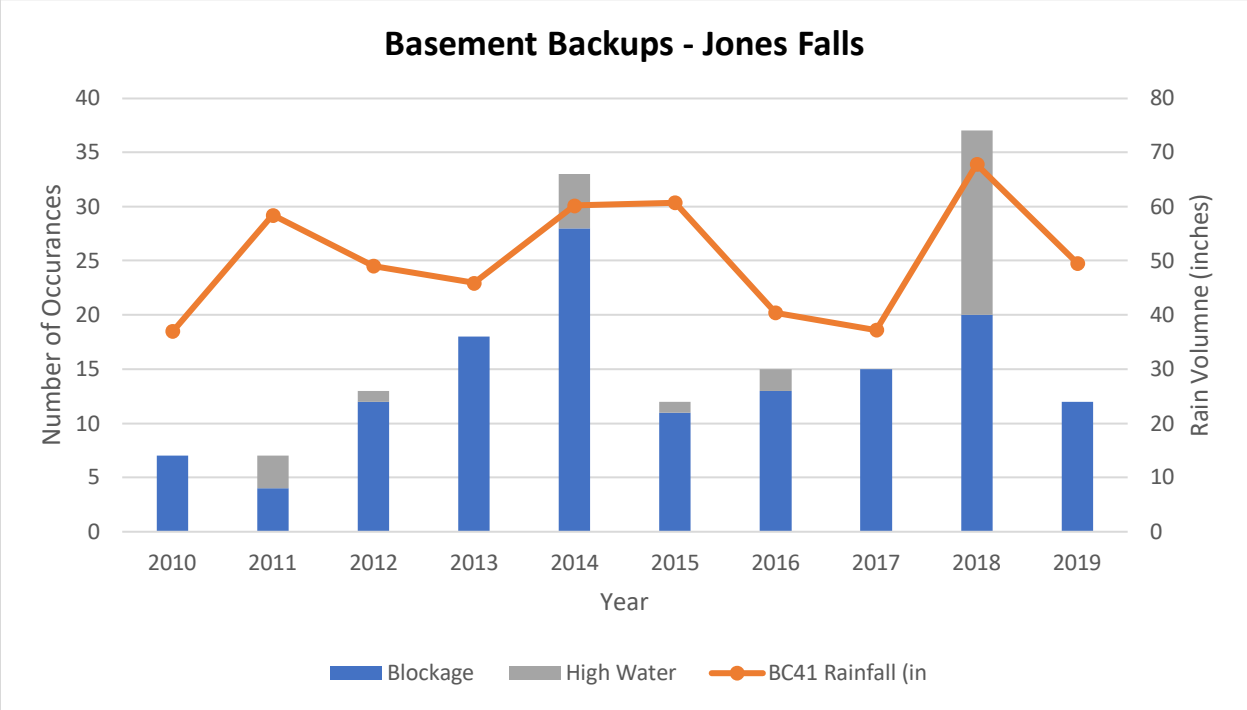

Figure 2-2: Basement Backups in Jones Falls

Table 2-1 and **Figure 2-2** show distinct correlation between basement backup occurrences and annual recorded rainfall, particularly for the record rainfall of 2018. Rehabilitation construction was performed in various parts of the sewershed from 2015 through 2019 with comprehensive rehabilitation for I/I reduction performed in BC02, BC03, BC04, and BC09. The historic high 2018 rainfall in Baltimore County resulted in 20 basement backups in Jones Falls reported as being caused by high flows that year. None of the

recorded basement backups due to high flows occurred during the post rehabilitation period in any of the meter basins where comprehensive rehabilitation was performed from.

3.0 Quantification of Reduction in Base Infiltration (BI) and RDII

Base Infiltration (BI) is defined as the amount of groundwater that is entering the sanitary sewer system on a continuous basis. Base infiltration enters the system through pipe joints, sewer line defects (including main sewer lines and service laterals), and defective manhole walls, benches, and pipe seals.

Rainfall Dependent Infiltration and Inflow (RDII) in a sanitary sewer system is defined as extraneous flow that is a direct result of storm water runoff.

This section presents the effective BI rates determined through pre- and post-rehabilitation dry-weather data analysis, the effective RDII rates determined through pre- and post-rehabilitation wet-weather data analysis, as well as a comparison of the estimated BI/RDII reduction predicted in the 2013 SRRR Plan with the actual BI/RDII reduction observed in the Jones Falls Sewershed.

3.1 Quantification of Reduction in Base Infiltration (BI)

For basins in the Jones Falls Sewershed where comprehensive rehabilitation was completed, (BC02, BC03, BC04 and BC09), BI for the pre-rehabilitation conditions was obtained from the existing hydraulic model, calibrated using the 2008 flow monitoring by RK&K (November 2011). Whereas the post-rehabilitation BI rates were obtained from the model calibrated by RJN using the 2018-2019 flow monitoring data.

In accordance with the County's SRRR Plan Guidelines, BI was calculated based on analysis of average dry weather flow data using a methodology that uses minimum night flows. The minimum hourly flowrate (usually observed between 2-4 AM) represents the basin's flow when most residents are asleep and thus not contributing flow to the sanitary sewer system. This approach assumes that the BI is 90 percent of minimum night flows (Paul S. Mitchell, Patrick L. Stevens, and Adam Nazaroff, "A comparison of methods and a simple empirical solution to quantifying base infiltration in sewers," Water Practice, 2007).

$$BI = 0.90 \times \text{Minimum Night Flows (during selected dry days)}$$

The main characteristics that affect base infiltration are the size, length, and condition of the pipes in a basin. To eliminate the problem of non-matching basins, the base infiltration volume for each basin is divided by the total tributary length in each basin while accounting for pipe diameter. The base infiltration for each basin is therefore expressed as gallons per day per inch of diameter per mile of pipe (gpd/idm) which reduces the effect of the differences in tributary pipe length and size between the basins and normalizes the results for better comparison. This enables an 'apples to apples' comparison of the basins where rehabilitation was done.

A comparison of the BI determined from the pre-rehabilitation condition to the BI determined from the post-rehabilitation condition determines the percentage of BI reduction in the meter basins studied. **Table 3-1** presents the predicted, as well as the effective reduction of BI in each meter basin. The predicted BI reduction presented in **Table 3-1** was obtained from the 2013 Jones Fall SRRR Report ("Jones Fall Sewershed Repair, Replacement and Rehabilitation Plan", 2013 Jones Fall SRRR Plan, RK&K, Section 5.6. p. 5-15). The report projected 23% reduction of BI in meter basins where rehabilitation was performed, per the SRRR guidelines.

Table 3-1 Predicted and Measured Reduction of BI for Pre- and Post-Rehabilitation Conditions

Meter Basin	Pre-Rehab BI Volume (GPD)	Pre-Rehab BI Severity (gpd/inch-mile)	Post-Rehab BI Volume (GPD) [a]	Post-Rehab BI Severity (gpd/inch-mile)	Predicted BI Change (%)	Gross BI Reduction (%)	Effective BI Reduction (%)
BC02	36,900	1,372	31,300	1,224	-23	-10.83	-45.72
BC03 [c]	139,500	8,965	273,000	17,522	-23	95.45	60.56
BC04	99,000	2,826	60,000	1,820	-23	-35.59	-70.47
BC09 [d]	1,017,000	7,385	77,000	620	-23	-91.61	-126.49
BC26	62,100	1,348	154,510	1,818	+10 [b]	34.88	Control Basin

a) The number was obtained from the model calibrated by RJN using the post-rehabilitation flow monitoring data.
b) The predicted BI change for a control basin of +10% was used both in the Herring Run Capacity Assessment Report (WR&A, November 2012) and in the Herring Run Performance Assessment report (RJN Group, 2020); therefore, an assumption was made to use that same value for the Jones Falls Sewershed since a different value was not stated in the Jones Falls HCA Report.
c) Base Infiltration results are suspect for BC03 due to small basin idm and little flow added into this meter basin from private sewers.
d) Base Infiltration results show an effective reduction over 100% for BC09. The diversion valve controlling the flow into Jones Falls from Texas Sewershed was replaced and stopped a significant amount of flow that was bypassing the valve and leaking into the Jones Falls Sewershed.

The change in BI in the control basin (BC26) is determined using the same methodology used for the meter basins where rehabilitation was performed, to account for flow differences attributable to non-rehabilitation related factors. This establishes the 'effective' BI reduction attributable to rehabilitation construction. In other words, the BI in the rehabilitated basins as determined from the flow monitoring data (gross BI change) is adjusted by the percentage of BI change in the control basin to establish the 'effective' BI. If the BI reduction percentage in a basin as determined from the flow monitoring data is equal to or less than the percentage of BI change of the control basin (+34.88%), then the basin is considered to have no effective BI reduction from the rehabilitation construction.

According to the results demonstrated in **Table 3**, the severity of the BI has been reduced in basins BC02, BC04, and BC09. The percentage of the reduction in BI in BC02, BC04, and BC09 basins is 46%, 70%, and 126%, respectively. Although comprehensive rehabilitation was performed in BC03, the analysis identified BC03 as having an increase in base infiltration. BC03 has a net tributary area that is very small due to its primary purpose is to act as a flow balance check for upstream meters (BC01, BC01A, BC02, and BCDF) as they combine into the interceptor. The only wastewater contribution to the meter basin itself is from the private sewers withing the MD Fairground which has sporadic/seasonal usage. The leaking diversion valve upstream of the meter likely impacted the data causing the irregularity in the results in Basin BC03.

3.2 Quantification of Reduction in Rain Derived Inflow and Infiltration (RDII)

To quantify RDII for the pre- and post-rehabilitation conditions, InfoWorks ICM was used to calibrate the collection system model using the collected wet weather flow data. RDII in the model is measured by the "fixed runoff coefficient" (R-value). The R-value was first determined for each meter basin for the pre-rehabilitation condition by completing model simulations for various rainfall events until the metered peak flow and volume was adequately reproduced by the calibrated model. The guidelines below were established for wet weather calibration of the model for both pre- and post-rehabilitation conditions.

- The modeled peak flow rate should be within -10 percent and +25 percent of the observed peak rate.
- The modeled volume of flow should be within -10 percent and +20 percent of the observed flow volume.

- The shape and timing of the hydrographs should be similar.

After completion of the dry weather calibration for the post-rehabilitation condition, the second step of the calibration process involved wet weather calibration using rain events of various intensity and duration that occurred during the post-rehabilitation flow monitoring period. For wet weather calibration, the R-values were adjusted iteratively until the model was calibrated (model-predicted and observed conditions match within established parameters) and adequately predicted peak flow, volume, and the hydrograph shape and timing. An example of modeled versus observed metered flow is shown in **Figure 3-1** for meter site BC25 from 07/11/2019 to 07/12/2019. The model data is in green and the meter flow data is in blue.

	Rainfall			Depth		Flow		
	Depth (in)	Peak (in/hr)	Average (in/hr)	Min (ft)	Max (ft)	Min (MGD)	Max (MGD)	Volume (US Mgal)
Rain	2.970	4.440	0.110					
Observed				0.000	0.308	0.000	0.805	0.481
...>Flow survey-v4				0.221	0.409	0.233	0.818	0.468
...>Flow survey-v4				inf	-inf	inf	-inf	0.000

Figure 3-1 Modeled vs. Observed Flow at BC25 during Rainfall from 07/11/2019 to 07/12/2019.

Figure 3-2 below shows statistical plots of modeled versus observed (meter-recorded) volume and peak flow under a series of rain events for basin BC25 and for basin BC30. As illustrated in this figure, the model reasonably simulates the recorded (observed) flow data. The modeled and observed data are generally within established margins of error and established tolerances.

Appendix A provides modeled and observed data in tabular format, time series plots and statistical plots for all meter sites.

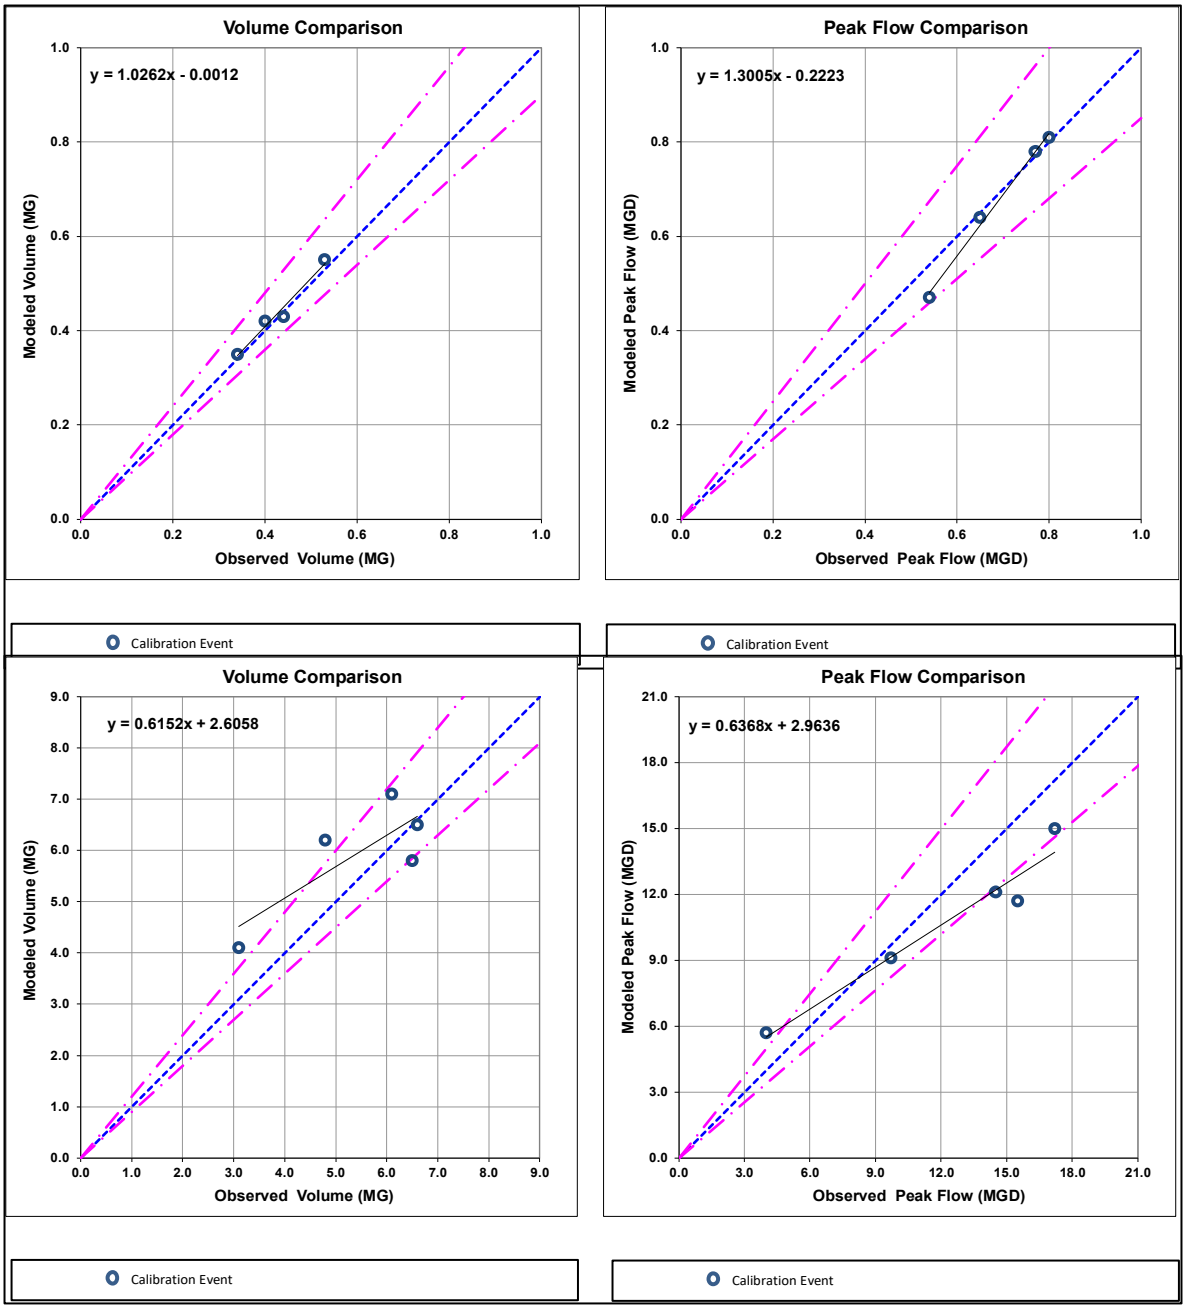

Figure 3-2 Statistical Plots of Volume and Peak Flow for BC25 (top) and BC30 (bottom)

Table 3-2 presents the percentage of RDII removal predicted in the SRRR plan in comparison to that achieved from rehabilitation construction. The predicted RDII removal percentage was obtained from the 2013 Jones Fall SRRR Report ("Jones Fall Sewershed Repair, Replacement and Rehabilitation Plan", 2013 Jones Fall SRRR Plan, RK&K, Section 5.6. p. 5-15). Similar to the "effective" reduction evaluation applied to base infiltration as previously described, the change in RDII in the control basin is applied to the RDII removal determined for the rehabilitated basins to obtain the effective RDII removal percentage.

Table 3-2 Predicted vs. Achieved Percentage of RDII Removal

Basin	Predicted RDII Removal (%)	Actual RDII Removal (%)	Effective RDII Removal (%)
BC02	-35	-2.06	-16.10
BC03 [a]	-35	-96.46	-110.59
BC04	-35	-22.11	-36.26
BC09	-35	-55.13	-69.16
BC26	10	14.04	Control basin

a) RDII results appear irregular for BC03 due to the leaking diversion valve upstream.

The results in **Table 3-2** indicate that rehabilitation work has reduced the extent of inflow into the sewer system within all basins where rehabilitation was completed, however, the extent of the RDII reduction in BC02 was less than the other basins. The analysis indicates a 14% increase in RDII in the control basin which was applied to the basins where rehabilitation was performed to obtain the "effective" RDII reduction shown in **Table 3-2.**

4.0 Effectiveness of Repair, Replacement, and Rehabilitation Projects

This section evaluates the effectiveness of corrective actions completed in the Jones Falls Sewershed to address capacity and structural issues outlined in the Jones Falls SRRR Plan. The evaluation was performed based on a review of County-provided post-construction inspection records, improvements implemented based on the 2013 SRRR Plan (Section 6.0), and model simulation results using the updated hydraulic model recalibrated based on pre- and post-rehabilitation flow monitoring data.

4.1 Completed Rehabilitation and Relief Sewer Projects

In the Jones Falls Sewershed, the County completed rehabilitation on public manholes, laterals, and sewers which received an inspection score of a 4 or 5 or within areas that exhibited excessive I/I that contributed to a model predicted SSO location. Rehabilitation for manholes included installing frame seals, inserting inflow inserts, lining, and full replacement. Pipes received lining, point repairs, lateral connection repair, or full pipe replacement.

RJN reviewed the County's records for the Jones Falls Sewershed to confirm rehabilitation was performed based on the recommendations outlined in Section 6 of the Jones Falls SRRR Plan, which was submitted to the County in early 2013 and approved by US EPA and MDE later that year. Rehabilitation construction was performed between 2015 and 2019.

In addition to the corrective action rehabilitation, the County planned relief sewers in the Jones Falls sewershed to eliminate capacity deficiencies and prevent future SSO's. Construction of the Coppermine Terrace relief sewer has been completed.

Map 1 ("Sewer, Manhole and Hydraulic Corrective Action Recommendations Map", 2012 Jones Falls Collection System Evaluation & Sewershed Plan, RK&K) depicts the structural, O&M, and capacity improvements described in the SRRR Plan for each meter basin in Jones Falls. Comprehensive

rehabilitation for I/I removal was completed in basins BC02, BC03, BC04, and BC09 as described in the SRRR Plan. **Map 2** ("Jones Falls Rehabilitation Completed"), depicts the rehabilitation that was completed in the Jones Falls sewershed, including rehabilitation in basins that were not part of the comprehensive rehabilitation plan.

4.2 Collection, Pumping, and Transmission System Modeling

This section presents capacity analysis results from model simulations of the Jones Falls sewer network in response to dry and wet weather flows under the projected Year 2025 population and employment projection conditions for both pre- and post-rehabilitation conditions. The intent of the modeling for performance assessment is to compare the effects of predicted flows both before and after rehabilitation to assess the success of work completed relative to addressing predicted capacity constraints in the system. Future (Year 2025) population conditions were selected for the capacity analysis so that the model simulations were run with projected future consumption flows included. The post-rehab condition model is different from the pre-rehab condition model in the following aspects:

- The post-rehab condition model reflects reduced RDII and BI rates as identified from BI and RDII quantification.
- The construction of the Coppermine Terrace relief sewer
- The construction of a portion of the Towson Town Boulevard relief sewer

Other than the differences noted above, the pre- and post-rehabilitation condition models for the Jones Falls Sewershed are identical to each other and both models reflect rehabilitation projects completed prior to the beginning of 2008 pre-rehabilitation flow monitoring.

All simulation runs were completed using a free-discharge assumption at the County – City boundary. This is consistent with the approach used for the hydraulic model developed for the 2013 SRRR Plan. The City has not completed Phase II projects necessary to establish alternative predicted future boundary conditions at the jurisdictional boundary.

4.3 Flow Capacity Assessment

<u>Dry Weather Flow Capacity Assessment</u>

During the dry-weather flow condition, the model simulations do not predict any SSOs in the Jones Falls Sewershed under either the pre- or post-rehabilitation condition. However, model predictions indicate surcharges in both pre- and post-rehabilitation conditions. According to the model predictions, nine (9) pipe segments surcharge during the pre-rehabilitation conditions, while thirteen (13) pipes surcharge in post-rehabilitation conditions. **Appendix B** lists each pipe segment in the model, the simulated dry-weather peak flow, pipe full capacity, and percentage of capacity used under pre- and post-rehabilitation conditions.

<u>Wet Weather Flow Capacity Assessment</u>

Consistent with the 2013 SRRR Plan approach and per the County guidelines, the 2, 10, and 20-year, 24-hour duration storms, and the 2 and 10-year, 6-hour duration storms were simulated, and the wet weather flow capacity assessment was completed. The storm distribution chosen for analysis is the NRCS Type II distribution. The storm depths for the five design storms are as follows:

- 2-Year, 6-Hour Storm – 2.37 inches of rain
- 2-Year, 24-Hour Storm – 3.38 inches of rain
- 10-Year, 6-Hour Storm – 3.50 inches of rain
- 10-Year, 24-Hour Storm – 5.19 inches of rain
- 20-Year, 24-Hour Storm – 6.06 inches of rain

Tables 4-1A and **4-1B** present the model predicted occurrences of sewer overflow locations and flood volumes for all five design storm events in the meter basins where comprehensive rehabilitation I/I reduction projects and/or relief sewers were constructed (BC02, BC03, BC04 and BC09). **Table 4-1A** shows the results for the pre-rehabilitation condition, and **Table 4-1B** shows the results for the post-rehabilitation condition.

During wet weather flow conditions in basins where comprehensive rehabilitation was completed, the Jones Falls pre-rehabilitation condition model predicts eight (8) SSOs for the 2-year 6-hour, 21 SSOs for the 2-year 24-hour storms, 23 SSOs for the 10-year 6-hour storm, 34 SSOs for the 10-year 24-hour storm, and 39 overflows for the 20-year 24-hour design storm (**Table 4-1A**).

Table 4-1B shows the predicted number of overflows in each meter basin under the post-rehabilitation condition. According to the results, the rehabilitation projects have decreased the occurrence as well as volume of SSOs in the meter basins where rehabilitation work was completed. The model predicts no overflow for the 2-year 6-hour, three (3) SSOs for the 2-year 24-hour storms, four (4) SSOs for the 10-year 6-hour storm, eleven (11) SSOs for the 10-year 24-hour storm, and twelve (12) overflows for the 20-year 24-hour design storm.

Table 4-2 shows the percentage of predicted overflow volume reduced in predicted SSO locations, for each meter basin under the five different storm conditions. For the post-rehabilitation condition, the predicted overflow volume is reduced between 70% and 100% when compared to the pre-rehabilitation condition.

The simulated wet weather peak flow, the pipe full capacity, the percentage of capacity used, and the surcharge state for each pipe segment modeled during the five design storms for the pre- and post-rehabilitation conditions are provided in **Appendix B**.

Map 3 depicts the model predicted SSO and flow restriction locations in Jones Falls for all five (5) design storm simulations under the post-rehabilitation condition.

Table 4-1A Jones Falls Pre-Rehabilitation Model Predicted SSO Results Summary

5.0 Effectiveness of Preventative/Proactive Maintenance Programs

As part of the performance assessment, RJN evaluated the effectiveness of the County's preventative and proactive maintenance programs in reducing root, grease and other blockages. The County's approved collection system operation and maintenance (O&M) plan, dated January 12, 2006, outlines the various preventative and proactive maintenance programs the County has implemented in Jones Falls.

5.1 Sewer Cleaning Program

The County's approved Collection System Operation and Maintenance Plan requires the County to clean all gravity sewers that are 8-inch diameter or larger every seven years, subject to future cleaning frequency re-evaluations.

In addition to the Operation and Maintenance (O&M) Plan's seven-year cleaning cycle, the Baltimore County Bureau of Utilities maintains a recurring specials list, which identifies specific sewer segments requiring routine cleaning. The recurring specials list is reviewed and revised on a regular basis based on historical customer complaints, recorded historical O&M defects/observations and sewer location. The County 'specials' list is included in **Appendix C**.

5.2 Sewershed Blockage History

County records containing sanitary sewer flow stoppages, and the subsequent County response, were reviewed by RJN for the period between January 2010 and December 2019. **Table 5-1** summarizes the results of that review.

Table 5-1 Rates and Causes of Blockages

Cause of Blockage	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Total
Cleaning	-	-	-	-	1	-	5	1	2	1	10
Debris	1	-	-	-	-	2	-	-	2	2	7
Grease	4	2	4	2	5	5	4	4	6	5	41
Private	-	-	-	-	-	-	-	-	-	2	2
Rags	1	1	1	1	-	1	-	-	6	1	12
Roots	2	4	4	8	10	6	6	3	8	2	53
Unknown/Other	1	1	4	5	2	1	2	9	12	5	42
Unspecified	2	2	3	4	13	2	2	6	4	2	40
Totals	**11**	**10**	**16**	**20**	**31**	**17**	**19**	**23**	**40**	**20**	**207**

Prior to SRRR implementation, the two main known causes of stoppages in Jones Falls were roots and grease. Through construction and post construction periods, grease and roots remain the leading causes of blockages in the Jones Falls system. The County-provided blockage records are included in **Appendix C**.

5.3 Fats, Oils and Grease (FOG) Control Program

The County's FOG control program is detailed in the approved revised FOG Program Modification Plan, dated August 21, 2009. In accordance with the Plan, the County inspects FOG generating facilities using the risk scoring system and FOG generator identification evaluation developed by the County for the program. The inspection findings and FOG generating facility enforcement history are recorded in the County's FOG database for use in the County's annual FOG control program effectiveness evaluation. Program/analysis revisions that are identified by the effectiveness evaluation are addressed accordingly.

In addition to the FOG control program, the Bureau of Utilities' specials list (see Section 5.1) identifies specific sewer segments that experience grease deposition and require routine cleaning. The recurring specials list is reviewed and revised on a regular basis based on historical customer complaints, recorded historical O&M defects/observations and the FOG control program inspection findings.

On September 16, 2010, the County posted on its Department of Environmental Protection & Sustainability website a FOG manual to be used by Food Service Facilities as a guide for complying with the County's revised Food Service Facilities Regulations. The County continues inspecting FOG generating facilities using the revised risk scoring system and the FOG generator identification evaluation. To address residential FOG generators, the County plans to develop informational material that describes the effects of FOG on the wastewater collection system. The material will be distributed to residential property owners.

RJN analyzed the inspection and violation records of Food Service Facilities (FSFs) in the Jones Falls sewershed from 2013 through 2020 as provided by the County. **Figure 5-1** shows yearly FSF inspection and violation totals. No significant trend was observed between 2013 and 2020 following analysis of inspection and violation records in Jones Falls. **Appendix C** includes the County-provided FSF inspection and violation records that were reviewed by RJN.

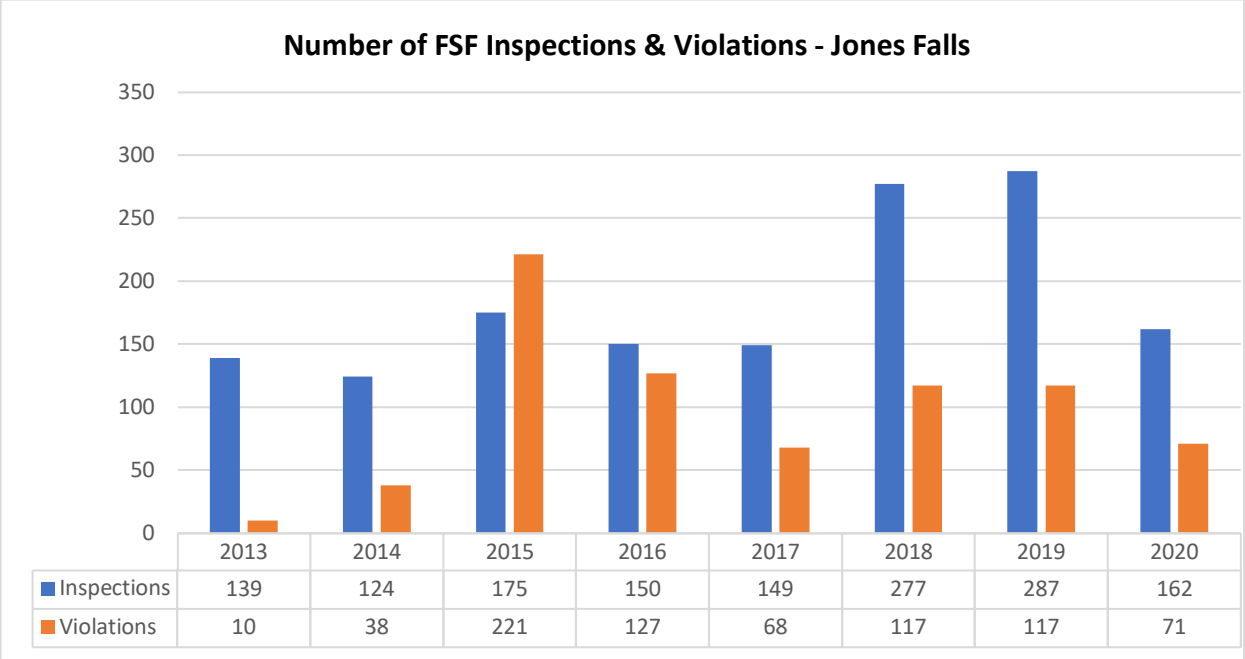

Figure 5-1: Food Service Facility Inspections and Violations in Jones Falls

6.0 Conclusions

The results of the base infiltration reduction assessment indicate that the completed rehabilitation projects in basins BC02, BC04, and BC09 were effective in reducing groundwater infiltration when compared to the predicted base infiltration reductions in the 2013 SRRR Plan while basin BC03 showed an increase in base infiltration. The increase in base infiltration in BC03 can be attributed to the small inch diameter mile (idm) and the small net tributary area as well as the closure of the leaking diversion valve upstream. This basin's primary purpose appears to act as a flow balance check meter for the upstream meters as they combine into the interceptor. In addition, the only wastewater contribution to the meter basin itself is the MD Fairground. The results of the RDII reduction assessment indicate that completed rehabilitation projects were effective in reducing RDII into the sewer system in three out of the four rehabilitated basins.

Four (4) Non-Pump Station SSOs were originally constructed in the Jones Falls Sewershed to relieve the sanitary sewer collection system and overflow in the event of surcharge caused by hydraulic capacity limitations during wet weather. Constructive overflow SSO (31A) was eliminated as of May 2007 as well as SSO 131 in 2010, prior to the development of the SRRR Plan. Overflow structure SSO 120 was eliminated in 2011 through rehabilitation. Overflow structure SSO 113 has not yet been closed because Baltimore City corrective actions are required prior to closure.

Pre- and post-rehabilitation flow monitoring data was used to update the hydraulic model based on the monitored flow conditions. The model was then used to simulate pre- and post-rehabilitation hydraulic conditions, respectively, under projected 2025 population and employment conditions as obtained from the hydraulic model used for the 2013 SRRR Plan. Model simulations show that I/I reduction rehabilitation and relief sewer construction in Jones Falls reduced predicted overflow volumes between 89 and 100 percent in total, for those basins where comprehensive I/I reduction rehabilitation was performed, or relief sewers were constructed.

RJN evaluated the effectiveness of the County's preventative and proactive maintenance programs in reducing root, grease, and other blockages. Based on the results, the County's maintenance programs are generally effective in preventing overflows resulting from blockages, defective pipe, and high flows. The

County's approved collection system operation and maintenance (O&M) plan outlines the various preventative and proactive maintenance programs the County has implemented in Jones Falls. The County maintains a list of sites that require special cleaning in the Jones Falls Sewershed; these are sites that require recurring cleaning due to grease, roots, or other blockages. From January 2010 through December 2019, the County performed over 4,000 SLRAT O&M field visits including regular maintenance and special cleaning in addition to preventative and investigative work. A total of 20 blockages were recorded in 2019.

Non-constructed overflows trended downward during the overall 2010 – 2019 evaluation period. With the exception of two overflows totaling over 5,000 gallons in 2018 during dry weather conditions, attributed to a defective pipe, discharges from sanitary sewer manholes (non-constructed SSOs) in the Jones Falls sewershed totaled 1,165 gallons during the assessed post rehabilitation period (2019). There were no discharges attributed to high flows during the assessed post-rehabilitation period,

The number of basement backups not attributed to high flows peaked in 2014 and 2018, but otherwise has remained steady around 11 backups each year. The annual number of basement backups (i.e. private property discharges) reached a high of 37 in 2018, including 17 basement backups attributed to high flows. These 17 high flow basement backups are attributed to the record rainfall recorded in throughout Baltimore County in 2018. None of the SSO discharges or basement backups associated with high flows occurred in meter basins where comprehensive rehabilitation for I/I reduction was performed during the post rehabilitation period.

Overall, the results of the performance assessment indicate that the rehabilitation performed, and relief sewers constructed were effective. Three out of the four constructed overflows have been eliminated. The volume of non-constructed SSOs have begun to decrease in the post rehabilitation monitoring period and the model predicted SSO volumes are projected to decrease 90 to 100 percent. The number of recorded basement backups did increase during the evaluation period, but the vast majority of these occurred during the record rainfall year of 2018.

Re: Baltimore County Judicial Consent Decree 1:05-cv-02028-AMD, AI# 31394
Sewershed Performance Assessments: West Low Level, Dead Run, Herring Run, and Gwynns Falls
[Response requested in 30 days]

Dear Mr. Peluso:

The Maryland Department of the Environment, Water Management Administration, Compliance Division (Department) has reviewed the Performance Assessment Reports for the West Low Level Sewershed and Dead Run Sewershed, dated June 4, 2019, for the Herring Run Sewershed, dated September 1, 2020, and for the Gwynns Falls Sewershed, dated October 6, 2020, submitted in accordance with Judicial Consent Decree 1:05-cv-02028-AMD (Consent Decree) Paragraph 10.E. The Department acknowledges that the 90-day period under which comment is expected to be provided (Paragraph 10.E.iii.) has passed, however the Department respectfully submits the following response, consistent with the overall purpose and goal of the Consent Decree.

Across the Reports, the Department acknowledges that 2018 was an unusually rainy year, creating challenges in comparing pre- and post-construction data to determine the effectiveness of the Sewershed Repair, Replacement, and Rehabilitation (SRRR) projects. The Department also understands that the final post-rehabilitation modeling uses 2025 population data, assumes that all projects within the Sewershed are completed (though some are still pending), and for the County-City boundary, either uses assumptions provided by Baltimore City, or assumes unrestricted discharge at the County-City boundary, since future boundary conditions depend on Baltimore City's own Sewershed projects which are currently pending.

The Department acknowledges that the County's assessment of the **West Low Level Sewershed** concluded that the SRRR projects: did not reduce groundwater infiltration in either WLL1 or WLL3; did reduce inflow into the WLL3 sewer system, but not into the WLL1 sewer system; and are expected to eliminate overflows in WLL3 under the 2-year storm designs and reduce predicted overflow volume by 91% under the 10-year, 6-hour storm design, but not reduce overflows in WLL1. The assessment also concluded that the County's maintenance programs to reduce overflows caused by blockages did successfully reduce non-grease blockages.

The Department also acknowledges that the County's assessment of the **Dead Run Sewershed** concluded that the SRRR projects: resulted in two basins with no effective groundwater infiltration reduction, two with significantly less reduction than expected, and one which met the reduction goal; were effective in reducing inflow into the sewer system throughout Dead Run Sewershed with the exception of DR11; and are expected to help to eliminate/reduce predicted overflows in four of the five basins. The assessment also concluded that the County's maintenance programs to reduce overflows caused by blockages are generally effective at doing so.

The Department acknowledges that the County's assessment of the **Herring Run Sewershed** concluded that the SRRR projects: were somewhat effective at reducing groundwater infiltration in the Herring Run Sewershed; were effective in reducing inflow into the sewer system within both basins; and are expected to reduce predicted overflow volumes between 75% and 80% in the basins. The assessment also concluded that the County's maintenance programs to reduce overflows caused by blockages are generally effective at doing so.

The Department acknowledges that certain analyses of the SRRR projects in the **Gwynns Falls Sewershed** were complicated by having no control basin, and by the substantial alteration of several of the basins in terms of size and tributary length. The Department also acknowledges that the County's assessment nevertheless concluded that the SRRR projects: were effective at reducing groundwater infiltration across the Sewershed; were effective at reducing rainfall inflow throughout the Sewershed; and are expected to eliminate predicted overflow volumes completely in many basins, and reduce the overflow volume between 31% and 75% in others, with the exception of one basin which predicted an increase in overflow volume under certain storm conditions. The assessment also concluded that the County's maintenance programs to reduce overflows caused by blockages are generally effective at doing so.

Based on the results of these assessments, and the information gained, the Department requests an update regarding additional planned projects in the Sewersheds, modified O&M Program components, and/or any next steps intended to address the remaining insufficiencies and move towards the CD goal of eliminating SSOs. In the Gwynns Falls Report, the County's contractor, RJN Group, recommended that the County conduct flow monitoring for model verification at the locations where the model predicts overflows. The Department would be in agreement with this, or other similar ground-truth confirmation, as a first step for all Sewersheds, if more information is needed prior to deciding whether and what additional steps should be taken. **Within the next 30 days, please provide your response in writing to the Department.** The Department also requests that any outstanding projects which were included in the post-construction model (e.g., relief sewers) be clearly identified in each quarterly report until they are complete; and that specific progress updates be provided therein, especially the identification of any changes that would affect modeling assumptions and could be expected to have measurable impact on the results presented in these Reports.

Thank you for your continued cooperation in this matter. If you should have any questions, please contact Ms. Sharon Talley, Chief, Enforcement Division, Compliance Program, at (410) 537-3510 or by email at sharon.talley@maryland.gov.

Hi Mr. McCann,

Unfortunately for a period of time when we were working from home during the pandemic, letters were not being date stamped.

That is the letter that we sent electronically on April 22, 2021. The Department has not provided any specific feedback on the Jones Falls Sewershed to date.

Michael,

As discussed in our February 1, 2023 email communications, I will reiterate below:

The CD requires submission of the PARs for review and comment. To the best of my knowledge, the latest formal communication regarding any PARs from MDE occurred on April 22, 2021, prior to the submission of the Jones Falls PAR (June 2021), and so it was not included in that letter. The County responded to this letter on July 19, 2022. The Department has not provided formal response back, nor has it separately provided a response to the Jones Falls PAR (beyond acknowledging receipt).

Subject: Re: PIA request

Mr. McCann,

To the best of my knowledge, that's all the documentation that Enforcement has which is responsive to your PIA request - at least as I understood it to be modified, to include only formal written communications (e.g., letters, reports, and submissions) between Baltimore County and MDE regarding the CD. We did not review any email communications. To be clear, letters, reports and submissions which were transmitted electronically, as many have been since the pandemic, *were also provided to you*. These are the files that were sent to you electronically. In the event that you are requesting *emails* between MDE and the County, that would require some additional time to provide, and we would need to generate a new estimate for that information. Let me know if you need any clarification on that point.

Regarding a formal response to the Jones Falls PAR, you are correct that we have not provided one. I believe the latest formal communication on the PARs on our part occurred prior to the submission of the Jones Falls PAR, and so it was not included (the April 22, 2021 letter, "Multiple PARs"). The County responded to this letter on July 19, 2022. The Department has not provided formal response back, nor has it separately provided a substantive response to the Jones Falls PAR (beyond perhaps acknowledging receipt).

Regarding your request to meet and discuss the CD further, the Department welcomes the submission of comments, concerns, or other information in order to ensure Baltimore County's compliance with the Consent Decree, but declines your request to meet concerning interpreting the Consent Decree and the SRRR. Please do submit any additional comments, concerns, or other information for the Department's review.

I apologize that such a simple answer took so long to produce. Please let me know if I can be of any further assistance. If you'd like to submit a document as noted above, you can send it to arno.laud@maryland.gov and copy myself.

Thank you,
Jess
