Baltimore County Department of Public Works, Ste. 307
111 W. Chesapeake Avenue
Towson, Maryland 21204

Re: Sewer Capacity
Jones Falls Sewershed

Dear Mr. Walsh:

Pursuant to the Public Information Act, Annotated Code of Maryland §§10-611 through 10-630, I write to request copies of documents maintained by Baltimore County regarding the above-referenced matter. I believe, but do not know for certain, that the documents responsive to these requests would be maintained by the Department of Public Works.

Unless stated otherwise, the requests shall pertain to (i) the Jones Falls Sewershed (the "Sewershed"), and (ii) the period of time from January 1, 2005 to the present. I have provided headings to the requests, which are intended to assist the reviewer in identifying the documents requested.

Consent Decree- Reporting/Compliance

1. All Quarterly Reports and Annual Reports submitted to EPA and/or MDE pursuant to the Consent Decree entered in 2005 in the matter of *United States of America et al. v. Baltimore County, Maryland* (the "Consent Decree").

2. All other reports, plans and other documents submitted to EPA and/or MDE pursuant or relating to the Consent Decree, including but not limited to the Sewershed Repair, Replacement, and Rehabilitation Plan ("SSSR Plan"), Long-Term Capacity/Peak Flow Management Evaluation Report ("LTC/PFME Report"), SSO Characterization Reports, Inflow & Infiltration Evaluation Report, SSO Elimination Plans, Collection

System Inspection Plans, CCTV Inspection Reports, Performance Assessments, SSO Incident Reports, and Discharge and Building Backup Reports.

3. All updates to and revised versions of the SSSR Plan, LTC/PFME Report, and other reports and plans submitted to EPA and/or MDE.

4. All correspondence sent to or received from EPA and/or MDE pursuant to or relating to the Consent Decree.

5. All correspondence sent to or received from Rummel, Klepper & Kahl ("RK&K") relating to Consent Decree and/or the County's obligations under the Consent Decree.

6. All documents evidencing, reflecting or relating to the actions taken by the County to eliminate sanitary system overflows in accordance with the Consent Decree.

7. All "force majeure" notifications submitted to EPA and/or MDE pursuant to section XII of the Consent Decree.

8. All documentation relating to citizen/resident complaints regarding SSOs in the Jones Falls Sewershed.

9. All correspondence between County and Baltimore City, and other documents sent to or received from Baltimore City, regarding Sewershed boundary flows, capacity and/or responsibility for SSO's.

Growth

10. All population growth, employment growth, and future land use data used in connection with the preparation of the LTC/PFME Report, the SRRR Plan or any update or revision thereto.

11. All population growth, employment growth, and future land use data supporting the Towson Run relief sewer.

12. All population growth, employment growth, and future land use data supporting the determination that adequate sewer capacity exists to accommodate the Towson Row development.

13. All employment growth, and future land use data supporting the determination that adequate sewer capacity exists to accommodate the Johns Hopkins surgical outpatient center at Green Spring Station.

14. All student population growth, employment growth, and future land use data supporting the determination that adequate sewer capacity exists to accommodate the expansion of facilities of Towson University.

Water Quality

15. All reports, studies, data, and other documents reflecting or relating to water quality in Lake Roland and/or its tributary streams.

16. All reports, studies, data, and other documents reflecting or relating to fecal contamination in Lake Roland and/or its tributary streams.

Towson Run Interceptor/Relief Sewer

17. All data, projections, rationale and other documents justifying the construction of the Towson Run relief sewer.

18. All plans, drawings and other documents reflecting (i) the location and/or route of the Towson Run relief sewer, (ii) the current status of the construction of the Towson Run relief sewer, *i.e.,* the segments that have been installed, (iii) the schedule for construction of the remaining segments of the relief sewer, (iv) the size and capacity of the relief sewer. and (v) information regarding hydraulic modeling of the new interceptor/relief sewer in relation to the existing sewer.

19. All documents reflecting the current flow data (including peak flows) of the Towson Run Interceptor.

20. All documents reflecting the flow data (including current peak flows) of the completed segments of the Towson Run relief sewer.

21. All capacity analyses and other documents reflecting the current capacity of the Towson Run Interceptor.

22. All capacity analyses and other documents reflecting the planned or expected capacity of the Towson Run relief sewer.

23. All documents reflecting whether the Towson Run relief sewer will replace the Towson Run Interceptor or provide storage capacity for the Towson Run Interceptor.

24. All peak flow projections for the Towson Run Sewershed and the data supporting those projections.

25. All documents reflecting the capacities or other factors that trigger recommendation regarding a relief sewer in 10 and 20-year storm events.

Lake Roland Interceptor

26. All documents relating to or reflecting any defects or maintenance issues in the Lake Roland Interceptor, whether the defects have been repaired, and how they were repaired.

27. All documents relating to or reflecting the current peak carrying capacity of the Lake Roland Interceptor.

28. All documents relating to or reflecting the projected peak carrying capacity of the Lake Roland Interceptor.

29. All studies and condition reports of the Lake Roland Interceptor, including I&I Analysis.

30. All studies and information relating to how wastewater flow leaving Baltimore County is affected by capacity issues at the point of entry to the Baltimore City system.

Growth Management Act/Basic Services Maps/ Triennial Review

31. All documents constituting or reflecting any County policy, standard, or procedure for determining sewer capacity under the Growth Management Act in section 4A of the Zoning Regulations.

32. All documents constituting or reflecting any County's policy, standards, or procedures for determining areas of concern or deficiency in the Basic Services Sewerage Map.

33. All documents reflecting, or which would allow one to determine, the "maximum level of nonindustrial development" permitted in the Sewershed under section 4A02.4.C.3 of the County's Zoning Regulations, including but not limited to documents reflecting or that would allow one to determine the "available sewerage capacity," the "county's share of the maximum reserve capacity of the sewerage in the area," and "the daily quantity of sewerage from any industrial permits for which construction permits are expected to be issued" as those terms are used in section 4A02.4.C.3.

34. All documents reflecting the Department of Public Work's determination of the "quantity of sewerage yielded by a building or part of a building to be devoted principally to uses other than dwelling or retail or office uses" under section 4A02.4.C.3.c.

35. All correspondence and other documents reflecting or relating to any discussion or determination of whether there is adequate sewer capacity in any area within the Sewershed.

36. All applications for and other documents constituting or relating to any reserve capacity use certificate issued for a development in the Sewershed.

37. All documents comprising DPW's file for the triennial review of the County's Water Supply and Sewerage Plan as it relates to the Sewershed and/or the Towson Run Interceptor/Relief Sewer, for the years 2005, 2008, 2011, 2014, and 2017.

Thank you for your cooperation. Please contact me if you have any questions or concerns.

Very truly yours,

Michael R. McCann

Follow Up Flag: Follow up
Flag Status: Flagged

Michael,

Below is the County's response to your PIA Request, Jones Falls Sewershed (18-37). The files are large and if they don't go through I will put them on a CD for you to pick up. Dave Bayer spent an additional hour in search and preparation. Please provide one more check for $50 made out to Baltimore County, Maryland, referencing PIA #18-37. As a courtesy the copying costs are waived at this time.

A. Consent Decree Documents:

1. SRRR Plan was previously provided on a CD. It is our understanding that the CD transmitted contained the following two (2) Appendices:

   Appendix L, LTC/PFMR, was on the CD with the SRRR Plan.
   Appendix B, I and I Evaluation Report, was on the CD with the SRRR Plan.

2. The Inspection Plan and Inspection Plan Amendment are attached to this email.

3. The SSO Elimination Plans for the four (4) SSO's that were located within the Jones Falls Sewershed are attached (SSO #131: Alabama Road, SSO #120: Charles Street Avenue, SSO #113: Marnat Road, and SSO #13A: Rider Avenue).

4. The Rainfall Monitoring Plan is attached.

5. The Revised Flow Monitoring Plan is attached.

B. Other portions of the PIA Request, as consolidated:

1. The Population and Employment Projections for the Jones Falls Sewershed from 2000 through 2030 are attached.

2. Projected Wastewater Flow Data is detailed in the Hydraulic Capacity Assessment Report (Appendix K). The Planning Office provided Population and Employment Projections that were distributed by Regional Planning Districts not Zip Codes.

3. The County chose to evaluate two synthetic Design Storms not required by the Consent Decree (the 2-yr 6-hour and the 10-yr 6-hour Design Storms) to determine the impacts on the County's collection system

from synthetic Design Storms having shorter durations because Design Storms having different durations produce significantly different hydrographs and peak discharges.

4. The SRRR Plan Section 5.6.2 details the assumptions regarding the Infiltration and Inflow rates used in the predictive model.

5. The SRRR Plan Section 5.6.2 details the assumption made regarding pipe deterioration.

7. a. Determining Deficiency: See Section 4A02.4(C) of the Baltimore County Zoning Regulations.

   b. Determining Areas of Concern: Areas of Concern have no basis in the BCZR Growth Management Article. They are advisory only and indicate areas known to the Sewer Design Section of the DPW Bureau of Engineering & Construction where connection to the public sewer system may require improvements or corrections to the receiving sewer system to ensure adequate dry and wet-weather capacity to serve the property to which the connection is requested. The specific requirements are as specified in the PAI Development Plan Review Bureau Policy Manual and the DPW Design Manual, both which can be found on the County website, https://www.baltimorecountymd.gov/Agencies/permits/pdmdvplr.html and apply to all development in the County.

8. Table 5.3.1 in the Jones Falls Sewershed SRRR Plan details the calibration quality of the predictive model. Pipe segments that exhibited sensitivity to flow changes were noted. Pipe segments that exhibited sensitivity to physical changes were documented.

9. There aren't any documents reflecting the standards or thresholds for determining when a future relief sewer is needed.

Related to Brooklandville and deficient sewers, the County identified several pipe segments in the Brooklandville area as lacking capacity during wet weather. Flow monitoring confirmed several sewer segments were at or near capacity during wet weather events, and because of the potential for possible future development in the area, this additional area of special concern was added to the 2007 Basic Services Maps.

The link to the "Applications of Hydrologic Methods In Maryland" is:
http://gishydro.eng.umd.edu/panel.htm

I believe that DPW has provided the responsive records that exists in response to your PIA request at this time.

Subject: RE: PIA Request - Jones Falls Sewershed Sewer, Baltimore County (18-37)

Michael,

Sorry for the delay. Been a bit hectic here.

In your email dated March 6, you stated you were requesting "In addition to any documents "reflecting" the standard/threshold for determining if a sewer shed is deficient, please produce any documents stating or setting forth the actual standard/threshold."

- Dave Bayer needs additional clarification on what you mean by this request. Without such clarification he does not know how to determine the amount of time needed to gather the records.

My description was purposely basic. As I am sure you understand, it is difficult to clarify this when I don't know, for certain, what it is that I am clarifying. What I do know is, first, there are "sewerage standards" in the Growth Management Act (BCZR, section 4A) that determine whether an area should be on the Basic Services Maps. I would anticipate that, aside from the standards themselves, there are County policies that describe or explain these standards, including a policy that describes how the sewer shed is determined. I know, for example, that the Traffic Engineering, has policies for determining traffic sheds. Second, I would think that the County has a standard or threshold for determining when a relief sewer (Towson relief sewer) is necessary. That may be a specific storm event, for example.

In that same email you stated "there is an area in Brooklandville that is identified on the Basic Services Map as deficient. I would think there might be documents in connection with that determination that either reflect or state the standard/threshold. Please provide those documents."

- Dave Bayer stated that he would need additional time to gather those records. *Dave – how much additional time would you need?*

Dave Thomas – please look at #7 below and let me know if you have any responsive records.

In regard to the requested records (pasted below for everyone's reference, relevant sections highlighted) from your 2/20 email, please provide a check for $100 (2 hours of Dave Bayer's time) made out to "Baltimore County, Maryland" referencing Request #18-37 for the search and preparation (S&P) fees. It can be dropped off at the Law Office front desk (400 Washington Ave, 2nd Floor). I will drop off today.

Once the check is received and processed, I will help coordinate the date and time for when you can come and inspect the County's records. If any of the records are readily available in electronic format, we will make a CD of those records.

A. Consent Order documents: Below is a list of documents required by the Consent Decree that we want to make sure we have copies of. I understand that many of them might be appendices or otherwise part of other documents, in particular the SRRR Plan (Dec. 2012) and the LTC/PFME Report (Nov. 2012).

Since we have those two documents, we only need the *documents that have been issued by the County/sent to MDE subsequent to the periods covered by the SRRR Plan and the LTC/PFME Report, i.e., after Dec. and Nov. 2012 respectively.*

With respect to the annual and quarterly reports, we only need *annual reports since 2016 and quarterly reports since the 4th quarter of 2017.*

SRRR Plan
LTC/PFME Report
Non-Pump Station Elimination Report
SSO Characterization Reports
I/I Evaluation Reports
SSO Elimination Plans

Collection System Inspection Plans
CCTV Inspection Reports
Rainfall and Flow Monitoring Plans
Performance Assessment Reports
SSO Incident Reports
Discharge and Building Backup Reports
All other annual and quarterly reports submitted to MDE
All correspondence between MDE/EPA and the County or its representatives relating to the Consent Decree

B. Other PIA Requests, as consolidated:

1. All documents reflecting current projections of population/employment growth through 2027.

County's response: The County has no such documents other than those referenced in the 2012 SRRR report.

2. All documents reflecting current and projected wastewater flow data through 2027.

County's response: The County has no such documents other than those referenced in the 2012 SRRR report. The Planning Office makes all population projections, which are not done by sewershed but rather by zip code.

3. All documents reflecting the assumptions/bases that the County relied upon for its use of the 10 year/6 hour storm event as representative of rainfall patterns, as opposed to the 2, 10, and 20 year/24 hour storm events.

County's response: The County relied upon the MDE recommended storm event. The County has no other documents.

4. All documents reflecting the assumptions/bases for the County's Infiltration/In-Flow ("I/I") rates used in the predictive model in the LTC/PFME report, before and after intercept piping improvements, and any data reflecting actual improvements achieved by the work that has been undertaken.

County's response: The County's assumptions are set forth in the guidelines in the SRRR Plan. The County has not yet completed any analysis of the actual improvements in I/I rates from the improvement projects that have been undertaken.

5. All documents reflecting the County's assumptions/bases for deterioration in pipe infiltration rates over time used in the predictive model in the LTC/PFME report.

County's response: The County will provide such documents.

6. All reports, studies, data and other documents relating to water quality or fecal contamination in Lake Roland and its tributary streams, including those concerning the causes of such contamination and proposed remedies.

County's response: DPW does not have any such documents, has not been informed that there is any such contamination from human sources, and has not evaluated causes or remedies of any such contaminations. The Department of Environmental Protection and Sustainability (DEPS) may have such documents.

7. All documents reflecting the County's bases and standards for determining areas of concern or deficiency under the Growth Management Act and for purposes of preparing the Basic Services Maps (e.g., the Maps identify an area of concern around Greenspring Station).

County's response: The County identifies areas of concern/deficiency as any area where constructed SSO are located. These locations are identified in an appendix to the County's annual reports. The County has not conducted evaluations of reserve capacity deterioration. [*Milana: It sounded like Dave Thomas might have further information on this point. I understand Dave to be an employee of DPW, so please check with him on this*]

8. All documents reflecting any sensitivity analysis for the predictive model of sewer capacity or any other documents that would help one understand the relationships between input and output values and the more sensitive parameters.

County's response: The County will check to see if any Monte Carlo simulation or other sensitivity analysis was performed. Also, the table at page 5-5 of the SRRR plan addresses calibration quality of the model.

9. All documents reflecting the standards or thresholds for determining when a relief sewer is needed, including the level of surcharge in an interceptor. [*Milana: This was not specifically discussed at our meeting, but is covered by our original PIA].*

Michael,

As previously agreed, please remit a check made out to "Baltimore County, Maryland" referencing Request #18-37 for the search and preparation (S&P) fees. It can be dropped off at the Law Office front desk (400 Washington Ave, 2nd Floor).
The meeting was 50 minutes long with Tom Kiefer ($50), Paul Sayan ($159), Keith Eysaman ($159), Dave Bayer ($50) and myself ($50) present. The payment for County staff/consultant time due is $468.00. With the exception of the items we have stated are available for production, no more work will be done in regard to this PIA request until the check for the above S&P fee is received.

Also, per our meeting, we are awaiting your written clarification as to the records you are more specifically seeking. Upon receipt, we will let you know the estimated amount of time it will take to gather the records and what S&P fees may be due to complete the search.

Regards,
Milana

I would prefer Tuesday, Monday's are not good for me but if it works for everyone else, I will make it work.

RK&K (Keith) - Ok Monday, will Tuesday work?
Berger (Paul) - ?
Tom (DPW) - Ok Monday, will Tuesday work?
Glen (DPW)- Ok Monday, will Tuesday work?
Milana (Law) - prefer Tuesday
McCann - ok either day

erger.com%2Four-work%2Fproject%2Fbaltimore-county-sanitary-sewer-overflow-consent-decree-program-maryland-us) can definitely make it. In your previous email, you had stated that you wanted both the RK&K and Berger consultants at the meeting. There would be no other people; the meeting would include me, Tom, Glen, Paul and hopefully a person from RK&K from the County side.

Although I am available on Thursday and Friday, I do not know whether the other participants can all attend. I am not available on Monday.

To: Milana Vayner
Subject: RE: PIA Request - Jones Falls Sewershed Sewer, Baltimore County (18-37)

Milana: I think we are going to need to push this back. It's getting late and I need to let my folks know since we were planning on meeting in advance to focus our requests and haven't done that.

As for who should be there, we definitely need RK&K there and Tom. Not certain why anyone else is necessary if, as you say RK&K is the one who created the databases and knows where to find the documents. For example, I am not sure who "Berger" is, but I do feel a bit uncomfortable bringing a blank check and having to pay for whomever might show up.

Instead of tomorrow, I can do Thursday anytime, Friday after 3:30, and Monday after 11 am.

Let me know what works and who, other than RK&K and Tom, you think needs to be present. Thanks.

Michael

RK&K would know what information is available in the County system whereas the data person, also consultant (Berger), would know how to extract it out of the County system. Which one, or both, do you want at the meeting? (Both are $191/hr.)

>
> Michael,
> OK. I'll have a meeting room reserved and will let you know where once that happens. Our consultant is $191/hour and that is who is familiar with our databases because they built them. In discussing the provision of the PIA that relates to records that exist in databases, the Attorney General has written that application of this provision will depend on the nature and characteristics of particular databases, but generally speaking, an agency is obligated to extract data from an existing database if it has the capacity to do so "within [its] existing functionality and in the normal course." *Comptroller of the Treasury v. Immanuel*, 216 Md. App. 259, 271 (2014). So, an agency should comply with a request if it has staff available who routinely perform the type of data extraction requested, but need not do so if it would call for expertise outside the agency's existing capabilities. *See* the Office of the Attorney General Maryland Public Information Act Manual, https://secure-web.cisco.com/1QWwi5gbwN72YQPPiXwdiiBIbZyTUHuJAJF7PgQuo_nkLEDQXk5KG-2tctjQHWMLvQpYFxahTQTii3_gVjUaH_HX7RHRRI-kfxa9OB1zuUjJjpc6CWmX3C9Zg_3q0elPOZAQPfT7fYMaJeUgucxRzNRJ8PJfbVbCJhKFr08Jy2dUlWTT02o0FSoDobtYCzFfLaxyomLa7Czr-Nqps9-3eZ9hDBAcukbFrreHS5vzPKo9JpRoSJT-ziB8uv5eBqu6zpdwNk42mz-a1mseEqRxlSmh33BrlP7SFMDMIwldt9knsxCeoRieFp5RM_5_PvpczXaLwVe5kwrb19nIj0OV07d2Q55jV1TfV4zfaUU8pO8ZU1dn6MLNMMF3VStzLesTtBhzG20d2fURgONrvpBfNynvCpdlaTISzk8WdB7FWFQYuzLQjtQkyBNWsmuE1uq81mpiamZOzWLxNDLCDdHG4Mw/https%3A%2F%2Fwww.oag.state.md.us%2FOpengov%2FChapter2.pdf. DPW does not "routinely perform the type of data extraction requested" and the only way to do perform such an extraction would be to require DPW to "call for

expertise outside the agency's existing capabilities." If you are agreeable to paying the actual cost of the consultant's hourly rate, we can invite the consultant to the meeting. Otherwise Tom will advise which one of the DPW Engineer's is available and best suited to attend our meeting and the rate would be $60/hour.

Michelle or Stacy,
Could you please reserve a room and send a meeting invite?

Thank you all,
Milana

Michael,

These are the times we have available. Tom will try to bring in someone else, but we've already expended the two hours allotted by the Public Information Act and can have the records described in my previous email ready for your inspection when we meet. \
This meeting will entail two additional hours of time, for which a $120 prepayment ($60/hr x 2 people) is required.

2/5: 3-4pm
2/7: 1-2pm

If you have any questions, feel free to call.

Subject: RE: PIA Request - Jones Falls Sewershed Sewer, Baltimore County (18-37)

Milana: Thank you. I apologize for the delay. The person I needed to confer with about is out of town this entire month.

I have some possible limitations on the request that I think will be helpful, but I think it is best if we meet to discuss this. It would be necessary to have someone, perhaps more than one person, attend the meeting who is/are familiar with the documents that the County has. As I said, it is difficult to limit the scope of the requests without having a sense of what actually exists. I am confident that, with the right person(s) in the room, we should be able to limit the requests considerably.

Can we arrange such a meeting on February 5, 6, or 7?

Thank you.

RE: *Maryland Public Information Act Request - Jones Falls Sewershed Sewer Capacity*

Dear Mr. McCann:

This correspondence is in response to your letter dated November 14, 2018, received via email by the Department of Public Works, requesting responsive records to a list of thirty-seven (37) items related to the Consent Decree and the Jones Falls Sewershed from January 1, 2005 to the present.

Thank you for returning my call from yesterday. Pursuant to our phone conversation this morning, you would like to come in with your colleague to meet with us to narrow down the scope of the request. Please let me know as soon as you can which of these you would like to set for the meeting, as calendars tend to fill up quickly. From the three dates discussed, the following are available:

January 3 (1-2pm or 3-4pm) or
January 4 (any time between 9am-3pm).

The General Provisions (GP) Article of the Annotated Code of Maryland, §4-206 provides that "the official custodian may charge an applicant a reasonable fee for the search for, preparation of, and reproduction of a public record." A "reasonable fee" is defined as "a fee bearing a reasonable relationship to the recovery of actual costs incurred by a governmental unit." GP §4-206(a). "The custodian may not charge a fee for the first 2 hours." GP §4-206(c). Baltimore County's Code of Regulations authorizes the custodian of records to require the prepayment of search, preparation and reproduction fees. (See Regulation 08.01.01.15.E., which can be found at http://www.baltimorecountymd.gov/Agencies/infotech/index.html.)

As I mentioned over the phone, DPW's general retention policy, which does apply to some of the requested records, is as follows: The files stay in the office for a year, then they go to archives for 2 years. They are shredded after 3 years, except for federal aid projects which we keep for 10 years or unless there is an ongoing enforcement action or active contract. The County's email retention policy is 18 months, unless an employee happens to save/print/file it. The records you are requesting are from almost 14 years ago, so some records may have been purged. This does not constitute a denial under the PIA and a search will be done in accordance with the legal requirements of the PIA for any responsive records.

DPW has expended in excess of the two hours allotted by law, and is estimating the following for to produce the requested records due to the length of time covered by the request and the sheer number of records. Further, all query results must be reviewed to determine if the records are responsive to the request.

Position	Function	Billing Rate/Hour	Hours	Amount
Supervisor	oversight/management and correspondence	$60	8	$480
Engineer 4	research coordination and aggregation	$60	42	$ 2,520
Engineer 3 - Bayer	research, data review	$60	129	$ 7,740
Engineer 3 - Bokey	research, data review	$60	40	$ 2,400
Database consultant	queries, research, data review	$60*	342	$ 20,520
Attorney	review for responsiveness, redact as necessary	$60	10	$ 600
TOTALS			**571**	**$ 34,260**

* The consultant's rate is $191/hr. The actual cost to the County, just for the consultant's time is $65,322.

To the extent that any portions of your request would require the County to "create, compile, or program a new public record," that currently does not exist and which is not required under the PIA (*See* GP §4-205(c)(4)(iii)), in discussing this provision, the Attorney General has written: Application of this provision will depend on the nature and characteristics of particular databases, but generally speaking, an agency is obligated to extract data from an existing database if it has the capacity to do so "within [its] existing functionality and in the normal course." *Comptroller of the Treasury v. Immanuel*, 216 Md. App. 259, 271 (2014). So, an agency should comply with a request if it has staff available who routinely perform the type of data extraction requested, but need not do so if it would call for expertise outside the agency's existing capabilities. See the Office of the Attorney General Maryland Public Information Act Manual, https://secure-web.cisco.com/1QWwi5gbwN72YQPPiXwdiiBIbZyTUHuJAJF7PgQuo_nkLEDQXk5KG-2tctjQHWMLvQpYFxahTQTii3_gVjUaH_HX7RHRRI-kfxa9OB1zuUjJjpc6CWmX3C9Zg_3q0elPOZAQPfT7fYMaJeUgucxRzNRJ8PJfbVbCJhKFr08Jy2dUIWTT02o0FSoDobtYCzFfLaxyomLa7Czr-Nqps9-3eZ9hDBAcukbFrreHS5vzPKo9JpRoSJT-ziB8uv5eBqu6zpdwNk42mz-a1mseEqRxlSmh33BrlP7SFMDMIwldt9knsxCeoRieFp5RM_5_PvpczXaLwVe5kwrb19nIj0OV07d2Q55jV1TfV4zfaUU8pO8ZU1dn6MLNMMF3VStzLesTtBhzG20d2fURgONrvpBfNynvCpdlaTISzk8WdB7FWFQYuzLQitQkyBNWsmuE1uq81mpiamZOzWLxNDLCDdHG4Mw/https%3A%2F%2Fwww.oag.state.md.us%2FOpengov%2FChapter2.pdf

During our meeting we will discuss for which items in your request DPW does not "routinely perform the type of data extraction requested" and whether the only way to do perform such an extraction would be to require DPW to "call for expertise outside the agency's existing

capabilities." If the need for such data extraction arises, we note now that we decline to do such extraction. This does not constitute a denial under the PIA.

Records that can be made available in a mix of electronic and hard copies for you to come in and inspect are:
- Annual and quarterly reports 2005- present
- SRRR plan for Jones Falls Sewershed
- LTC/PFME report
- Collection System Inspection Plans

Lastly, if you choose to proceed with this request and remit payment for the search and preparation fees, the County is authorized to require the prepayment of $.50 per page for hard copies and $.25 per page for PDF emailed copies, for the reproduction of the records. Once the requested information is ready, you will receive correspondence as to the amount due. The County will not release these records until it receives payment for the copying costs.

In accordance with GP §4-203(c)(1)(i)(4), I must inform you of remedies available for review. If you are alleging that you are being charged an unreasonable fee (defined as more than ($350.00) under GP § 4-206, you may file a complaint with the State Public Information Act Compliance Board, pursuant to GP § 4-1A-05. If you are alleging a complaint set out in GP § 4-1B-04, you may submit your complaint to the Public Access Ombudsman. You may also pursue judicial enforcement remedies as provided in GP §4-362.

Jones Falls Sewershed
Comprehensive Evaluation

News & Information

Q3 2022 ISSUE
FALL UPDATE

INTRODUCTION

Jones Falls Sewershed Comprehensive Evaluation

Slightly more than two years into a three plus year project, Baltimore County and their Engineering Consultant, Hazen and Sawyer, continue to make significant progress in completing a long term comprehensive evaluation of the Jones Falls Sewershed. The following are currently being evaluated with future projects vetted for long term capacity:

- Future capacity needs driven by planned development, potential re-development, and possible future connection of unserved areas of the sewershed, including nearly 1,000 septic facilities spread throughout Jones Falls.
- Strategies needed to further protect the environment from potential sanitary sewer overflows (SSOs) and residents/businesses from potential basement backups.
- Best Management Practices for continued proactive operation and maintenance of the sanitary sewer system.
- Recommended approaches to address sewer system vulnerabilities and improve long-term sustainability and resiliency.
- Development of a Capital Improvement Program (CIP) to address system deficiencies at year 2025, and at 20-year and 50-year planning horizons.

What Area Does the Jones Falls Sewershed Encompass?

The Jones Falls Sewershed includes approximately 1,124,000 linear feet (LF) of gravity sewers ranging from 6- to 42-inches in diameter and approximately 6,200 sewer manholes and structures. The area served by this sewershed is shown in below.

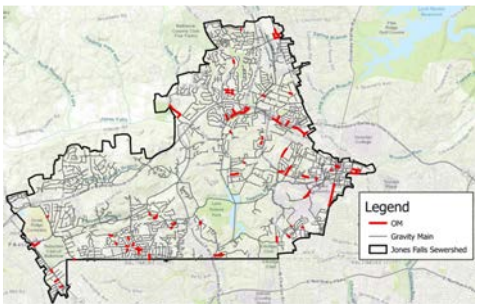

Figure 1: Jones Falls Sewershed

The entire engineering assessment completed will be documented in a comprehensive report that will provide a flexible roadmap enabling Baltimore County to develop informed, asset-based, risk-based, and prioritized Capital Improvement Plan budgets for near-term and long-term system improvements.

Work on the Comprehensive Report has already begun with a Draft anticipated in 2023. Improvements therein will both protect the environment and protect residents/businesses.

Baltimore County remains firm in meeting the following commitments and achieving the long term planning goals.

Commitments:

- Maintain proper sanitation so communities can continue to thrive and prosper.
- Continue prioritization of clean water access.
- Conduct planning projects that are necessary for the County to meet future utility challenges and build upon past improvements.
- Revitalize utility infrastructure to meet forecasted population and employment growth.

Planning Goals:

1. Enhance resiliency and sustainability through properly planned infrastructure improvements.
2. Preserve and protect the environment through projects that improve water quality.
3. Focus planning efforts on assessment and improvement of the existing sewer system.
4. Track and prioritize needed sewer system improvements and proactively repair/replace infrastructure that impacts the community or the environment.

A brief update on critical project accomplishments made through Q3 2022, which build upon prior accomplishments, are included below.

Data Review

Comprehensive review of over 17,500 available historical records.

Field Data Gathering/Reconnaissance

Completed a Hot Spot Analysis associated with all SSO, basement backup, and work order data.

Hydraulic Model Expansion

Completed a gap analysis of the existing model to assess ways the model could be improved upon for use as a tool to better estimate the impacts that rainfall has on sewer system operations. The existing model, constructed over ten years ago, was found to not accurately represent current wet weather flow conditions. This is not unusual given the age of the model. The existing model properly predicted wet weather flows at 1 of 39 meters *(Figure 2)*.

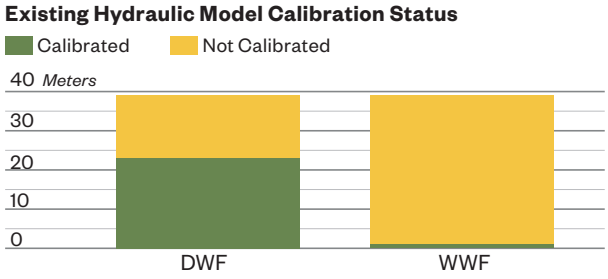

Figure 2

Based upon the model gap analysis, completed field survey of 106 manholes to update the hydraulic model.

Completed a flow, level, and rainfall monitoring data analysis to assess current high rainfall dependent inflow and infiltration (RDII) sewer service areas. These areas respond more dramatically to rainfall *(Red areas shown in Figure 3)*.

Selected additional flow monitor locations to refine the hydraulic model calibration effort.

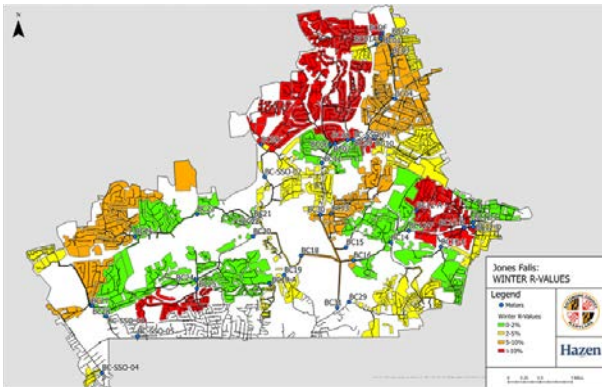

Figure 3 :
Winter High RDII Areas within the Jones Falls Sewershed

Baltimore County deployed 26 additional flow monitors. Monitoring will continue through Summer 2022, such that dry weather, wet weather, and high groundwater flow data is gathered. Expanding the hydraulic model to include all sewers in the sewershed allows for a more detailed sewershed wide analysis. The original model was only required to include pipes 10-inches and larger. The number of manholes in the model increased from 1,513 to 6,715 while the number of pipes increased from 1,342 to 6,919.

Hydraulic Modeling Validation

Expanded model calibration/verification with new flow monitoring data is being completed now with much progress made. Data is anticipated to be collected through Summer 2022.

Stakeholder Engagement

Met with the following stakeholders in the sewershed to better understand potential increases in residential and employment populations: GBMC, St. Joseph Medical Center, Sheppard Pratt, Towson University.

Dashboards

Development of a series of Project Dashboards that are being used to present evaluation findings. These will be expanded once capacity analysis is completed *(Figure 4)*.

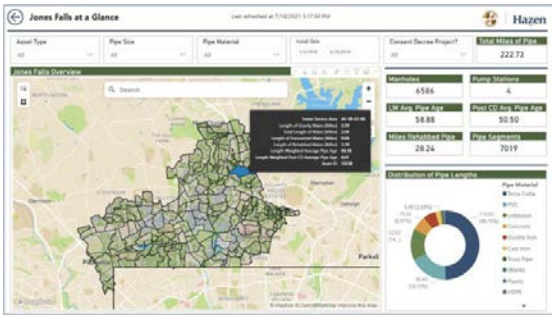

Figure 4

Environmental Investigations

Environmental investigations in and near all large water features within the sewershed (Lake Roland, Jones Falls, etc.) began in Fall 2021 and will continue into 2022.

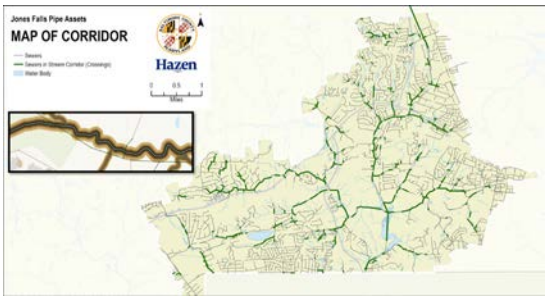

Figure 5

Climate Change

Assessed the potential impacts climate change may have on rainfall within the sewershed, including more frequent and higher intensity storm events.

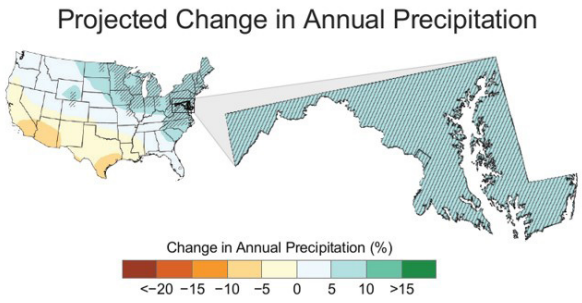

Figure 6

Mobile GIS

Implemented Mobile GIS to streamline data gathering. It replaces maps and redundant data entry, allowing gathered data to be immediately shared within the project team.

Population Estimates

Developed future population estimates, both residential and employment, which will contribute to future flows within the sewershed. All sewer assets must be capable of conveying future flows to protect residents, businesses, and the environment from overflows and backups.

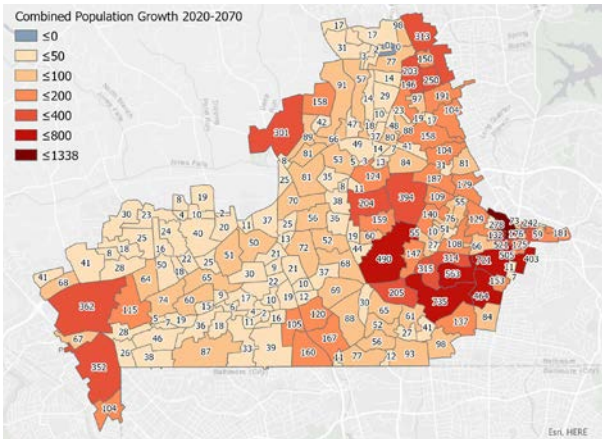

Figure 7

Water Meter Billing

Distributed water meter billing information to the hydraulic model for increased accuracy in sewer modeling.

COF Criteria	Social			Financial	Environment
	Vibrant Communities	Workforce Empowerment	Equitable Decision Making	Government Accountability	Sustainability
Environmental Impact	x		x		x
Transportation Impact	x	x	x	x	
Critical Facilties	x		x		
Diameter		x		x	x
Pipe Accessibility				x	x

Figure 8

Consequence of Failure Criteria

Developed Consequence of Failure Criteria, which are being used to assess and prioritize each recommendation within the sewershed. These criteria account for a Triple Bottom Line evaluation including Social, Financial, and Environmental impacts.

Future Innovation Areas

Identify

Identify innovation options that offer the County the most value.

- Leverage existing data
- Utilize the County's Tools (CityWorks, InfoWorks, etc.)
- Address known concerns within the sewer system (RDII, energy usage, etc.).

Assess

Assess the return on investment for potential use elsewhere in the sewer system.

- Pilot/test and assess results

Position

Position the County as a leading utility in sewer system design & operation.

Baltimore County and Hazen have been having ongoing discussions with respect to future innovations. The goals of these future projects are as shown above.

Flow Monitoring

Flow monitoring data from 32 flow monitors has been analyzed for the data collected from November 2021 through June 2022. Flow data has been imported in the HazenQ software, integrated with previously collected 2018 flow data. Connectivity diagram had been updated to include new locations. Flow data has been reviewed for quality.

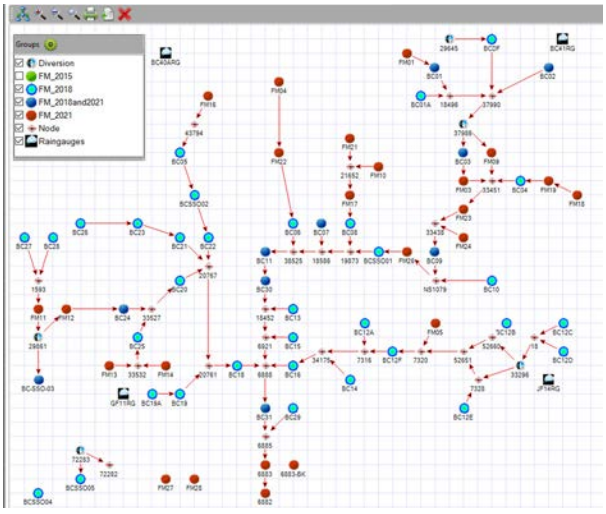

Figure 9

Rainfall

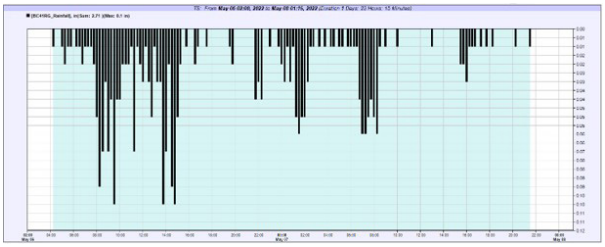

Figure 10

Rainfall data from multiple rain gauges has been analyzed using the data collected from November 2021 through June 2022. Rainfall has been imported in the HazenQ software and return period calculated.

Dry Weather Flow (DWF) Calibration

DWF calculations are under way for each metershed. Normalized DWF patterns are being created and transferred to the modeling subcatchments. GWI component is distributed using subcatchments area and ADSF component is distributed using water consumption.

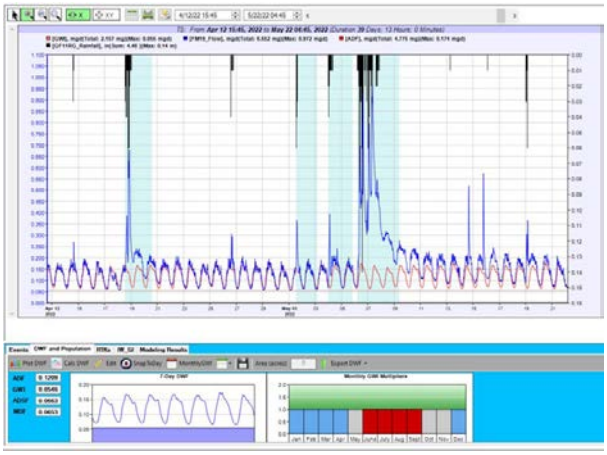

Figure 11

Stream Asset Prioritization

- Developed Framework: Existing approach modified to fit Baltimore County; New COF category introduced - Public Health/ Environmental Impact
- Completed Desktop Analysis: LOF and COF factors decided upon and calculated; Risk scores assigned to all assets; Areas of interest identified with all levels of risk

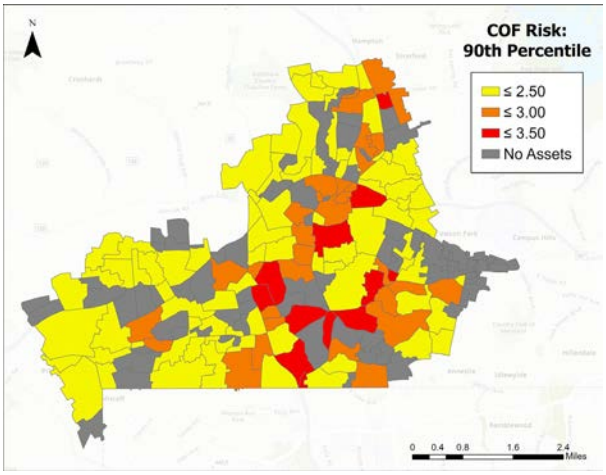

Figure 12

Looking Ahead

Upcoming Project Tasks

Engineering evaluation work continues while flow monitoring efforts reached partial completion in Summer 2022. Planned upcoming project tasks are highlighted below.

Continued stakeholder engagement to fully understand the unique dynamics within the Jones Falls Sewershed, including community interests and potential residential and employment growth over the next 50 years.

Continued sewer and manhole inspections through 2022 and into 2023. Additional system evaluation will occur after hydraulic modeling once Summer 2022 flow data is available, anticipated this Fall.

What to expect going forward?

Given that this project is intended to map out what the sewer system needs to look like over a 50 year period, it is important to cover all possible aspects of what the sewer system could become by the year 2050 (~30 year period) and 2070. The following tasks, planned to occur at a later stage in the evaluation, will be completed as a part of this effort to provide a complete picture of the near and long term sewershed needs.

- Capacity assessment using the calibrated model under future flow conditions. ***Work is underway on this - see the update included in this quarterly issue!***
- Acoustic and Sonar inspection of assets identified during the modeling evaluation effort. Anticipated in late 2022 and continuing into 2023 following hydraulic modeling.
- Development of a recommended CIP.
- Recommendations on Asset Management Program features, which will allow for proactive protection of the environment and the County's residents and businesses. Initial Asset Management framework development has been completed and will be refined when hydraulic modeling results are generated in 2022 based on updated flow monitoring *(see Figure 13)*.

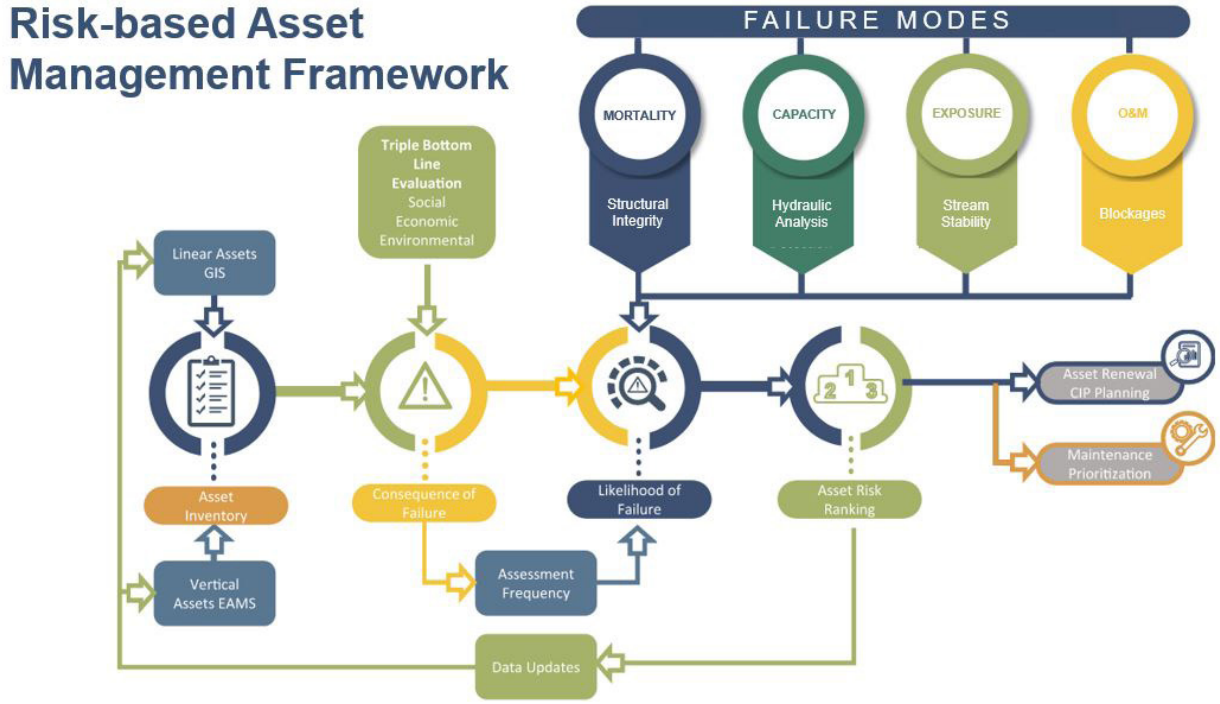

Figure 13

Upcoming Project Tasks (continued)

A concerted effort is being made on this project to expand and refine the hydraulic model so that it can be used as an advanced tool to accurately reflect future wet weather conditions. Potential future flows can also be properly evaluated with the advanced model.

Target Completion Date

The Final Report is anticipated to be completed in late 2023. Baltimore County will continue to provide updates on the project, on a regular basis.

Data continues to be gathered through flow and level monitors located throughout the sewershed. Flow monitoring through May 2022 has been gathered and will continue through Summer and Fall 2022. Hazen and Sawyer continues to use this captured data to improve the County's Jones Falls Sewershed hydraulic model. A concerted effort has been made in Q2 to evaluate the flow data gathered with results anticipated in Q3 and Q4 of 2022. Using the improved hydraulic model will allow for informed decisions to be made on capacity needs throughout the entire sewershed and at the neighborhood level.

Winter 2022 Update to Follow!

Lisa: On a somewhat unrelated note, the question was raised during a recent hearing whether the attached proposal from Hazen is the one upon which that company has been performing its work for the County, i.e., is it the final one? (it was the one provided to us and the subject of our conversations with Mr. Vetter and DPW staff in early 2020).

Please let me know.

Thank.

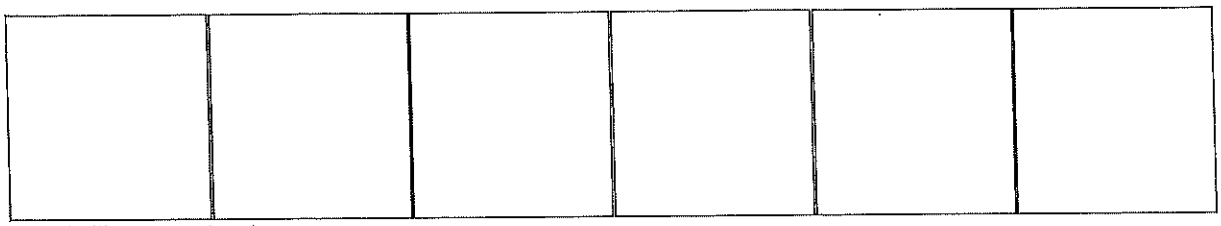
CONNECT WITH BALTIMORE COUNTY



Baltimore County Department of Public Works
On-Call Engineering Services for Pumping Stations
Project No. 2015-03

Task 003 – Jones Falls Sewershed Comprehensive Evaluation

January 29, 2020

In accordance with Baltimore County's request under the On-Call Engineering Services for Pumping Stations Agreement, Project No. 2015-03, Hazen and Sawyer is pleased to submit this Scope of Services and Fee Proposal for the Jones Falls Sewershed Comprehensive Evaluation. The proposed Scope of Services is in accordance with the executed agreement with Baltimore County dated February 23, 2016 and amended on May 24, 2019.

BACKGROUND

The County is requesting a comprehensive evaluation of the Jones Fall Sewershed to assess the near-term and long-term needs of the sanitary sewer system, including:

- Future capacity needs driven by development, re-development and/or future connection of unserved areas of the sewershed
- Strategies needed to further protect the environment from potential sanitary sewer overflows (SSOs)
- Best Management Practices for continued proactive operation and maintenance of the sanitary sewer system
- Strategies to address vulnerabilities and improve long-term sustainability and resiliency

The Jones Falls Sewershed includes approximately 1,124,000 linear feet (LF) of gravity sewers ranging from 6- to 42-inches in diameter and approximately 6,200 manholes or other sewer structures. Data and reporting from previous studies will be provided to Hazen as part of this comprehensive needs assessment. Hazen and Sawyer will complete an evaluation addressing the capacity, operations and maintenance (O&M), and structural needs of the sewer system and develop a comprehensive plan and strategies to address system deficiencies at year 2025, 20-year, and 50-year planning horizons and two additional planning horizons determined by the County. This work will be detailed in a comprehensive sewershed evaluation report that will provide a flexible roadmap enabling the County to develop informed, asset-based, risk-based, and prioritized Capital Improvement Plan (CIP) budgets for near-term and long-term system improvements and strategies.

GENERAL ASSUMPTIONS

For the purposes of this Task Order, the following assumptions are made:

- All available requested data and reports will be provided to the Consultant by the County in a timely manner.
- Flow and rainfall monitoring data collected by others after the notice to proceed for this task will be provided in electronic time series format to the Consultant by the County on a monthly basis for the duration of the monitoring period. Raw data will be supplied within one week of the end of the month and QA/QC'd final data will be supplied within four weeks of the end of the month.
- No lidar inspection will be performed.
- Recent CCTV and manhole inspection data is available for most of the Sewershed.
- Up to 50,000 LF of CCTV inspections are included based on an assumed average production rate of 450 linear feet (LF) per day for CCTV inspection and light cleaning.
- Up to 15,000 LF of heavy cleaning is included based on an assumed average production rate of 300 LF per day for heavy cleaning.
- Up to 20,000 LF of combination sonar/CCTV inspection is included based on an assumed average production rate of 1,000 LF per day for sonar/CCTV inspection.
- Up to 100 MACP Level 1 manhole inspections are included based on an assumed average production rate of 10 manholes per day.
- Up to 50 MACP Level 2 manhole inspections are included based on an assumed average production rate of 8 manholes per day.
- Up to 150 manhole surveys are included.
- The County is conducting a Performance Assessment, including I/I analysis, associated with the recent sewer improvements within the Sewershed. However, this assessment will not be completed for another eighteen (18) or more months. The County will provide data as it becomes available during this Task, but Hazen will proceed without this information. Hazen will develop an interim I/I analysis and update the I/I analysis after the performance assessment is complete. The modeling efforts described in Tasks 5 and 6 will utilize the interim I/I analysis results.
- Scope of Services does not include any design work. Conceptual locations of capacity improvements and strategies will be determined.
- Scope is limited to review of existing water quality data and reports. No water quality sampling, testing or fieldwork will be performed.
- For the future capacity assessment, the County will provide direction on targeted areas and timing for extending sewer service to properties with on-site septic systems. Planning level costs will be developed only for upgrades to the existing system as required to accommodate additional flows from properties with septic systems. Evaluation of sizing, location and costs of new infrastructure extensions to serve septic system areas is not included.

SCOPE OF SERVICES

The scope of services is divided into the following tasks:

- Task 1 – Project Administration
- Task 2 – Gather and Review Existing Data
- Task 3 – System Characterization and Data Gap Analysis
- Task 4 – Flow/Rainfall Monitoring Data Review and Interim I/I Analysis
- Task 5 – Hydraulic Model Refinement, Calibration and Verification
- Task 6 – Asset Management and Capital Improvement Program Development
- Task 7 – Sewershed Evaluation Reports
- Task 8 – Public Outreach

TASK 1 – PROJECT ADMINISTRATION

Task 1.1 – Project Management

The project team for this Task Order consists of the Consultant and its subconsultants, Savin Engineers, P.C., PEER Consultants, P.C., C.C. Johnson & Malhorta, P.C. (CCJM) and Mobile Dredging and Video Pipe (MDVP). The Consultant will coordinate the overall work of the project to include project management, subconsultant coordination and MBE/WBE participation management.

The Consultant will schedule, manage and coordinate the efforts of its subconsultants. The Consultant will be responsible for quality control of subconsultant's deliverables.

Deliverables:

- Monthly Invoices (one original invoice with copy of all backup paperwork; two copies of the invoice only)

Task 1.2 – Kick-off Meeting

Before the start of the project, a kick-off meeting will be scheduled to discuss the project goals, communication protocol, schedule, deliverables and existing data acquisition. Participants in this meeting are expected to include the Consultant project manager, the Consultant's technical expert, and the County's project manager. Consultant will submit an electronic format agenda in advance of the meeting, prepare the meeting minutes, and submit the minutes to all attendees in electronic format within five (5) business days after the meeting.

Deliverables:

- Draft and Final Meeting Agenda (PDF format)
- Draft and Final Meeting Minutes (PDF format)

Task 1.3 – Task Schedule and Progress Reports

Consultant will prepare a task-based schedule for the performance of the work under this Task Order. The baseline schedule will be submitted for approval and will outline the major tasks to be completed under this Task Order. The schedule will identify projected submittal dates for the Draft and Final Reports discussed in Task 7 of this proposal. The Consultant will assess the project progress and report on the progress on a monthly basis. Monthly progress reports will detail work activities completed during the reporting period, work activities planned for the next period, budget status, schedule status and an issue log. Consultant will update monthly, or as appropriate, the schedule for performing the services.

Deliverables:

- Draft and Final Baseline Schedule (PDF format)
- Monthly Updated Schedule (PDF format)
- Monthly Progress Reports with look-ahead (PDF format)

Task 1.4 – Additional Meetings

Additional meetings will be scheduled throughout the course of the project as needed, at the request of the County or the Consultant, to meet Task Order objectives. A total of eighteen (18) meetings, including the project kick-off, are assumed for this scope.

The following meetings with Baltimore County are anticipated:

- Task 1 – One (1) project kickoff meeting (see Task 1.2 above)
- Task 3 – One (1) data review/mapping meeting to discuss focus areas
- Task 3 – One (1) meeting to discuss data gap analysis and fieldwork recommendations
- Task 5 – One (1) meeting with the County's planning group
- Task 5 – Five (5) meetings with developers and large institutions to discuss future development projections
- Task 5 – One (1) meeting with the County's Groundwater Management Section to discuss septic systems
- Task 5 – One (1) meeting to review model update recommendations
- Task 5 – One (1) meeting to review capacity assessment results and define level of service
- Task 6 – One (1) meeting to develop initial scoring approach for risk assessment
- Task 6 – One (1) meeting to review the initial results of the risk assessment and adjust scoring criteria as needed
- Task 6 – One (1) meeting to review cleaning/CCTV needs for O&M funding assessment

- Task 6 – One (1) meeting to review the capital improvement program recommendations
- Task 7 – One (1) meeting to review the County's comments on Draft Report
- Task 7 – One (1) meeting to review the Power BI dashboard

Consultant will submit an electronic format agenda in advance of each meeting, prepare the meeting minutes, and submit the minutes to all attendees in electronic format within five (5) business days after the meeting.

Deliverables:

- Draft and Final Meeting Agendas for each meeting (PDF format)
- Draft and Final Meeting Minutes for each meeting (PDF format)

Task 1.5 – QA/QC

Quality assurance/quality control procedures will be employed to maintain quality of all deliverables. These procedures include the use of quality control reviews of engineering assumptions and calculations, quality assurance audits of the workflow processes, and other measures necessary to provide a deliverable of a quality meeting industry standards. A quality control review will be conducted on each submittal prior to delivery to the County. These reviews apply to all modeling databases, technical memoranda, or reports generated for this Task Order. Members of in-house staff not associated with the Task Order will be selected to perform these reviews.

TASK 2 – GATHER AND REVIEW EXISTING DATA

Consultant will gather and review existing data for the Jones Falls Sewershed. All data will be provided by Baltimore County for the Consultant's review. A formal data request will be submitted prior to the kick-off meeting. The Consultant anticipates the following data, at a minimum, will be requested and reviewed for completeness and fitness for the project's purpose:

- Jones Falls Model Development and Calibration Report
- Jones Falls Long Term Capacity/Peak Flow Management Evaluation (LTC/PFME) Report
- Jones Falls Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan
- Historical sanitary sewer overflow (SSO) data including cause if available in electronic format by asset ID or property address
- Historical basement backup data where capacity or blockage is the cause in electronic format by property address
- Historical work order data including cleaning, repairs and complaint calls in electronic format by asset ID or property address
- Historical smoke and dye testing results in electronic format
- Frequent preventative maintenance cleaning areas and other known trouble spots
- Current Baltimore County GIS data including sewer assets, road centerline, pavement, railroads, sub-basin delineations, parcels, buildings, critical facilities, zoning, land

use/planning, hydrology features, soil types, and flow meter and rain gauge locations (current and previous)

- Available land use plans, including the Baltimore County Master Plan 2020
- Current population characteristics
- Population and employment projections, including the latest Baltimore Metropolitan Council of Government (BMCOG) projections
- Flow projections, as gathered by the County, from large institutions and developments within the sewershed (i.e., GBMC, Sheppard Pratt, St. Joseph Medical Center, Towson University, Towson Row, etc.). Hazen will support this data collection effort as described under Task 5.2.
- Most recent copy of the InfoWorks model files
- As-built drawings of the sewer collection system, pump stations and force mains
- Available records on work done as part of the implementation of the SRRR Plan including record drawings, corrective action tracking spreadsheet or other electronic format data
- Drawings for collection system improvements that are in design or construction or are installed but not currently in the GIS
- List of planned improvements, including any local relief sewers required for future planned development
- Record drawings for any previous collection system improvements in the Sewershed, including sewer rehabilitation
- Available flow and rainfall monitoring data from previous and current monitoring efforts, including data for areas of the system where corrective actions were completed (post-construction monitoring). Flow meter installation and maintenance records will also be provided.
- Report on performance assessment of rehabilitation projects which will be completed following the current flow monitoring program (report to be prepared by others)
- Most recent CCTV inspection data including videos and PACP-compliant databases
- Most recent manhole inspection data including photos and MACP-compliant databases
- Water meter consumption data for the last twelve (12) months in electronic format by month. Geocoded locations preferred.
- Level sensor data
- Pump station SCADA data
- Pump station information including pump curves, wet well set points, and record drawings
- Records of on-site septic systems located within the Sewershed from the Groundwater Management section. GIS features preferable if available but electronic address records are also acceptable.
- Data on condition of existing septic systems within the Sewershed as well as any water quality monitoring data in the vicinity of pertinent septic systems
- Records of new tap connections and/or subdivision plans for new development and re-development areas since the last comprehensive flow monitoring period in 2008, as available in electronic format
- Available historical water quality data and reports, including the NPDES Annual Report, prepared by Baltimore County's Department of Environmental Protection and

Sustainability or other entities. Consultant will review water quality data in conjunction with rainfall data, SSO data, and GIS mapping of on-site septic system locations and identify any correlations between the datasets.

Deliverables:

- Formal data request in an email prior to kick-off meeting
- List of data provided by Baltimore County
- List of data discrepancies or major data gaps after data review

TASK 3 – SYSTEM CHARACTERIZATION AND DATA GAP ANALYSIS

The objective of this task is to understand and map the locations of existing problems such as known O&M issues, SSOs, and pipe failures to identify focus areas and additional flow, level and rainfall monitoring needs. Through the data gap analysis, the Consultant will understand the extent and relative confidence in asset attribute data to be incorporated into the model. The result is a prioritized field data collection plan.

Consultant will map the data collected under Task 2 (to the extent the data can be geolocated) and identify data gaps/needs for the hydraulic modeling and areas of focus for further evaluation. All field work performed under this task will be provided to the County in a format to import into the County's Computerized Maintenance Management System (CMMS) software, which the County is planning to roll out in January 2020. Consultant will work with the County to confirm data standards necessary to facilitate import into the CMMS and GIS.

Task 3.1 – Map Existing Data and Identify Problem Areas

Consultant will map the existing data using ArcGIS Pro including:

- SSOs
- Basement backups
- Frequent cleaning areas
- Work orders, differentiating between pre- and post-rehabilitation work orders in areas where comprehensive rehabilitation has been completed
- Pipeline Assessment Certification Program (PACP) inspection data
- Manhole Assessment Certification Program (MACP) inspection data
- Rehabilitation data (previous projects, projects in planning/design/construction)
- Capacity improvement projects (in planning/design/construction)
- Flow meter, level sensor and rain gauge locations and meter basin boundaries and characteristics
- Rehabilitation and replacement recommendations from the SRRR Plan, including the installation dates of these improvements (construction work is nearing completion)
- Capacity deficiencies identified from previous modeling/study efforts
- New taps since the last model was developed

- On-site septic system locations

Consultant will review the mapped data to identify the following areas of focus:

- Problem areas for O&M issues
- Areas with known or suspected capacity constraints
- Areas with structural condition concerns

Special attention will be paid to dates. County will provide dates when improvements were made within the Sewershed, so that the data can be analyzed by way of pre- and post-repair. The County has indicated that repair and rehabilitation work from the SRRR Plan (largely structural repairs) and some isolated relief sewer work within the Sewershed is nearly complete.

Deliverables:

- Maps of the existing data and preliminary areas of focus and suggested additional monitoring locations will be presented at a progress meeting with Baltimore County and provided to the County in electronic PDF and hard copy format.

Task 3.2 – Gap Analysis and Additional Field Data Collection Recommendations

Consultant will conduct a gap analysis to identify missing values, errors, and inconsistencies in asset attributes that will impact the model. Gap analysis will be performed using the data management tools available in InfoWorks CS and GIS. Automated inference tools within InfoWorks CS and GIS will be utilized to identify questionable data such as:

- Reverse grade slopes
- Missing attribute data
- Larger diameter pipes upstream of smaller diameter pipes
- Orphan pipes or manholes
- Incorrect spatial data (e.g., a manhole location inconsistent with nearby assets)
- Incorrect elevation data (e.g. manhole rim elevations conflicting with adjacent terrain)

This will include detailed analysis of data sources for pipes in the model including GIS, record drawings, and CCTV inspections. Consultant will apply engineering judgment to determine locations where assumptions and interpolations will suffice for model calibration. Manhole surveys will be performed as needed under Task 3.3.

Consultant will also utilize the mapped data to identify the following:

- Assets without inspection data
- Assets in problem areas that do not have recent inspection data
- Any locations where additional flow or level monitoring is needed for model calibration or model expansion, or to further investigate problem areas (see Task 4.1)
- Areas where acoustic inspections or other investigations should be performed to ascertain potential blockages that could inform the model calibration and capacity assessments

- Exposed assets adjacent to or crossing streams where external asset condition should be verified

Consultant will recommend additional field work to address critical data gaps. The base scope assumes:

- Up to 100 manhole surveys to be completed by subconsultant CCJM
- Up to 50,000 LF of CCTV inspections to be completed by subconsultant Savin Engineers
- Up to 100 Level 1 and 50 Level 2 manhole inspections to be completed by subconsultant Savin Engineers
- Up to 15 additional flow meters (including for areas of model expansion) – flow monitoring to be performed by others under a separate task. The County has two (2) contractors that can install these flow meters once final locations are selected.
- Up to 20 level monitors – level monitoring to be performed by others under a separate task. The County has two (2) contractors that can install these level monitors once final locations are selected.
- Up to 200 acoustic inspections to be completed by subconsultant MDVP
- Up to 15,000 LF of creek walks and exposed asset assessments to be completed by Consultant

Consultant will develop Survey 123 Forms for various field data collection efforts. These forms will be tailored to collect necessary data by asset type.

The additional fieldwork to be performed by the Consultant is described in Tasks 3.3 through 3.7.

Deliverables:

- Maps of the additional fieldwork recommendations will be presented at a progress meeting with Baltimore County and provided to the County in electronic PDF and hard copy format.
- GIS or other electronic format data identifying specific assets to be included in the additional field investigation.

Task 3.3 – Manhole Surveys

The base scope assumes up to one hundred (100) manhole surveys will be conducted. Visual observations will be made concerning the pipe connectivity and system configuration, and rim-to-invert depth measurements will be taken for all incoming and outgoing pipes. The Consultant will also collect horizontal and vertical location data (x and y location points and rim elevation) for each manhole. No confined-space entry will be performed. Where unmapped sewer lines and manholes are found or other corrections to the existing GIS maps are needed based on field conditions, map corrections will be made and submitted to the County in ArcGIS shapefile format or in any specified format meeting the County requirements for GIS changes.

Deliverables

- Field survey data in electronic format or in County specified format
- GIS shapefile for map corrections

Task 3.4 – CCTV Inspections

Consultant will conduct closed-circuit television (CCTV) inspections in accordance with the National Association of Sewer Service Companies (NASSCO) PACP standards. The base scope assumes up to 50,000 linear feet (LF) of gravity sewer mains ranging from 8 to 42 inches in diameter will be inspected. No confined space entry will be performed. Traffic control by a subconsultant to Savin Engineers is assumed for up to seven (7) days.

CCTV Inspection Requirements

- CCTV inspection will proceed after a single light cleaning pass or prior to cleaning as long as the camera can make it through the pipe. After the CCTV inspection, if the pipe is not a minimum of 95 percent clear, up to two (2) additional light cleaning passes will be performed in accordance with NASSCO (National Association of Sewer Service Companies) standards.
- Heavy cleaning (consisting of more than three passes with the hydraulic cleaner, root cutting and/or grease cutting) is included in this scope for up to 15,000 LF of gravity sewer mains ranging from 8 to 30 inches in diameter.
- All inspection records will be provided in a PACP-compliant database with inspection fields populated.
- Inspection videos will be recorded in MPEG1 format and will follow the naming convention established by the County.
- New manholes will be reported to the County.

Reverse Inspection Setups

- If the upstream and downstream manholes are inaccessible due to private property, a CCTV inspection/reverse inspection will be attempted from the nearest upstream or downstream manholes located in the public right-of-way.

Deliverables

- PACP-compliant CCTV inspection database, logs, photos and videos
- GIS shapefiles of pipe defects (point features) and pipe ratings (pipe features)
- Identification of debris levels to be input into the hydraulic model

Task 3.5 – Manhole Inspections

Consultant will conduct manhole inspections in accordance with NASSCO MACP standards. The base scope assumes up to 100 MACP Level 1 and up to 50 MACP Level 2 manhole inspections will be performed. No confined space entry will be performed for Level 1

inspections. Consultant will work with the County to identify which optional fields to include in the Level 1 inspections, if any.

Manhole Inspection Requirements

- All inspection records will be provided in an MACP-compliant database with inspection fields populated.
- The inspections will include electronic images of the surface, casting and chimney, barrel and invert.
- Defects will be identified, and active infiltration quantified in accordance with the NASSCO MACP standards for Level 2 inspections.
- New and/or buried manholes will be reported to the County.
- Consultant is not responsible for frame or cover replacement or for raising manhole cover to grade.
- Consultant will notify the County of all manholes with signs of surcharge identified during the field inspection work.

Could Not Locate / Could Not Access (CNL/CNA) Manholes

- Consultant will perform due diligence when attempting to locate manholes. A list of CNL/CNA manholes will be provided to the County after due diligence has been performed without success.
- Consultant will make a minimum of two separate inspection attempts at different times before designating a manhole as CNA due to private property, parked car or heavy traffic.

Deliverables

Consultant will prepare and submit the following to the County:

- MACP-compliant manhole inspection database and photos in electronic format
- GIS shapefiles of manhole defects and manhole ratings

Task 3.6 – Acoustic Inspection

Consultant will conduct up to 200 acoustic inspections of sewer mains ranging from 8 to 12 inches in diameter using InfoSense's SL-RAT technology to inform potential for blockage. Acoustic inspections will be performed in O&M problem areas as identified in Task 3.1. It is assumed that 140 inspections will be on-road and 60 inspections will be off-road. Traffic control is limited to signs and cones (no flagmen or arrow boards). No flow control will be provided, and no confined space entry will be performed.

In areas where acoustic inspection scores pipes below seven (7), a follow-up PACP-compliant CCTV inspection will be conducted to ascertain the nature of the blockage/debris and to provide a record that some level of blockage was found. Recommendations for follow-up cleaning will be provided.

Cleaning and subsequent CCTV inspection of the cleaned pipe are not included in the scope. Post-cleaning CCTV inspection data, provided by the County, will be reviewed to confirm results.

Deliverables

Consultant will prepare and submit the following to the County:

- Electronic results of acoustic survey scores in Excel and/or GIS format
- PACP-compliant CCTV inspection database, logs, photos and videos of any CCTV inspections performed
- GIS files of pipe defects (point features) and pipe ratings (pipe features)

Task 3.7 – Creek Walks/Exposed Asset Assessments

Consultant will perform creek walks and exposed asset assessments for up to 15,000 LF of sewer mains located adjacent to or crossing streams. Consultant will visually assess the exterior condition of exposed sewers and manholes. The general condition of the streambanks in these areas will be recorded. Survey 123 forms will be developed and implemented as part of this effort.

Deliverables

- Survey 123 export of field data including photos and other data
- PDF field reports for each asset

Task 3.8 – Sonar/CCTV Inspections

Consultant will conduct up to 20,000 LF of sonar/CCTV inspections of sewer mains ranging from 30 to 42 inches in diameter. Sonar/CCTV inspections will be performed in O&M problem areas as identified in Task 3.1. No flow control will be provided, and no confined space entry will be performed.

Deliverables

Consultant will prepare and submit the following to the County:

- Electronic results of the sonar inspections
- PACP-compliant CCTV inspection database, logs, photos and videos
- Identification of debris levels to be input into the hydraulic model
- GIS files of pipe defects (point features) and pipe ratings (pipe features)

Task 3.9 – Summarize Field Data

Consultant will summarize field data collected under Tasks 3.3 through 3.7 and will utilize the data as needed to refine and calibrate the collection system model. Consultant will develop

rehabilitation and other "next-action" recommendations as necessary based on the inspection data. Field data results and recommendations will be incorporated into the Asset Management Program Development in Task 6.

TASK 4 – FLOW/RAINFALL MONITORING DATA REVIEW AND INTERIM I/I ANALYSIS

The objective of this task is to review and analyze the flow and rainfall monitoring data collected under a separate task order to support the model calibration and determine infiltration/inflow reduction strategies and priorities.

Task 4.1 – Flow, Level and Rainfall Monitoring Data Review

Consultant will review temporary flow and rainfall monitoring locations (installed/maintained by others) and provide feedback on the adequacy of the locations for hydraulic modeling purposes (and to support model expansion, and characterization of the system with respect to any observed SSO/O&M issues that would affect system performance). Consultant will identify future needs for flow monitoring. Since the data is collected, screened and processed by others, a QA/QC review of the flow monitoring data set will be conducted by the Consultant to assess its sufficiency for use in model calibration and verification as well as interim I/I analyses. It is assumed that up to twelve (12) months of data from up to forty-five (45) flow meter sites will be reviewed and analyzed. Data from up to fifteen (15) additional flow meter sites installed based on the Consultant's recommendations will be reviewed and analyzed for up to twelve (12) months. Consultant will review and analyze rain gauge and radar rainfall data for the flow monitoring time period. Consultant will review and analyze level sensor data for up to twenty (20) locations. Review and analysis will include flow meter volume balances as applicable.

Task 4.2 – Flow Disaggregation and Rainfall Derived Infiltration/Inflow (RDII) Evaluation

Consultant will disaggregate data from the flow meters into:

- Base sanitary flow (weekday, weekend)
- Base groundwater infiltration (GWI) including normalized GWI such as GPD/ft/in
- Seasonal RDII metrics (e.g., RTK) for each meter basin including volumes and R-values representing fast, medium and slow response.

Consultant will summarize RDII characteristics for each meter basin in tabular format and thematically map using GIS.

Deliverables:

- Tables and maps of RDII characteristics (PDF format)

TASK 5 – HYDRAULIC MODEL REFINEMENT AND CALIBRATION

The objectives of this task are to refine and calibrate the existing model so that it can be used as a tool to assess current capacity for certain levels of service, to identify future capacity constraints from new growth and redevelopment, and to develop and size improvement strategies to address capacity issues.

Task 5.1 – Existing Model Review

Consultant will review the existing model for fitness for purpose by:

- Reviewing model extents and making recommendations for refinements/expansion based on previous tasks. For the purposes of this proposal, it is assumed that the model will be expanded to include all 8-inch sewers. Refinements/expansion will be completed under Task 5.6.
- Performing wet and dry weather existing model verification with new flow and rainfall data
- Reviewing pump station and force main representations and output relative to available data
- Comparing current GIS and corrective action records to model input
- Reviewing model subcatchment representation

Deliverables:

- Summary of recommended additional field data collection in GIS or other electronic format as well as an overview of model adjustments needed as a result of the verification exercise.

Task 5.2 – Develop Future Condition Models

Consultant will develop future flow projections for near term (2025), 20-year and 50-year planning horizons and up to two (2) additional planning horizons in the event that project phasing improvement strategies might be implemented. The 50-year planning analysis will include an assessment of build-out conditions, with the assumption that any available land within the County's service boundaries for the Sewershed is developed in accordance with its current zoning. County will define the available, developable land within the Sewershed. The development of future condition models for these planning horizons will include the following:

- Review of available land use plans
- Attending one (1) meeting with applicable planning groups/agencies within Baltimore County to discuss projected future development and development timing
- Attending up to five (5) meetings with large institutions and commercial developments to discuss projected future development and development timing (e.g., GBMC, St. Joseph Medical Center, Sheppard Pratt, Towson University, Towson Row)

- Review of water consumption data in combination with dry weather flow meter data to assess unit dry weather flow variability throughout the sanitary sewer system. The assessment will involve looking at unit dry weather flows based on development type, development age, industry type, commercial type, etc. and will be used to "truth check" flow data estimates.
- Review of population and employment projections

The Consultant will develop design flow determination strategies and parameters such as unit dry weather flows for various land uses. Consultant will develop future wet weather design flow determination strategies and parameters as applicable. Infill development (i.e., re-development or new development in developed areas) will be handled differently than greenfield development (i.e., development in undeveloped areas). Future RDII strategies and parameters will be developed for new development where new pipes will be built while RDII strategies and parameters from the calibrated model will be used for infill areas. Consultant will delineate future "pipelines" to represent the connection of future flows to the existing pipe network as necessary to properly represent timing of flows. In some cases, future subcatchments will be connected directly to the nearest existing pipe.

Consultant will develop thematic mapping of development conditions for near term (2025), 20-year and 50-year planning horizons and up to two (2) additional planning horizons. These future flow projections will be utilized in the future capacity assessment to be performed under Task 5.8.

Deliverables:

- Maps showing projected future development locations including new development and potential redevelopment by parcel for 2025, 20-year, and 50-year planning horizons and up to two (2) additional planning horizons (PDF format)
- Future populations and flow projections tied to parcels
- Any future "pipelines" to represent flows from future development areas if necessary, to properly represent timing of flows

Task 5.3 – Assessment of Septic System Elimination

The Consultant will identify and map all parcels within the Sewershed that are currently served by septic systems based on geolocated electronic data provided by the County. The Consultant will attend one (1) meeting with the County's Groundwater Management Section to identify areas within the Sewershed where septic system elimination may be desired in the future. Future design flow determination strategies including flow projections will be developed for up to 1,100 septic systems to be connected to the public sewer. The future flow projections for this septic system elimination will be included in the future condition models developed under Task 5.2. Planning level cost estimates will be developed for the strategies to construct upgrades to existing sewer system infrastructure to accommodate the septic system elimination. These sewer system improvements will be included in the Capital Improvement Program to be developed under Task 6.6.

Deliverables:

- Maps of the parcels with septic systems and potential septic elimination areas (PDF format)
- Future design flow determination strategies including flow projections for the septic system elimination
- Planning level cost estimates for the upgrades to the existing sewer system infrastructure required for the septic system elimination

Task 5.4 – Phase 2 Field Investigations

Consultant will recommend and perform (upon authorization by the County) additional field investigations based on the more detailed model review including:

- Collecting manhole survey data for the expanded model or where additional conflicts are found between existing data sources. Up to fifty (50) additional manhole surveys will be performed. No confined space entry will be performed.
- Conducting pump station flow testing for four (4) pump stations to obtain accurate capacity representations in the model as well as wet well settings.
- Identification of debris levels will be completed using CCTV inspection and sonar inspection data as described in Tasks 3.4 and 3.8

Deliverables:

- Manhole survey data in electronic format or in County specified format
- Pump station drawdown testing results including comparison of actual operating conditions to original pump curves

Task 5.5 – Model Update Recommendations

Consultant will develop detailed recommendations for existing model updates including:

- Existing model representation of physical system including manhole survey results, new construction/rehabilitation/replacement, and debris as identified during the CCTV and sonar inspections described in Tasks 3.4 and 3.8
- New development
- Subcatchment delineations
- Dry weather flow representation
- RDII hydrology
- Model expansion
- Sensitivity analysis

Deliverables:

None. Work from this task will be documented in the Model Update and Calibration Report.

Task 5.6 – Update Physical Model Representation and Subcatchment Delineation

Consultant will update the current physical model based on the results of the gap analysis, GIS review, manhole surveys, CCTV/sonar inspections, pump station testing, recent development, modified subcatchment delineations, and recent system improvements.

Expansion of model networks will be initially done by importing County-provided GIS data for modeled sewer pipes and manholes into the InfoWorks framework, reviewing record drawings of applicable pump stations and force mains, and performing a QA/QC analysis on pipe/manhole connectivity and alignment. Data gaps will be populated using a combination of record drawings, field inspection data, and other data collected in prior tasks. Interpolation and extrapolation of inverts and/or rim elevations will be performed when no other reliable data sources exist. Subcatchment data for sewer service areas that are available in GIS will be used as a starting point for delineation of flow inputs in the model network. The larger subcatchments will be subdivided as required to achieve appropriate modeling resolution. Pump station operational information will be defined in the model for explicitly-modeled pumps and station piping, and configuration of diversion structures and SSO structures will also be defined.

Deliverables:

None. Work from this task will be documented in the Model Update and Calibration Report.

Task 5.7 – Model Calibration/Verification

The model will be configured to accurately represent both dry weather flow conditions as well as wet weather performance of the collection system. Dry weather flows will be developed based on a combination of flow metering data, water consumption data, and population data as appropriate. Wet weather flows will be developed using standard hydrologic parameters that represent the rainfall-dependent infiltration and inflow response of sewer systems. These parameters will be calibrated and verified as described below. Groundwater influences and/or tidal influences will be represented as observed through monitoring data.

Based on 2019-2020 flow and rainfall monitoring data, field testing, available water consumption data and other information, Consultant will perform dry and wet weather calibration for the model. Consultant will utilize the flow and rainfall monitoring data received from the County to perform dry and wet weather calibrations and verifications of the hydraulic models. Representative storm events of varying intensities and depths will be selected from the radar rainfall data set to be used for calibration and verification. A maximum of ten (10) wet weather events will be used for calibration and the remainder of the continuous monitoring period (up to 18 months of total data) for verification of the model. The calibration approach is to use a combination of fixed runoff and groundwater infiltration (GWI) model.

A sensitivity analysis including up to five (5) model parameters for one (1) storm event (from the monitoring period) at up to ten (10) monitoring locations will be performed to assess the relative impact of model parameter values on flow predictions. Graphs of the predicted storm flow hydrograph using the calibrated parameter value, a high value and low value will be prepared for

each instance.

The model will be calibrated by adjusting hydrologic and hydraulic parameters with the target to achieve the calibration/verification goals listed below. Model calibration accuracy and quality will be judged by industry guidelines, such as delineated in the Wastewater Planning User's Group Code of Practice for the Hydraulic Modelling of Sewer Systems (Nov. 2002). These guidelines establish the following calibration/verification goals for two out of three wet weather events:

- Dry weather peak flows within +10% and -10%
- Dry weather flow volumes within +10% and -10%
- Wet weather peak flows within +25% and -15%
- Wet weather flow volumes within +20% and -10%
- Wet weather peak depths within +1.6 feet and -0.3 feet
- Timing and shape of hydrographs are similar

Consultant will summarize the calibration/verification results by meter including calibration/verification statistics as well as summaries of calibration challenges, especially if the calibration/verification goals could not be met with reasonable effort.

Deliverables:

- Model Update and Calibration Report summarizing Tasks 5.1 through 5.7.
- InfoWorks ICM files for the revised current conditions model, 2025 model, 2040 model, 2070 model and up to two (2) additional planning horizon models

Task 5.8 – Baseline/Future Capacity Assessment

Consultant will use the calibrated and verified model to evaluate the sewer system's response to simulations of up to five (5) precipitation frequency events and also an extended period simulation using historical rainfall data under baseline (2020) and future conditions (2025, 2040, 2070 and up to two other planning horizons). Assessment of the existing precipitation frequency events will include the following:

- 2-year (24-hour),
- 10-year (24-hour),
- 20-year (24-hour),
- 2-year (6-hour),
- 10-year (6-hour) and
- Extended period simulation (EPS)

A sensitivity analysis will be performed on the precipitation frequency events. Changing rainfall patterns model science will be used to estimate the standard return frequency of the precipitation frequency events at a 50-year planning horizon. Comparison of the current precipitation frequency and the 2070 estimated precipitation frequency will be presented in tabular format. For a single return period and duration (i.e., 10-year, 6-hour precipitation frequency), Consultant

shall simulate the existing system's response to the IDF values for the current and projected future precipitation frequency events.

An extended period simulation will be performed following review of up to ten (10) years of rainfall data. The extended period simulation will be conducted using a "typical" year of rainfall.

The simulations will be performed for six scenarios, baseline 2020 (based on the time period for which monitoring data is collected) and future (growth scenario based on future flow projections, 2025, 2040, 2070 and up to two (2) other planning horizons). Future flow projections will be as developed under Task 5.2.

The ability of the wastewater collection system to convey baseline and future flows during both dry and wet weather (using the existing precipitation frequency events and the EPS) will be evaluated, including the systems' capability to convey buildout flows (50-year planning horizon). Locations of model-predicted SSOs, surcharging and capacity deficiencies will be identified. Predicted volumes of model-predicted SSOs at each location will be provided for each storm event. Pump station performance will also be evaluated. Tables and GIS maps depicting the performance of the collection system for each simulation (model-predicted SSOs, model-predicted surcharging, pipeline capacity deficiencies, pump station capacity deficiencies) will be developed. Results of the capacity assessment will be presented in a workshop with the County.

A sensitivity analysis of storm duration on predicted SSOs will be performed for up to two (2) of the precipitation frequency events (listed above) under the baseline scenario. Two (2) additional durations will be tested, one of which will be longer in duration than the storms listed above, and one of which will be shorter. A summary table of SSOs by precipitation frequency event will be developed.

Consultant will coordinate with the City of Baltimore and provide capacity assessment results at the City/County system boundaries to the City. Consultant will utilize the City's latest InfoWorks model as a boundary condition in this study.

Deliverables:

- Slides from Capacity Assessment workshop
- GIS files showing capacity results for each simulation
- Thematic maps in PDF format showing capacity assessment results for each precipitation frequency event and development condition (locations of SSOs and sewers that are surcharged, including extent of surcharge and type of surcharge; i.e., backwater induced or capacity related)
- Tables showing the length of sewers surcharged by diameter ranges
- Return period analysis: summary and comparison of surcharged and flooded manholes under various conditions
- Capacity Assessment Report, including an evaluation of the system's capability to convey flow

Task 5.9 – Define Levels of Service (LOS) Strategies

Consultant will work with the County to establish strategies for the level of service (LOS) definition and the planning objectives/strategies for the collection system. The LOS strategy is the triggers for improvements (unmet LOS for a selected precipitation frequency event) as well as the design targets for improvements (LOS achieved for a selected precipitation frequency event) in terms of a precipitation frequency and level threshold (overflow, extent of surcharge). The selection of the strategy for level of service will be determined in conjunction with the capacity assessment results. The Consultant will prepare for and lead a LOS workshop with the County to develop consensus moving forward for these strategies.

Deliverables:

- Slides and exhibits from LOS workshop (to be combined with the Capacity Assessment workshop)

TASK 6 – ASSET MANAGEMENT AND CAPITAL IMPROVEMENT PROGRAM DEVELOPMENT

The objective of this task is to develop risk scoring for all pipes within the sewershed by analyzing the structural, O&M and capacity assessment data and to create a prioritized capital improvement framework that addresses structural, O&M and capacity issues and strategies for modernizing the collection system.

Task 6.1 – Analysis of Existing Data for Asset Management Program

Consultant will review the data gathered under Tasks 2 through 5 for the following purposes:

- Establish pipe cohorts based on available data and experience
- Identify deterioration curves, end of useful life and remaining useful life for each cohort (using industry standards, supplemented by available age and line break/failure data)
- Identify collection system capacity-related deficiencies based on the simulations performed under Task 5
- Assess physical condition and capacity of each pipe segment using available data

PACP scoring of the pipes will not be performed as part of this task.

Task 6.2 – Risk Assessment

Consultant will develop consequence of failure (CoF), likelihood of failure (LoF) and overall risk scores (business risk exposure or BRE) for each pipe segment based on the data analyzed in Task 6.1. Additional field investigations will not be performed for this task. The development of the scoring criteria and BRE scoring will include a workshop with the County to develop

consensus on the initial scoring approach, as well as a second meeting to review the initial results and to make any necessary adjustments to the scoring framework:

- Consequence of Failure (CoF) Scoring – Develop CoF criteria, weighting and scoring for all sewer (gravity and force mains) pipes. Utilize GIS model-builder to develop CoF scores for each pipe asset based on accepted criteria. Apply the criteria to each pipe segment within GIS.

- Likelihood of Failure (LoF) Scoring - Develop (LoF) criteria, weighting and scoring for all sewer (gravity and force mains) pipes. Utilize GIS model-builder to develop LoF scores for each pipe asset based on accepted criteria. Apply the criteria to each pipe segment within GIS. The LoF scoring will incorporate available condition data and will include structural failure as well as capacity and blockage (O&M) failure risks.

- Business Risk Exposure (BRE) Scores – Develop a combined BRE score as a combination of the CoF and LoF. Assign BRE scores for each pipe segment. In addition, the Consultant will develop a risk matrix that indicates risk regions that will incorporate strategies depending on the combination of CoF and LoF. Every pipe asset will be assigned a corrective action option and priority for consideration and evaluation.

Task 6.3 – Develop Capacity Improvement Strategies

Consultant will develop and evaluate strategies for achieving the selected level of service at year 2025, 20-year and 50-year planning horizons and up to two other planning horizons, including preliminary construction cost estimates. Strategies may include an option to pump flows from the Jones Falls Sewershed elsewhere within the sanitary sewer system either permanently or during wet weather events only. The capacity impacts on another Sewershed when receiving flow from the Jones Fall Sewershed will be determined based on the existing hydraulic modeling and capacity assessments which have been developed for those Sewersheds.

The number of SSOs predicted to be reduced by implementation of strategies will be provided. The percentage of predicted SSO volume captured by implementing strategies will be provided.

Task 6.4 – Asset Renewal, Capacity Upgrade, and O&M Funding Assessment

The LoF, CoF, and BRE scores will be utilized to develop a preliminary Asset Renewal, Capacity Upgrade, and O&M Funding assessment that will provide strategies for annual renewal and replacement (R&R), capacity upgrades, and operation and maintenance (O&M) spending needs over the five planning horizons (year 2025, 20-year, 50-year, and up to two other planning horizons) to maintain a desired overall level of service/risk using current dollars. The R&R and capacity upgrades funding assessment will include assumptions for replacement versus rehabilitation as well as unit price costing using available local bidding information combined with other available costing data. The O&M funding assessment will include forecasting of cleaning and CCTV inspection needs. Consultant will work with the County to determine internal or external resource assumptions. CCTV inspection and cleaning needs will include

forecasting of inspection and cleaning frequencies by pipe to the extent practicable and will include reactive and preventive cleaning lengths. Consultant will meet with the County to develop consensus on cleaning and CCTV inspection needs assumptions to be used in the forecasting. Consultant will develop a list of equipment and staff needed to achieve the goals internally.

Task 6.5 – Near-Term Pipeline Renewal and Replacement, Capacity, and O&M Strategies

The risk assessment scores from Task 6.2 will be used to identify pipe segments that will require near-term improvements (next ten years), as well as priority cleaning and CCTV inspection. A list of segments requiring near-term improvements will be developed based on risk assessment and capacity deficiencies. An updated list of near-term pipeline renewal projects will be provided to the County. Costs for these projects will be developed based on unit costs from recent pipeline bids/projects in the area. It is assumed the County will provide the bid tabs from recent pipeline renewal projects. For priority cleaning and CCTV inspection, the Consultant will develop pipe runs (for larger trunk sewers) and pipe clusters (for more systematic basin-wide assessments) to be assessed over the next five years.

Deliverables:

- Asset Management Program Development Report summarizing the results of Tasks 6.1 through 6.4, including funding assessment and list of renewal/modernization projects and costs

Task 6.6 – Prioritized Capital Improvement Framework

Consultant will develop a prioritized capital improvement framework (CIF) for each planning horizon (up to five total) based on the results of the asset management program development and considering possible strategies that could be implemented.

Consultant will develop a project prioritization strategy with County input and develop a CIF framework from the list of strategies to achieve the target LOS at each planning horizon.

Consultant will identify and evaluate strategies for modernizing the collection system including real-time controls, permanent sensor networks, interceptor maintenance programs, and predictive maintenance.

A Power BI dashboard (see Task 7.3) will be utilized to present long-term risk profiles under varying funding scenarios and will include consideration for remaining useful life (RUL) in terms of structural, O&M and capacity perspectives. Pipe renewal and replacement costs and capacity upgrade costs will be based on available costing information and the use of current costing tools. The dashboard will include items such as the remaining useful life of each pipe segment, the risk scores, renewal and replacement costs, capacity upgrade costs, long-term projected strategies and CIF, etc. In addition, potential maintenance key performance indicators (KPIs), including inspections and service test results, will be included.

Deliverables:

- Detailed list of infrastructure needs.
- Detailed list of strategies.
- CIF will be included in the Comprehensive Report and Power BI Dashboard described in Task 7.

TASK 7 – SEWERSHED EVALUATION REPORT

The objective of this task is to provide a deliverable that identifies a roadmap forward for providing reliable sewer service in accordance with the County's long-term objectives for the Jones Falls Sewershed.

Task 7.1 – Draft Jones Falls Sewershed Comprehensive Evaluation Report

Consultant will develop a Draft Jones Falls Sewershed Comprehensive Evaluation Report that will discuss the comprehensive evaluation, including the data review and mapping, data gap analysis, additional fieldwork, flow/rainfall monitoring analysis, I/I analysis, model review and calibration, capacity assessment and strategies including asset management and capital improvement program development. GIS maps will be utilized to illustrate results of the various evaluation steps, including:

- Existing data review: problem areas, SSOs, basement backups, work orders, constraints/issues relative to condition, capacity and water quality
- Data gap analysis: missing/erroneous data and additional data needs
- Additional fieldwork: locations and results of fieldwork
- Interim I/I analysis results
- Future condition models: projected development for each planning horizon
- Capacity assessment results: model-predicted overflows and surcharging under various precipitation frequency events and an extended period simulation for each planning horizon
- Capacity and Renewal & Replacement improvements: for risk level at each planning horizon and best available current RUL estimates
- Asset management development: risk scores, Renewal & Replacement, capacity, and O&M recommendations

Consultant will summarize and provide detailed lists of infrastructure needs and strategies to address capacity, structural and O&M deficiencies within the sewershed. A prioritized capital improvement program for year 2025, 20-year and 50-year planning horizons and up to two additional planning horizons based upon possible strategies implemented will be presented, including planning-level construction cost estimates and an implementation schedule.

The Draft Report will also discuss Best Management Practices (i.e., Interceptor Maintenance Program) for on-going proactive maintenance of the small diameter and large diameter sewer mains within the Sewershed.

Deliverables:

- Draft Report: 2 hard copies and 1 electronic PDF copy

Task 7.2 – Final Jones Falls Sewershed Comprehensive Evaluation Report

Consultant will prepare a formal Response to Comments table addressing the County's comments on the Draft Report. Consultant will incorporate the comments into a Final Jones Falls Comprehensive Sewershed Evaluation and Remedial Measures Report.

Deliverables:

- Response to Comments table (PDF format)
- Final Report: 2 hard copies and 1 electronic PDF copy
- All InfoWorks model files
- Power BI dashboard (see Task 7.3)

Task 7.3 – Power BI Dashboard

Power BI is a data analytics software that uses dashboard pages to visualize data and assist in communicating results to technical and non-technical stakeholders. Consultant will develop an interactive Power BI dashboard to illustrate the following project tasks: data review and mapping, I/I analysis, future flow projections, capacity assessment, asset management, and capital improvement program. The thematic maps produced for the comprehensive evaluation report (Task 7.1) will be utilized in the framework for the dashboard. Power BI will provide interactive maps, tables and graphs to summarize, compare and analyze the results of this sewershed evaluation. The dashboard will allow the County to view the relationships between the various improvement projects and understand how development "triggers" impact the improvements. The Power BI dashboard will be customized to communicate findings/recommendations between the various County groups or with external stakeholders. Up to fifteen (15) dashboard pages will be developed.

TASK 8 – PUBLIC OUTREACH

Task 8.1 – Community Meetings

Consultant will prepare presentations and handouts for meetings/workshops with the general public or community/environmental groups. Consultant will attend up to five (5) meetings/workshops.

Deliverables:

- Exhibits and presentation materials for community meetings

PROJECT SCHEDULE

The Consultant is prepared to start this work immediately upon authorization/issuance of a purchase order. A proposed project milestone schedule is provided in Attachment A.

Baltimore County Department of Public Works
On-Call Engineering Services for Pumping Stations
Project No. 2015-03

Task 004 – Jones Falls Sewershed Comprehensive Evaluation

January 23, 2020

In accordance with Baltimore County's request under the On-Call Engineering Services for Pumping Stations Agreement, Project No. 2015-03, Hazen and Sawyer is pleased to submit this Scope of Services and Fee Proposal for the Jones Falls Sewershed Comprehensive Evaluation. The proposed Scope of Services is in accordance with the executed agreement with Baltimore County dated February 23, 2016 and amended on May 24, 2019.

BACKGROUND

The County is requesting a comprehensive evaluation of the Jones Fall Sewershed to assess the near-term and long-term needs of the sanitary sewer system, including:

- Future capacity needs driven by development, re-development and/or future connection of unserved areas of the sewershed
- Strategies needed to further protect the environment from potential sanitary sewer overflows (SSOs)
- Best Management Practices for continued proactive operation and maintenance of the sanitary sewer system
- Strategies to address vulnerabilities and improve long-term sustainability and resiliency

The Jones Falls Sewershed includes approximately 1,124,000 linear feet (LF) of gravity sewers ranging from 6- to 42-inches in diameter and approximately 6,200 manholes or other sewer structures. Data and reporting from previous studies will be provided to Hazen as part of this comprehensive needs assessment. Hazen and Sawyer will complete an evaluation addressing the capacity, operations and maintenance (O&M), and structural needs of the sewer system and develop a comprehensive plan and strategies to address system deficiencies at year 2025, 20-year, and 50-year planning horizons and two additional planning horizons determined by the County. This work will be detailed in a comprehensive sewershed evaluation report that will provide a flexible roadmap enabling the County to develop informed, asset-based, risk-based, and prioritized Capital Improvement Plan (CIP) budgets for near-term and long-term system improvements and strategies.

GENERAL ASSUMPTIONS

For the purposes of this Task Order, the following assumptions are made:

- All available requested data and reports will be provided to the Consultant by the County in a timely manner.
- Flow and rainfall monitoring data collected by others after the notice to proceed for this task will be provided in electronic time series format to the Consultant by the County on a monthly basis for the duration of the monitoring period. Raw data will be supplied within one week of the end of the month and QA/QC'd final data will be supplied within four weeks of the end of the month.
- No lidar inspection will be performed.
- Recent CCTV and manhole inspection data is available for most of the Sewershed.
- Up to 50,000 LF of CCTV inspections are included based on an assumed average production rate of 450 linear feet (LF) per day for CCTV inspection and light cleaning.
- Up to 15,000 LF of heavy cleaning is included based on an assumed average production rate of 300 LF per day for heavy cleaning.
- Up to 20,000 LF of combination sonar/CCTV inspection is included based on an assumed average production rate of 1,000 LF per day for sonar/CCTV inspection.
- Up to 100 MACP Level 1 manhole inspections are included based on an assumed average production rate of 10 manholes per day.
- Up to 50 MACP Level 2 manhole inspections are included based on an assumed average production rate of 8 manholes per day.
- Up to 150 manhole surveys are included.
- The County is conducting a Performance Assessment, including I/I analysis, associated with the recent sewer improvements within the Sewershed. However, this assessment will not be completed for another eighteen (18) or more months. The County will provide data as it becomes available during this Task, but Hazen will proceed without this information.
- Scope of Services does not include any design work. Conceptual locations of capacity improvements and strategies will be determined.
- Scope is limited to review of existing water quality data and reports. No water quality sampling, testing or fieldwork will be performed.
- For the future capacity assessment, the County will provide direction on targeted areas and timing for extending sewer service to properties with on-site septic systems. Planning level costs will be developed only for upgrades to the existing system as required to accommodate additional flows from properties with septic systems. Evaluation of sizing, location and costs of new infrastructure extensions to serve septic system areas is not included.

SCOPE OF SERVICES

The scope of services is divided into the following tasks:

- Task 1 – Project Administration
- Task 2 – Gather and Review Existing Data
- Task 3 – System Characterization and Data Gap Analysis
- Task 4 – Flow/Rainfall Monitoring Data Review and Interim I/I Analysis
- Task 5 – Hydraulic Model Refinement, Calibration and Verification
- Task 6 – Asset Management and Capital Improvement Program Development
- Task 7 – Sewershed Evaluation Reports
- Task 8 – Public Outreach

TASK 1 – PROJECT ADMINISTRATION

Task 1.1 – Project Management

The project team for this Task Order consists of the Consultant and its subconsultants, Savin Engineers, P.C., PEER Consultants, P.C., C.C. Johnson & Malhorta, P.C. (CCJM) and Mobile Dredging and Video Pipe (MDVP). The Consultant will coordinate the overall work of the project to include project management, subconsultant coordination and MBE/WBE participation management.

The Consultant will schedule, manage and coordinate the efforts of its subconsultants. The Consultant will be responsible for quality control of subconsultant's deliverables.

Deliverables:

- Monthly Invoices (one original invoice with copy of all backup paperwork; two copies of the invoice only)

Task 1.2 – Kick-off Meeting

Before the start of the project, a kick-off meeting will be scheduled to discuss the project goals, communication protocol, schedule, deliverables and existing data acquisition. Participants in this meeting are expected to include the Consultant project manager, the Consultant's technical expert, and the County's project manager. Consultant will submit an electronic format agenda in advance of the meeting, prepare the meeting minutes, and submit the minutes to all attendees in electronic format within five (5) business days after the meeting.

Deliverables:

- Draft and Final Meeting Agenda (PDF format)
- Draft and Final Meeting Minutes (PDF format)

Task 1.3 – Task Schedule and Progress Reports

Consultant will prepare a task-based schedule for the performance of the work under this Task Order. The baseline schedule will be submitted for approval and will outline the major tasks to be completed under this Task Order. The schedule will identify projected submittal dates for the Draft and Final Reports discussed in Task 7 of this proposal. The Consultant will assess the project progress and report on the progress on a monthly basis. Monthly progress reports will detail work activities completed during the reporting period, work activities planned for the next period, budget status, schedule status and an issue log. Consultant will update monthly, or as appropriate, the schedule for performing the services.

Deliverables:

- Draft and Final Baseline Schedule (PDF format)
- Monthly Updated Schedule (PDF format)
- Monthly Progress Reports with look-ahead (PDF format)

Task 1.4 – Additional Meetings

Additional meetings will be scheduled throughout the course of the project as needed, at the request of the County or the Consultant, to meet Task Order objectives. A total of eighteen (18) meetings, including the project kick-off, are assumed for this scope.

The following meetings with Baltimore County are anticipated:

- Task 1 – One (1) project kickoff meeting (see Task 1.2 above)
- Task 3 – One (1) data review/mapping meeting to discuss focus areas
- Task 3 – One (1) meeting to discuss data gap analysis and fieldwork recommendations
- Task 5 – One (1) meeting with the County's planning group
- Task 5 – Five (5) meetings with developers and large institutions to discuss future development projections
- Task 5 – One (1) meeting with the County's Groundwater Management Section to discuss septic systems
- Task 5 – One (1) meeting to review model update recommendations
- Task 5 – One (1) meeting to review capacity assessment results and define level of service
- Task 6 – One (1) meeting to develop initial scoring approach for risk assessment
- Task 6 – One (1) meeting to review the initial results of the risk assessment and adjust scoring criteria as needed
- Task 6 – One (1) meeting to review cleaning/CCTV needs for O&M funding assessment

- Task 6 – One (1) meeting to review the capital improvement program recommendations
- Task 7 – One (1) meeting to review the County's comments on Draft Report
- Task 7 – One (1) meeting to review the Power BI dashboard

Consultant will submit an electronic format agenda in advance of each meeting, prepare the meeting minutes, and submit the minutes to all attendees in electronic format within five (5) business days after the meeting.

Deliverables:

- Draft and Final Meeting Agendas for each meeting (PDF format)
- Draft and Final Meeting Minutes for each meeting (PDF format)

Task 1.5 – QA/QC

Quality assurance/quality control procedures will be employed to maintain quality of all deliverables. These procedures include the use of quality control reviews of engineering assumptions and calculations, quality assurance audits of the workflow processes, and other measures necessary to provide a deliverable of a quality meeting industry standards. A quality control review will be conducted on each submittal prior to delivery to the County. These reviews apply to all modeling databases, technical memoranda, or reports generated for this Task Order. Members of in-house staff not associated with the Task Order will be selected to perform these reviews.

TASK 2 – GATHER AND REVIEW EXISTING DATA

Consultant will gather and review existing data for the Jones Falls Sewershed. All data will be provided by Baltimore County for the Consultant's review. A formal data request will be submitted prior to the kick-off meeting. The Consultant anticipates the following data, at a minimum, will be requested and reviewed for completeness and fitness for the project's purpose:

- Jones Falls Model Development and Calibration Report
- Jones Falls Long Term Capacity/Peak Flow Management Evaluation (LTC/PFME) Report
- Jones Falls Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan
- Historical sanitary sewer overflow (SSO) data including cause if available in electronic format by asset ID or property address
- Historical basement backup data where capacity or blockage is the cause in electronic format by property address
- Historical work order data including cleaning, repairs and complaint calls in electronic format by asset ID or property address
- Historical smoke and dye testing results in electronic format
- Frequent preventative maintenance cleaning areas and other known trouble spots
- Current Baltimore County GIS data including sewer assets, road centerline, pavement, railroads, sub-basin delineations, parcels, buildings, critical facilities, zoning, land

use/planning, hydrology features, soil types, and flow meter and rain gauge locations (current and previous)

- Available land use plans, including the Baltimore County Master Plan 2020
- Current population characteristics
- Population and employment projections, including the latest Baltimore Metropolitan Council of Government (BMCOG) projections
- Flow projections, as gathered by the County, from large institutions and developments within the sewershed (i.e., GBMC, Sheppard Pratt, St. Joseph Medical Center, Towson University, Towson Row, etc.). Hazen will support this data collection effort as described under Task 5.2.
- Most recent copy of the InfoWorks model files
- As-built drawings of the sewer collection system, pump stations and force mains
- Available records on work done as part of the implementation of the SRRR Plan including record drawings, corrective action tracking spreadsheet or other electronic format data
- Drawings for collection system improvements that are in design or construction or are installed but not currently in the GIS
- List of planned improvements, including any local relief sewers required for future planned development
- Record drawings for any previous collection system improvements in the Sewershed, including sewer rehabilitation
- Available flow and rainfall monitoring data from previous and current monitoring efforts, including data for areas of the system where corrective actions were completed (post-construction monitoring). Flow meter installation and maintenance records will also be provided.
- Report on performance assessment of rehabilitation projects which will be completed following the current flow monitoring program (report to be prepared by others)
- Most recent CCTV inspection data including videos and PACP-compliant databases
- Most recent manhole inspection data including photos and MACP-compliant databases
- Water meter consumption data for the last twelve (12) months in electronic format by month. Geocoded locations preferred.
- Level sensor data
- Pump station SCADA data
- Pump station information including pump curves, wet well set points, and record drawings
- Records of on-site septic systems located within the Sewershed from the Groundwater Management section. GIS features preferable if available but electronic address records are also acceptable.
- Data on condition of existing septic systems within the Sewershed as well as any water quality monitoring data in the vicinity of pertinent septic systems
- Records of new tap connections and/or subdivision plans for new development and re-development areas since the last comprehensive flow monitoring period in 2008, as available in electronic format
- Available historical water quality data and reports, including the NPDES Annual Report, prepared by Baltimore County's Department of Environmental Protection and

Sustainability or other entities. Consultant will review water quality data in conjunction with rainfall data, SSO data, and GIS mapping of on-site septic system locations and identify any correlations between the datasets.

Deliverables:

- Formal data request in an email prior to kick-off meeting
- List of data provided by Baltimore County
- List of data discrepancies or major data gaps after data review

TASK 3 – SYSTEM CHARACTERIZATION AND DATA GAP ANALYSIS

The objective of this task is to understand and map the locations of existing problems such as known O&M issues, SSOs, and pipe failures to identify focus areas and additional flow, level and rainfall monitoring needs. Through the data gap analysis, the Consultant will understand the extent and relative confidence in asset attribute data to be incorporated into the model. The result is a prioritized field data collection plan.

Consultant will map the data collected under Task 2 (to the extent the data can be geolocated) and identify data gaps/needs for the hydraulic modeling and areas of focus for further evaluation. All field work performed under this task will be provided to the County in a format to import into the County's Computerized Maintenance Management System (CMMS) software, which the County is planning to roll out in January 2020. Consultant will work with the County to confirm data standards necessary to facilitate import into the CMMS and GIS.

Task 3.1 – Map Existing Data and Identify Problem Areas

Consultant will map the existing data using ArcGIS Pro including:

- SSOs
- Basement backups
- Frequent cleaning areas
- Work orders, differentiating between pre- and post-rehabilitation work orders in areas where comprehensive rehabilitation has been completed
- Pipeline Assessment Certification Program (PACP) inspection data
- Manhole Assessment Certification Program (MACP) inspection data
- Rehabilitation data (previous projects, projects in planning/design/construction)
- Capacity improvement projects (in planning/design/construction)
- Flow meter, level sensor and rain gauge locations and meter basin boundaries and characteristics
- Rehabilitation and replacement recommendations from the SRRR Plan, including the installation dates of these improvements (construction work is nearing completion)
- Capacity deficiencies identified from previous modeling/study efforts
- New taps since the last model was developed

- On-site septic system locations

Consultant will review the mapped data to identify the following areas of focus:

- Problem areas for O&M issues
- Areas with known or suspected capacity constraints
- Areas with structural condition concerns

Special attention will be paid to dates. County will provide dates when improvements were made within the Sewershed, so that the data can be analyzed by way of pre- and post-repair. The County has indicated that repair and rehabilitation work from the SRRR Plan (largely structural repairs) and some isolated relief sewer work within the Sewershed is nearly complete.

Deliverables:

- Maps of the existing data and preliminary areas of focus and suggested additional monitoring locations will be presented at a progress meeting with Baltimore County and provided to the County in electronic PDF and hard copy format.

Task 3.2 – Gap Analysis and Additional Field Data Collection Recommendations

Consultant will conduct a gap analysis to identify missing values, errors, and inconsistencies in asset attributes that will impact the model. Gap analysis will be performed using the data management tools available in InfoWorks CS and GIS. Automated inference tools within InfoWorks CS and GIS will be utilized to identify questionable data such as:

- Reverse grade slopes
- Missing attribute data
- Larger diameter pipes upstream of smaller diameter pipes
- Orphan pipes or manholes
- Incorrect spatial data (e.g., a manhole location inconsistent with nearby assets)
- Incorrect elevation data (e.g. manhole rim elevations conflicting with adjacent terrain)

This will include detailed analysis of data sources for pipes in the model including GIS, record drawings, and CCTV inspections. Consultant will apply engineering judgment to determine locations where assumptions and interpolations will suffice for model calibration. Manhole surveys will be performed as needed under Task 3.3.

Consultant will also utilize the mapped data to identify the following:

- Assets without inspection data
- Assets in problem areas that do not have recent inspection data
- Any locations where additional flow or level monitoring is needed for model calibration or model expansion, or to further investigate problem areas (see Task 4.1)
- Areas where acoustic inspections or other investigations should be performed to ascertain potential blockages that could inform the model calibration and capacity assessments

- Exposed assets adjacent to or crossing streams where external asset condition should be verified

Consultant will recommend additional field work to address critical data gaps. The base scope assumes:

- Up to 100 manhole surveys to be completed by subconsultant CCJM
- Up to 50,000 LF of CCTV inspections to be completed by subconsultant Savin Engineers
- Up to 100 Level 1 and 50 Level 2 manhole inspections to be completed by subconsultant Savin Engineers
- Up to 15 additional flow meters (including for areas of model expansion) – flow monitoring to be performed by others under a separate task. The County has two (2) contractors that can install these flow meters once final locations are selected.
- Up to 20 level monitors – level monitoring to be performed by others under a separate task. The County has two (2) contractors that can install these level monitors once final locations are selected.
- Up to 200 acoustic inspections to be completed by subconsultant MDVP
- Up to 15,000 LF of creek walks and exposed asset assessments to be completed by Consultant

Consultant will develop Survey 123 Forms for various field data collection efforts. These forms will be tailored to collect necessary data by asset type.

The additional fieldwork to be performed by the Consultant is described in Tasks 3.3 through 3.7.

Deliverables:

- Maps of the additional fieldwork recommendations will be presented at a progress meeting with Baltimore County and provided to the County in electronic PDF and hard copy format.
- GIS or other electronic format data identifying specific assets to be included in the additional field investigation.

Task 3.3 – Manhole Surveys

The base scope assumes up to one hundred (100) manhole surveys will be conducted. Visual observations will be made concerning the pipe connectivity and system configuration, and rim-to-invert depth measurements will be taken for all incoming and outgoing pipes. The Consultant will also collect horizontal and vertical location data (x and y location points and rim elevation) for each manhole. No confined-space entry will be performed. Where unmapped sewer lines and manholes are found or other corrections to the existing GIS maps are needed based on field conditions, map corrections will be made and submitted to the County in ArcGIS shapefile format or in any specified format meeting the County requirements for GIS changes.

Deliverables

- Field survey data in electronic format or in County specified format
- GIS shapefile for map corrections

Task 3.4 – CCTV Inspections

Consultant will conduct closed-circuit television (CCTV) inspections in accordance with Baltimore County's SRRR Guidelines. The base scope assumes up to 50,000 linear feet (LF) of gravity sewer mains ranging from 8 to 42 inches in diameter will be inspected. No confined space entry will be performed. Traffic control by a subconsultant to Savin Engineers is assumed for up to seven (7) days.

CCTV Inspection Requirements

- CCTV inspection will proceed after a single light cleaning pass or prior to cleaning as long as the camera can make it through the pipe. After the CCTV inspection, if the pipe is not a minimum of 95 percent clear, up to two (2) additional light cleaning passes will be performed in accordance with NASSCO (National Association of Sewer Service Companies) standards.
- Heavy cleaning (consisting of more than three passes with the hydraulic cleaner, root cutting and/or grease cutting) is included in this scope for up to 15,000 LF of gravity sewer mains ranging from 8 to 30 inches in diameter.
- All CCTV inspections will be performed in accordance with the NASSCO PACP standards.
- All inspection records will be provided in a PACP-compliant database with inspection fields populated.
- Inspection videos will be recorded in MPEG1 format and will follow the proper naming convention as set forth in the Baltimore County SRRR Guidelines.
- New manholes will be reported to the County.

Reverse Inspection Setups

- If the upstream and downstream manholes are inaccessible due to private property, a CCTV inspection/reverse inspection will be attempted from the nearest upstream or downstream manholes located in the public right-of-way.

Deliverables

- PACP-compliant CCTV inspection database, logs, photos and videos
- GIS shapefiles of pipe defects (point features) and pipe ratings (pipe features)
- Identification of debris levels to be input into the hydraulic model

Task 3.5 – Manhole Inspections

Consultant will conduct manhole inspections in accordance with NASSCO MACP standards.

The base scope assumes up to 100 MACP Level 1 and up to 50 MACP Level 2 manhole inspections will be performed. No confined space entry will be performed for Level 1 inspections. Consultant will work with the County to identify which optional fields to include in the Level 1 inspections, if any.

Manhole Inspection Requirements

- All inspection records will be provided in an MACP-compliant database with inspection fields populated.
- The inspections will include electronic images of the surface, casting and chimney, barrel and invert.
- Defects will be identified, and active infiltration quantified in accordance with the NASSCO MACP standards for Level 2 inspections.
- New and/or buried manholes will be reported to the County.
- Consultant is not responsible for frame or cover replacement or for raising manhole cover to grade.
- Consultant will notify the County of all manholes with signs of surcharge identified during the field inspection work.

Could Not Locate / Could Not Access (CNL/CNA) Manholes

- Consultant will perform due diligence when attempting to locate manholes. A list of CNL/CNA manholes will be provided to the County after due diligence has been performed without success.
- Consultant will make a minimum of two separate inspection attempts at different times before designating a manhole as CNA due to private property, parked car or heavy traffic.

Deliverables

Consultant will prepare and submit the following to the County:

- MACP-compliant manhole inspection database and photos in electronic format
- GIS shapefiles of manhole defects and manhole ratings

Task 3.6 – Acoustic Inspection

Consultant will conduct up to 200 acoustic inspections of sewer mains ranging from 8 to 12 inches in diameter using InfoSense's SL-RAT technology to inform potential for blockage. Acoustic inspections will be performed in O&M problem areas as identified in Task 3.1. It is assumed that 140 inspections will be on-road and 60 inspections will be off-road. Traffic control is limited to signs and cones (no flagmen or arrow boards). No flow control will be provided, and no confined space entry will be performed.

In areas where acoustic inspection scores pipes below seven (7), a follow-up PACP-compliant CCTV inspection will be conducted to ascertain the nature of the blockage/debris and to provide a record that some level of blockage was found. Recommendations for follow-up cleaning will

be provided.

Cleaning and subsequent CCTV inspection of the cleaned pipe are not included in the scope. Post-cleaning CCTV inspection data, provided by the County, will be reviewed to confirm results.

Deliverables

Consultant will prepare and submit the following to the County:

- Electronic results of acoustic survey scores in Excel and/or GIS format
- PACP-compliant CCTV inspection database, logs, photos and videos of any CCTV inspections performed
- GIS files of pipe defects (point features) and pipe ratings (pipe features)

Task 3.7 – Creek Walks/Exposed Asset Assessments

Consultant will perform creek walks and exposed asset assessments for up to 15,000 LF of sewer mains located adjacent to or crossing streams. Consultant will visually assess the exterior condition of exposed sewers and manholes. The general condition of the streambanks in these areas will be recorded. Survey 123 forms will be developed and implemented as part of this effort.

Deliverables

- Survey 123 export of field data including photos and other data
- PDF field reports for each asset

Task 3.8 – Sonar/CCTV Inspections

Consultant will conduct up to 20,000 LF of sonar/CCTV inspections of sewer mains ranging from 30 to 42 inches in diameter. Sonar/CCTV inspections will be performed in O&M problem areas as identified in Task 3.1. No flow control will be provided, and no confined space entry will be performed.

Deliverables

Consultant will prepare and submit the following to the County:

- Electronic results of the sonar inspections
- PACP-compliant CCTV inspection database, logs, photos and videos
- Identification of debris levels to be input into the hydraulic model
- GIS files of pipe defects (point features) and pipe ratings (pipe features)

Task 3.9 – Summarize Field Data

Consultant will summarize field data collected under Tasks 3.3 through 3.7 and will utilize the data as needed to refine and calibrate the collection system model. Consultant will develop rehabilitation and other "next-action" recommendations as necessary based on the inspection data. Field data results and recommendations will be incorporated into the Asset Management Program Development in Task 6.

TASK 4 – FLOW/RAINFALL MONITORING DATA REVIEW AND INTERIM I/I ANALYSIS

The objective of this task is to review and analyze the flow and rainfall monitoring data collected under a separate task order to support the model calibration and determine infiltration/inflow reduction opportunity priorities.

Task 4.1 – Flow, Level and Rainfall Monitoring Data Review

Consultant will review temporary flow and rainfall monitoring locations (installed/maintained by others) and provide feedback on the adequacy of the locations for hydraulic modeling purposes (and to support model expansion, and characterization of the system with respect to any observed SSO/O&M issues that would affect system performance). Consultant will identify future needs for flow monitoring. Since the data is collected, screened and processed by others, a QA/QC review of the flow monitoring data set will be conducted by the Consultant to assess its sufficiency for use in model calibration and verification as well as I/I analyses. It is assumed that up to twelve (12) months of data from up to forty-five (45) flow meter sites will be reviewed and analyzed. Data from up to fifteen (15) additional flow meter sites installed based on the Consultant's recommendations will be reviewed and analyzed for up to twelve (12) months. Consultant will review and analyze rain gauge and radar rainfall data for the flow monitoring time period. Consultant will review and analyze level sensor data for up to twenty (20) locations. Review and analysis will include flow meter volume balances as applicable.

Task 4.2 – Flow Disaggregation and Rainfall Derived Infiltration/Inflow (RDII) Evaluation

Consultant will disaggregate data from the flow meters into:

- Base sanitary flow (weekday, weekend)
- Base groundwater infiltration (GWI) including normalized GWI such as GPD/ft/in
- Seasonal RDII metrics (e.g., RTK) for each meter basin including volumes and R-values representing fast, medium and slow response.

Consultant will summarize RDII characteristics for each meter basin in tabular format and thematically map using GIS.

Deliverables:

- Tables and maps of RDII characteristics (PDF format)

TASK 5 – HYDRAULIC MODEL REFINEMENT AND CALIBRATION

The objectives of this task are to refine and calibrate the existing model so that it can be used as a tool to assess current capacity for certain levels of service, to identify future capacity constraints from new growth and redevelopment, and to develop and size improvement strategies to address capacity issues.

Task 5.1 – Existing Model Review

Consultant will review the existing model for fitness for purpose by:

- Reviewing model extents and making recommendations for refinements/expansion based on previous tasks. For the purposes of this proposal, it is assumed that the model will be expanded to include all 8-inch sewers. Refinements/expansion will be completed under Task 5.6.
- Performing wet and dry weather existing model verification with new flow and rainfall data
- Reviewing pump station and force main representations and output relative to available data
- Comparing current GIS and corrective action records to model input
- Reviewing model subcatchment representation

Deliverables:

- Summary of recommended additional field data collection in GIS or other electronic format as well as an overview of model adjustments needed as a result of the verification exercise.

Task 5.2 – Develop Future Condition Models

Consultant will develop future flow projections for near term (2025), 20-year and 50-year planning horizons and up to two (2) additional planning horizons in the event that project phasing improvement strategies might be implemented. The 50-year planning analysis will include an assessment of build-out conditions, with the assumption that any available land within the County's service boundaries for the Sewershed is developed in accordance with its current zoning. County will define the available, developable land within the Sewershed. The development of future condition models for these planning horizons will include the following:

- Review of available land use plans
- Attending one (1) meeting with applicable planning groups/agencies within Baltimore County to discuss projected future development and development timing

- Attending up to five (5) meetings with large institutions and commercial developments to discuss projected future development and development timing (e.g., GBMC, St. Joseph Medical Center, Sheppard Pratt, Towson University, Towson Row)
- Review of water consumption data in combination with dry weather flow meter data to assess unit dry weather flow variability throughout the sanitary sewer system. The assessment will involve looking at unit dry weather flows based on development type, development age, industry type, commercial type, etc. and will be used to "truth check" flow data estimates.
- Review of population and employment projections

The Consultant will develop future flow parameters such as unit dry weather flows for various land uses on a per acre basis. Consultant will develop future wet weather flow parameters as applicable. Infill will be handled differently than new green field development. Future RDII parameters will be developed for new development where new pipes will be built while RDII parameters from the calibrated model will be used for infill areas. Consultant will delineate future "pipelines" to represent the connection of future flows to the existing pipe network as necessary to properly represent timing of flows. In some cases, future subcatchments will be connected directly to the nearest existing pipe.

Consultant will develop thematic mapping of development conditions for near term (2025), 20-year and 50-year planning horizons and up to two (2) additional planning horizons. These future flow projections will be utilized in the future capacity assessment to be performed under Task 5.8.

Deliverables:

- Maps showing projected future development locations including new development and potential redevelopment by parcel for 2025, 20-year, and 50-year planning horizons and up to two (2) additional planning horizons (PDF format)
- Future populations and flow projections tied to parcels
- Any future "pipelines" to represent flows from future development areas if necessary, to properly represent timing of flows

Task 5.3 – Assessment of Septic System Elimination

The Consultant will identify and map all parcels within the Sewershed that are currently served by septic systems based on geolocated electronic data provided by the County. The Consultant will attend one (1) meeting with the County's Groundwater Management Section to identify areas within the Sewershed where septic system elimination may be desired in the future. Future flow projections will be developed for up to 1,100 septic systems to be connected to the public sewer. The future flow projections for this septic system elimination will be included in the future condition models developed under Task 5.2. Planning level cost estimates will be developed for the strategies to construct upgrades to existing sewer system infrastructure to accommodate the septic system elimination. These sewer system improvements will be included in the Capital Improvement Program to be developed under Task 6.6.

Deliverables:

- Maps of the parcels with septic systems and potential septic elimination areas (PDF format)
- Future flow projections for the septic system elimination
- Planning level cost estimates for the upgrades to the existing sewer system infrastructure required for the septic system elimination

Task 5.4 – Phase 2 Field Investigations

Consultant will recommend and perform (upon authorization by the County) additional field investigations based on the more detailed model review including:

- Collecting manhole survey data for the expanded model or where additional conflicts are found between existing data sources. Up to fifty (50) additional manhole surveys will be performed. No confined space entry will be performed.
- Conducting pump station flow testing for four (4) pump stations to obtain accurate capacity representations in the model as well as wet well settings.
- Identification of debris levels will be completed using CCTV inspection and sonar inspection data as described in Tasks 3.4 and 3.8

Deliverables:

- Manhole survey data in electronic format or in County specified format
- Pump station drawdown testing results including comparison of actual operating conditions to original pump curves

Task 5.5 – Model Update Recommendations

Consultant will develop detailed recommendations for existing model updates including:

- Existing model representation of physical system including manhole survey results, new construction/rehabilitation/replacement, and debris as identified during the CCTV and sonar inspections described in Tasks 3.4 and 3.8
- New development
- Subcatchment delineations
- Dry weather flow representation
- RDII hydrology
- Model expansion

Deliverables:

None. Work from this task will be documented in the Model Update and Calibration Report.

Task 5.6 – Update Physical Model Representation and Subcatchment Delineation

Consultant will update the current physical model based on the results of the gap analysis, GIS review, manhole surveys, CCTV/sonar inspections, pump station testing, recent development, modified subcatchment delineations, and recent system improvements.

Expansion of model networks will be initially done by importing County-provided GIS data for modeled sewer pipes and manholes into the InfoWorks framework, reviewing record drawings of applicable pump stations and force mains, and performing a QA/QC analysis on pipe/manhole connectivity and alignment. Data gaps will be populated using a combination of record drawings, field inspection data, and other data collected in prior tasks. Interpolation and extrapolation of inverts and/or rim elevations will be performed when no other reliable data sources exist. Subcatchment data for sewer service areas that are available in GIS will be used as a starting point for delineation of flow inputs in the model network. The larger subcatchments will be subdivided as required to achieve appropriate modeling resolution. Pump station operational information will be defined in the model for explicitly-modeled pumps and station piping, and configuration of diversion structures and SSO structures will also be defined.

Deliverables:

None. Work from this task will be documented in the Model Update and Calibration Report.

Task 5.7 – Model Calibration/Verification

The model will be configured to accurately represent both dry weather flow conditions as well as wet weather performance of the collection system. Dry weather flows will be developed based on a combination of flow metering data, water consumption data, and population data as appropriate. Wet weather flows will be developed using standard hydrologic parameters that represent the rainfall-dependent infiltration and inflow response of sewer systems. These parameters will be calibrated and verified as described below. Groundwater influences and/or tidal influences will be represented as observed through monitoring data.

Based on 2019-2020 flow and rainfall monitoring data, field testing, available water consumption data and other information, Consultant will perform dry and wet weather calibration for the model. Consultant will utilize the flow and rainfall monitoring data received from the County to perform dry and wet weather calibrations and verifications of the hydraulic models. Representative storm events of varying intensities and depths will be selected from the radar rainfall data set to be used for calibration and verification. A maximum of ten (10) wet weather events will be used for calibration and the remainder of the continuous monitoring period (up to 18 months of total data) for verification of the model. The calibration approach is to use a combination of fixed runoff and groundwater infiltration (GWI) model.

The model will be calibrated by adjusting hydrologic and hydraulic parameters with the target to achieve the calibration/verification goals listed below. Model calibration accuracy and quality will be judged by industry guidelines, such as delineated in the Wastewater Planning User's Group Code of Practice for the Hydraulic Modelling of Sewer Systems (Nov. 2002). These

guidelines establish the following calibration/verification goals for two out of three wet weather events:

- Dry weather peak flows within +10% and -10%
- Dry weather flow volumes within +10% and -10%
- Wet weather peak flows within +25% and -15%
- Wet weather flow volumes within +20% and -10%
- Wet weather peak depths within +1.6 feet and -0.3 feet
- Timing and shape of hydrographs are similar

Consultant will summarize the calibration/verification results by meter including calibration/verification statistics as well as summaries of calibration challenges, especially if the calibration/verification goals could not be met with reasonable effort.

Deliverables:

- Model Update and Calibration Report summarizing Tasks 5.1 through 5.7.
- InfoWorks ICM files for the revised current conditions model, 2025 model, 2040 model, 2070 model and up to two (2) additional planning horizon models

Task 5.8 – Baseline/Future Capacity Assessment

Consultant will use the calibrated and verified model to simulate up to five (5) design storm events and an extended period simulation using historical rainfall data and analyze the collection system under baseline (2020) and future conditions (2025, 2040, 2070 and up to two other planning horizons). Potential design storms include the following standard County events:

- 2-year (24-hour),
- 10-year (24-hour),
- 20-year (24-hour),
- 2-year (6-hour) and
- 10-year (6-hour)
- Extended period simulation (to be determined as described below)

A sensitivity analysis will be performed on the standard County design storms. Climate change model science will be used to estimate the standard return frequency of the County design storms at a 50-year planning horizon. Comparison of the current return frequency and the 2070 estimated return frequency will be presented in tabular format. For a single return period and duration (i.e., 10-year, 6-hour storm), Consultant will simulate the existing system's response to the IDF values for the current design storm and the projected future design storm.

An extended period simulation will be performed using a storm event selected following review of up to ten (10) years of rainfall data. The storm event will be selected with input from the County to represent either an "average" storm event or a major storm event from the last ten (10) years.,

The simulations will be performed for six scenarios, baseline (based on the time period for which monitoring data is collected) and future (growth scenario based on future flow projections, up to five (5) scenarios). Future flow projections will be as developed under Task 5.2.

The ability of the wastewater collection system to convey baseline and future flows during both dry and wet weather will be evaluated, including the systems' capability to convey buildout flows (50-year planning horizon). Locations of model-predicted SSOs, surcharging and hydraulic deficiencies will be identified. Predicted volumes of model-predicted SSOs at each location will be provided for each storm event. Pump station performance will also be evaluated. Tables and figures depicting the performance of the collection system for each simulation will be developed. Results of the capacity assessment will be presented in a workshop with the County.

Consultant will coordinate with the City of Baltimore to evaluate the downstream impacts of the future capacity assessments and will utilize the City's latest InfoWorks model as a boundary condition in this study.

Deliverables:

- Slides from Capacity Assessment workshop
- GIS files showing capacity results for each simulation
- Thematic maps in PDF format showing capacity assessment results for each design storm and development condition (locations of SSOs and sewers that are surcharged, including extent of surcharge and type of surcharge; i.e., backwater induced or capacity related)
- Tables showing the length of sewers surcharged by diameter ranges
- Return period analysis: summary and comparison of surcharged and flooded manholes under various conditions
- Capacity Assessment Report, including an evaluation of the system's capability to convey flow

Task 5.9 – Define Levels of Service (LOS) Strategies

Consultant will work with the County to establish strategies for the level of service (LOS) definition and the planning objectives/strategies for the collection system. The LOS strategy is the triggers for improvements (unmet LOS for a selected storm event) as well as the design targets for improvements (LOS achieved for a selected storm event) in terms of a storm intensity and level threshold (overflow, extent of surcharge). The selection of the strategy for level of service will be determined in conjunction with the capacity assessment results. The Consultant will prepare for and lead a LOS workshop with the County to develop consensus moving forward for these strategies.

Deliverables:

- Slides and exhibits from LOS workshop (to be combined with the Capacity Assessment workshop)

TASK 6 – ASSET MANAGEMENT AND CAPITAL IMPROVEMENT PROGRAM DEVELOPMENT

The objective of this task is to develop risk scoring for all pipes within the sewershed by analyzing the structural, O&M and capacity assessment data and to create a prioritized capital improvement framework that addresses structural, O&M and capacity issues and strategies for modernizing the collection system.

Task 6.1 – Analysis of Existing Data for Asset Management Program

Consultant will review the data gathered under Tasks 2 through 5 for the following purposes:

- Establish pipe cohorts based on available data and experience
- Identify deterioration curves, end of useful life and remaining useful life for each cohort (using industry standards, supplemented by available age and line break/failure data)
- Identify collection system capacity-related deficiencies based on the simulations performed under Task 5
- Assess physical condition and capacity of each pipe segment using available data

PACP scoring of the pipes will not be performed as part of this task.

Task 6.2 – Risk Assessment

Consultant will develop consequence of failure (CoF), likelihood of failure (LoF) and overall risk scores (business risk exposure or BRE) for each pipe segment based on the data analyzed in Task 6.1. Additional field investigations will not be performed for this task. The development of the scoring criteria and BRE scoring will include a workshop with the County to develop consensus on the initial scoring approach, as well as a second meeting to review the initial results and to make any necessary adjustments to the scoring framework:

- Consequence of Failure (CoF) Scoring – Develop CoF criteria, weighting and scoring for all sewer (gravity and force mains) pipes. Utilize GIS model-builder to develop CoF scores for each pipe asset based on accepted criteria. Apply the criteria to each pipe segment within GIS.

- Likelihood of Failure (LoF) Scoring - Develop (LoF) criteria, weighting and scoring for all sewer (gravity and force mains) pipes. Utilize GIS model-builder to develop LoF scores for each pipe asset based on accepted criteria. Apply the criteria to each pipe segment within GIS. The LoF scoring will incorporate available condition data and will include structural failure as well as capacity and blockage (O&M) failure risks.

- Business Risk Exposure (BRE) Scores – Develop a combined BRE score as a combination of the CoF and LoF. Assign BRE scores for each pipe segment. In addition, the Consultant will develop a risk matrix that indicates risk regions that will incorporate

strategies depending on the combination of CoF and LoF. Every pipe asset will be assigned a corrective action option and priority for consideration and evaluation.

Task 6.3 – Develop Capacity Improvement Strategies

Consultant will develop and evaluate strategies for achieving the selected level of service at year 2025, 20-year and 50-year planning horizons and up to two other planning horizons, including preliminary construction cost estimates. Strategies may include an option to pump flows from the Jones Falls Sewershed elsewhere within the sanitary sewer system either permanently or during wet weather events only. The capacity impacts on another Sewershed when receiving flow from the Jones Fall Sewershed will be determined based on the existing hydraulic modeling and capacity assessments which have been developed for those Sewersheds.

Task 6.4 – Asset Renewal, Capacity Upgrade, and O&M Funding Assessment

The LoF, CoF, and BRE scores will be utilized to develop a preliminary Asset Renewal, Capacity Upgrade, and O&M Funding assessment that will provide strategies for annual renewal and replacement (R&R), capacity upgrades, and operation and maintenance (O&M) spending needs over the five planning horizons (year 2025, 20-year, 50-year, and up to two other planning horizons) to maintain a desired overall level of service/risk using current dollars. The R&R and capacity upgrades funding assessment will include assumptions for replacement versus rehabilitation as well as unit price costing using available local bidding information combined with other available costing data. The O&M funding assessment will include forecasting of cleaning and CCTV inspection needs. Consultant will work with the County to determine internal or external resource assumptions. CCTV inspection and cleaning needs will include forecasting of inspection and cleaning frequencies by pipe to the extent practicable and will include reactive and preventive cleaning lengths. Consultant will meet with the County to develop consensus on cleaning and CCTV inspection needs assumptions to be used in the forecasting. Consultant will develop a list of equipment and staff needed to achieve the goals internally.

Task 6.5 – Near-Term Pipeline Renewal and Replacement, Capacity, and O&M Strategies

The risk assessment scores from Task 6.2 will be used to identify pipe segments that will require near-term improvements (next ten years), as well as priority cleaning and CCTV inspection. A list of segments requiring near-term improvements will be developed based on risk assessment and capacity deficiencies. An updated list of near-term pipeline renewal projects will be provided to the County. Costs for these projects will be developed based on unit costs from recent pipeline bids/projects in the area. It is assumed the County will provide the bid tabs from recent pipeline renewal projects. For priority cleaning and CCTV inspection, the Consultant will develop pipe runs (for larger trunk sewers) and pipe clusters (for more systematic basin-wide assessments) to be assessed over the next five years.

Deliverables:

- Asset Management Program Development Report summarizing the results of Tasks 6.1 through 6.4, including funding assessment and list of renewal/modernization projects and costs

Task 6.6 – Prioritized Capital Improvement Framework

Consultant will develop a prioritized capital improvement framework (CIF) for each planning horizon (up to five total) based on the results of the asset management program development.

Consultant will develop a project prioritization strategy with County input and develop a CIF from the list of improvements to achieve the target LOS at each planning horizon.

Consultant will identify and evaluate strategies for modernizing the collection system including real-time controls, permanent sensor networks, interceptor maintenance programs, and predictive maintenance.

A Power BI dashboard (see Task 7.3) will be utilized to present long-term risk profiles under varying funding scenarios and will include consideration for RUL in terms of structural and capacity perspectives. Pipe renewal and replacement costs and capacity upgrade costs will be based on available costing information and the use of current costing tools. The dashboard will include items such as the remaining useful life of each pipe segment, the risk scores, renewal and replacement costs, capacity upgrade costs, long-term projected CIF, etc. In addition, potential maintenance key performance indicators (KPIs), including inspections and service test results, will be included.

Deliverables:

- Detailed list of infrastructure needs.
- Detailed list of strategies.
- CIF will be included in the Comprehensive Report and Power BI Dashboard described in Task 7.

TASK 7 – SEWERSHED EVALUATION REPORT

The objective of this task is to provide a deliverable that identifies a roadmap forward for providing reliable sewer service in accordance with the County's long-term objectives for the Jones Falls Sewershed.

Task 7.1 – Draft Jones Falls Sewershed Comprehensive Evaluation Report

Consultant will develop a Draft Jones Falls Sewershed Comprehensive Evaluation Report that will discuss the comprehensive evaluation, including the data review and mapping, data gap analysis, additional fieldwork, flow/rainfall monitoring analysis, I/I analysis, model review and calibration, capacity assessment and asset management and capital improvement program development. GIS maps will be utilized to illustrate results of the various evaluation steps, including:

- Existing data review: problem areas, SSOs, basement backups, work orders, constraints/issues relative to condition, capacity and water quality
- Data gap analysis: missing/erroneous data and additional data needs
- Additional fieldwork: locations and results of fieldwork
- I/I analysis results
- Future condition models: projected development for each planning horizon
- Capacity assessment results: model-predicted overflows and surcharging under various design storms for each planning horizon
- Capacity and R&R improvements: for risk level at each planning horizon and best available current RUL estimates
- Asset management development: risk scores, R&R, capacity, and O&M recommendations

Consultant will summarize and provide detailed lists of infrastructure needs and strategies to address capacity, structural and O&M deficiencies within the sewershed. A prioritized capital improvement program for year 2025, 20-year and 50-year planning horizons and up to two additional planning horizons will be presented, including planning-level construction cost estimates and an implementation schedule.

The Draft Report will also discuss Best Management Practices (i.e., Interceptor Maintenance Program) for on-going proactive maintenance of the small diameter and large diameter sewer mains within the Sewershed.

Deliverables:

- Draft Report: 2 hard copies and 1 electronic PDF copy

Task 7.2 – Final Jones Falls Sewershed Comprehensive Evaluation Report

Consultant will prepare a formal Response to Comments table addressing the County's comments on the Draft Report. Consultant will incorporate the comments into a Final Jones Falls Comprehensive Sewershed Evaluation and Remedial Measures Report.

Deliverables:

- Response to Comments table (PDF format)
- Final Report: 2 hard copies and 1 electronic PDF copy
- All InfoWorks model files
- Power BI dashboard (see Task 7.3)

Task 7.3 – Power BI Dashboard

Consultant will develop an interactive Power BI dashboard to illustrate the following project tasks: data review and mapping, I/I analysis, future flow projections, capacity assessment, asset management, and capital improvement program. The thematic maps produced for the

comprehensive evaluation report (Task 7.1) will be utilized in the framework for the dashboard. Power BI will provide interactive maps, tables and graphs to summarize, compare and analyze the results of this sewershed evaluation. The dashboard will allow the County to view the relationships between the various improvement projects and understand how development "triggers" impact the improvements. The Power BI dashboard will be customized to communicate findings/recommendations between the various County groups or with external stakeholders. Up to fifteen (15) dashboard pages will be developed.

TASK 8 – PUBLIC OUTREACH

Task 8.1 – Community Meetings

Consultant will prepare presentations and handouts for meetings/workshops with the general public or community/environmental groups. Consultant will attend up to five (5) meetings/workshops.

Deliverables:

- Exhibits and presentation materials for community meetings

PROJECT SCHEDULE

The Consultant is prepared to start this work immediately upon authorization/issuance of a purchase order. A proposed project milestone schedule is provided in Attachment A.

DATA EVALUATION REPORT

On-Call Sanitary Sewer Rehabilitation Design Services – Task 14
Lake Roland Sewer Rehabilitation

Baltimore County, Maryland

Date: June 2022

RAMBOLL

PAGE INTENTIONALLY LEFT BLANK

1. INTRODUCTION

1.1 BACKGROUND

Baltimore County owns, operates, and maintains several large-diameter sanitary sewer interceptors that run through Lake Roland Park. Lake Roland Park is a 500+ acre park located in Towson, MD that is a multifaceted facility with hiker/biker trails, a dog park, pavilions, a nature center, and lake amenities including kayaking and canoeing. The Park is a high-use public area with activities (including nature and environmental programs) occurring year-round.

The County engaged Ramboll Americas Engineering Solutions, Inc. (Ramboll) for the development of design documents for the repair and rehabilitation of the interceptors, manholes, and junction chambers located within Lake Roland Park. The primary focus of this project is to minimize the inflow and infiltration(I/I) into the interceptors to reduce the likelihood of sanitary sewer overflows. Figure 1.1 below, graphically represents the limits of work, as defined by the County, for this project.

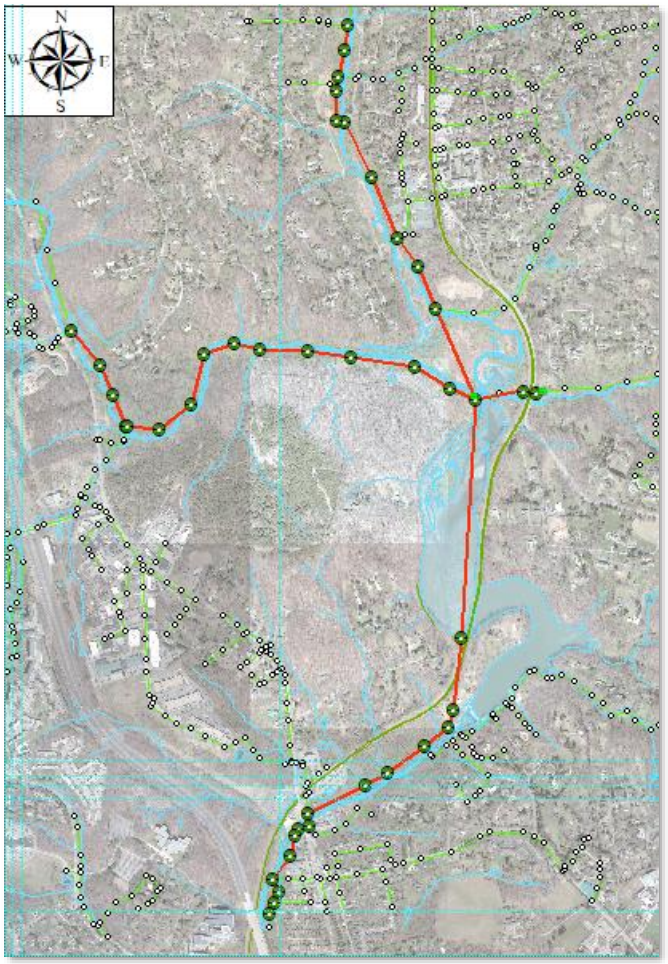

Figure 1.1 Project Map

In total, the project consists of approximately 19,550 linear feet of pipe (43 segments), ranging in size from 24-inches to 42-inches in diameter and the associated manholes/junction chambers (43 total units) along the project limits. Piping included in the project is distributed approximately as follows:

- 24-inches: 820 LF
- 27-inches: 1,755 LF
- 30-inches: 4,500 LF
- 42-inches: 12,470 LF

Note: In order to stay consistent with prior projects that Ramboll has completed with the County, the sewer pipe lengths used in this report are based on the "SHAPE_Length" field in the County's GIS. This field was compared to other applicable fields in the GIS dataset. Also, it is important to note that the pipe size distribution shown above uses the best available GIS data supplemented with information from CCTV pipeline inspections and manhole inspections.

The project area is comprised of the following sewer service areas (SSA's): 45-51-00-00, 45-52-00-00,45-53-00-00, 45-54-00-00, 45-55-01-00, 45-55-02-00, 45-56-00-00, 45-58-01-00, 45-59-02-00, 45-59-04-00, 45-59-06-00, 45-60-00-00, 45-62-01-00, 45-63-00-00, 45-65-00-00. Project asset maps, presenting the location of the assets associated with this report, are provided in **Appendix A**.

Services for this project commenced with a detailed desktop data review of existing system information including an evaluation of assets with special access considerations (i.e., private property) to assist in determining Right-of-Entry requirements for the project. Conclusions and recommendations derived from this initial data review and evaluation effort have been summarized and presented in this Data Evaluation Report. Field inspection/confirmation activities, permitting coordination, Right-of-Entry coordination and agreements, final design, bid phase services and construction phase services will be provided upon review and approval of this report by the County.

1.2 PURPOSE

As part of the preliminary engineering efforts for the project, the County requested a detailed review/evaluation of available existing system data in order to identify/accomplish the following:

- Confirm the condition of the pipelines and manholes associated with this project based on available system inspection data.
- Verify the rehabilitation recommendation (pipelines and manholes) included as part of this project.
- Preliminarily identify access and bypass requirements.
- Identify data gaps requiring additional/follow-up field evaluation efforts.
- Develop a preliminary list of permitting needs/requirements for the project.

The conclusions and recommendations of this review, as outlined above, are presented in this Data Evaluation Report.

2. DATA REVIEW AND RECOMMENDATIONS

2.1 GENERAL

This section introduces the data review activities and recommendations that were performed as part of this effort.

2.2 DATA REVIEW PROCESS

The County previously performed a sewer system evaluation that included the mapping and inspection of gravity sewers and manholes in the Lake Roland area. The data and documentation compiled as part of these efforts (including follow-up inspection and maintenance data) was made available by the County through web portal access to their online data library.

Data reviewed and analyzed as part of this review effort included:

- Geographic Information System (GIS).
- Closed-circuit television (CCTV) inspection videos and inspection logs.
- Sonar inspections completed on the lines
- Manhole inspection reports and photographs.
- Record drawings
- Maintenance records of assets (including repairs).

2.3 PIPELINE DATA REVIEW & RECOMMENDATIONS

A review of pipeline inspection data (i.e., CCTV inspection logs, videos, sonar inspections) was performed to confirm that all pipelines are suitable for trenchless rehabilitation technologies through CIPP lining. All segments have CCTV inspections reports available for review. Additionally, Redzone Sonar inspection data is available for the 42" trunkline that runs north to south. The review efforts consisted of the following:

1. Review of all available CCTV and associated inspection logs to evaluate the condition of each segment included in the project. In cases where multiple inspections are available, the most recently dated inspection report was reviewed.

2. Review of available Redzone sonar reports to confirm condition of existing pipeline for rehabilitation.

3. Provided a corrective action recommendation for each pipeline reviewed. Recommendations either confirm or revise the rehabilitation for the pipelines within the Lake Roland project.

Upon completing the review, it was determined that all pipe segments within the system can be rehabilitated using CIPP lining. Since the goal of the Lake Roland Sewer Rehabilitation project is to minimize the amount I/I into the system and prevent overflows, all lines have been identified for rehabilitation, even if structural damage

was not identified. The review of the CCTV inspections showed 24 segments with active infiltration at pipe joints, 14 of which also included some level of structural defects. Of the remaining 19 segment inspections available, 11 segments had structural defects alone and 8 segments either showed no structural defects or infiltration.

The distribution of pipe sizes recommended for CIPP lining is as follows:

- 24-inches RCP: 820 LF
- 27-inches RCP: 1,755 LF
- 30-inches RCP: 4,500 LF
- 42-inches RCP: 12,470 LF

A detailed review table supporting the above summary has been provided in **Appendix B.**

2.4 MANHOLE AND JUNCTION CHAMBER DATA REVIEW AND RECOMMENDATIONS

Similar to the pipeline data review goals, available manhole inspection data (manhole inspection reports) was reviewed in order to determine what rehabilitation should be proposed across the project area. Due to difficult access and proximity to the CIPP work associated with the pipelines, it was initially proposed that all manholes receive epoxy lining. To further confirm any additional rehabilitation required, the manhole data review approach consisted of the following:

1. Review of all available manhole reports to evaluate the condition of each asset included in project scope. No attempt was made to identify and/or correct minor cosmetic problems.
2. Provided a corrective action recommendation for each manhole.

Upon completing the review, a preliminary rehabilitation summary assessment was developed that categorized the following:

- Manholes recommended for frame and cover resetting/replacement.
- Manholes recommended for work associated with the frame seal.
- Manholes recommended for epoxy coating based on manhole defects.
- Manholes requiring full rehabilitation (epoxy coating) in conjunction with pipeline CIPP installation.
- Manholes requiring full replacement

Upon completing the review, it was determined that all 44 manholes within the system will need rehabilitation. Of the 43 manholes, 31 assets show evidence of infiltration. There are 2 manholes that are noted as 24" in their inspection reports. Field verification will be required to confirm that they are 24". Should this confirm manhole size, it will require full replacement to facilitate CIPP lining of the adjoining pipe segment. Epoxy lining was

identified as a rehabilitation method due to the high capacity of the pipelines which can cause H2S to accumulate within the manholes. The distribution of manhole rehabilitation is the following:

Rehabilitation	Manholes (ea.)
Replace/Repair or Raise Manhole Frame and Cover	15
Replace Manhole	2
Epoxy Lining	40

Additionally, there are two junction chambers located within this project. These junction chambers, NS560 and NS561, do not have any inspection data available for them. There are existing record drawings available for these junction chambers, however their structural integrity is unknown. In order determine the rehabilitation requirements of these junction chambers, they are recommended for inspection. County crews many need to be utilized for field activities to allow for access into the chambers for inspection.

A detailed review table supporting the above summary has been provided in **Appendix B.**

2.5 BYPASS SYSTEM EVALUATION

A preliminary bypass system evaluation was completed to assess the feasibility of potential staging sites which could accommodate both sanitary sewer bypass operation and large diameter lining operations, including on-site wet-out. As detail design efforts commence (including refinement of site accessibility needs and requirements), the approach for providing necessary bypass operations to construct the project will continue to be refined.

2.5.a Bypass Flow Evaluation

Due to the nature of CIPP lining, complete bypass will be required to complete this work. Bypass pumping design will be furthered as the design progresses. Ramboll has not yet reviewed flow calculations for this project, however all flows into the project are contributed by gravity. As the design progresses, Ramboll will review all flow rates provided by the County's flow metering network and further refine the bypass requirements for the project. Currently, it is expected that the bypass pumping will consist of three (3) 12"-15" HDPE pipelines to allow for redundancy should any individual pipeline failure occur. Every attempt will be made to allow for bypass piping to be routed along the proposed access trails for the work. This will limit the environmental impact and footprint for the project as machinery will be required to install the bypass lines. In areas where this is not possible the design will consider a route to minimize impacts and maintain a limited footprint.

2.5.b Site Staging Evaluation

A desktop review of potential staging sites for the sanitary sewer bypass operations was conducted using aerial imagery and County GIS mapping for all of the system assets. Potential sites were evaluated for suitability of bypass pump staging in addition to staging required for large diameter lining operations (i.e., on-site wet-out, crane usage, boiler truck access, etc.). An assumed 50' by 100' area was used as a representative potential staging area for each site. The dimensions of this representative area are subject to change based on field conditions and the final bypass design. Due to the complexity of the project, the project will be broken up into nine (9) sites that will be considered for their constructability, access requirements, environmental impacts, and bypass requirements. Sites were evaluated based on the criteria described below:

- Availability of Public ROW: Does the site provide adequate area for staging within the public ROW?
- Potential Environmental Impacts: Is the site located within an environmentally sensitive area such as wetlands and/or in close proximity to waterways?
- Potential Tree Impacts: Will the site require tree removal to establish staging area?
- Safety Hazards: Is the site located in a high-hazard work location (i.e., high-speed road corridors, proximity to overhead electric lines, etc.)?
- Private Property Issues: Is the site located on private property or near private business driveways where coordination with the property owner may be required?

Appendix C includes site maps for each of the referenced project sites (Sites #1 through #9.) Each site map includes preliminary layouts and mapping of access points, access trails/roads, bypass layouts, and staging locations.

The following table identifies the assets associated with each of the aforementioned Site Maps in **Appendix C**:

Site Map	Assets
1	6931-6930, 6930-18452, 18452-6928, 6928-6927
2	6927-6926, 6926-6925, 6925-6924
3	6924-6923, 6923-6921, 6921-NS561
4	20763-20762, 20762-21329, 21329-20761, 20761-72975, 72975-20760, 20760-20759, 20759-20758
5	20758-20757, 20757-20756, 20756-20755, 20755-20754, 20754-20753, 20753-21328, 21328-6888
6	NS560-6890, 6890-6889, 6889-6888
7	NS561-6888, 6888-6887, 6887-6886, 6886-14565
8	14565-6885, 6885-6883, 6883-6882, 6882-6880, 6880-6879
9	6879-6878, 6878-16379, 16379-6877, 6877-6876, 6876-6875, 6875-6874, 6874-TCM27

2.6 INVESTIGATION OF ASSETS IN NON-PUBLIC RIGHTS-OF-WAY

The initial data review revealed several assets that are located in non-public rights-of-way. For these assets, a separate investigation was conducted to develop a listing of potentially impacted properties which may require property owner approval for accessing and completing the suggested rehabilitation activity. Assets and properties of focus during this investigation include:

- Sewer assets that are outside of the public right-of-way and/or located within property corridors requiring special agency approval (i.e., State Highway Authority (SHA), etc.)
- Sewer assets where access could possibly be achieved through parking lots, driveways, or other previously constructed gravel/dirt roads or paths. (These instances would require property owner approval for construction activities.)
- Sewer assets located in non-paved and, at times, wooded and/or wetland areas which would require the installation of temporary access roads for site access (along with obtaining property owner approval).

Preliminary investigative efforts completed as part of this initial data review consisted of a desktop review of the existing GIS/site mapping throughout the project area and a review of existing record drawings in an attempt to identify any documentation/acknowledgement of utility easements (or lack thereof) along the assets in question. GIS data has identified 15 private property owners that may be affected, who range from commercial to residential properties. Additionally, there is land owned by the City of Baltimore, the Mass Transit Association, and Baltimore County. Ramboll has conducted several field visits to assess the current site conditions of each location and additional efforts will be conducted as the project progresses.

2.7 ACCESS OPPORTUNITIES

To complete the necessary rehabilitation, access trails to staging locations throughout the project extents will need to be developed. Large portions of the project are located within the dense treelined area of Baltimore County's Lake Roland Park, with steep slopes and minimal existing trail access. Access trails and temporary easements will be further developed as the design progresses; however, an initial attempt was made to show potential options.

Due to the proximity to and presence of streams and wetlands, temporary construction crossings and bridges will be required for a number of these sites as well. Ramboll has conducted numerous site walks with County staff, the design team, the environmental permitting team, bypass experts and the Lake Roland Nature Council. During these site walks, observations were made considering the terrain, existing park amenities, environmental features and potential impacts, and the surrounding communities and private properties. Preliminary review of the record drawings allowed for the design of the site access and ability to line multiple assets from one upstream location.

Each of the nine (9) sites are located outside of public roadways and traverse private property or public land not owned by the County. Based on preliminary review of existing record drawings (geometry) and site features, preliminary design of project staging and site access are identified below. It should be noted that the setups below show a feasible option for accessing these sites and they will be further refined as design progresses.

- ***Site #1- Ruxton Road –*** This site has access off Ruxton road which allows for easy access at the north part of the project location to 4 segments. Figure 2.1 shows the location of this site. A temporary access trail may require clearing of vegetation and potentially a temporary access roadway.

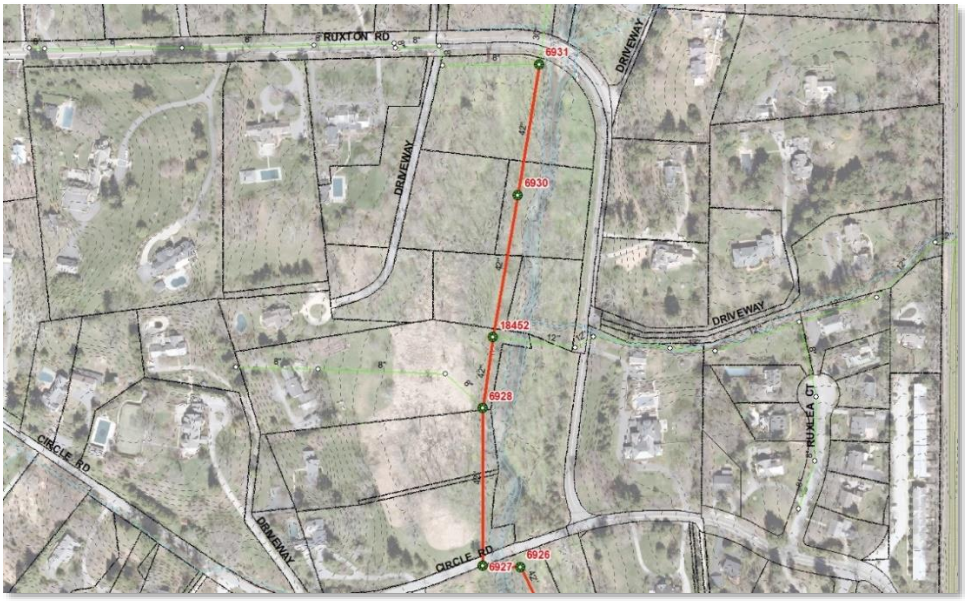

Figure 2.1 Site 1 Map

» *Access* – Access to Site #1 is from Ruxton Road, a public right-of-way. The 4 segments in this site are all located within private property and will require private property access agreements with the Homeowners. There are 9 parcels that will be impacted by this site, with a 10' existing utility easement over the pipeline. A 50' limit of disturbance (LOD) is shown on the site map as well and will be utilized for access if it is needed along the buried pipeline section.

» *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 1,190LF in total length and all are 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that the segments in this site have a consistent 0.14% slope and do not have any drop manholes along the run. There is a possibility that this could allow for all sewers to be CIPP lined from the upstream MH 6931. If this is possible, full access roads to all manholes will not be needed, just foot/light duty access to allow for manhole lining and cutting out of the pipe liners. Review of CCTV inspection data shows no major defects, but 2 segments have high rates of infiltration. Review of manhole inspection data show

that MH 6930 will require replacement of the frame and cover. All other manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.

- *Site Grade* – Along this site, the grade is flat with very little change in slope. This will allow for easier access and bypass capability at this site. All segments in this site are within 20' of the stream and will require special permitting due to the environmental impacts.
- *Bypass Capability* – County bypass requirements include redundancy of either the largest pump or 50% of the pumping capacity, whichever is greater. As noted above, for bypass within this site, three (3) 12"-15" HDPE bypass pipes will be utilized to bypass flows. A pump staging area of 30'x50' is shown on the Site #1 map in **Appendix C**. The bypass line for this site will be approximately 1,550 LF with two tie ins for collection sewers that connect to manholes along the alignment. Suction is anticipated to occur upstream of manhole 6931 with discharge to manhole 6927. The footprint for the bypass line along the access trail will be approximately 4' wide.

- ***Site #2 – Circle Road*** - Circle Road provides direct access to manholes 6927 and 6926. There is an existing bridge over the stream that may require a structural review prior to movement of large equipment across. (Assessment of the bridge will be performed by Ramboll structural personnel.) Only a small access trail may be necessary as both manholes are close to the roadway.

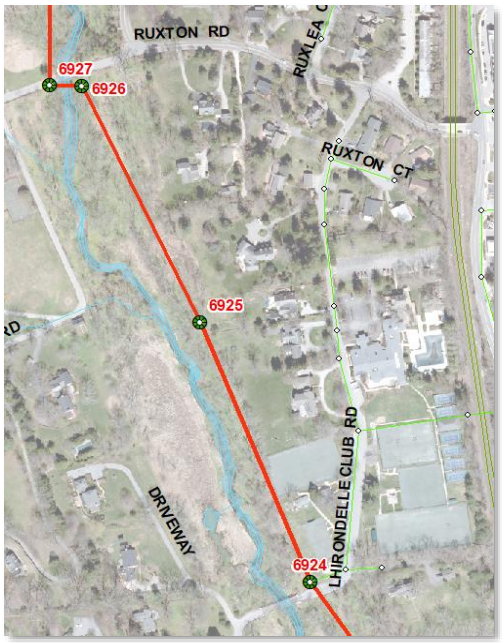

Figure 2.2 Site 2 Map

- *Access* – Access to Site #2 is from Circle Road, a public right-of-way. The 3 segments in this site are all located within property owned by the City of Baltimore. A small portion of the project is within

property owned by Lhirondelle Club and will require private property access agreements with the property owner. There is a 10' existing utility easement over the pipeline. A 50' limit of disturbance (LOD) is shown on the site map as well and will be utilized for access if it is needed along the buried pipeline section.

- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 1,640LF in total length and all are 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that the segments in this site have a consistent slope and there are no drop manholes along the run. There is a possibility that this could allow for all sewers to be CIPP lined from the upstream MH 6926. If this is possible, full access roads to all manholes will not be needed, just foot/light duty access to allow for manhole lining and cutting out of the pipe liners. Review of CCTV inspection data shows no major defects, but segments have high rates of infiltration. Review of manhole inspection data show that MH 6924 will require replacement of the frame and cover. All other manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.
- *Site Grade* – Along this site, the grade is flat with very little change in slope. This will allow for easier access and bypass capability at this site. No segments in this site are within 20' of the stream, however potential presence of wetlands may require special permitting due to the environmental impacts.
- *Bypass Capability* – County bypass requirements include redundancy of either the largest pump or 50% of the pumping capacity, whichever is greater. For bypass within this site, three (3) 12"-15" HDPE bypass pipes will be utilized to bypass flows. A pump staging area of 30'x50' is shown on the Site #2 map in **Appendix C.** The bypass line for this site will be approximately 1,600 LF with one tie in for a collection sewer that connects to a manhole along the alignment. Suction is anticipated to occur at manhole 6928 with discharge to manhole 6923. The footprint for the bypass line which will run along the access trail and under and existing bridge will be approximately 4' wide. Environmental permitting will be required to run the HDPE bypass mains through the potential wetlands and streams.

- ***Site #3 – Lhirondelle Club Road*** – This access point allows for the CIPP of three segments with minimal access trail building required.
  - *Access* – Access to Site #3 is from Lhirondelle Club Road, a public right-of-way. The 3 segments in this site are all located within property owned by the City of Baltimore. A small portion of the project is within property owned by Lhirondelle Club and will require private property access agreements for running small bypass operations within the property. There is a 10' existing utility easement over the pipeline. A 50' limit of disturbance (LOD) is shown on the site map as well and will be utilized for access if it is needed along the pipeline section.

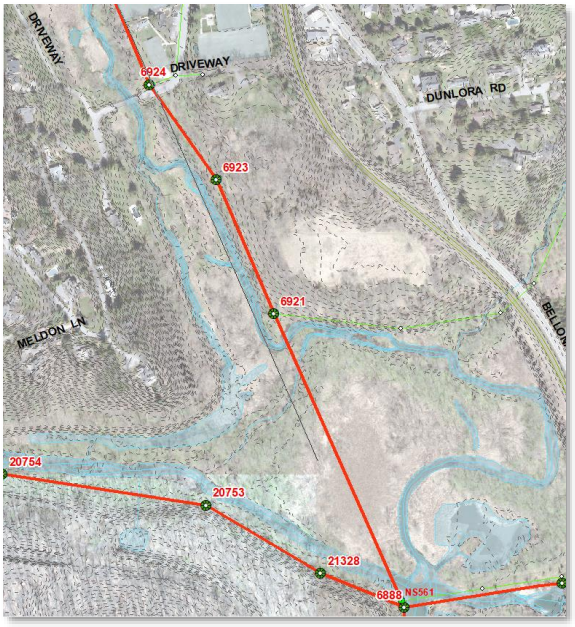

Figure 2.3 Site 3 Map

- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 2,160 LF in total length and all are 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that the segments in this site have a consistent slope and there are no drop manholes along the run. There is a possibility that this could allow for all sewers to be CIPP lined from the upstream MH 6924. If this is possible, full access roads to all manholes will not be needed, just foot/light duty access to allow for manhole lining and cutting out of the pipe liners. Review of CCTV inspection data shows no major structural defects along the pipeline segments, but several have high rates of infiltration. Review of manhole inspection data show that MH 6921 will require replacement of the frame and cover, while inspection information was not available for MH6923. All manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.
- *Site Grade* – Along this site, the grade is relatively flat with minimal change in slope. This will allow for easier access and bypass capability at this site. All segments in this site are within 20' of the stream and will require special permitting due to the environmental impacts.
- *Bypass Capability* – County bypass requirements include redundancy of either the largest pump or 50% of the pumping capacity, whichever is greater . For bypass within this site, three (3) 12"-15" HDPE bypass pipes will be utilized to bypass flows. A pump staging area of 30'x50' is shown on the Site #3 map in **Appendix C.** The bypass line for this site will be approximately 2,500 LF with one tie in for a collection sewer that connects to a manhole along the alignment. Suction is anticipated to occur at manhole 6925 with discharge to manhole 6888. The footprint for the bypass line which will run along

the access trail and under and existing bridge will be approximately 4' wide. Environmental permitting will be required to run the HDPE bypass mains through the potential wetlands and streams.

- ***Site #4 – Falls Road*** – This access point will require clearing and grubbing. A temporary stream crossing bridge, and long stretches of stabilized construction trails will be required. This access trail can follow along portions of the existing walking trails within Lake Roland Park.

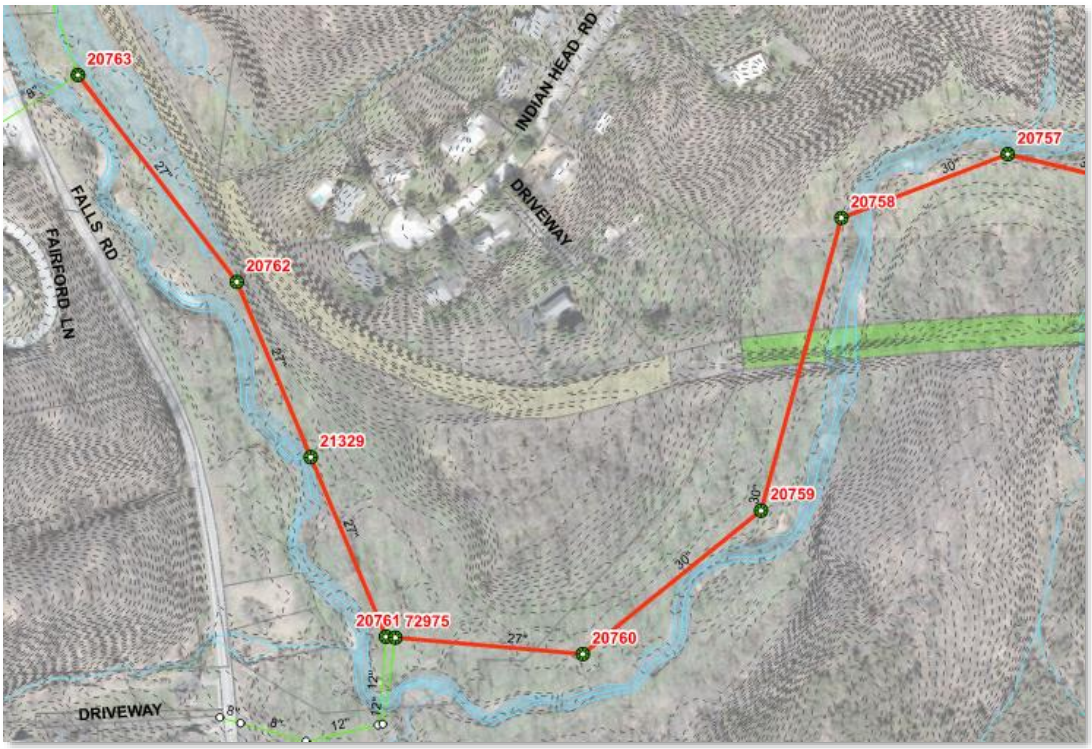

Figure 2.4 Site 4 Map

- *Access* – Access to Site #4 is from Falls Road, a public right-of-way. The 7 segments in this site are located within property owned by the City of Baltimore and property owned by the Lake Roland Protective Association. All of the lines within this site are located within the Lake Roland County Park. Every effort will be made to identify methods/approaches to maintain park accessibility near and along project corridors during construction. There is a 10' existing utility easement over the pipeline. A wide, stabilized access trail will be required along the 50' LOD. This will be required in order to bring necessary lining equipment into the site. A 50' limit of disturbance (LOD) is shown on the site map.
- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 3,555 LF total and all are 27" or 30" reinforced concrete cylinder pipe (RCCP). Record drawings show that some segments in this site have a consistent slope and the absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact in certain

locations. Review of CCTV inspection data shows no major defects along the pipeline run, but segments along the run have high rates of infiltration. Review of manhole inspection data show some manholes will require replacement of the frame and cover. All manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.

- *Site Grade* – Predominantly along this site, the grade is relatively flat with minimal change in slope. This will allow for construction of access trails and bypass capability at this site. All segments in this site are within 50' of the stream and could require special permitting due to the environmental impacts.
- *Bypass Capability* –A pump staging area of 30'x50' is shown on the Site #4 map in **Appendix C.** The bypass line for this site will be approximately 4,000 LF with multiple tie ins for collection sewers that connect to manholes along the alignment. Suction is anticipated to occur at manhole 20764 with discharge to manhole 20757. The footprint for the bypass line, which will run along the access trail and across the existing stream will be approximately 4' wide. Environmental permitting will be required to run the HDPE bypass mains through the potential wetlands and streams.

- ***Site #5 – Lake Roland Nature Center*** – This access point will require clearing and grubbing. A temporary crossing bridge or other means to traverse the stream, and long stretches of stabilized construction trails will be required. This access trail can follow along portions of the existing walking trails within Lake Roland Park.

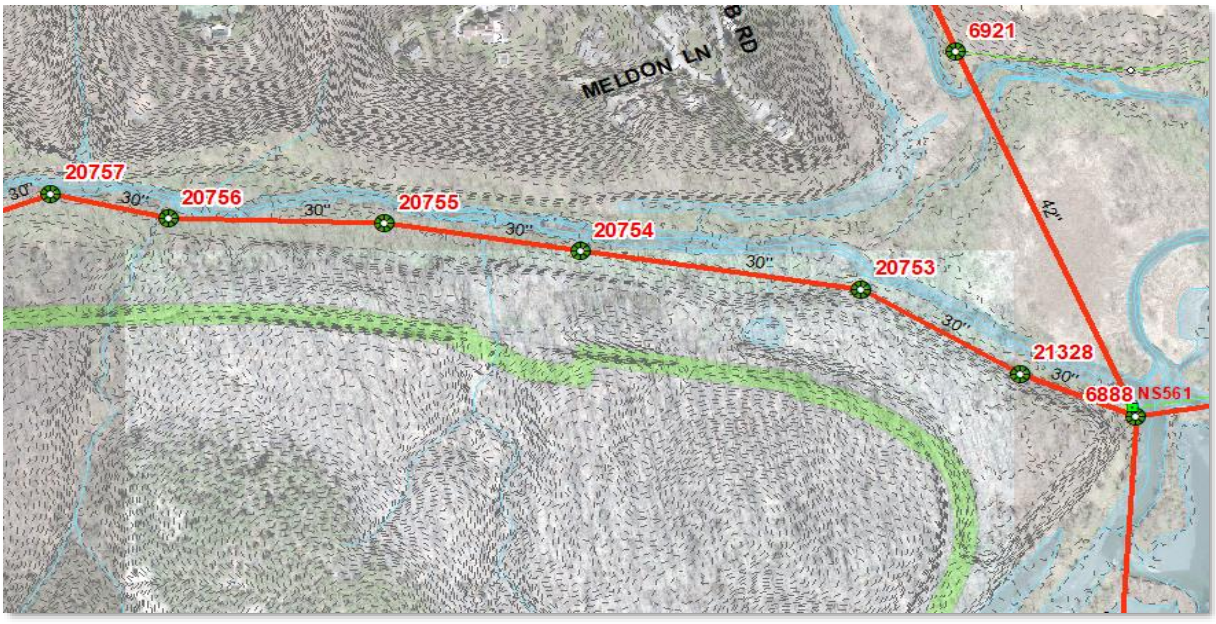

Figure 2.5 Site 5 Map

- *Access* – The 7 segments in this site are located within property owned by the City of Baltimore. Access to Site #5 is through private residential properties at the end of Hollins Lane (a public roadway). All of

the lines within this site are located within the Lake Roland County Park. Every effort will be made to identify methods/approaches to maintain park accessibility near and along project corridors during construction. There is a 10' existing utility easement over the pipeline, and a potential 50' limit of disturbance (LOD) is shown on the site map. A wide, stabilized access trail will be required along the 50' LOD. This will be required in order to bring necessary lining equipment into the site. Access to this site will be in coordination with Site #7 and utilize the same access road to portions of the project.

- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 3,390 LF total and are all 30" reinforced concrete cylinder pipe (RCCP). Record drawings show that all segments in this site have a consistent slope and there is an absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact in certain locations. Review of CCTV inspection data shows no major defects along the pipeline run, but segments along the run have high rates of infiltration. Review of manhole inspection data show some manholes will require replacement of the frame and cover. All manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.
- *Site Grade* – Along the sewer lines, the grade is relatively flat with minimal change in slope. The access location on Hollins Lane will require coordination with the private property owner(s) at the end of the roadway. (Final identification of the access route location/alignment will dictate the residences requiring engagement/coordination.) Additional information on the grading at this access point, see Site #7 map in **Appendix C** . This will allow for construction of access trails and bypass capability at this site. All segments in this site are within 50' of the stream and could require special permitting due to the environmental impacts.
- *Bypass Capability* –A pump staging area of 30'x50' is shown on the Site #5 map in **Appendix C.** The bypass line for this site will be approximately 3,500 LF. Suction is anticipated to occur at manhole 20759 with discharge to manhole 6888. The footprint for the bypass line, which will run along the access trail and across the existing stream will be approximately 4' wide. Environmental permitting will be required to run the HDPE bypass mains through the potential wetlands and streams.

- ***Site #6 – Bellona Road –*** The access point on Bellona Rd leads to an existing Baltimore County easement. Little access trail creation is expected to be required. It is assumed that the Light rail crossing will not be an issue at this location, as segment 6889-6888 can be rehabilitated from manhole 6890.

Figure 2.6 Site 6 Map

- *Access* – Access to Site #6 is from Bellona Road, a public right-of-way. The 3 segments in this site are located within property owned by Baltimore County, Baltimore City, and the Mass Transit Administration. Access to the site will occur within the extents of an existing Baltimore County utility easement property. A potential 50' limit of disturbance (LOD) is shown on the site map. Little to no access trail will be necessary for this project.
- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 820 LF total and are all 24" reinforced concrete cylinder pipe (RCCP). Record drawings show that all segments in this site have a consistent slope and there is an absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact of this location. Should the final design not allow for continuous lining at this site, access to MH 6889 will be very difficult. The presence of the MTA property and active Light rail line will require extensive permitting and coordination. Review of CCTV inspection data shows no major defects along the pipeline run, but several segments along the run possess high rates of infiltration. Review of manhole inspection data show MH6890 will require replacement of the frame and cover. MH 6889 does not show any defects and should be considered to be removed from the scope of the project due to the

difficulty of access. All other manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.

- *Site Grade* – Access to lining manhole MH6890 is available through a relatively flat area. This will allow for ease of access trails and bypass capability at this site. There is a steeper grade change as the line approaches the MTA Light Rail line. This should not prove as a challenge unless access to the MTA location is required. Segments in this site are not within 50' of the stream and should not require special permitting due to the environmental impacts.
- *Bypass Capability* –The bypass for this site will be through the 36" sewer north of the line within this project that are connected at NS560. The figure below shows the junction chamber per record drawings from the County. Additional flow calculations will be required to ensure that the 36" sewer has enough capacity to receive the flow that has been diverted from the existing 24" sewer, however this is not anticipated to be an issue as the 24" line appears to be currently dry.

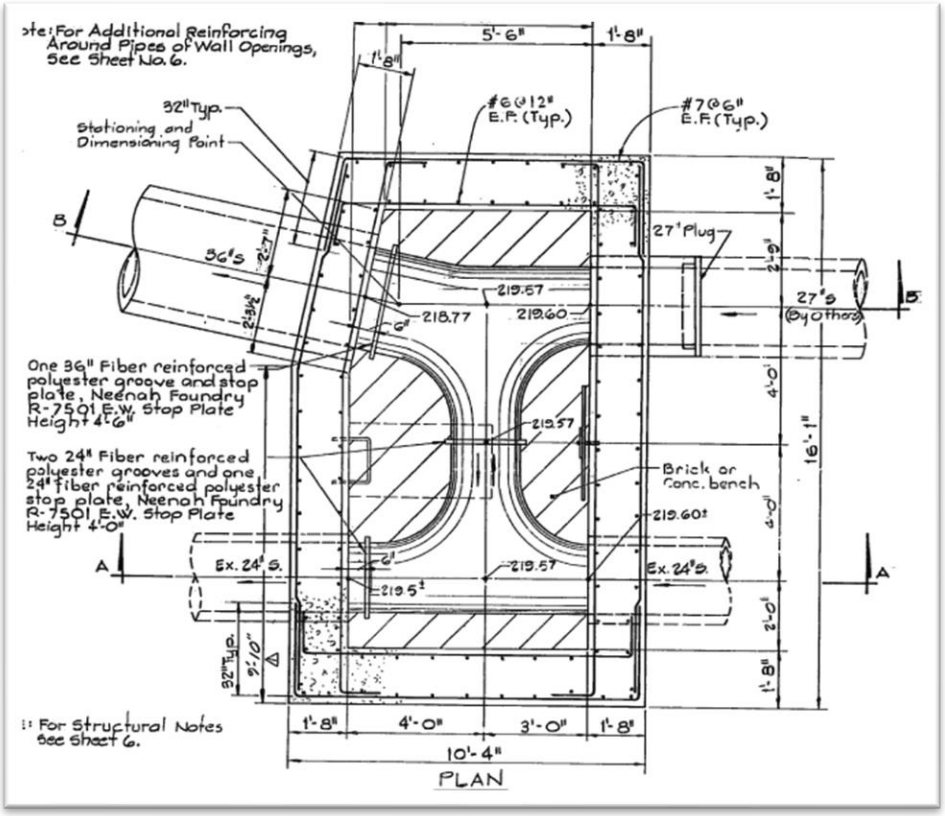

***Figure 2.7 Site 6 Map* NS560 Junction Chamber**

- ***Site #7 – Hollins Lane*** – This access point will allow for rehabilitation of the sewer lines underneath Lake Roland.

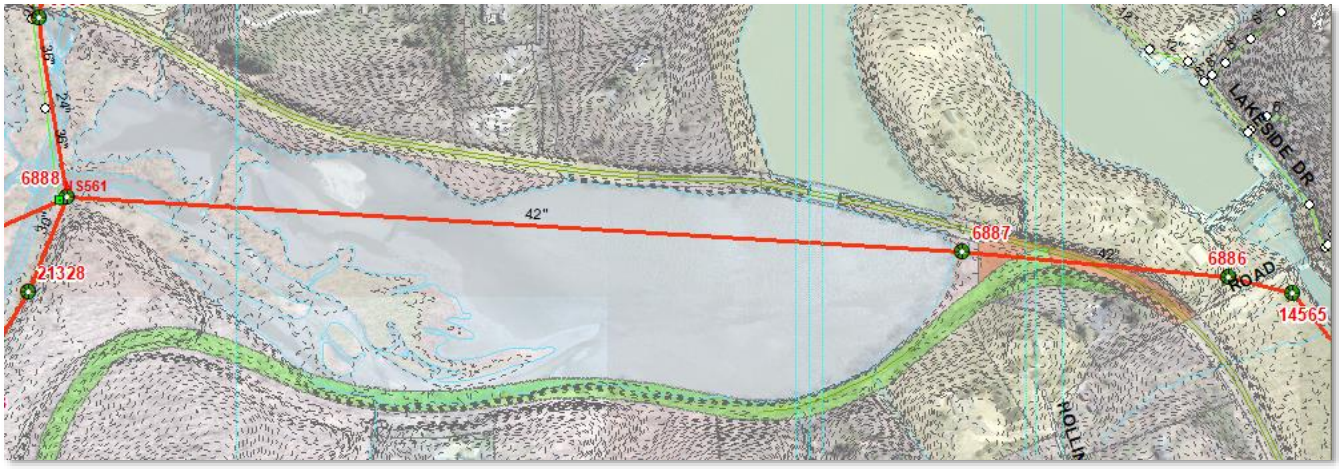

Figure 2.8 Site 7 Map

- *Access* – Access to Site #7 is from Hollins Lane (outlined at part of Site #5). The 4 segments in this site are located within property owned by the City of Baltimore, the Lake Roland Protective Association, and the Mass Transit Administration. As discussed as part of Site #5, access to the site will occur through residential private property located at the end of Hollins Lane. Coordination and homeowner approval will be required to secure access for this project. All of the lines within this site are located within the Lake Roland County Park. Every effort will be made to identify methods/approaches to maintain park accessibility near and along project corridors during construction. There is a 10' existing utility easement over the pipeline, and a potential 50' limit of disturbance (LOD) is shown on the site map. A wide, stabilized access trail will be required along the LOD. This will be required to bring necessary lining equipment into the site. Access to this site will be in coordination with Site #5 and utilize the same access road to portions of the project.
- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 4,030 LF total and are all 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that all segments in this site have a consistent slope and there is an absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact in certain locations. Review of CCTV inspection data shows no major defects along the pipeline run, but segments along the run have high rates of infiltration. All manholes within the site will require epoxy lining, which has a minimal LOD footprint impact.
- *Site Grade* – Each segment in this site has differing slopes. Segment 6888-6887 runs underneath Lake Roland, segment 6887-6886 is a steep slope, and segment 6886-14565 has a relatively flat slope. The access location on Hollins Lane has a steep slope to reach the project area. This access location was chosen due to the slope being the most manageable compared to the surrounding area. A stabilized

construction entrance to deal with the steep slopes will be a necessity. Some segments in this site are within 20' of the stream and will require special permitting due to the environmental impacts.

- *Bypass Capability* –A pump staging area of 30'x50' is shown on the Site #7 map in **Appendix C.** The bypass line for this site will be approximately 6,000 LF. Suction is anticipated to occur at structure NS561 with discharge to manhole 6885. The footprint for the bypass line is anticipated to run along the access trail, around the western perimeter of the Lake, and will be approximately 4' wide. As design progresses, further review of potential bypass routes will occur, including exploring the potential to float (or partially float) the bypass operation across the lake. An alternate alignment is shown on Sheet 8, Site #7 Alternate Alignment in Appendix C. This alternate alignment would reduce impacts to Park operations (including the dog park and future COVID-19 memorial) however it would result in greater cost and risk to the County. Further analysis will occur as design progresses.

- ***Site #8 – Light Rail Parking Lot*** – There is an existing utility trail off of the southeast corner of the MTA light rail parking lot. This trail can provide a good access point for the manholes along the north side of the Jones Falls.

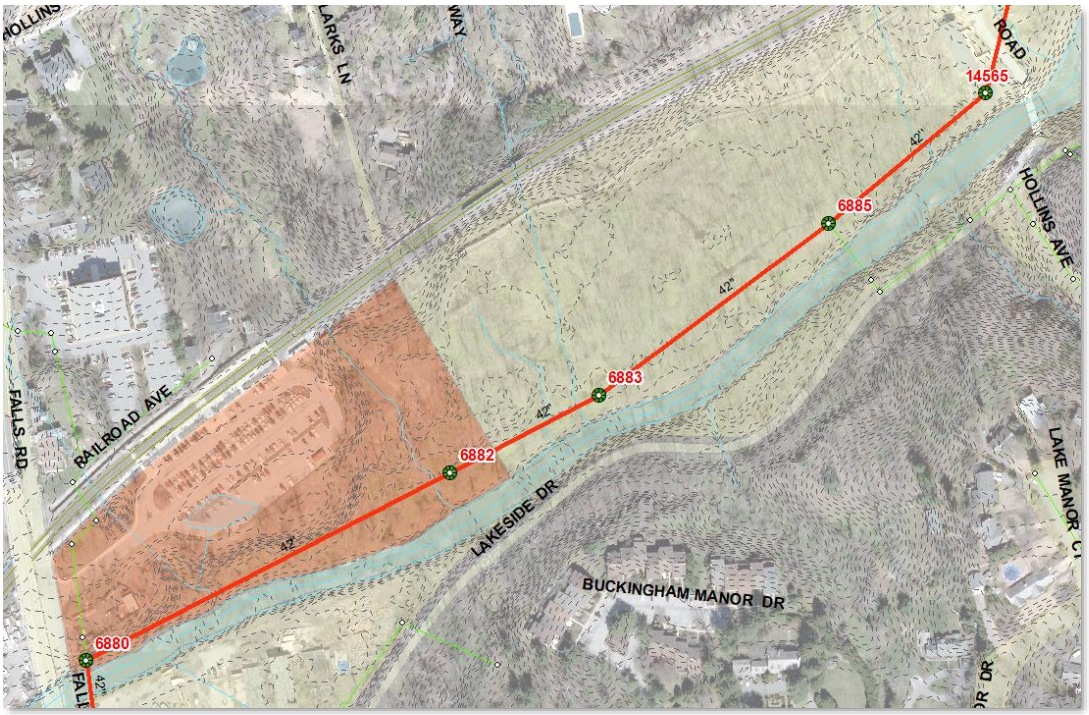

Figure 2.9 Site 8 Map

- *Access* – Access to Site #8 is from the light rail parking lot, a private property. The 5 segments in this site are located within property owned by private property owners and the Mass Transit Administration. Every effort will be made to identify methods/approaches to maintain park accessibility near and along project corridors during construction. There is a 10' existing utility

easement over the pipeline, and a potential 50' limit of disturbance (LOD) is shown on the site map. A wide, stabilized access trail will be required along portions of the LOD. This will be required to bring necessary lining equipment into the site.

- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 2,150 LF total and are all 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that all segments in this site have a consistent slope and there is an absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact in certain locations. Review of CCTV inspection data shows no major defects along the pipeline run, but segments along the run have high rates of infiltration. Manhole 6880 will require replacement of the frame and cover, while all will require epoxy lining, which has a minimal LOD footprint impact.
- *Site Grade* – The slope along this access road and the sewer lines are relatively flat. MH6880 is located down a steep slope and will be difficult to access. To meet this challenge, it is proposed that the line be CIPP lined from the downstream manhole 6879. All segments in this site are within 50' of the stream and may require special permitting due to the environmental impacts.
- *Bypass Capability* – A pump staging area of 30'x50' is shown on the Site #8 map in **Appendix C**. The bypass line for this site will be approximately 2,500 LF with three tie ins for collection sewers that connect to manholes along the alignment. Suction is anticipated to occur at manhole 6886 with discharge to manhole 16379. The footprint for the bypass line which will run along the access trail and along water bodies will be approximately 4' wide. Environmental permitting will be required to run the HDPE bypass mains through the potential wetlands and water bodies. The possibility also exists to route the bypass along Lakeside Drive. While this would result in fewer environmental impacts, it may impact traffic to the park. Further analysis will occur as design progresses.

- ***Site #9 – Falls Road – Private Property*** –All properties are currently operating businesses, and construction will require coordination.
  - *Access* – Access to Site #9 is from various private properties along Falls Road. Every one of the 7 segments included in this site are located on private property. Access can be gained off Falls Rd or Fairfield Ave. Access agreements will need to be obtained in order to complete this work. Further design will aim to minimize the number of access points and property agreements that will be needed. There is a 10' existing utility easement over the pipeline, and a potential 50' limit of disturbance (LOD) is shown on the site map. A wide, stabilized access trail will be required along portions of the LOD. This will be required to bring necessary lining equipment into the site.

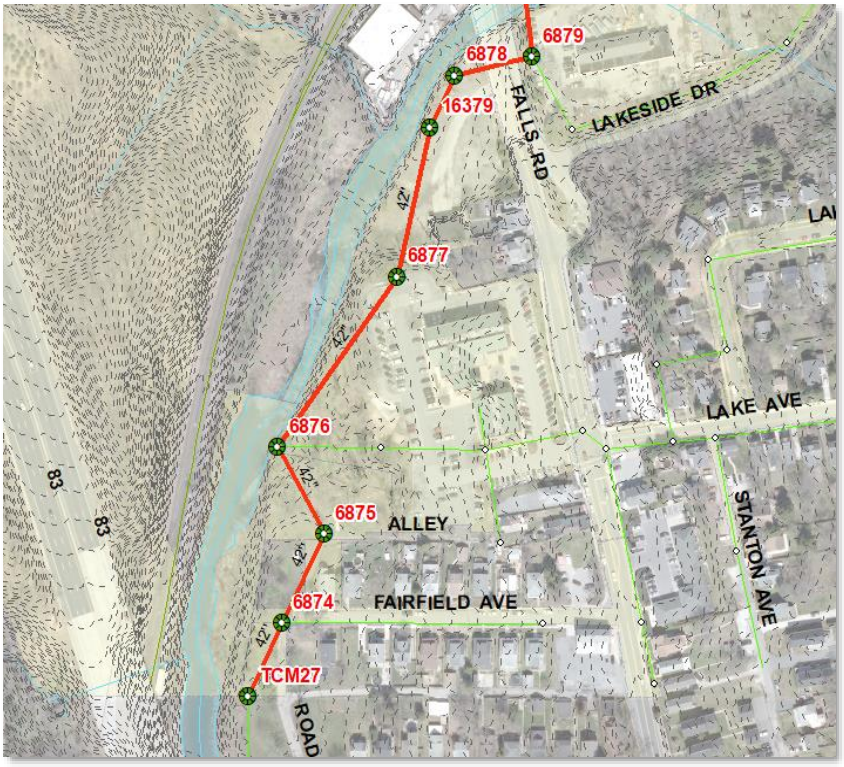

Figure 2.10 Site 9 Map

- *Pipeline and Manhole Data Review* – The segments along this pipeline are approximately 1,302 LF total and are all 42" reinforced concrete cylinder pipe (RCCP). Record drawings show that all segments in this site have a consistent slope and there is an absence of drop manholes along the run. There is a possibility that this could allow for some sewers to be lined together and lessen the impact in certain locations. Review of CCTV inspection data shows no major defects along the pipeline run, but segments along the run have high rates of infiltration. Two (2) manholes (6878 and 6879) will require new frame and covers and to be raised above grade, while all will require epoxy lining, which has a minimal LOD footprint impact.

- *Site Grade* – The slope along the majority of the lines is small and the area is relatively flat. There are manholes that are located within 10' of Jones Falls and access to these may pose a greater challenge due to the slope of the streambank.

- *Bypass Capability* – A pump staging area of 30'x50' is shown on the Site #9 map in **Appendix C.** The bypass line for this site will be approximately 2,000 LF with three (3) tie-ins for collection sewers that connect to manholes along the alignment. Suction is anticipated to occur at manhole 6879 with

discharge to the first City manhole downstream of TCM27. The footprint for the bypass line which will run along the access trail will be approximately 4' wide.

2.8 PERMITTING EVALUATION

An initial desktop screening of asset locations was conducted to preliminarily identify permits which may be required for the successful completion of this project. The project includes assets which are located in a variety of environments including, but not limited to: county-maintained roads, state-maintained roads, non-public rights-of-way, and environmentally sensitive areas. The desktop review consulted the following resources:

- Available County GIS
- High Resolution Aerial Photography
- Natural Resource Conservation Service (NRCS) – Soil Survey
- U.S. Fish and Wildlife Service (USFWS) – National Wetland Inventory Mapping
- Maryland Environmental Resource and Land Information Network (MERLIN)

The Permit evaluation recommendations are split into two areas for this report: environmental, and non-environmental.

Environmental

The purpose of the evaluation into environmental permitting was to identify the potential for project-related impacts to natural resources in the vicinity of the affected assets.

A review of the USFWS National Wetland Inventory Maps did identify the presence of federally mapped wetlands in the project area. Specifically, Estuarine and Marine Wetland, Freshwater Forested/Shrub Wetland and Freshwater Emergent Wetland were identified at and near the project site. Linear freshwater wetlands (Palustrine, forested, seasonally flooded) were identified at and near the project using the Maryland MERLIN environmental mapping tool. The MERLIN results suggest the potential for regulated freshwater wetlands at the site. High resolution aerial photography identified the presence of forest and riparian habitat in the vicinity of the project area as well as water features inclusive of the Chesapeake Bay Watershed.

The results of the desktop review indicate that the following environmental permits and submittals may be required for this project:

- Joint Federal/State Permit for Alteration of Floodplain, Waterways and Non-tidal and Tidal Wetland in Maryland (Maryland Department of Environment and the U.S. Army Corps of Engineers).
- Forest Stand Delineation (Baltimore County Environmental Protection and Sustainability Office)
- Forest Conservation Plan (Baltimore County Environmental Protection and Sustainability Office)

- Erosion and Sediment Control Permit (Baltimore County Soil Conservation District)
- Grading Plan (Baltimore County Environmental Protection and Sustainability Office)

Other approvals may be required as additional information (e.g., presence of sensitive species and/or cultural resources) and rehabilitation design becomes available.

Non-Environmental

The focus of the evaluation into non-environmental permitting was to determine if any assets in the project are located on properties controlled by agencies that may require additional permits to complete the rehabilitation recommendations. This evaluation was performed using the County's "Parcels" GIS shapefile and high-resolution aerial photography.

It is possible that rehabilitation activities will be performed on assets within the Maryland Transit Authority (MTA) rights-of-way, and coordination and permitting to access these sites may be required. It is anticipated that one or more SHA Utility Permit(s) will be required for this project. Additionally, further correspondence with the MTA will be necessary to facilitate rehabilitation activities within the MTA right-of-way and to identify any further access requirements. As the assets within the right-of-way are identified for trenchless rehabilitation and are not expected to require any excavation at this time, some barriers for permitting should be reduced. Excavation activities within (or in the vicinity) of railways often require additional design, coordination, and construction efforts to accommodate design requirements and criteria dictated by the entity.

Based upon a review of applicable regulations, location of assets, and work to be performed, as well as the desktop review of available resources, the only non-environmental approvals identified for the project, thus far, will be a State Highway Administration – Utility Permit

3. NEXT STEPS

Following County approval of this document, Ramboll will move forward with design activities. Ramboll will perform additional field investigations and review of LiDAR data for the potential staging areas that have been laid out in this report. Ramboll recommends that the two 24" manholes and both junction chambers be inspected by Ramboll staff. Should the County desire, Ramboll will also perform follow-up inspections of manholes that did not have available inspections data provided. Should no additional inspection activities be required, Ramboll will continue with the design for the project. Coordination with the public and any private stakeholders in the project will commence following completion of the 70% deliverables, at which time the design will be ready for presentation. A thorough review of the environmental impacts will begin and permitting requirements will be furthered.

Subject: FW: Question on the sewer requirements and Johns Hopkins at Greenspring

D'Andrea/Pete,
I see this to be a big problem and Teresa Moore is asking. Can we do anything now to make JH uphold their obligations to the agreement?
Thanks,
Jeff

Subject: Re: Question on the sewer requirements and Johns Hopkins at Greenspring

Hopkins' engineer just stopped working on the project.
They never got the permits that are needed, and they never acquired the off site right of way that is needed.
PAI issued the occupancy for the building without requiring that Hopkins fulfill their obligations in accordance with the agreement.
David

Hi Dave,
I recently talked to Lisa about this and I know you had been trying to get this rectified. What is the current status?
Thanks,
Jeff

CAUTION: This message from teresa@thevpc.org originated from a non Baltimore County Government or non BCPL email system. Hover over any links before clicking and use caution opening attachments.

Dear Jeff,

I have a board meeting tomorrow and will be covering the proposed 61-lot development near the intersection of Joppa and Falls.
As part of the county comments at the recent Concept Plan hearing, it has come to light that sewer upgrades required as part of the approvals for the surgical center at Johns Hopkins Medical at Greenspring Station, were never done.
During discussions and the hearing process – those that raised concerns about the failing sewer issue in this vicinity would be corrected before a building and occupancy permits would be approved.
It seems that never happened, but the building was built and is occupied.
Do you some time to discuss today or tomorrow? My board meeting is at 6 p.m. tomorrow and I anticipate lots of questions on this.

Teresa Moore

S□□□ect□RE: Johns Hopkins/Greenspring Manor

1. Yes, as outlined in the MOU Section 2, Hopkins was to prepare the drawings, and get all of the permits and off-site right-of-way. Yes, we agreed to manage the Contract from Request to Advertise through construction after we received all of the Bid Ready Documents and the easements were acquired by Hopkins.
2. Yes.
3. Sanitary sewer overflows.
4. Storage (and DPW has been opposed to that option) would be one option, finding another location that avoids the capacity deficient areas would be another option, however, we believe that option would be unfeasible.
   Zero is the "breaking point" of number of units that could be built without causing an SSO.

   David

Subject: Johns Hopkins/Greenspring Manor

Good afternoon Dave/Lisa,

After having the meeting with the Administration today, we have the following questions:

1. Was Hopkins to prepare all plans and specifications along with permits for the their project? If so, were we (Engineering) sending it up to contracts? Who was responsible for securing the R/W?
2. Does this feed the Jones Falls sewershed (Lafferty)?
3. If Hopkins didn't do the improvements, what are the ramification of their new connection?
4. If Greenspring Manor were to continue through development, is there another way to provide capacity? Is there a "breaking point" for Greenspring Manor (no. of units)?

Thanks,
Jeff

SUBJECT: 2021 Basic Services Maps
Public Water and Sewer Status

In accordance with your request, we are furnishing an update for the 2021 Basic Services Map.

Water
No deficiencies are known to exist.

Sewer
All of the remaining sewer relief point locations are being metered. We have completed several rehabilitation projects and are now performing post-monitoring to determine the projects' effectiveness. In addition, we have projects still in design which will eventually eliminate the areas of concern.

Everyone should be aware that the removal of an area of special concern does not mean that an area has unlimited developmental potential. All developments are evaluated hydraulically on a case-by-case basis, and determinations are made to see if the development will need downstream supplementation.

Subject: RE: Follow up

The package sent to Council to approve had the correct maps that were previously presented to the Planning Board.

Council voted on and approved the same Sewer Basic Services maps that the Planning Board approved.

When the sewer map was sent to the County Council chairman for signature following the approval, there was a printing error by the GIS staff. The signed map is missing all areas of concern, not just the one Mr. McCann references.

We are actively working to get the correct map signed by Council so that we can post it to the DPWT website.

Jeannette Applauso has been in contact with Taylor Bensley of your staff regarding this problem.

Hi director Lafferty,

I hope you are well. Councilman Patoka wanted me to follow up with you regarding the following inquiry we received from Michael McCann:

The basic question, again, is why did the 2022 Basic Service Map for sewer suddenly not show Brooklandville/GS station as an area of concern. It was in 2021 and is back again in the recently submitted draft map from DPW. Danke!!

Anything you can share with us would be greatly appreciated.

Thanks so much and have a great weekend!

Best,

Justin Silberman

Hey Michael,

Not sure if this is helpful or not, but after doing some quick digging, I have some attachments and info from the 2022 Basic Services Map right shortly prior to being introduced before the County Council ... I'll see if there is any additional information we have. I saw your email just came through, which might include one or two of the same attachments.

Attached for your information please find five attachments for your review related to the 2022 Basic Services Maps. These include the following:

- Cover letter from Planning Director Steve Lafferty indicating the Planning Board recommended adoption of the 2022 Basic Services Maps
- The three Basic Services Maps for Transportation, Water Supply, and Sewer Areas
- Memorandum related to the Transportation Map
- Memorandum related to the Water and Sewer Maps
- Spreadsheet listing the D, E, and F Transportation intersections

Hope this helps for now.

Thanks!

EXECUTIVE SUMMARY

This document, upon approval by the U.S. Environmental Protection Agency (EPA), establishes a Total Maximum Daily Load (TMDL) for fecal bacteria in Jones Falls (basin number 02-13-09-04). Section 303(d) of the federal Clean Water Act (CWA) and the EPA implementing regulations direct each state to identify and list waters, known as water quality limited segments (WQLSs), in which current required controls of a specified substance are inadequate to achieve water quality standards. For each WQLS, states are required to either establish a total maximum daily load (TMDL) of the specified substance that the waterbody can receive without violating water quality standards, or demonstrate that water quality standards are being met.

The Maryland Department of the Environment (MDE) has identified Jones Falls and all tributaries above Lake Roland, a designated Use III waterbody (Water Contact Recreation, Protection of Aquatic Life and Natural Trout Waters), and Jones Falls between North Avenue (Baltimore City) and Lake Roland, a designated Use IV waterbody (Water Contact Recreation, Protection of Aquatic Life and Recreational Trout Waters) [Code of Maryland Regulations (COMAR) 26.08.02.08.08] in the State's 303(d) List as impaired by metals (copper and lead) (1996), nutrients (1996), sediments (1996), bacteria (fecal coliform) (2002), polychlorinated biphenyls (PCBs) - Lake Roland (2002), and by impacts to biological communities (2004). This document proposes to establish a TMDL for fecal bacteria in Jones Falls and its tributaries that will allow for the attainment of the designated use, primary contact recreation. The impairment for metals (copper and lead) was removed from the 303(d) List through a water quality analyses approved by EPA in December 2, 2004. A TMDL for chlordane was approved by EPA on March 23, 2001. The listings for nutrients, sediments, PCBs and impacts to biological communities will be addressed separately at a future date. A data solicitation for fecal bacteria was conducted by MDE in 2003, and all readily available data from the past five years was considered.

To establish baseline and allowable pollutant loads for this TMDL, a flow duration curve approach was used incorporating flow strata estimated from United States Geological Survey (USGS) daily flow monitoring data and bacteria monitoring data. The sources of fecal bacteria were estimated at five representative stations in the Jones Falls watershed where samples were collected for one year. Multiple antibiotic resistance analysis (ARA) source tracking was used to determine the relative proportion of domestic (pets and human associated animals), human (human waste), livestock (agricultural related animals), and wildlife (mammals and waterfowl) source categories.

The allowable load is determined by estimating a baseline load from current monitoring data. The baseline load is estimated using a long-term geometric mean and weighting factors from the flow duration curve. The TMDL load for fecal bacteria entering Jones Falls is established after considering four different hydrological conditions: high flow and low flow annual conditions; and high flow and low flow seasonal conditions (the period between May 1st and September 30th where water contact recreation is more prevalent). This allowable load is reported in units of Most Probable Number (MPN)/day and represents a long-term load estimated over a variety of hydrological conditions.

Two scenarios were developed, the first assessing whether attainment of current water quality standards could be achieved with maximum practicable reductions (MPRs) applied, and the second allowing higher reductions than MPRs. Scenario solutions were based on an optimization method where the objective was to minimize the overall risk to human health, assuming that the risk varies over the four bacteria source categories. In the five subwatersheds of Jones Falls, it was estimated that water quality standards could not be attained with the MPRs. Thus, a second scenario was applied allowing greater reductions that may not be feasible.

The fecal bacteria TMDL developed for the Jones Falls watershed is 860 billion MPN *E. coli*/day. The TMDL is distributed between a load allocation (LA) for nonpoint sources and waste load allocations (WLA) for point sources, including National Pollutant Elimination System (NPDES) wastewater treatment plants (WWTPs), NPDES municipal separate storm sewer systems (MS4) and NPDES combined sewer overflows (CSOs). The LA is 212 billion MPN *E. coli*/day. The WWTP WLA is 0.05 billion MPN *E. coli*/day. The MS4s WLA is 647.95 billion MPN *E. coli*/day and the CSO load allocation is 0.0 MPN *E. coli*/day. The margin of safety (MOS) has been incorporated using a conservative assumption by estimating the loading capacity of the stream based on a more stringent water quality endpoint concentration. The *E. coli* water quality criterion concentration was reduced by 5%, from 126 MPN/100ml to 119.7 MPN/100ml.

Once the EPA has approved a TMDL, and it is known what measures must be taken to reduce pollution levels, implementation of best management practices (BMPs) is expected to take place. MDE intends for the required reduction to be implemented in an iterative process that first addresses those sources with the largest impacts to water quality and creating the greatest risks to human health, with consideration given to ease and cost of implementation. In addition, follow up monitoring plans will be established to track progress and to assess the implementation efforts. As previously stated, water quality standards cannot be attained in the Jones Falls subwatersheds using the MPR scenario. This may occur in subwatersheds where wildlife is a significant component or in subwatersheds that require very high reductions of fecal bacteria loads to meet water quality standards. Therefore, MDE proposes a staged approach to implementation of the required reductions, beginning with the MPR scenario, as an iterative process that first addresses those sources making the largest impacts on water quality and creating the greatest risks to human health, with consideration given to ease and cost of implementation. In addition, follow-up monitoring plans will be established to track progress and to assess the effectiveness of implementation efforts.

1.0 INTRODUCTION

This document, upon approval by the U.S. Environmental Protection Agency (EPA), establishes a Total Maximum Daily Load (TMDL) for fecal bacteria in Jones Falls (basin number 02-13-09-04). Section 303(d)(1)(C) of the federal Clean Water Act (CWA) and the EPA implementing regulations direct each state to develop a TMDL for each impaired water quality limited segment (WQLS) on the Section 303(d) List, taking into account seasonal variations and a protective margin of safety (MOS) to account for uncertainty. A TMDL reflects the total pollutant loading of the impairing substance a waterbody can receive and still meet water quality standards.

TMDLs are established to achieve and maintain water quality standards. A water quality standard is the combination of a designated use for a particular body of water and the water quality criteria designed to protect that use. Designated uses include activities such as swimming, drinking water supply, and shellfish propagation and harvest. Water quality criteria consist of narrative statements and numeric values designed to protect the designated uses. Criteria may differ among waters with different designated uses.

The Maryland Department of the Environment (MDE) has identified Jones Falls and all tributaries above Lake Roland, a designated Use III waterbody (Water Contact Recreation, Protection of Aquatic Life and Natural Trout Waters), and Jones Falls between North Avenue (Baltimore City) and Lake Roland, a designated Use IV waterbody (Water Contact Recreation, Protection of Aquatic Life and Recreational Trout Waters) [Code of Maryland Regulations (COMAR) 26.08.02.08.08] in the State's 303(d) List as impaired by metals (copper and lead) (1996), nutrients (1996), sediments (1996), bacteria (fecal coliform) (2002), PCBs (Lake Roland) (2002) and by impacts to biological communities (2004). This document proposes to establish a TMDL of fecal bacteria in Jones Falls and its tributaries that will allow for the attainment of the designated use, primary contact recreation. The impairment for metals (copper and lead) was removed from the 303(d) List through a water quality analyses approved by EPA in December 2, 2004. A TMDL for chlordane was approved by EPA on March 23, 2001. The listings for nutrients, sediments, PCBs and impacts to biological communities will be addressed separately at a future date. A data solicitation for fecal bacteria was conducted by MDE in 2003, and all readily available data from the past five years was considered.

Fecal bacteria are microscopic single-celled organisms (primarily fecal coliforms and fecal streptococci) found in the wastes of warm-blooded animals. Their presence in water is used to assess the sanitary quality of water for body-contact recreation, consumption of molluscan bivalves (shellfish), and drinking water. Excessive amounts of fecal bacteria in surface water used for recreation are known to indicate an increased risk of pathogen-induced illness to humans. Infections due to pathogen-contaminated recreation waters include gastrointestinal, respiratory, eye, ear, nose, throat, and skin diseases (EPA, 1986).

In 1986, EPA published "Ambient Water Quality Criteria for Bacteria", in which three indicator organisms were assessed to determine their correlation with swimming-associated illnesses. Fecal coliform, *E. coli* and enterococci were the indicators used in the analysis. Fecal coliform are a subgroup of total coliform bacteria and *E. coli* are a subgroup of fecal coliform. Most *E.*

coli are harmless and are found in great quantities in the intestines of people and warm-blooded animals; however, certain pathogenic strains may cause illness. Enterococci are a subgroup of bacteria in the fecal streptococcus group. Fecal coliform, *E. coli* and enterococci can all be classified as fecal bacteria. The results of the EPA study (EPA, 1986) demonstrated that fecal coliform showed less correlation to swimming-associated gastroenteritis than either *E. coli* or enterococci.

The Jones Falls watershed was listed on the Maryland 303(d) List in 2002 using fecal coliform as the indicator organism. Based on EPA's guidance (EPA, 1986), adopted by Maryland in 2004, the State has revised the bacteria water quality criteria and it is now based on water column limits for either *E. coli* or enterococci. Because multiple monitoring datasets are available within this watershed for various pathogen indicators, the general term fecal bacteria will be used to refer to the impairing substance throughout this document. The TMDL will be based on the pathogen indicator organisms specified in Maryland's current bacteria water quality criteria, either *E. coli* or enterococci. The indicator organism used in the Jones Falls TMDL analysis was *E. coli*.

2.0 SETTING AND WATER QUALITY DESCRIPTION

2.1 General Setting

Location

The Jones Falls watershed is located in the Patapsco River region of the Chesapeake Bay watershed within Maryland (see Figure 2.1.1). The watershed covers a portion of Baltimore County and Baltimore City, Maryland. Jones Falls proper flows east and south from its headwaters in Garrison, Maryland to its discharge into the Inner Harbor in downtown Baltimore City. An impoundment is located at Lake Roland, just north of the Baltimore County/City boundary. Several tributaries drain to the Jones Falls mainstem, including Moores Branch, Roland Run, Towson Run, Western Run, and Stoney Run. The entire Jones Falls watershed area comprises 37,290 acres (58.3 sq. mi.).

Jones Falls is a free flowing, non-tidal stream. Due to the density of the urban landscape in downtown Baltimore City, Jones Falls flows through roughly three miles of underground duct before discharging into the Baltimore Harbor. This flow regime changes the effective watershed area considered for this report. First, runoff from the area above the underground portion of the watershed does not flow into the Jones Falls mainstem, but rather is routed directly to the Baltimore Harbor. Second, it is not possible to monitor in the underground portion of the stream. Therefore, the watershed area considered for this TMDL is the effective watershed area (*i.e.*, the land area draining to the above-ground portion of the stream). The lower extent of the watershed area will be determined by the location of the most downstream monitoring station in the Jones Falls mainstem before going underground. Therefore, the area of the effective Jones Falls watershed considered in this TMDL analysis is 34,122 acres (53.3 sq. mi.).

Geology/Soils

The Jones Falls watershed lies within the Piedmont and Coastal Plain provinces of central Maryland. The Piedmont province is characterized by gentle to steep rolling topography, and low hills and ridges. The surficial geology is characterized by crystalline rocks of volcanic origin and often determines the limits of stream bank and streambed. These crystalline formations decrease in elevation from northwest to southeast and eventually extend beneath the younger sediments of the Coastal Plain. The fall line represents the transition between the Atlantic Coastal Plain province and the Piedmont province. The Atlantic Coastal Plain surficial geology is characterized by thick, unconsolidated marine sediments deposited over the crystalline rock of the piedmont province. The deposits include clays, silts, sands, and gravels (Coastal Environmental Services, 1995).

The Jones Falls watershed drains from northwest to southeast, following the gradient of the underlying crystalline bedrock in the Piedmont province. The surface elevations range from approximately 680 feet to sea level at the discharge. Stream channels of the sub-watersheds are well incised in the Eastern Piedmont, and exhibit relatively straight reaches and sharp bends, reflecting their tendency to following zones of fractured or weathered rock. The stream channels

broaden abruptly as they flow down across the fall line into the soft, flat Coastal Plain sediments (Coastal Environmental Services, 1995).

Above the Baltimore City/County boundary, Jones Falls lies predominantly in the Baile soil series. Soils in this series are very deep, poorly drained, exhibit slow to moderately slow permeability, and occur on upland depressions and slopes. The secondary soil series in the Baltimore County area of the watershed is the Hatboro soil series, which has similar characteristics as the Baile soil series and is often found in flood plains.

In Baltimore City the primary soil series is the Lehigh series. This series is characterized by deep and somewhat poorly drained soil with slow permeability. The secondary soil series present in the lower Jones Falls watershed is the Beltsville soil series, which is distinguished by being moderately well drained and often found in upland regions of the coastal plain geologic region. The spatial distributions for each soil series are shown in Figure 2.1.2.

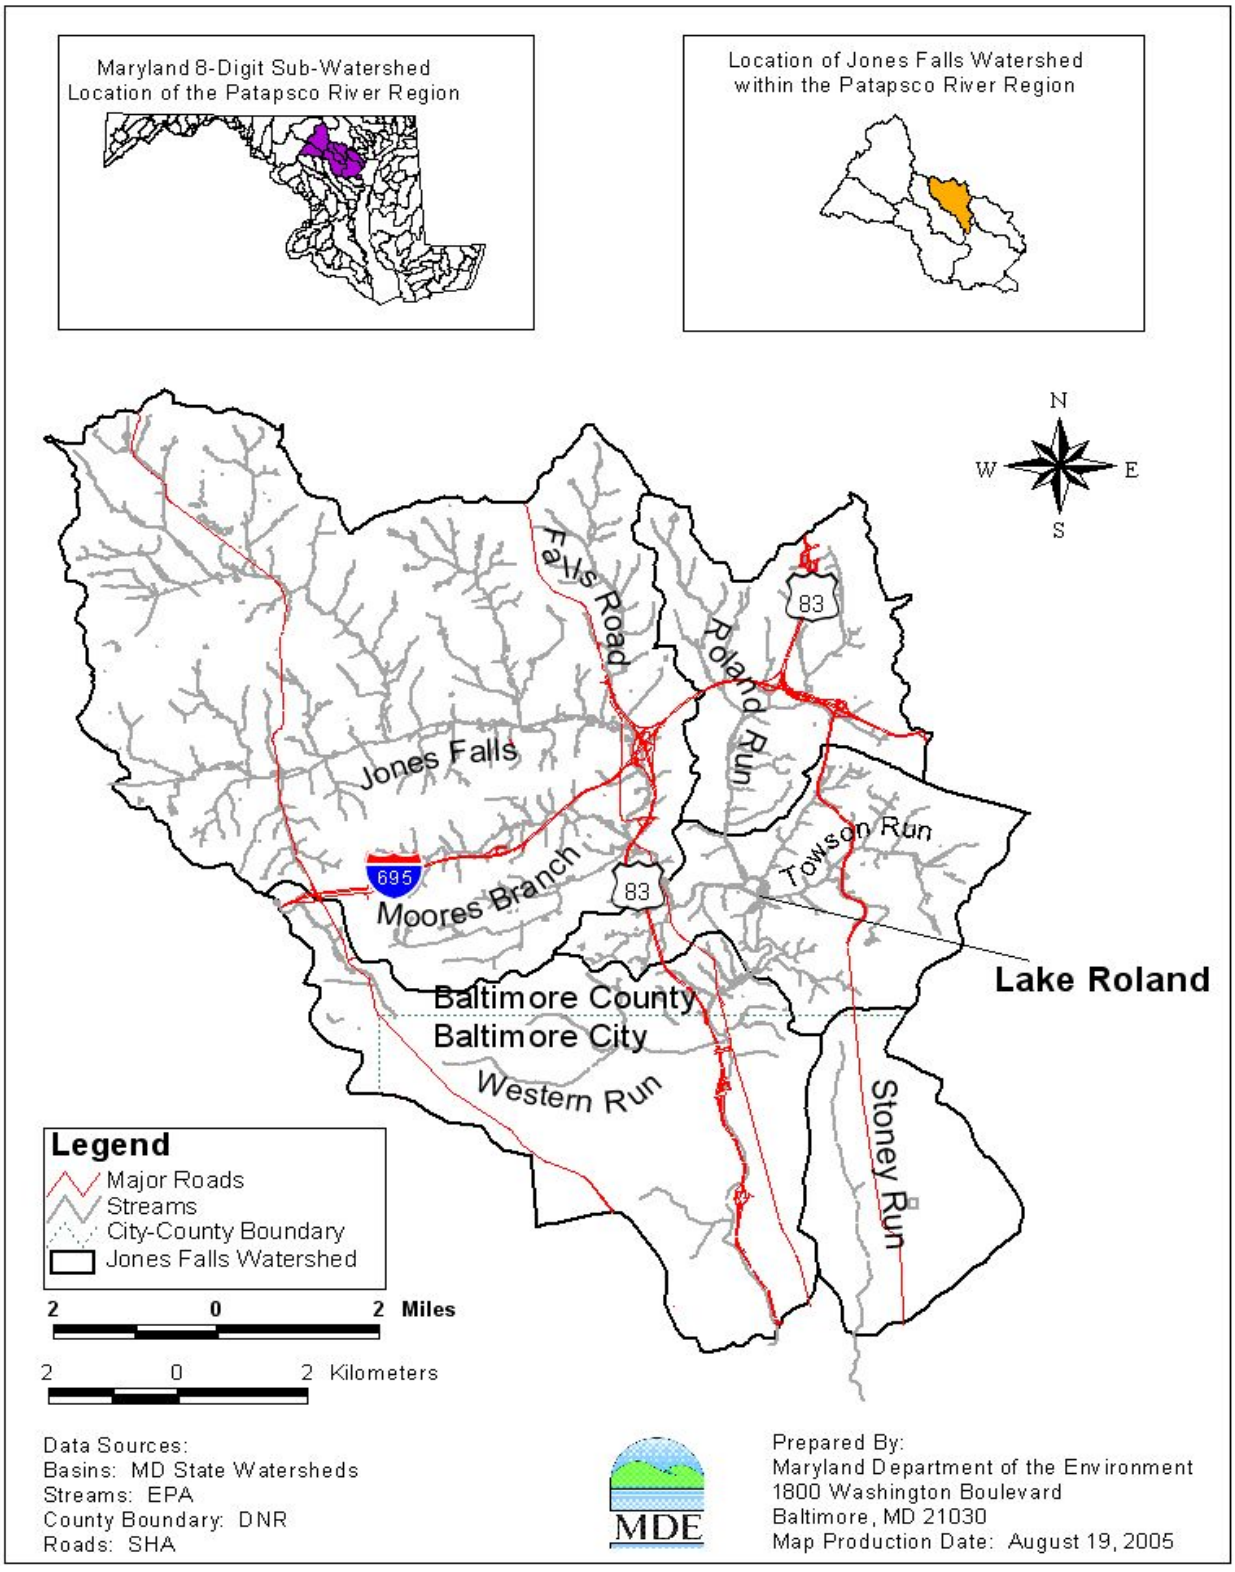

Figure 2.1.1: Location Map of the Jones Falls Watershed

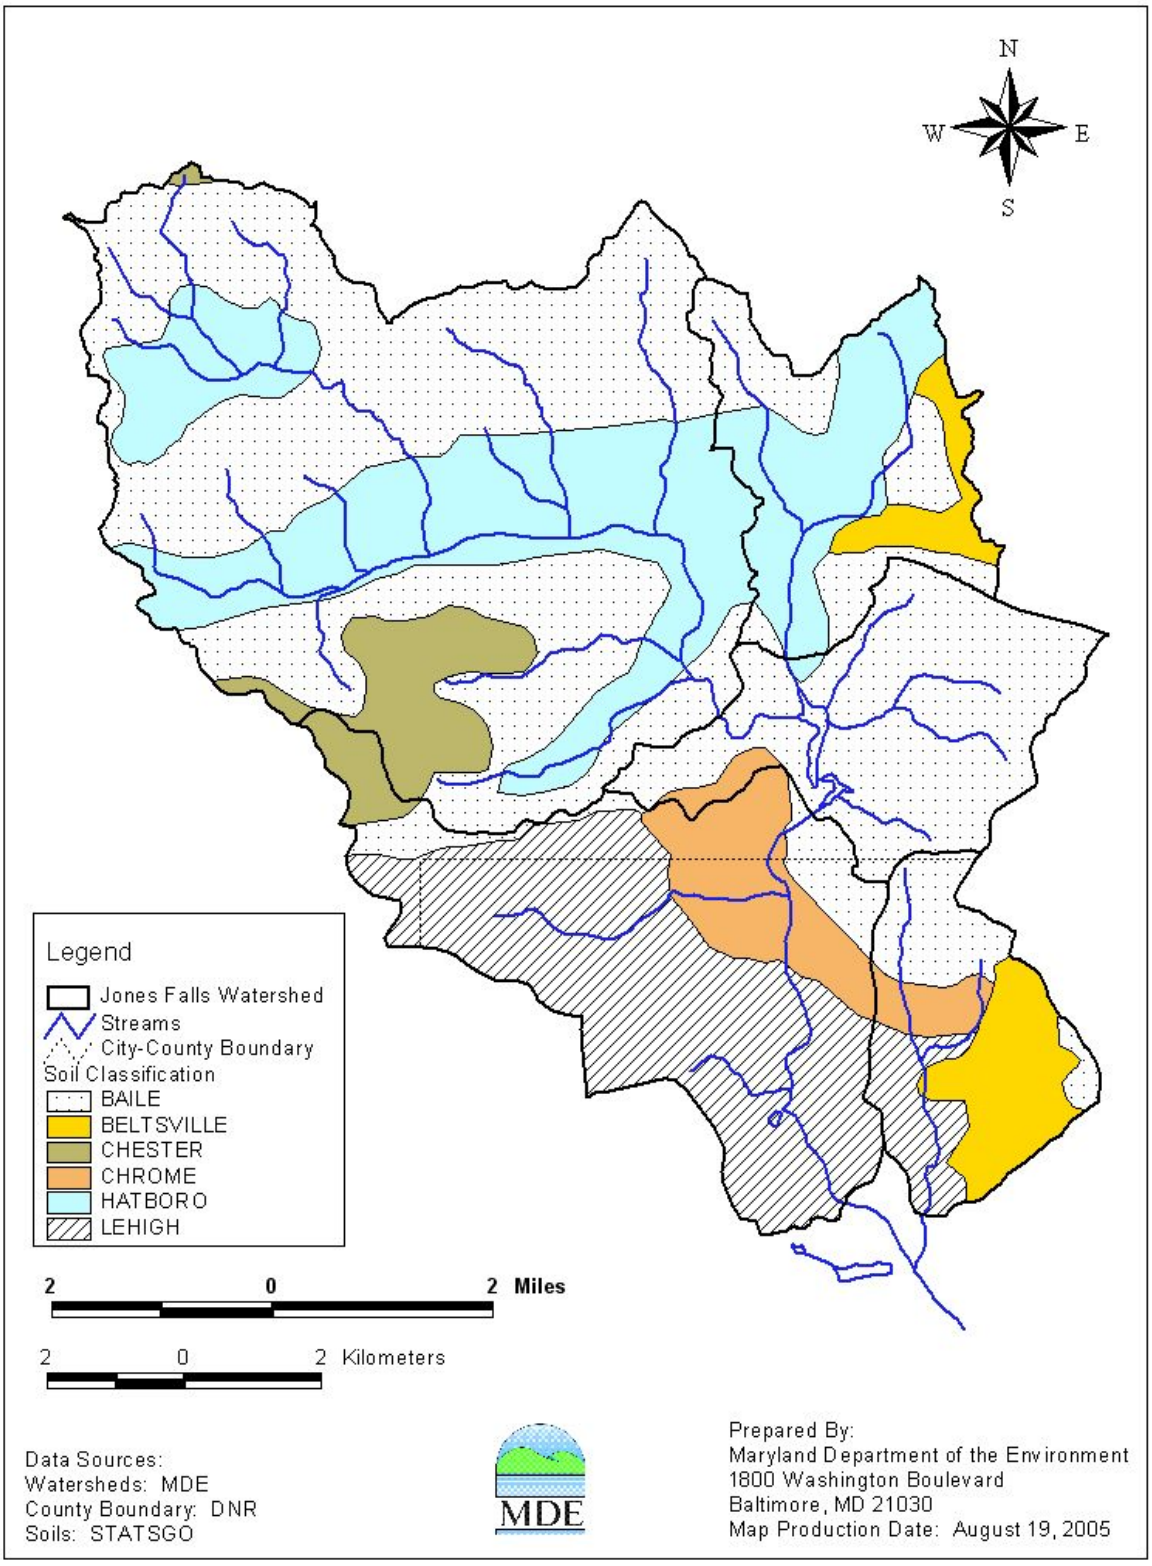

Figure 2.1.2: General Soil Series in the Jones Falls Watershed

Land Use

The Jones Falls watershed encompasses 34,122 acres (53.3 sq. mi.) within urban Baltimore City and suburban Baltimore County. The Jones Falls watershed is one of the most densely populated watersheds within the Chesapeake Bay drainage basin.

The 2000 Maryland Department of Planning (MDP) land use/land cover data shows that the watershed can be characterized as primarily residential and forested. Park and forest lands cover 16% of the watershed and are concentrated in the Baltimore County portion of the watershed. The residential and commercial land uses cover approximately 75% of the watershed and are more concentrated in the Baltimore City portion of the watershed. The land use percentage distribution for Jones Falls Basin is shown in Table 2.1.1, and spatial distributions for each land use are shown in Figure 2.1.3.

Table 2.1.1: Land Use Percentage Distribution for Jones Falls Watershed

Land Type	Acreage	Percentage
Forest	5,901	17.3
Residential	20,080	60.9
Commercial	4,486	13.1
Crops	2,326	6.8
Pasture	547	1.6
Water	54	0.2
Totals	**34,122**	**100%**

Population

The total population in the Jones Falls watershed is estimated to be 152,195. Figure 2.1.4 displays the population density in the watershed. Urban areas are more densely populated within the Baltimore City limits. The population is less dense in the suburban areas of Baltimore County.

The population and the number of households in the watershed were estimated based on a weighted average from the Geographic Information System (GIS) 2000 Census Block and the 2002 MDP land use cover. Since the Jones Falls watershed is a sub-area of the Census Block, the GIS tool was used to extract the areas from the 2000 Census Block within the watershed.

Based on the land use for residential density (low, medium, high) from the MDP land use cover, the number of dwellings per acre was calculated using Table 2.1.2 in the Jones Falls watershed.

Table 2.1.2: Number of Dwellings Per Acre

Land use Code	Dwellings Per Acre
11 Low Density Residential	1
12 Medium Density Residential	5
13 High Density Residential	8

Based on the number of households from the total population from the Census Block and the number of dwellings per acre from the MDP land use cover, population per subwatershed was calculated (Table 2.1.3).

Table 2.1.3: Total Population Per Subwatershed in Jones Falls Watershed

Subwatershed	Population	Dwellings
UQQ0005	32,791	9,956
JON0184	35,517	13,558
JON0082	28,570	8,276
JON0039	35,812	20,783
SRU0005	19,505	7,207
Total	152,195	59,780

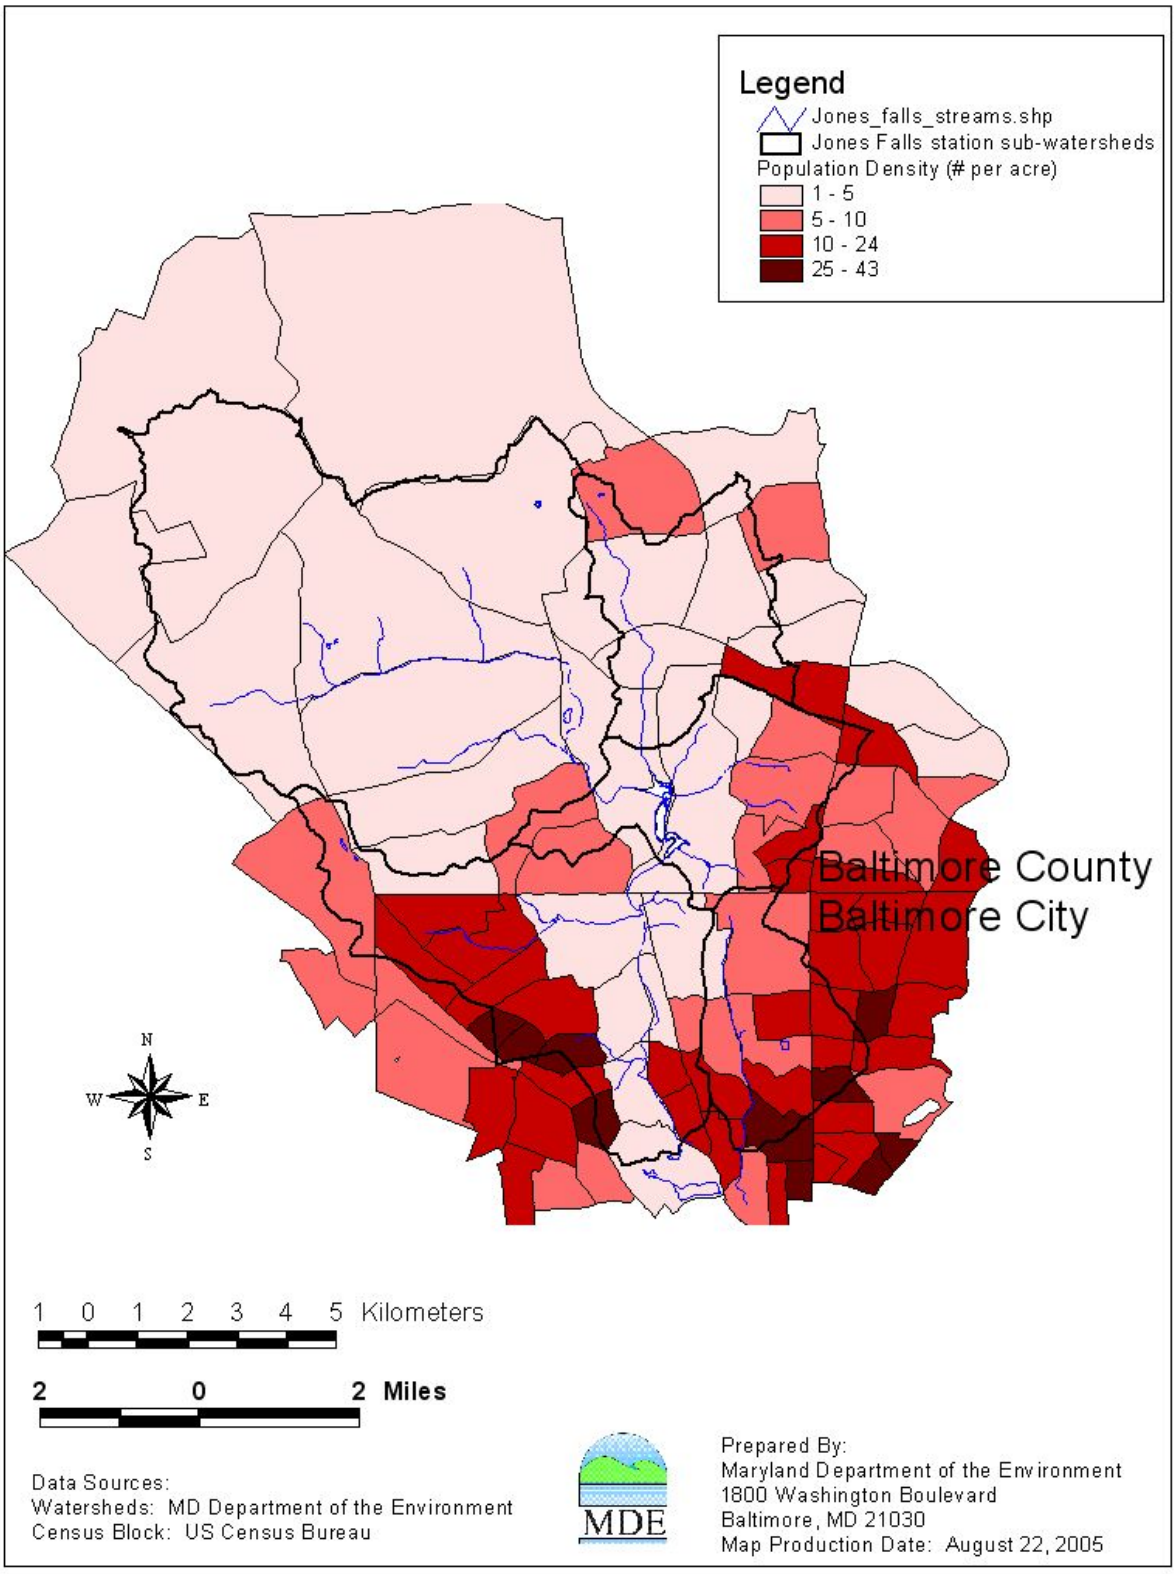

Figure 2.1.4: Population Density in Jones Falls Watershed

2.2 Water Quality Characterization

From EPA's guidance document "Ambient Water Quality Criteria for Bacteria" (1986), fecal bacteria, *E. coli*, and enterococci were assessed as indicator organisms for predicting human health impacts. A statistical analysis found that the highest correlation to gastrointestinal illness was linked to elevated levels of *E. coli* and enterococci in fresh water (enterococci in salt water), leading EPA to propose that states use *E. coli* or enterococci as pathogen indicators.

As per EPA's guidance, Maryland has adopted the new indicator organisms, *E. coli* and enterococci, for the protection of public health in Use I, II, III and IV waters. These bacteria listings were originally assessed using fecal coliform bacteria. The assessment was based on a geometric mean of the monitoring data, where the result could not exceed a geometric mean of 200 MPN/100ml. From EPA's analysis (EPA, 1986), this fecal coliform geometric mean target equates to an approximate risk of 8 illnesses per 1,000 swimmers at fresh water beaches and 19 illnesses per 1,000 swimmers at marine beaches (enterococci only), which is consistent with MDE's revised Use I bacteria criteria. Therefore the original 303(d) List fecal coliform listings can be addressed using the refined bacteria indicator organisms to assure that risk levels are acceptable.

Bacteria Monitoring

Table 2.2.1 lists the historical monitoring data for the Jones Falls watershed. MDE conducted monitoring sampling from October 2002 through June 2003. Monitoring Station JON0184 (CORE) was used by the Maryland Department of Natural Resources (DNR) to identify the bacterial impairment. There are five MDE monitoring stations in the Jones Falls watershed. In addition to the bacteria monitoring stations, there are three United States Geological Survey (USGS) gaging stations used in deriving the surface flow in Jones Falls. The locations of these stations are shown in Tables 2.2.2 to 2.2.4 and Figure 2.2.1. Observations recorded during the period 2002-2003 from the five MDE monitoring stations are shown in Appendix A. In general, based on statewide monitoring data, fecal bacteria concentrations are higher in the headwaters. This is consistent with findings from Wickham, *et al*. (2005) regarding pathogens in Maryland, where the likelihood of an impairment decreases with watershed size. A table listing the monitoring results from the Jones Falls watershed appears in Appendix A.

Bacteria counts are highly variable and results are presented on a log scale for the five monitoring stations for data collected for October 2002 through June 2003. Ranges were typically between 10 and 10,000 MPN/100 ml.

Table 2.2.1: Historical Monitoring Data in the Jones Falls Watershed

Sponsor	Location	Date	Design	Summary
Maryland Department of Natural Resources (DNR) CORE Monitoring	Baltimore County	1995 - 1999	Fecal Coliform*	JON0184 - High Bacteria concentrations
Maryland Department of Natural Resources (DNR) CORE Monitoring	Baltimore County	10/02 to 10/03	Fecal Coliform*	2002 305(b) Update – JON0184 show bacteria geometric mean of 344 MPN/100mL
Baltimore City	Baltimore City	1997 - 2001	Fecal Coliform*	Geometric Mean = 2,724 MPN/100mL
MDE	Baltimore City and Baltimore County	10/02 – 06/03	*E Coli*	5 stations Enumeration 2x per Month

*Only *E. coli* was used for this analysis.

2.3 Water Quality Impairment

Designated Uses and Water Quality Standard

The Maryland water quality standards Surface Water Use Designations for Jones Falls are Use III for the mainstem and all tributaries above Lake Roland (Nontidal Cold Water), and Use IV for Jones Falls from North Avenue to Lake Roland Dam (Recreational Trout Waters). See COMAR 26.08.02.08R(b). Jones Falls was first listed in the State's 2002 303(d) List as impaired by fecal coliform bacteria, and has been included on the final 2004 Integrated 303(d) List.

Water Quality Criteria

The State water quality standard for bacteria (*E. coli*) used in this study is as follows (COMAR 26.08.02.03-3):

Table 2.3.1: Bacteria Criteria Values from Table 1 COMAR 26.08.02.03-3 Water Quality Criteria Specific to Designated Uses.

Indicator	Steady-state Geometric Mean Indicator Density
Freshwater	
E. coli	126 MPN/100 ml

Interpretation of Bacteria Data for General Recreational Use

The relevant portion (for freshwater) of the listing methodology pursuant to the 2006 integrated 303(d) List for all Use Waters - Water Contact Recreation and Protection of Aquatic Life is as follows:

Recreational Waters

A steady-state geometric mean will be calculated with available data where there are at least five representative sampling events. The data shall be from samples collected during steady-state conditions and during the beach season (Memorial Day through Labor Day) to be representative of the critical condition. If the resulting steady-state geometric mean is greater than 126 cfu/100 ml *E. coli* in freshwater, the waterbody will be listed as impaired. If fewer than five representative sampling events for an area being assessed are available, data from the previous two years will be evaluated in the same way. The single sample maximum criterion applies only to beaches and is to be used for closure and advisory decisions based on short term exceedances of the geometric mean portion of the standard.

Water Quality Assessment

The water quality impairments in the Jones Falls watershed were assessed by comparing both the annual and the seasonal (May 1st – September 30th) steady-state geometric means of *E. coli* concentrations with the water quality criterion. The steady-state condition is defined as unbiased sampling targeting average flow conditions and/or equally sampling or providing for unbiased sampling of high and low flows. The 1986 EPA criteria document assumed steady-state flow in determining the risk at various bacterial concentrations, and therefore the chosen criterion value also reflects steady-state conditions (EPA, 1986). The steady-state geometric mean condition can be estimated either by monitoring design or more practically by statistical analysis as follows:

1. A stratified monitoring design is used where the number of samples collected is proportional to the duration of high flows, mid flows and low flows within the watershed. This sample design allows a geometric mean to be calculated directly from the monitoring data.

2. Routine monitoring typically results in samples from varying hydrologic conditions (*i.e.*, high flows, mid flows and low flows) where the numbers of samples are not proportional to the duration of those conditions. Averaging these results without consideration of the sampling conditions results in a biased estimate of the steady-state geometric mean. The potential bias of the steady-state geometric means can be reduced by weighting the samples results collected during high flow, mid flow and low flow regimes by the proportion of time each flow regime is expected to occur. This ensures that the high flow and low flow conditions are proportionally balanced on an annual and seasonal basis.

3. If (1) the monitoring design was not stratified based on flow regime or (2) flow information is not available to weight the samples accordingly, then a geometric mean of sequential monitoring data can be used as an estimate of the steady-state geometric mean condition for the specified period.

A routine monitoring design was used to collect bacteria data in the Jones Falls watershed. To estimate the steady-state geometric means, the monitoring data were first reviewed by plotting the sample results versus their corresponding daily flow duration percentile. Graphs illustrating these results can be found in Appendix B.

To calculate the steady-state geometric means with routine monitoring data, a conceptual model was developed by dividing the daily flow frequency for the stream segment into strata that are representative of hydrologic conditions. A conceptual continuum of flows is illustrated in Figure 2.3.1.

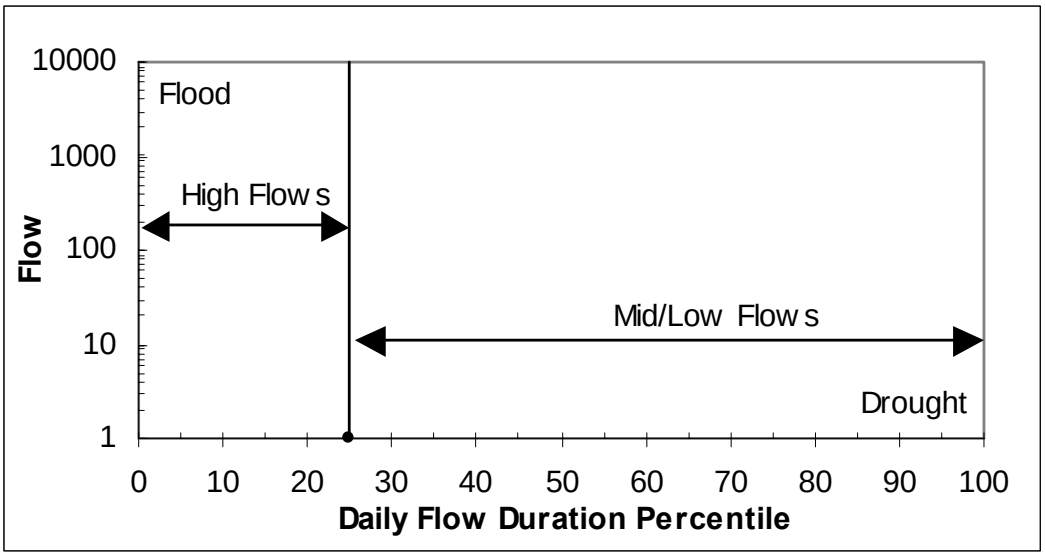

Figure 2.3.1: Conceptual Diagram of Flow Duration Zones

During high flows a significant portion of the total stream flow is from surface flow contributions. Low flow conditions represent periods with minimal rainfall and surface runoff. There is typically a transitional period (mid flows) between the high and low flow durations that is representative of varying contributions of surface flow inputs that result from differing rainfall volumes and antecedent soil moisture conditions. The division of the entire flow regime into strata enables the estimation of a less biased geometric mean from routine monitoring data that more closely approaches steady state. Based on a flow analysis of several watersheds throughout Maryland, it was determined that flows within the 25th to 30th daily flow duration percentiles were representative of average daily flows. It is assumed for this analysis that flows above the 25th percentile represent high flows and flows below the 25th percentile represent mid/low flows. A detailed method of how the flow strata were defined is presented in Appendix B.

Factors for estimating a steady-state geometric mean are based on the frequency of each flow stratum. The weighting factor accounts for the proportion of time that each flow stratum represents. The weighting factors for an average hydrological year used in the Jones Falls TMDL analysis are presented in the following table (Table 2.3.2).

Table 2.3.2: Weighting factors for Average Hydrology Year Used for Estimation of Geometric Means in the Jones Falls Watershed (Average Hydrology Year)

Flow Duration Zone	Duration Interval	Weighting Factor
High Flows	0 – 25%	0.25
Mid/Low Flows	25 – 100%	0.75

Bacteria enumeration results for samples within a specified flow stratum will receive their corresponding weighting factor. The steady-state geometric mean is calculated as follows:

$$M = \sum_{i=1}^{2} M_i * W_i \qquad (1)$$

where

$$M_i = \frac{\sum_{j=1}^{n_i} \log_{10}(C_{i,j})}{n_i} \qquad (2)$$

M = log weighted mean
M_i = log mean concentration for stratum *i*
W_i = Proportion of stratum *i*
$C_{i,j}$ = Concentration for sample *j* in stratum *i*
n_i = number of samples in stratum *i*

Finally the steady-state geometric mean concentration is estimated using the following equation:

$$C_{gm} = 10^{M} \qquad (3)$$

Cgm = Steady-state geometric mean concentration

Tables 2.3.3 and 2.3.4 present the maximum and minimum concentrations by stratum, geometric means by stratum and the overall steady-state geometric mean for the Jones Falls subwatersheds for the annual and the seasonal (May 1st –September 30th) periods.

Table 2.3.3: Jones Falls Annual Steady-state Geometric Mean by Stratum per Subwatersheds

Station	Flow Stratum	# Samples	*E. coli* Minimum (MPN/100ml)	*E. coli* Maximum (MPN/100ml)	Annual Steady-state Geometric Mean (MPN/100ml)	Annual Overall Geometric Mean (MPN/100ml)

2.4 Source Assessment

Nonpoint Source Assessment

Nonpoint sources of fecal bacteria do not have one discharge point but occur over the entire length of a stream or waterbody. During rain events, surface runoff transports water and fecal bacteria over the land surface and discharges to the stream system. This transport is dictated by rainfall, soil type, land use, and topography of the watershed. Many types of nonpoint sources introduce fecal bacteria to the land surface, including the manure spreading process, direct deposition from livestock during the grazing season, and excretions from pets and wildlife. The deposition of non-human fecal bacteria directly to the stream occurs when livestock or wildlife have direct access to the waterbody. Nonpoint source contributions from human activities generally arise from failing septic systems and their associated drain fields or leaking infrastructure (*i.e.*, sewer systems). Land use in the Jones Falls watershed consists primarily of forested and developed land uses; therefore, sources associated with agricultural land use (*i.e.*, livestock) represent a minimal contribution to the load allocation (LA) in this watershed. The entire watershed is covered by two National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) individual permits; therefore, contributions from domestic animal and human sources will be categorized under point sources or Waste Load

Allocations (WLAs). Wildlife contributions will be distributed between WLAs and LAs due to the presence of wildlife in both developed and undeveloped areas of the watershed.

Sewer Systems

Sewage collection systems within the Jones Falls watershed convey wastewater from municipalities in Baltimore County and Baltimore City. The wastewater is treated by one municipal wastewater treatment plant (WWTP), the Back River WWTP. Some sections of the Baltimore City sewage collection system are combined sewer systems (CSSs), receiving stormwater as well as wastewater. In addition, storm water in the watershed is conveyed through storm sewers covered by NPDES MS4 permits. Because the bacteria sources associated with these sewer systems are thus derived from point sources, they are addressed in the Point Source Assessment section below.

Septic Systems

There are on-site disposal (septic) systems located in the northern and western part of the Jones Falls watershed. Table 2.4.1 displays the number of septic systems and households per subwatershed. Figure 2.4.1 presents the areas covered by sewers and the septics location in the Jones Falls watershed.

Table 2.4.1: Septic Systems and Households per Subwatershed in Jones Falls Watershed

Subwatershed Station	Households per Subwatershed	Septics Systems (units)
UQQ0005	9,956	633
SRU0005	7,207	0
JON0184	13,558	3,998
JON0082	8,276	464
JON0039	20,783	134

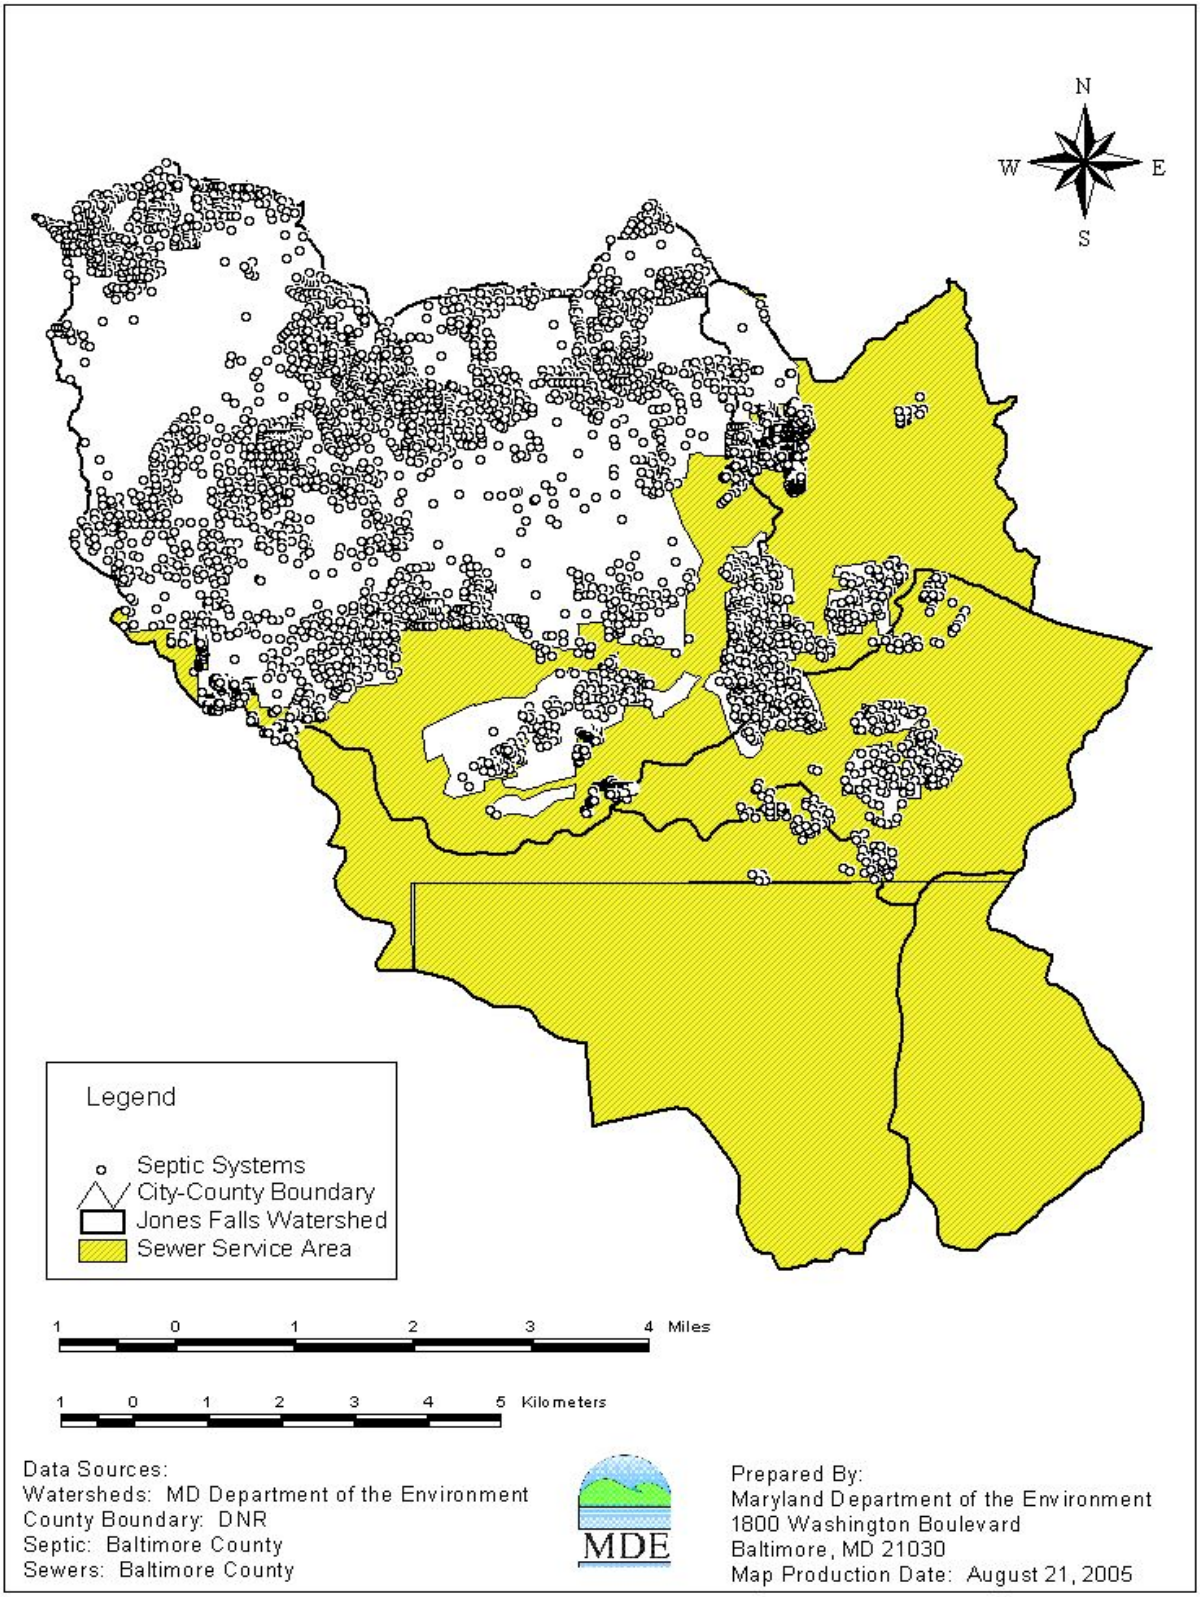

Figure 2.4.1: Sanitary Sewer Service Area and Septics in the Jones Falls Watershed

Point Source Assessment

There are two broad types of National Pollutant Discharge Elimination System (NPDES) permits considered in this analysis, individual and general. Both types of permits include industrial and municipal categories. Individual permits can include industrial and municipal WWTPs and Phase I municipal separate storm sewer systems (MS4s). MDE general permits have been established for surface water discharges that include: Phase II and other MS4 permits, surface coal mines, mineral mines, quarries, borrow pits, ready-mix concrete, asphalt plants, seafood processors, hydrostatic testing of tanks and pipelines, marinas, concentrated animal feeding operations, and stormwater associated with industrial activities.

Municipal Separate Stormwater Systems (MS4)

The Jones Falls watershed is located in Baltimore City and Baltimore County, which are both individual Phase I National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit jurisdictions. The MS4 permits cover stormwater discharges from the municipal separate stormwater sewer systems in the City and the County.

Baltimore City has conducted stormwater monitoring for 15 years in the area, both at the outfalls and in the stream. The City has monitored for fecal bacteria during base flow and storm events. Broken sanitary pipes laid in the streambed are a major source of fecal bacteria. As a result, fecal concentrations are higher in Jones Falls during dry weather than during wet weather, because the wastewater is exfiltrating (seeping) into the stream.

Sanitary Sewer Overflows

Sanitary Sewer Overflows (SSOs) occur when the capacity of a sanitary sewer is exceeded. There are several factors that may contribute to SSOs from a sewer system, including pipe capacity, operations and maintenance effectiveness, sewer design, age of system, pipe materials, geology and building codes. SSOs are prohibited by the facilities' permit and therefore must be reported to MDE's Water Management Administration in accordance with COMAR 26.08.10, to be addressed under the State's enforcement program.

In 2002, Baltimore City, MDE, and EPA entered into a civil consent decree to address SSOs and combined sewer overflows (CSOs)[1] within its jurisdictional boundaries. See U.S., et al., v. Mayor and City Council of Baltimore, JFM-02-12524, Consent Decree (entered Sept. 30, 2002). Similarly, in 2005, Baltimore County, MDE and EPA entered into a civil consent decree to address SSOs in the County. See U.S., et al. v. Baltimore County, AMD-05-2028, Consent Decree (entered Sept. 20, 2006). The consent decrees require the City and the County to evaluate their sanitary sewer systems and to repair, replace, or rehabilitate the systems as indicated by the results of those evaluations, with all work to be completed by January 2016 for Baltimore City and by March 2020 for Baltimore County.

[1] A "combined sewer system" is a sewer system in which stormwater and sanitary sewerage are conveyed through a common set of pipes for treatment at a wastewater treatment plant. A CSO is an overflow from such a combined system. Baltimore City agreed in the Consent Decree to separate the sanitary and stormwater lines in the small areas served by a combined system and has completed that separation.

There were a total of 64 SSO events reported between October 2002 and October 2003. Approximately 454,066 gallons of SSO discharge were released through various waterways (surface water, groundwater, sanitary sewers, *etc*.) in the Jones Falls mainstem and tributaries (MDE, Water Management Administration). Figure 2.4.2 depicts the location where SSOs occurred between October 2002 and 2003 in the Jones Falls watershed.

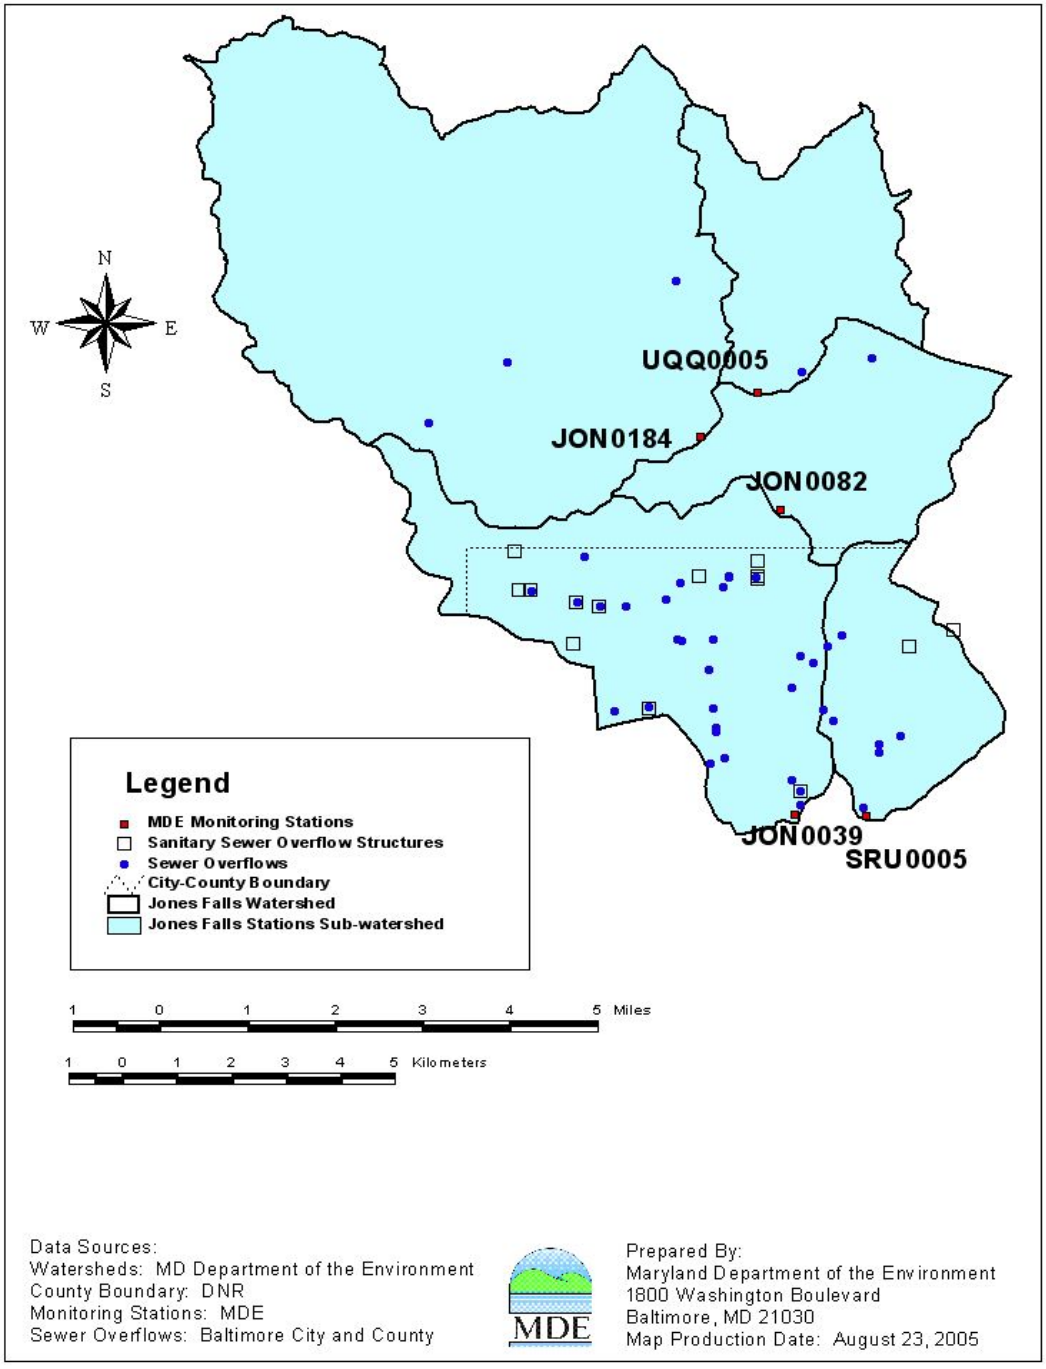

Figure 2.4.2: Location of Sanitary Sewer Overflows in the Jones Falls Watershed

SSO and CSO Structures

CSO and SSO structures, which are a part of the sewage collection system infrastructure, are designed to release sewage when the capacity of a combined or separate sewer system is exceeded, in order to prevent backups within the collection system. Like non-structural SSOs, there are several factors that may contribute to structural CSOs and SSOs from a sewage collection system, including pipe capacity, operations and maintenance effectiveness, sewer design, age of system, pipe materials, geology and building codes. Structural CSOs and SSOs are designed to discharge; therefore, they are subject to NPDES permit requirements. As explained in the preceding section, all overflow structures will be eliminated from the sanitary sewer system by January 2016 for Baltimore City and by March 2020 for Baltimore County.

In the Jones Falls watershed, the Back River WWTP is responsible for all CSO and SSO structural releases under their associated NPDES permits. The watershed contains a total of 17 sewer overflow structures. Table 2.4.2 and Figure 2.4.3 display the location of CSO and SSO structures which discharge into the Jones Falls and its tributaries.

Table 2.4.2: Sanitary and Combined Sewer Overflow Structures in the Jones Falls Watershed

Treatment Plant	NPDES ID	CSO/SSO Structure ID	Type	Latitude	Longitude	Receiving Water
Back River WWTP	MD0021555	20	SSO	39.372	-76.701	Western Run

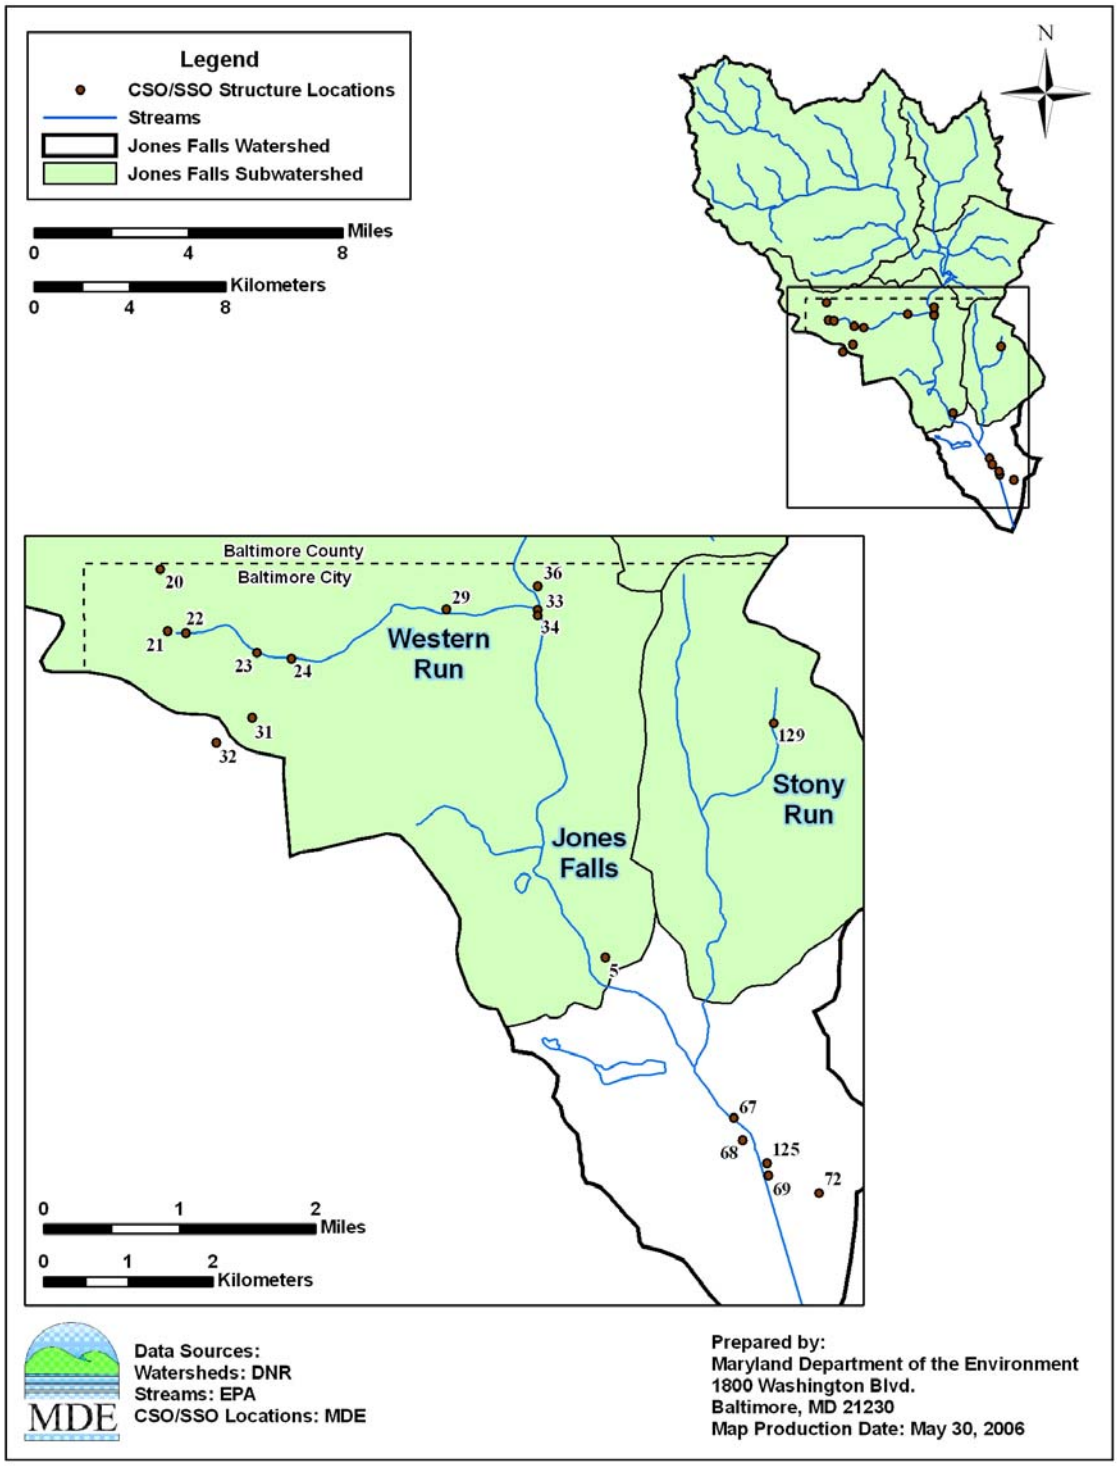

Figure 2.4.3: Sanitary and Combined Sewer Overflows Structures in the Jones Falls Watershed

Municipal and Industrial WWTPs

Based on the point source permitting information, there are seven NPDES industrial WWTPs in the watershed but none of them are permitted to discharge fecal bacteria into Jones Falls. There are two NPDES municipal point source facilities with permits regulating the discharge of fecal bacteria directly into the Jones Falls watershed: Villa Julie College and St. Timothy's School (Table 2.4.3 and Figure 2.4.4). The St. Timothy's School NPDES WWTP has a current permit, but the company managing the plant has informed MDE that the WWTP will be connected to the Baltimore County collection system by the end of July 2006 (Telephone conversation with Mr. Robert Corn, Miller Environmental Services, June 2006).

Table 2.4.3: NPDES municipal WWTPs with permits regulating the discharge of fecal bacteria directly in the Jones Falls Watershed (02-13-09-04)

Permittee	NPDES Permit No.	County	Average Annual Flow (MGD)	Average Annual Fecal Coliform Concentrations (MPN/100ml)	Fecal Coliform Load Per Day (Billion MPN/day)
Villa Julie WWTP	MD0066001	Baltimore County	0.0078	14.50	0.0043
St. Timothy's School WWTP	MD0056103	Baltimore County	0.0053	48.14	0.0097

Bacteria Source Tracking

Bacteria source tracking (BST) was used to identify the relative contribution of bacteria from different sources in in-stream water samples. BST Monitoring was conducted at four stations throughout the Jones falls watershed with 12 samples (one per month) collected for a one-year duration. Sources are defined as domestic (pets and human associated animals), human (human waste), livestock (agricultural animals), and wildlife (mammals and waterfowl). To identify sources, samples are collected within the watershed from known fecal sources and the patterns of antibiotic resistance of these known sources are compared to isolates of unknown bacteria from ambient samples. Details of the BST methodology and data can be found in Appendix C.

An accurate representation of the expected average source at each station is estimated by using a stratified weighted mean of the identified sample results over the specified period. The weighting factors are based on the log10 of the bacteria concentration and the percent of time that represents the high stream flow or low stream flow (see Appendix B). The procedure for calculating the stratified weighted mean of the sources per monitoring station as follows:

1. Calculate the percentage of isolates per source per each sample date (S).
2. Calculate the weighted percentage (MS) of each source per flow strata (high/low) (see Section 4). The weighting is based on the $\log_{10}$ bacteria concentration for the water sample.
3. The final weighted mean source percentage, for each source category, is based on the proportion of time in each flow duration zone (see Appendix C).

The weighted mean for each source category is calculated using the following equations:

$$M_k = \sum_{i=1}^{2} MS_{i,k} * W_i \qquad (4)$$

where

$$MS_{i,k} = \frac{\sum_{j=1}^{n_i} \log_{10}(C_{i,j}) * S_{i,j,k}}{n_i} \qquad (5)$$

M_k = weighted mean proportion of isolates of source *k*
$MS_{i,k}$ = Weighted mean proportion of isolates for source k in stratum *i*
W_i = Proportion covered by stratum *i*
i = stratum
j = sample
k = Source category (1 = human, 2 = domestic, 3 = livestock, 4 = wildlife, 5 = unknown)
C*i,j* = Concentration for sample *j* in stratum *i*
S*i,j,k* = Proportion of isolates for sample *j*, of source k in stratum *i*
n_i = number of samples in stratum *i*

The complete distributions of the annual and seasonal periods source loads are listed in Tables 2.4.4 and 2.4.5. Details of the BST data can be found in Appendix C.

3.0 TARGETED WATER QUALITY GOAL

The overall objective of the fecal bacteria TMDL set forth in this document is to establish the loading caps needed to ensure attainment of water quality standards in the Jones Falls watershed. These standards are described fully in Section 2.3, "Water Quality Impairment."

4.0 TOTAL MAXIMUM DAILY LOADS AND SOURCE ALLOCATION

4.1 Overview

This section provides an overview of the non-tidal fecal bacteria TMDL development, with a discussion on the many complexities involved with the estimation of bacteria concentrations, loads and sources. The second section presents the analysis framework and how the hydrological, water quality and BST data are linked together in the TMDL process. The third section describes the analysis for estimating a representative geometric mean fecal bacteria concentration and baseline loads. The analysis methodology is based on available monitoring data and is specific to a free flowing stream system. The fourth section addresses critical conditions and seasonality. The fifth section presents the margin of safety. The sixth section discusses TMDL loading caps. The seventh section presents TMDL scenario descriptions. The eighth section presents the load allocations. Finally, in the ninth section, the TMDL equation is summarized.

To be most effective, the TMDL provides a basis for allocating loads among the known pollutant sources in the watershed so that appropriate control measures can be implemented and water quality standards achieved. By definition, the TMDL is the sum of the individual waste load allocations (WLA) for point sources, load allocations (LA) for nonpoint sources and natural background sources. A margin of safety (MOS) is also included and accounts for the uncertainty in the analytical procedures used for water quality modeling, and the limits in scientific and technical understanding of water quality in natural systems. Although this formulation suggests that the TMDL be expressed as a load, the Code of Federal Regulations (40 CFR 130.2(i)) states that the TMDL can be expressed in terms of "mass per time, toxicity or other appropriate measure."

For many reasons, bacteria are difficult to simulate in water quality models. They reproduce and die off in a non-linear fashion as a function of many environmental factors, including temperature, pH, turbidity (UV light penetration), and settling. They occur in concentrations that vary widely (*i.e.*, over orders of magnitude) and accurate estimations of source inputs are difficult to develop. Finally, limited data are available to characterize the effectiveness of any program or practice at reducing bacteria loads (Schueler, 1999).

Bacteria concentrations, determined through laboratory analysis of in-stream water samples for bacteria indicators (*e.g., E. coli*), are expressed in either colony forming units (CFU) or most probable number (MPN) of colonies. The first method (Method 1600) is a direct estimate of the bacteria colonies (EPA, 1985), and the second (Method 9223B) is a statistical estimate of the number of colonies (APHA, 1998.) Enumeration results indicate the extreme variability in the

total bacteria counts. The distribution of the enumeration results from water samples tends to be lognormal, with a strong positive skew of the data. Estimating loads of constituents that vary by orders of magnitude can introduce much uncertainty and result in large confidence intervals around the final results.

Estimating bacteria sources can be problematic due to the many assumptions required and the limited available data. For example, when considering septic systems, information is required on spatial location of failing septic systems, consideration of transport to in-stream assessment location and estimation of the load from the septic system (degree of failure). Secondary sources, such as illicit discharges, also add to the uncertainty in a bacteria water quality model.

Estimating domestic animal sources requires information regarding the pet population in a watershed, how often the owners clean up after them, and the spatial location of the pet waste relative to the stream (near-field for upland transport). Livestock sources are limited by spatial resolution of Agricultural Census information (available at the county level), site-specific issues relating to animals' confinement, and confidentiality of data related to the development of Nutrient Management Plans. The most uncertain source category is wildlife. In an urban environment, this can result from the increased deer populations near streams to rat populations in storm sewers. In rural areas, estimation of wildlife populations and habitat locations in a watershed is required.

MDE appreciates the inherent uncertainty in developing traditional water quality models for the calculation of bacteria TMDLs. Traditional water quality modeling is very expensive and time consuming and, as identified, contains many potential uncertainties. MDE believes it should be reserved for specific constituents and complex situations. In this TMDL, MDE applies an analytical method which, when combined with BST analysis, appears to provide reasonable results (Cleland, 2003). Using this approach, Maryland can address more impaired streams in the same time period than by using the traditional water quality modeling methods.

4.2 Analysis Framework

This TMDL analysis uses flow duration curves to identify flow intervals that are indicators of hydrological conditions (*i.e.*, annual average, critical conditions). As explained previously, this analytical method, combined with water quality monitoring data and BST provides a better description of water quality and meets TMDL requirements.

Figure 4.2.1 illustrates how the hydrological (flow duration curve), water quality and BST data are linked together for the TMDL development.

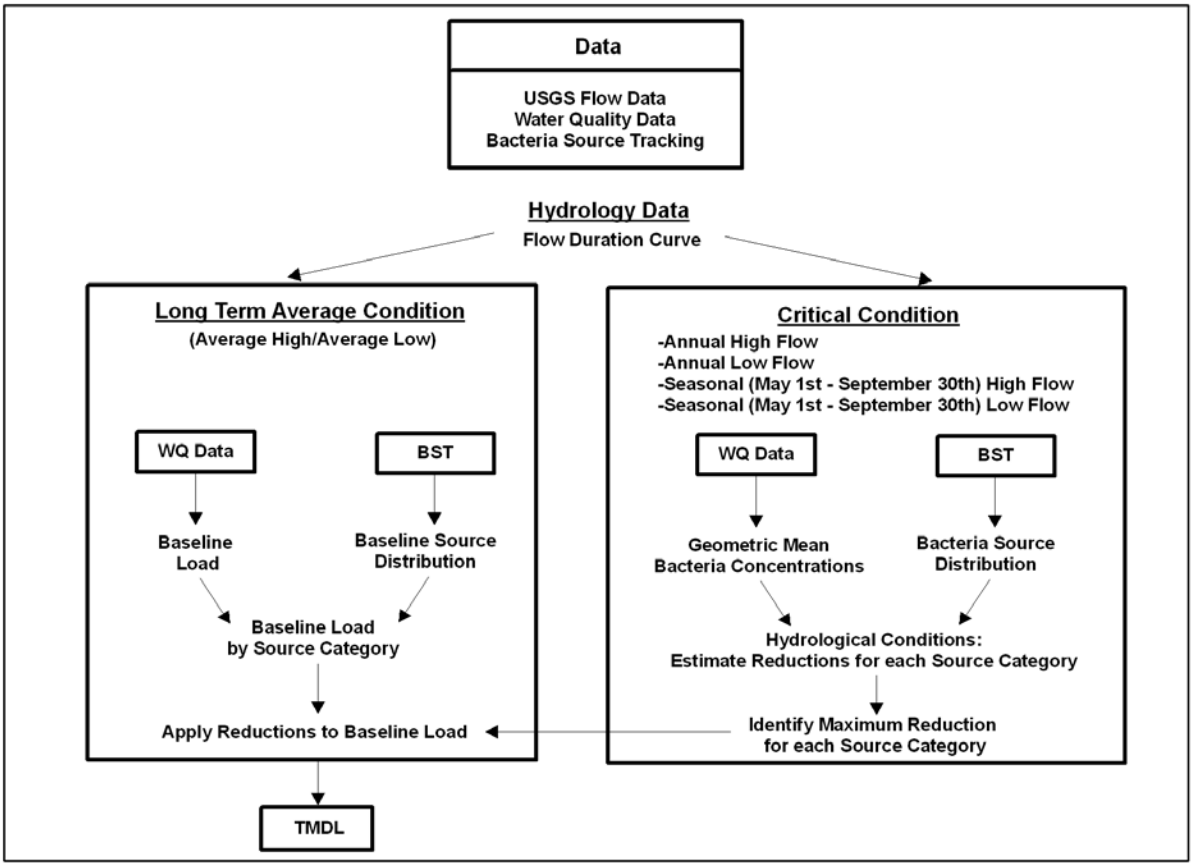

Figure 4.2.1: Diagram of Non-tidal Bacteria TMDL Analysis Framework

4.3 Estimating Baseline Loads

Baseline loads estimated in this TMDL analysis are reported as long-term average loads. The geometric mean concentration is calculated from the log transformation of the raw data. Statistical theory tells us that when back-transformed values are used to calculate average daily loads or total annual loads, the loads will be biased low (Richards, 1998). To avoid this bias, a factor should be added to the log-concentration before it is back transformed. There are several methods of determining this bias correction factor, ranging from parametric estimates resulting from the theory of the log-normal distribution to non-parametric estimates using a smearing factor. [Ferguson, 1986; Cohn *et al*., 1989; Duan, 1983]. There is much literature on the applicability of and results from these various methods with a summary provided in Richards (1998). Each has advantages and conditions of applicability. A non-parametric estimate of the bias correction factor (Duan, 1983) was used in this TMDL analysis.

The bias correction factor is estimated as follows:

$F_1 = A_i / C_i$ (6)

F_1 = Bias correction factor
A_i = Long term annual arithmetic mean for stratum *i*
C_i = Long term annual geometric mean for stratum *i*

Daily average flows are estimated for each flow stratum using the watershed area ratio approach, since nearby long-term flow monitoring data are available.

The loads for each stratum are estimated as follows:

$$L_i = Q_i * C_i * F_1 * F_2 \quad (7)$$

where

L_i = Daily average load (MPN/day) at each station for stratum *i*
Q_i = Daily average flow (cfs) for stratum *i*
C_i = long term annual geometric mean for stratum *i*
F_1= Bias correction factor
F_2= Unit conversion factor from cfs*MPN/100ml to MPN/day (2.4466x107)

For each subwatershed, the total baseline load is estimated as follows:

$$L_t = \sum_{i=1}^{2} L_i * W_i \quad (8)$$

L_t = Daily average load at station (MPN/day)
W_i= Proportion or weighting factor of stratum *i*

In the Jones Falls watershed, weighting factors of 0.25 for high flow and 0.75 for low flow were used to estimate the average annual baseline load expressed as billion MPN *E. coli*/day. Results are found in Table 4.3.1.

Table 4.3.1: Baseline Load Calculations

Station		JON0184	UQQ0005	JON0082sub	JON0039sub	SRU0005
Area (mi^2)		26.03	5.81	6.43	11.79	4.53
High Flow	Daily Average Flow (cfs)	80.9	18.1	20.0	77.8	17.8
	E. coli Concentration (MPN/100ml)	532.6	592.9	2,952.6	5,211.2	4,544.6
	Bias Correction Factor	12.0	4.7	6.7	3.6	3.0
Low Flow	Daily Average Flow (cfs)	19.1	4.4	4.9	5.5	3.1
	E. coli Concentration (MPN/100ml)	254.5	357.7	637.2	1,270.6	1,931.5
	Bias Correction Factor	1.6	2.0	5.7	1.8	2.3
Baseline Load (Billion *E. coli* MPN/day)		3,305	367	2,431	9,152	1,744

To treat each subwatershed as a separate entity, thus allowing separate loads and reduction targets for watersheds that have one or more upstream monitored sub-watersheds, they were subdivided into unique watershed segments. For stations JON0082 and JON0039, there is an upstream monitoring station (Figure 4.3.1). The subwatersheds were defined with the extension sub to the station name (e.g., JON0082sub, JON0039sub) and the total baseline loads from the upstream watersheds, estimated from the monitoring data, were multiplied by a transport factor derived from first order decay. The decay factor for *E. coli* used in the analysis was obtained from the study "Pathogen Decay in Urban Waters" by Easton *et al* (2001), and was estimated by linear regression of counts of microorganisms versus time (Die-off plots). The estimated transported loads were then subtracted from the downstream cumulative load to estimate the adjacent subwatershed load.

The general equation for the flow mass balance is:

$$\sum Q_{us} + Q_{sub} = Q_{ds} \quad (8)$$

where

Q_{us} = Upstream flow
Q_{sub} = Subwatershed flow
Q_{ds} = Downstream flow

and the general equations for bacteria loading mass balance:

$$\sum (e^{kt} * Q_{us} * C_{us}) + Q_{sub} * C_{sub} = Q_{ds} * C_{ds} \quad (9)$$

where

C_{us} = Upstream bacteria concentration
k = Bacteria (*E. coli*) decay coefficient (1/day) = 0.762 day^{-1}
t = travel time from upstream watershed to outlet
C_{sub} = Subwatershed bacteria concentration
C_{ds} = Downstream bacteria concentration

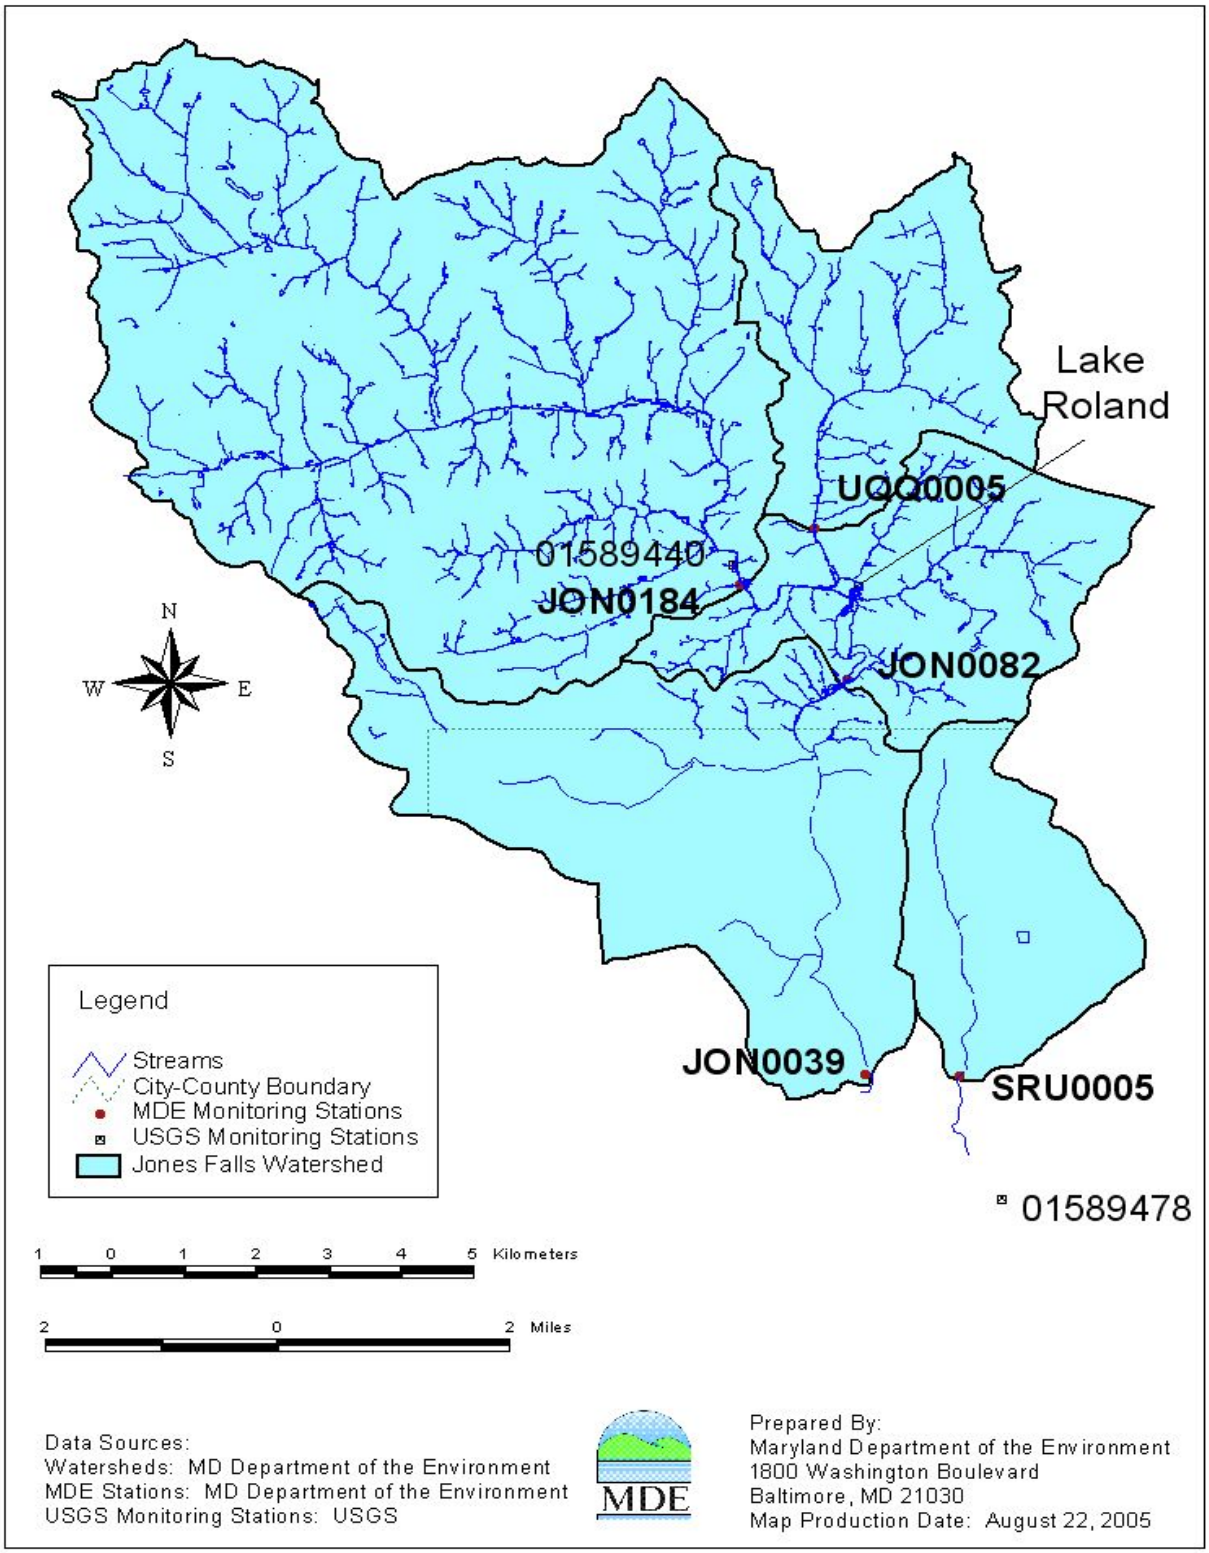

Figure 4.3.1: Monitoring Stations and Subwatersheds in the Jones Falls Watershed

The concentrations in the subwatersheds were estimated by considering the ratio of high flow concentration to low flow concentrations in the upstream watersheds. If the total load and average flow were used to estimate the geometric mean concentration, this estimated concentration would be biased if there was a correlation with flow and concentration. For example, in two strata, the steady-state geometric mean is estimated as follows:

$$L = (Q_{high} * W_{high} * C_{high}) + (Q_{low} * W_{low} * C_{low}) \quad (10)$$

L = Average Load
Q_i = Average flow for stratum i
W_i= Proportion of stratum i
C_i = Concentration for stratum i
n_i = number of samples in stratum i

The load in equation (10) is based on two concentrations and therefore when using the mass balance approach and the total load, this results in two unknowns, C_{high} and C_{low}, within one equation. Thus a relationship between C_{high} and C_{low}, must be estimated to solve for the concentration in both strata. This relationship is estimated using the average of the ratios estimated from the monitoring data in the upstream watersheds. Using this relationship, the following two equations result:

$$C_{low} = \frac{L}{Q_{high} * R * W_{high} + Q_{low} * W_{low}} \quad (11)$$

where

$$R = \frac{C_{high}}{C_{low}} \quad (12)$$

and the final geometric mean concentration is estimated as follows:

$$GM = 10^{W_{high} \log_{10}(C_{high}) + W_{low} \log_{10}(C_{low})} \quad (13)$$

Source estimates from the bacteria source tracking analysis are completed for each station and are based on the contribution from the upstream watershed, if applicable. Given the uncertainty of in-stream bacteria processes and the complexity involved in back-calculating an accurate source transport factor, the sources for JON0082sub, and JON0039sub were assigned from the analysis for JON0082, and JON0039, respectively.

4.4 Critical Condition and Seasonality

Federal regulations (40 CFR 130.7(c)(1)) require TMDLs to take into account critical conditions for stream flow, loading, and water quality parameters. The intent of this requirement is to ensure that the water quality of the waterbody is protected during times when it is most vulnerable.

For this TMDL the critical condition is determined by assessing annual and seasonal hydrological conditions for high flow and low flow periods. Seasonality is captured by assessing the time period when water contact recreation is expected (May 1st - September 30th). The average hydrological condition over a 15-year period is approximately 25% high flow and 75% low flow as defined in Appendix B. Using the definition of a high flow condition occurring when the daily flow duration interval is less than 25% and a low flow condition occurring when the daily flow duration interval is greater than 25%, the critical hydrological condition can be estimated by the percent of high or low flows during a specific period and hydrological condition.

Maryland's proposed fecal bacteria TMDL for Jones Falls has been determined by assessing various hydrological conditions to account for seasonal and annual averaging periods (Table 4.4.1). The following four conditions were used to account for the critical condition: annual high flow, annual low flow, seasonal high flow and seasonal low flow.

Table 4.4.1: Hydrological Conditions Used to Account for Critical Condition and Seasonality

Hydrological Condition		Averaging Period	Water Quality Data Used	Subwatershed	Fraction High Flow	Fraction Low Flow	Period
Annual	High	365 days	All	JON0184, UQQ0005, JON0082sub	0.80	0.20	April 1996 to March 1997
				JON0039sub, SRU0005	0.59	0.41	April 1996 to March 1997
	Low	365 days	All	JON0184, UQQ0005, JON0082sub	0.02	0.98	September 2001 to August 2002
				JON0039sub, SRU0005	0.08	0.92	August 2001 to July 2002
Seasonal	High	May 1st – Sept 30th	May 1st – Sept 30th	JON0184, UQQ0005, JON0082sub	0.78	0.22	May 1st, 1996 to September 30th, 1996
				JON0039sub, SRU0005	0.53	0.47	May 1st 2003 to September 30th, 2003
	Low	May 1st – Sept 30th	May 1st – Sept 30th	JON0184, UQQ0005, JON0082sub	0.01	0.99	May 1st, 2002 to September 30th, 2002
				JON0039sub, SRU0005	0.10	0.90	May 1st 1997 to September 30th, 1997

The critical condition is determined by the maximum reduction per source that satisfies all four conditions in each subwatershed, and is required to meet the water quality standard while minimizing the risk to water contact recreation. It is assumed that the reduction that can be implemented to a bacteria source category will be constant through all conditions.

The monitoring data for all stations located in the Jones Falls watershed cover a sufficient temporal span (at least one year) to estimate annual and seasonal conditions. The required reductions to meet water quality standards in each subwatershed and for each hydrological condition are presented in Table 4.4.2.

Table 4.4.2: Required Reductions to Meet Water Quality Standards

Station	Hydrological Condition		Domestic %	Human %	Livestock %	Wildlife %
JON0184	Annual	High flow	58.0%	98.0%	60.1%	0.0%
		Low flow	0.0%	98.0%	16.9%	0.0%

		Low flow	60.1%	98.0%	70.7%	0.0%
	Maximum Source Reduction		96.6%	98.0%	90.8%	0.0%
JON0082sub	Annual	High flow	98.0%	98.0%	98.0%	11.1%
		Low flow	69.6%	98.0%	72.6%	0.0%
	Seasonal	High flow	98.0%	98.0%	98.0%	42.5%
		Low flow	73.4%	98.0%	74.1%	0.0%
	Maximum Source Reduction		98.0%	98.0%	98.0%	42.5%
JON0039sub	Annual	High flow	98.0%	98.0%	98.0%	23.0%
		Low flow	84.5%	98.0%	98.0%	0.0%
	Seasonal	High flow	73.7%	98.0%	88.1%	0.0%
		Low flow	56.5%	98.0%	72.4%	0.0%
	Maximum Source Reduction		98.0%	98.0%	98.0%	23.0%
SRU0005	Annual	High flow	89.5%	98.0%	98.0%	0.0%
		Low flow	77.4%	98.0%	98.0%	0.0%
	Seasonal	High flow	98.0%	98.0%	98.0%	75.7%
		Low flow	98.0%	98.0%	98.0%	38.3%
	Maximum Source Reduction		98.0%	98.0%	98.0%	75.7%

4.5 Margin of Safety

A margin of safety (MOS) is required as part of this TMDL in recognition of the many uncertainties in the understanding and simulation of bacteriological water quality in natural systems and in statistical estimates of indicators. As mentioned in Section 4.1, it is difficult to estimate stream loadings for fecal bacteria due to the variation in loadings across sample locations and time. Load estimation methods should be both precise and accurate to obtain the true estimate of the mean load. Refined precision in the load estimation is due to using a stratified approach along the flow duration intervals thus reducing the variation in the estimates. Moreover, Richards (1998) reports that averaging methods are generally biased, and the bias increases as the size of the averaging window increases. Finally, accuracy in the load estimation is based on minimal bias in the final result when compared to the true value.

Based on EPA guidance, the MOS can be achieved through two approaches (EPA, April 1991). One approach is to reserve a portion of the loading capacity as a separate term in the TMDL (*i.e.*, TMDL = LA + WLA + MOS). The second approach is to incorporate the MOS as conservative assumptions used in the TMDL analysis. . For this TMDL, the second approach was used by estimating the loading capacity of the stream based on a more stringent water quality criterion concentration. The *E. coli* water quality criterion concentration was reduced by 5%, from 126 *E. coli* MPN/100ml to 119.7 *E. coli* MPN/100ml.

4.6 TMDL Loading Caps

The TMDL loading cap is an estimate of the assimilative capacity of the monitored watershed and is provided in MPN/day. The loading caps presented in this section are for the watersheds located upstream of monitoring stations JON0184, UQQ0005, JON0082, JON0039 and SRU0005.

The TMDL is based on a long-term average hydrological condition. Estimation of the TMDL requires knowledge of how the bacteria concentrations vary with flow rate or the flow duration interval. This concentration versus flow relationship is accounted for by using the strata defined on the flow duration curve.

The TMDL loading caps are estimated by first determining the baseline or current condition loads for each subwatershed and the associated geometric mean from the available monitoring data. The baseline load is estimated using the geometric mean concentration and average daily flow for each flow stratum. The loads from these two strata are then weighted to represent average conditions (see Table 4.3.1), based on the proportion of each stratum, to estimate the total long-term loading rate.

Next, the percent reduction required to meet the water quality criterion is estimated from the observed bacteria concentrations accounting for the critical conditions (See Section 4.4). A reduction in concentration is proportional to a reduction in load, thus the TMDL is equal to the current baseline load multiplied by one minus the required reduction.

$$TMDL = L_b * (1 - R) \quad (12)$$

where

Lb = Current or baseline load estimated from monitoring data
R = Reduction required from baseline to meet water quality criterion

The bacteria TMDLs for the subwatersheds are shown in Table 4.6.1

Table 4.6.1: Jones Falls Watershed TMDL Summary

Station	Baseline Load *E. coli* (Billion MPN/day)	TMDL Load *E. coli* (Billion MPN/day)	% Target Reduction
JON0184	3,305	250	92.4%
UQQ0005	367	29	92.1%

4.7 Scenario Descriptions

Source Distribution

The final source distribution is derived from the source proportions listed in Table 2.4.4. For the purposes of the TMDL analysis and allocations, the percentage of sources identified as "unknown" were removed and the known sources were then scaled up proportionally so that they totaled 100%. The source distribution used in this scenario is presented in Table 4.7.1.

Table 4.7.1: Baseline Loads Source Distributions

Station	Domestic		Human		Livestock		Wildlife	
	%	Load (Billion *E. coli* MPN/day)	%	Load (Billion *E. coli* MPN/day)	%	Load (Billion *E. coli* MPN/day)	%	Load (Billion *E. coli* MPN/day)
JON0184	27.4%	906.5	52.0%	1,719.2	16.3%	538.1	4.3%	141.5
UQQ0005	16.8%	61.6	70.5%	258.6	7.4%	27.1	5.3%	19.3
JON0082sub	24.1%	585.5	57.8%	1,404.7	13.2%	321.8	4.9%	118.7
JON0039sub	19.9%	1,816.7	67.5%	6,175.6	9.1%	832.3	3.6%	327.3
SRU0005	13.8%	240.4	80.1%	1,396.2	5.4%	94.1	0.7%	13.0

Practicable Reduction Targets

The maximum practicable reduction (MPR) for each of the four source categories is listed in Table 4.7.2. These values are based on best professional judgment and a review of the available literature. It is assumed that human sources would potentially confer the highest risk of gastrointestinal illness and therefore should have the highest reduction. If a domestic WWTP is located in the upstream watershed, this is considered in the MPR so as to not violate the permitted loads. The domestic animal category includes sources from pets (*e.g.*, dogs) and the MPR is based on an estimated success of education and outreach programs.

Table 4.7.2: Maximum Practicable Reduction Targets

	Human	Domestic	Livestock	Wildlife
Max Practical Reduction per Source	95%*	75%	75%	0%
Rationale	(a) Direct source inputs (b) Human pathogens more prevalent in humans than animals. (c) Enteric viral diseases spread from human to human[1]	Target goal reflects uncertainty in effectiveness of urban BMPs[2] and is also based on best professional judgment	Target goal based on sediment reductions from BMPs[3] and best professional judgment	No programmatic approaches for wildlife reduction to meet water quality standards Waters contaminated by wild animal waste offer a public health risk that is orders of magnitude less than that associated with human waste.[4]

*Since much of the human sources in this watershed are due to infrastructure failure, correction of exfiltration required by a consent decree may result in greater reductions than in other watersheds.

[2]USEPA. 1999. Preliminary Data Summary of Urban Storm Water Best Management Practices. EPA-821-R-99-012. U.S. Environmental Protection Agency, Washington, DC.
[3]USEPA. 2004. Agricultural BMP Descriptions as Defined for The Chesapeake Bay Program Watershed Model. Nutrient Subcommittee Agricultural Nutrient Reduction Workshop.
[4]Environmental Indicators and Shellfish Safety. 1994. Edited by Cameron, R., Mackeney and Merle D. Pierson, Chapman & Hall.

As previously stated, these practicable reduction targets are based on the available literature and best professional judgment. There is much uncertainty with estimated reductions from best management practices (BMPs). The BMP efficiency for bacteria reduction ranged from –6% to +99% based on a total of 10 observations (EPA, 1999). The MPR to agricultural lands was based on sediment reductions identified by the EPA (EPA, 2004).

The practicable reduction scenario was developed based on an optimization analysis whereby a subjective estimate of risk was minimized, and constraints were set on maximum reduction and allowable background conditions. Risk was defined on a scale of one to five, where it was assumed that human sources had the highest risk (5), domestic animal and livestock next (3) and wildlife the lowest (1) (see Table 4.7.2). The objective is to minimize the sum of the risk for all conditions while meeting the maximum practicable reduction constraints. The model was defined as follows:

$$\text{Min} \sum_{i=1}^{4} (Ph*5 + Pd*3 + Pl*3 + Pw*1) \qquad i = \text{hydrological condition}$$

Subject to

C = Ccr
0 <= Rh <= 95%
0 <= Rl <= 75%
0 <= Rd <= 75%
Rw = 0
Ph, Pl, Pd, Pw >= 1%

Where

Ph = % human source in final allocation
Pd = % domestic animal source in final allocation
Pl = % livestock source in final allocation
Pw = % wildlife source in final allocation
C = In-stream concentration
Ccr = Water quality criterion
Rh = Reduction applied to human sources
Rl = Reduction applied to livestock sources
Rd = Reduction applied to domestic animal sources
Rw = Reduction applied to wildlife sources

In none of the subwatersheds could the constraints of this scenario be satisfied, indicating there was not a practicable solution. A summary of the analysis is presented in Table 4.7.3.

Table 4.7.3: Practicable Reduction Results

Station	Applied Reductions				WQS Achievable
	Domestic %	Human %	Livestock %	Wildlife %	
JON0184	75.0%	95.0%	75.0%	0.0%	No
UQQ0005	75.0%	95.0%	75.0%	0.0%	No
JON0082sub	75.0%	95.0%	75.0%	0.0%	No
JON0039sub	75.0%	95.0%	75.0%	0.0%	No
SRU0005	75.0%	95.0%	75.0%	0.0%	No

The TMDL must specify load allocations that will meet the water quality standards. In the practicable reduction targets scenario none of the subwatersheds could meet water quality standards based on MPRs.

To further develop the TMDL, the constraints on the MPRs were relaxed in all five subwatersheds where the water quality attainment was not achievable with the MPRs. In this

subwatershed, the maximum allowable reduction was increased to 98% for all sources, including wildlife. A similar optimization procedure was used to minimize risk. Again, the objective is to minimize the sum of the risk for all conditions while meeting the maximum practicable reduction constraints. The model was defined as follows:

Min $\sum_{i=1}^{7}$ (Ph*5 + Pd*3 + Pl*3 + Pw*1) i = hydrological condition

Subject to

C = Ccr
0 <= Rh <= 98%
0 <= Rl <= 98%
0 <= Rd <= 98%
0 <= Rw <= 98%
Ph, Pl, Pd, Pw >= 1%

Where

Ph = % human source in final allocation
Pd = % domestic animal source in final allocation
Pl = % livestock source in final allocation
Pw = % wildlife source in final allocation
C = In-stream concentration
Ccr = Water quality criterion
Rh = Reduction applied to human sources
Rl = Reduction applied to livestock sources
Rd = Reduction applied to domestic animal sources
Rw = Reduction applied to wildlife sources

The summary of the analysis is presented in Table 4.7.4.

Table 4.7.4: TMDL Reduction Results: Optimization Model Up to 98% Reduction

Station	Domestic %	Human %	Livestock %	Wildlife %	Target Reduction
JON0184	97.7%	98.0%	90.1%	0.0%	92.4%

JON0082sub	98.0%	98.0%	98.0%	42.5%	95.3%
JON0039sub	98.0%	98.0%	98.0%	23.0%	95.3%
SRU0005	98.0%	98.0%	98.0%	75.7%	97.8%

4.8 TMDL Allocation

The TMDL allocations include the load allocation (LA) for nonpoint sources, and waste load allocations (WLA) for point sources, including WWTPs (if WWTPs are present in the watershed), stormwater (where MS4 permits are required), and CSOs (in watersheds with permitted CSOs and LTCPs not expecting complete elimination of CSOs). The margin of safety is explicit and is expressed as a 5% reduction of the *E. coli* water quality criterion concentration, from 126 MPN/100ml to 119.7 MPN/100ml. The final loads are based on average hydrological conditions with reductions estimated based on critical hydrological conditions. The load reduction scenario results in a load allocation that will achieve water quality standards. The State reserves the right to revise these allocations provided such allocations are consistent with the achievement of water quality standards.

The bacteria sources are grouped into four categories that are also consistent with divisions for various management strategies. The categories are human, domestic animal, livestock and wildlife. TMDL allocation rules are presented in Table 4.8.1. This table identifies how the TMDL will be allocated among the LA or nonpoint sources and the WLA or point sources (WWTPs, MS4 permits and CSOs, if applicable). Only the final LA or WLA is reported in this TMDL.

Table 4.8.1: Potential Source Contributions for the Jones Falls TMDL Allocations

Allocation Category	LA	WLA		
		WWTPs	MS4s	CSOs
Human		X	X	
Domestic			X	
Livestock	X			
Wildlife	X		X	

Load Allocation (LA)

All four bacteria source categories could contribute to nonpoint source loads (LA). For the human sources, the nonpoint source contribution (LA) in subwatersheds with WWTPs and CSOs is estimated by subtracting the WWTP (if applicable) and CSO loads (if applicable) from the final human load. There are two NPDES WWTPs in subwatershed JON0184, but only one will receive a WLA. There are no subwatersheds in the Jones Falls watershed with assigned NPDES CSS WLA.

Livestock loads are all assigned to the LA. Domestic animals (pets) allocation is assigned to the LA if no MS4 permits exist for the watershed. Since the entire Jones Falls watershed is covered by NPDES MS4 permits, bacteria loads from domestic animal sources are assigned to WLA-MS4 in all five subwatersheds of Jones Falls. However, wildlife sources will be distributed between the LA and the WLA-MS4, based on a ratio of the amount of urban land compared to pasture and forest land in the watershed.

Waste Load Allocation (WLA)

Municipal Separate Storm Sewer Systems (MS4)

Both individual and general NPDES MS4 Phase I and Phase II permits are point sources subject to WLA assignment in the TMDL. Quantification of rainfall-driven nonpoint source loads is uncertain. EPA recognized this in its guidance document entitled "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs" (November 2002), which states that available data and information usually are not detailed enough to determine WLAs for NPDES-regulated stormwater discharges on an outfall-specific basis. Therefore, in watersheds with an existing MS4 permit, domestic animal bacteria loads will be lumped into a single WLA-MS4 load. In watersheds with no existing individual MS4 permits, these loads will be included in the LA.

The jurisdictions within the Jones Falls watershed, Baltimore County and Baltimore City, are covered by individual Phase I MS4 program regulations. Based on EPA's guidance, the MS4 WLA is presented as one combined load for the entire land area of each county. In the future, when more detailed data and information become available, it is anticipated that MDE will revise the WLA into appropriate WLAs and LAs, and may also revise the LAs accordingly. Note that the overall reductions in the TMDL will not change. The WLA-MS4 distribution between Baltimore City and Baltimore County is presented in Table 4.8.2.

Table 4.8.2: MS4 Stormwater Allocations

Station	WLA – MS4 Loads (Billion MPN/day)		
	Baltimore City	Baltimore County	Total
JON0184	N/A	127.95	127.95
UQQ0005	N/A	23.44	23.44
JON0082sub	N/A	89.84	89.84
JON0039sub	278.24	92.75	370.99
SRU0005	35.70	N/A	35.70
Total	313.94	333.98	647.92

N/A – not applicable – subwatersheds within the County or the City only

Municipal and Industrial WWTPs

As explained in the source assessment section above, there are no industrial WWTPs with permits regulating the discharge of bacteria into Jones Falls. There are two municipal WWTPs with permits regulating the discharge of bacteria directly into the Jones Falls watershed. Only

Villa Julie College WWTP will receive a WLA. St. Timothy's WWTP will be connected to the Baltimore County collection system by the end of July 2006 and therefore it will not receive an allocation. This allocation is derived from the human source load and it is based on the permitted flow of the plant and the *E. coli* criterion concentration.

Combined Sewer Systems

There are two jurisdictions with NPDES CSSs within the Jones Falls watershed (See section 2.4, Source Assessment, for more detailed information). These jurisdictions with CSOs permitted to discharge in the Jones Falls have developed their Long Term Control Plans (LTCP), which state that CSOs are to be eliminated by the dates noted in the LTCPs. Therefore, no load will be assigned to WLA-CSOs in these jurisdictions and the final human load in the corresponding subwatersheds is allocated to the WLA-MS4.

4.9 Summary

The TMDLs for the Jones Falls subwatersheds are presented in Table 4.9.1.

Table 4.9.1: Jones Falls Watershed TMDL

Subwatershed	TMDL	LA	WLA WWTP	WLA MS4	WLA CSOs
	Billion MPN *E. coli*/day				
JON0184	250.16	122.17	0.05	127.95	0.0
UQQ0005	29.07	5.62	0.00	23.44	0.0
JON0082sub	114.54	24.70	0.00	89.84	0.0
JON0039sub	428.36	57.37	0.00	370.99	0.0
SRU0005	37.77	2.07	0.00	35.70	0.0
TOTAL	859.90	211.93	0.05	647.92	0.0

In all five subwatersheds, based on the maximum practicable reduction rates specified, water quality standards cannot be achieved. This occurs in watersheds that require very high reductions to meet water quality standards. However, if there is no feasible TMDL scenario, then MPRs are increased to provide estimates of the reductions required to meet water quality standards. For these watersheds, it is noted that the reductions may be beyond practical limits. In these cases, it is expected that the first stage of implementation will be to implement the MPR scenario.

5.0 ASSURANCE OF IMPLEMENTATION

Section 303(d) of the Clean Water Act and current EPA regulations require reasonable assurance that the TMDL load and wasteload allocations can and will be implemented. In the Jones Falls watershed, the TMDL analysis indicates that reduction of fecal bacteria loads from all sources including wildlife are beyond the maximum practicable reduction (MPR) targets. Jones Falls and its tributaries may not be able to attain water quality standards. The extent of the fecal bacteria load reductions required to meet water quality criteria in the watershed of Jones Falls are not feasible by effluent limitations or by implementing cost-effective and reasonable best management practices. Therefore, MDE proposes a staged approach to implementation beginning with the MPR scenario, with regularly scheduled follow-up monitoring to assess the effectiveness of the implementation plan.

The most significant planned implementation measures in the Jones Falls watershed involve the separation of combined sewer systems in Baltimore City and the elimination of sanitary sewer overflows in Baltimore City and Baltimore County. Each of these jurisdictions is obligated under a judicial consent decree and judgment to adopt and implement a Long Term Control Plan ("LTCP") to eliminate sewer overflows. See Consent Decree and Judgments, Consolidated Case Number: JFM-02-12524, Baltimore City Consent Decree (entered Sept. 30, 2002); and Consolidated Case Number: AMD-05-2028, Baltimore County Consent Decree (entered Sept. 20, 2006). The judicial decrees and judgments require the jurisdictions to implement these LTCPs by January 2016 for Baltimore City and by March 2020 for Baltimore County. Deadlines for LTCP implementation will be incorporated into NPDES permits and, if shorter than the court ordered deadline, permits will reflect what can be feasibly accomplished with consideration to the complexity of the engineering, the availability of resources, and the need for inter-jurisdictional coordination.

Additional reductions will be achieved through the implementation of BMPs; however, the literature reports considerable uncertainty concerning the effectiveness of BMPs in treating bacteria. As an example, pet waste education programs have varying results based on stakeholder involvement. Additionally, the extent of wildlife reduction associated with various BMPs methods (*e.g.*, structural, non-structural, *etc*.) is uncertain. Therefore, MDE intends for the required reductions to be implemented in an iterative process that first addresses those sources with the largest impact on water quality and human health risk, with consideration given to ease of implementation and cost. The iterative implementation of BMPs in the watershed has several benefits: tracking of water quality improvements following BMP implementation through follow-up stream monitoring; providing a mechanism for developing public support through periodic updates on BMP implementation; and helping to ensure that the most cost-effective practices are implemented first.

In 1983, the EPA Nationwide Urban Runoff Program found that stormwater runoff from urban areas contains the same general types of pollutants found in wastewater, and that 30% of identified cases of water quality impairment were attributable to stormwater discharges. In November 1990, EPA required jurisdictions with a population greater than 100,000 to apply for NPDES Permits for stormwater discharges. The jurisdictions where the Jones Falls watershed is located, Baltimore County and Baltimore City, are required to participate in the stormwater

NPDES program, and have to comply with the NPDES Permit regulations for stormwater discharges. The permit-required management programs are being implemented in the County and City to meet locally established watershed protection and restoration goals and to control stormwater discharges to the maximum extent practicable. These jurisdiction-wide programs are designed to control stormwater discharges to the maximum extent practical. Funding sources for implementation include the State Water Quality Revolving Loan Fund and the Stormwater Pollution Cost Share Program. Details of this program and additional funding sources can be found at http://www.dnr.state.md.us/bay/services/summaries.html.

Additionally, MDE's "Managing Maryland for Results" (MDE, 2005) states the following related to separate sewer system overflows and combined sewer system overflows:

> Objective 4.5: Reduce the quantity in gallons of sewage overflows [total for Combined Sewer System Overflows (CSO) and Separate Sewer System Overflows (SSO)] equivalent to a 50% reduction of 2001 amounts (50, 821,102 gallons) by the year 2010 through implementation of EPA's minimum control strategies, long-term control plans (LTCPs), and collection system improvements in capacity, inflow and infiltration reduction, operation and maintenance.
>
> Strategy 4.5.1: MDE adopted new regulations effective March 28, 2005 to detail procedures that must be followed regarding reporting overflows or treatment plant bypasses and also to require public notification of certain sewage overflows.
>
> Strategy 4.5.2: MDE will inspect and take enforcement actions against those CSO jurisdictions that have not developed long-term control plans by dates set within current consent or judicial orders.
>
> Strategy 4.5.3: MDE will take enforcement actions to require that jurisdictions experiencing significant or repeated SSOs take appropriate steps to eliminate overflows, and will fulfill the commitment in the EPA 106 grant for NPDES enforcement regarding the initiation of formal enforcement actions against 20% of jurisdictions in Maryland with CSOs and significant SSO problems annually.

Implementation and Wildlife Sources

It is expected that in some waters for which TMDLs will be developed, the bacteria source analysis indicates that after controls are in place for all anthropogenic sources, the waterbody will not meet water quality standards. Neither Maryland, nor EPA is proposing the elimination of wildlife to allow for the attainment of water quality standards, although managing the overpopulation of wildlife is an option for state and local stakeholders.

After developing and implementing to the maximum extent possible a reduction goal based on the anthropogenic sources identified in the TMDL, Maryland anticipates that implementation to reduce the controllable nonpoint sources may also reduce some wildlife inputs to the waters.

Appendix B - Flow Duration Curve Analysis to Define Strata

The Jones Falls watershed was assessed to determine hydrologically significant strata. The purpose of these strata is to apply weights to monitoring data and thus (1) reduce bias associated with the monitoring design and (2) approximate a critical condition for TMDL development. The strata group hydrologically similar water quality samples and provide a better estimate of the mean concentration at the monitoring station.

The flow duration curve for a watershed is a plot of all possible daily flows, ranked from highest to lowest, versus their probability of exceedance. In general, the higher flows will tend to be dominated by excess runoff from rain events and the lower flows will result from drought type conditions. The mid-range flows are a combination of high base flow with limited runoff and lower base flow with excess runoff. The range of these mid -level flows will vary with soil antecedent conditions. The purpose of the following analysis is to identify hydrologically significant groups, based on the previously described flow regimes, within the flow duration curve.

Flow Analysis

The Jones Falls Watershed has two active USGS flow gages, 1589440 and 1589478. The gage and dates of information used are as follows:

Table B-1: USGS Gages in the Jones Falls Watershed

USGS Gage #	Dates used	Description
1589440	October 1, 1992 – September 30, 2003	Jones Falls at Sorrento, MD
1589478	December 26, 1999 – September 30, 2003 (SWWM model substituted for 1991 thru 12/25/1999).	Jones Falls at Maryland Avenue, Baltimore, MD

Flow duration curves for these gages are presented in Figure B-1.

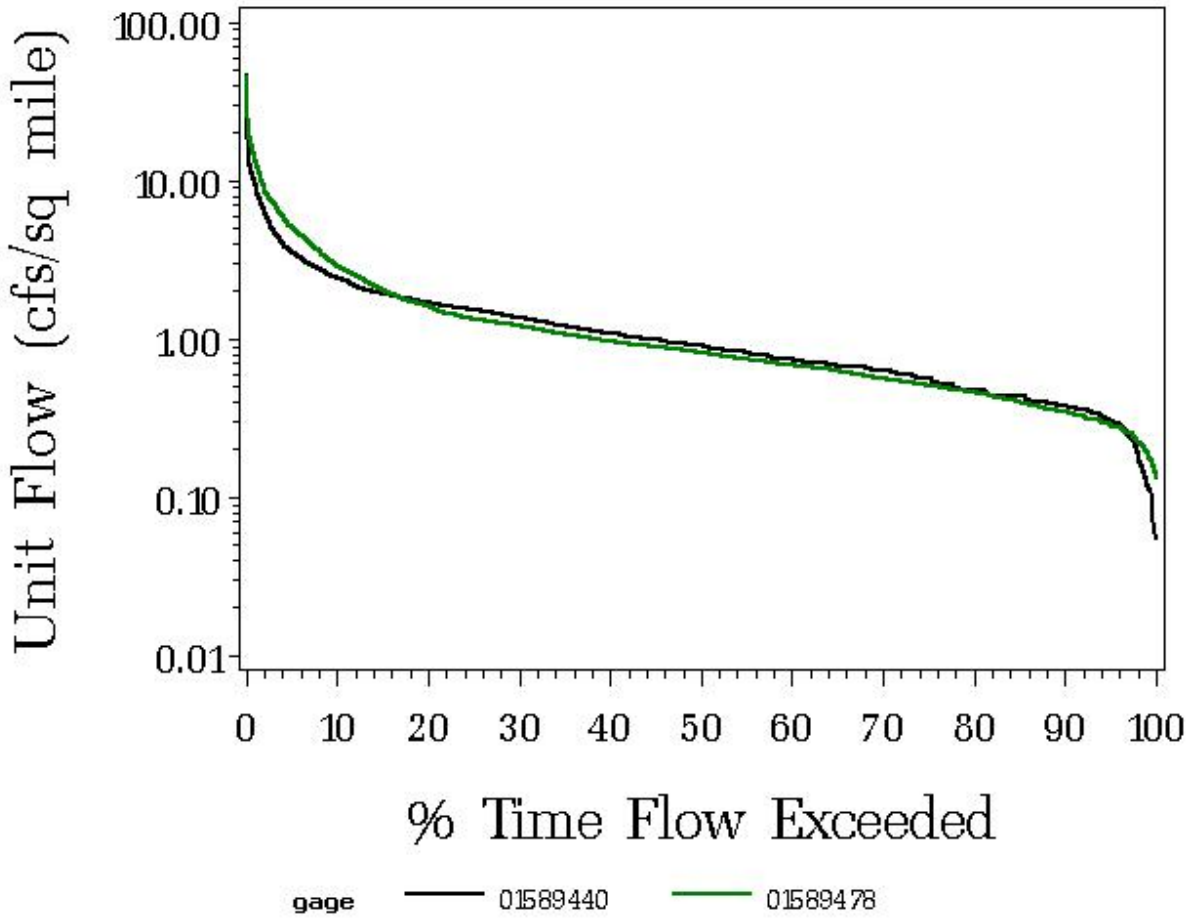

Figure B-1: Jones Falls Flow Duration Curves

Based on the long-term flow data for the Jones Falls watershed and other watersheds in the region (*i.e.* Gwynns Falls and Herring Run), the long term average daily unit flows range between 1.2 to 1.6 cfs/sq. mile, which corresponds to a range of 20th to 28th flow frequency based on the flow duration curves of these watersheds. Using the definition of a high flow condition occurring when flows are higher than the long-term average flow and a low flow condition occurring when flows are lower than the long-term average flow, the 25th percentile threshold was selected to define the limits between high flow and low flows. Therefore, a high flow condition will be defined as occurring when the daily flow duration percentile is less than 25% and a low flow condition will be define as occurring when the daily flow duration percentile is greater than 25%. Definitions of high and low range flows are presented in Table B-2.

Table B-2: Definition of Flow Regimes

High flow	Represents conditions where stream flow tends to be dominated by surface runoff.
Low flow	Represents conditions where stream flow tends to be more dominated by groundwater flow.

Flow-Data Analysis

The final analysis to define the daily flow duration intervals (flow regions, strata) includes the bacteria monitoring data. Bacteria (enterococci or *E. coli*) monitoring data are "placed" within the regions (stratum) based on the daily flow duration percentile of the date of sampling. Figures B-2 to B-6 show the Jones Falls *E. coli* monitoring data with corresponding flow frequency for the annual average and the seasonal conditions.

Maryland's water quality standards for bacteria state that a steady-state geometric mean will be calculated with available data where there are at least five representative sampling events. The data shall be from samples collected during steady-state conditions and during the beach season (Memorial Day through Labor Day) to be representative of the critical condition. If fewer than five representative sampling events are available, the previous two years will be evaluated. In Jones Falls, there are sufficient samples in the high flow strata to estimate the geometric mean. For the low flow strata less than five samples exist; therefore, the mid and low flow strata will be combined to calculate the geometric mean.

Weighting factors for estimating a weighted geometric mean are based on the frequency of each flow stratum during the averaging period. The weighting factors for the averaging periods and hydrological conditions are presented in Table B-3. Averaging periods are defined in this report as:

(1) Annual Average Hydrological Condition
(2) Annual High Flow Condition
(3) Annual Low Flow Condition
(4) Seasonal (May 1st – September 30th) High Flow Condition
(5) Seasonal (May 1st – September 30th) Low Flow Condition

Weighted geometric means for the average annual and the seasonal conditions are plotted with the monitoring data on Figures B-2 to B-6.

Table B-3: Weighting Factors for Estimation of Geometric Mean

Hydrological Condition		Averaging Period	Water Quality Data Used	Subwatershed	Fraction High Flow	Fraction Low Flow

INTRODUCTION

Microbial Source Tracking. Microbial Source Tracking (MST) is a relatively recent scientific and technological innovation designed to distinguish the origins of enteric microorganisms found in environmental waters. Several different methods and a variety of different indicator organisms (both bacteria and viruses) have successfully been used for MST, as described in recent reviews (Scott *et al.*, 2002; Simpson *et al.*, 2002). When the indicator organism is bacteria, the term Bacterial Source Tracking (BST) is often used. Some common bacterial indicators for BST analysis include: *E. coli*, *Enterococcus* spp., *Bacteroides-Prevotella,* and *Bifidobacterium* spp.

Techniques for MST can be grouped into one of the following three categories: molecular (genotypic) methods, biochemical (phenotypic) methods, or chemical methods. Ribotyping, Pulsed-Field Gel Electrophoresis (PFGE), and Randomly-Amplified Polymorphic DNA (RAPD) are examples of molecular techniques. Biochemical methods include Antibiotic Resistance Analysis (ARA), F-specific coliphage typing, and Carbon Source Utilization (CSU) analysis. Chemical techniques detect chemical compounds associated with human activities, but do not provide any information regarding nonhuman sources. Examples of this type of technology include detection of optical brighteners from laundry detergents or caffeine (Simpson *et al*., 2002).

Many of the molecular and biochemical methods of MST are "library-based," requiring the collection of a database of fingerprints or patterns obtained from indicator organisms isolated from known sources. Statistical analysis determines fingerprints/patterns of known sources species or categories of species (*i.e.*, human, livestock, pets, wildlife). Indicator isolates collected from water samples are analyzed using the same MST method to obtain their fingerprints or patterns, which are then statistically compared to those in the library. Based upon this comparison, the final results are expressed in terms of the "statistical probability" that the water isolates came from a given source (Simpson *et al*. 2002).

In this BST project, we studied the following Maryland nontidal watersheds: Gwynns Falls, Jones Falls, Herring Run, Georges Creek, and Wills Creek. Also included in the study was the Patuxent River Watershed shellfish harvesting area. The methodology used was the ARA with *Enterococcus* spp. as the indicator organism. Previous BST publications have demonstrated the predictive value of using this particular technique and indicator organism (Hagedorn, 1999; Wiggins, 1999). A pilot study using PFGE, a genotypic BST method, was used on a subset of known-source isolates collected from the Patuxent River Watershed.

Antibiotic Resistance Analysis. A variety of different host species can potentially contribute to the fecal contamination found in natural waters. Many years ago, scientists speculated on the possibility of using resistance to antibiotics as a way of determining the sources of this fecal contamination (Bell *et al.*, 1983; Krumperman, 1983). In ARA, the premise is that bacteria isolated from different hosts can be discriminated based upon differences in the selective pressure of microbial populations found in the gastrointestinal tract of those hosts (humans, livestock, pets, wildlife) (Wiggins, 1996). Microorganisms isolated from the fecal material of wildlife would be expected to have a much lower level of resistance to antibiotics than isolates

collected from the fecal material of humans, livestock and pets. In addition, depending upon the specific antibiotics used in the analysis, isolates from humans, livestock and pets could be differentiated from each other.

In ARA, isolates from known sources are tested for resistance or sensitivity against a panel of antibiotics and antibiotic concentrations. This information is then used to construct a library of antibiotic resistance patterns from known-source bacterial isolates. Microbial isolates collected from water samples are then tested and their resistance results are recorded. Based upon a comparison of resistance patterns of water and library isolates, a statistical analysis can predict the likely host source of the water isolates. (Hagedorn 1999; Wiggins 1999).

LABORATORY METHODS

Isolation of *Enterococcus* from Known-Source Samples. Fecal samples, identified to source, were delivered to the Salisbury University (SU) BST lab by Maryland Department of the Environment (MDE) personnel. Fecal material suspended in phosphate buffered saline was plated onto selective m-Enterococcus agar. After incubation at 37° C, up to 10 *Enterococcus* isolates were randomly selected from each fecal sample for ARA testing.

Isolation of Enterococcus from Water Samples. Water samples were collected by MDE staff and shipped overnight to MapTech Inc, Blacksburg, Va. Bacterial isolates were collected by membrane filtration. Up to 24 randomly selected *Enterococcus* isolates were collected from each water sample and all isolates were then shipped to the SU BST lab.

Antibiotic Resistance Analysis. Each bacterial isolate from both water and scat were grown in Enterococcosel® broth (Becton Dickinson, Sparks, MD) prior to ARA testing. *Enterococcus* are capable of hydrolyzing esculin, turning this broth black. Only esculin-positive isolates were tested for antibiotic resistance.

Bacterial isolates were plated onto tryptic soy agar plates, each containing a different concentration of a given antibiotic. Plates were incubated overnight at 37° C and isolates then scored for growth (resistance) or no growth (sensitivity). Data consisting of a “1” for resistance or “0” for sensitivity for each isolate at each concentration of each antibiotic was then entered into a spread-sheet for statistical analysis.

The following table includes the antibiotics and concentrations used for isolates in analyses for all the study watersheds.

Table C-1: Antibiotics and concentrations used for ARA

Antibiotic	Concentration (µg/ml)
Amoxicillin	0.625
Cephalothin	10, 15, 30, 50
Chloramphenicol	10
Chlortetracycline	60, 80, 100
Erythromycin	10
Gentamycin	5, 10, 15
Neomycin	40, 60, 80
Oxytetracycline	20, 40, 60, 80, 100
Salinomycin	10
Streptomycin	40, 60, 80, 100
Tetracycline	10, 30, 50, 100
Vancomycin	2.5

KNOWN-SOURCE LIBRARY

Construction and Use. Fecal samples (scat) from known sources in each watershed were collected during the study period by MDE personnel and delivered to the BST Laboratory at SU. *Enterococcus* isolates were obtained from known sources (e.g., human, dog, cow, beaver, coyote, deer, fox, rabbit, and goose). For each watershed, a library of patterns of *Enterococcus* isolate responses to the panel of antibiotics was analyzed using the statistical software CART® (Salford Systems, San Diego, CA). *Enterococcus* isolate response patterns were also obtained from bacteria in water samples collected at the monitoring stations in each basin. Using statistical techniques, these patterns were then compared to those in the appropriate library to identify the probable source of each water isolate. A combined library of known sources was used for Georges Creek and Wills Creek Watersheds using patterns from scat obtained from both watersheds, and the water isolate patterns of each were compared to the combined library.

STATISTICAL ANALYSIS

We applied a tree classification method, [1]CART®, to build a model that classifies isolates into source categories based on ARA data. CART® builds a classification tree by recursively splitting the library of isolates into two nodes. Each split is determined by the antibiotic variables (antibiotic resistance measured for a collection of antibiotics at varying concentrations).

1 The Elements of Statistical Learning: Data Mining, Inference, and Prediction. Hastie T, Tibshirani R, and Friedman J. Springer 2001.

The first step in the tree-building process splits the library into two nodes by considering every binary split associated with every variable. The split is chosen that maximizes a specified index of homogeneity for isolate sources within each of the nodes. In subsequent steps, the same process is applied to each resulting node until a *stopping* criterion is satisfied. Nodes where an additional split would lead to only an insignificant increase in the *homogeneity index* relative to the *stopping* criterion are referred to as *terminal* nodes.[2] The collection of *terminal* nodes defines the classification model. Each *terminal* node is associated with one source, the source that is most populous among the library isolates in the node. Each water sample isolate (*i.e.*, an isolate with an unknown source), based on its antibiotic resistance pattern, is identified with one specific *terminal* node and is assigned the source of the majority of library isolates in that *terminal* node.[3]

We imposed an additional requirement in our classification method for determining the sources of water sample isolates. We interpreted the proportion of the majority source among the library isolates in a *terminal* node as a probability. This proportion is an estimate of the probability that an isolate with unknown source, but with the same antibiotic resistance pattern as the library isolates in the *terminal* node, came from the source of the majority of the library isolates in the *terminal* node. If that probability was less than a specified *acceptable source identification probability*, we did not assign a source to the water sample isolates identified with that *terminal* node. Instead we assigned "Unknown" as the source for that node and "Unknown" for the source of all water sample isolates identified with that node. The *acceptable source identification probability* for the tree-classification model for an individual watershed is shown in the Results section for that watershed.

ARA Results: Jones Falls Watershed

Known-Source Library. The 982 known-source isolates in the library were grouped into four categories: pet (specifically dog), human, livestock (horse), and wildlife (deer, fox, goose) (Tables C-2). The library was analyzed for its ability to take a subset of the library isolates and correctly predict the identity of their host sources when they were treated as unknowns. Average rates of correct classification (ARCC) for the library were found by repeating this analysis using several probability cutoff points, as described above. The number-not-classified for each probability was determined. From these results, the percent unknown and percent correct classification (RCCs) was calculated (Table C-3).

---

2 An ideal split, i.e., a split that achieves the theoretical maximum for homogeneity, would produce two nodes each containing library isolates from only one source.

3 The CART® tree-classification method we employed includes various features to ensure the development of an optimal classification model. For brevity in exposition, we have chosen not to present details of those features, but suggest the following sources: Breiman L, et al. *Classification and Regression Trees*. Pacific Grove: Wadsworth, 1984; and Steinberg D and Colla P. *CART—Classification and Regression Trees.* San Diego, CA: Salford Systems, 1997.

Table C-2: Jones Falls. Category, potential sources, total number, and number of unique patterns in the known-source library

Category	Potential Sources	Total Isolates	Unique Patterns
Pet	dog	144	68
Human	human	438	266
Livestock	horse	107	42
Wildlife	deer, fox, goose,	293	85
Total		**982**	**461**

TableC-3: Jones Falls. Number of isolates not classified, percent unknown, and percent correct for six (6) cutoff probabilities

Cutoff Probability	Number Not Classified	Percent Unknown	Percent Correct
.25	0	0%	68%
.375	0	0%	68%
.50	128	13%	71%
.60	194	20%	72%
.70	521	53%	81%
.80	668	68%	90%
.90	855	87%	98%

A cutoff probability of 0.60 (60%) was shown to yield an ARCC of 72%. An increase to a 0.70 (70%) cutoff did not increase the rate of correct classification as much as it increased the percent unknown (Figure C-1). Therefore, using a cutoff probability of 0.60 (60%), the 194 isolates that were not useful in the prediction of probable sources were removed, leaving 788 isolates remaining in the library. This library was then used in the statistical prediction of probable sources of bacteria in water samples collected from the Jones Falls Watershed. The rates of correct classification for the four categories of sources in the library, at a 0.60 (60%) cutoff, are shown in Table C-4 below.

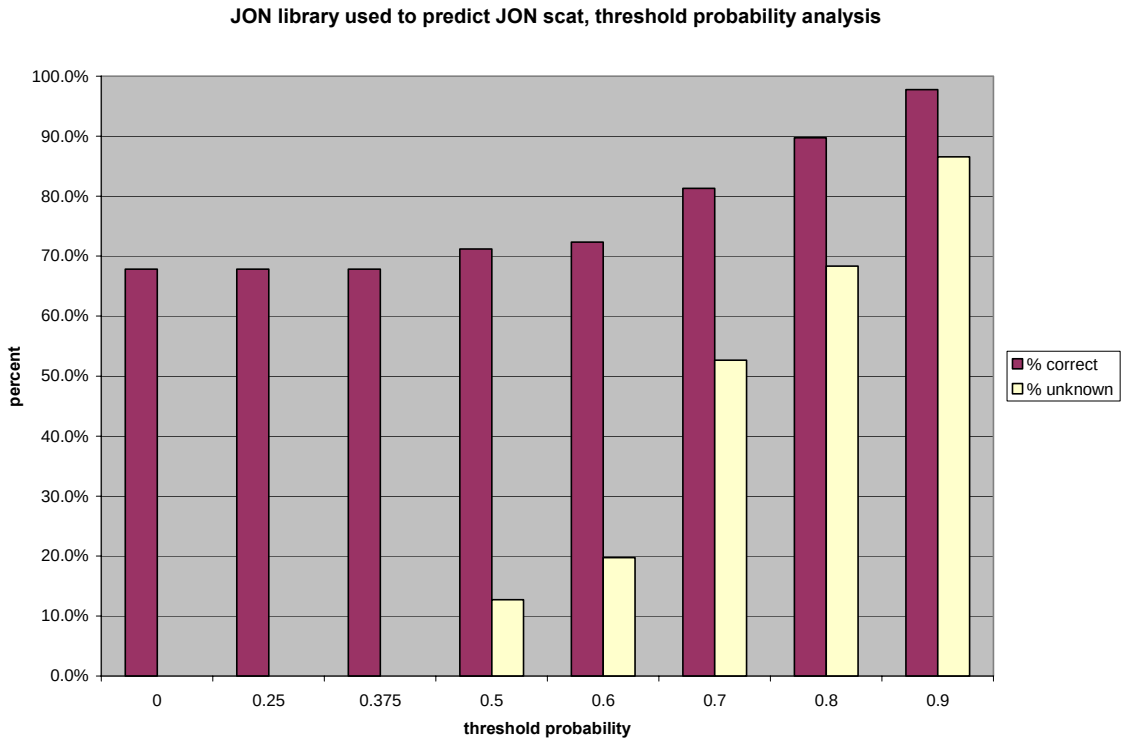

Figure C-1: Jones Falls. Classification Model: Percent Correct versus Percent Unknown.

Table C-4: Jones Falls. Actual species categories versus predicted categories, at a 60% probability cutoff, with rates of correct classification (RCC) for each category

	Predicted →					
Actual ↓	HUMAN	LIVESTOCK	PET	WILDLIFE	TOTAL	RCC[1]
HUMAN	**291**	16	37	20	364	80%
LIVESTOCK	5	**77**	2	7	91	85%
PET	8	5	**107**	3	123	87%
WILDLIFE	19	79	17	**95**	210	45%
Total	**323**	**177**	**163**	**125**	**788**	**72%**

[1]RCC = Actual number of predicted species category / Total number predicted.
Example: One hundred sixty-three (163) domestic correctly predicted / 175 total number predicted for domestic = 163/175 = 93%.

Jones Falls Water Samples. Monthly monitoring from five (5) stations on Jones Falls was the source of water samples. The maximum number of *Enterococcus* isolates per water sample was 24, although the number of isolates that actually grew was sometimes fewer than 24. A total of 1402 *Enterococcus* isolates were analyzed by statistical analysis. The BST results by species category, shown in Table C-5, indicates that 85% of the water isolates were classified after excluding unknowns when using a 0.60 (60%) probability cutoff.

Table C-5: Jones Falls. Potential host sources of water isolates by species category, number of isolates, percent isolates classified at cutoff probability of 60%.

Category	Number	% Isolates Classified 60% Prob.	% Isolates Classified (excluding unknowns)
DOMESTIC	231	16%	19%
HUMAN	771	55%	65%
LIVESTOCK	137	10%	12%
WILDLIFE	48	3%	4%
UNKNOWN	215		
Missing Data	0		
Total	1402		
% Classified	**85%**		

The seasonal distribution of water isolates from samples collected at each sampling station is shown below in Table C-6.

Table C-6: Jones Falls. *Enterococcus* isolates obtained from water collected during the fall, winter, spring, and summer seasons for each of the five (5) monitoring stations.

Station	Spring	Summer	Fall	Winter	Total
JON0039	72	68	76	70	**286**
JON0082	60	51	88	72	**271**

Jones Falls Summary

The use of ARA was successful for identification of bacterial sources in the Jones Falls Watershed as evidenced by the acceptable ARCC (72%) for the library. With the exception of the RCC for wildlife (45%), the RCCs ranged from 80% to 87%. Although wildlife has a low RCC, there will be no remedial action taken for wildlife sources. When water isolates were compared to the library and potential sources predicted, 85% of the isolates were classified by statistical analysis. The largest category of potential sources in the watershed as a whole was human (65%), followed by pet and livestock, (19% and 12% of the classified isolates, respectively). Three percent (4%) of the water isolates were classified as from wildlife.

EDUCATION

JOHNS HOPKINS UNIVERSITY, BALTIMORE, MARYLAND

- *B.A. NATURAL SCIENCES*
- *PH.D. ENVIRONMENTAL ENGINEERING*

CURRENT EMPLOYMENT

Principal, EcoLogix Group, Inc. (part-time, April 2015 – present).
Providing expert environmental consulting services to guide government agencies and businesses in the development of environmental strategies, building community and stakeholder support and obtaining State, federal and local government permits.

Lecturer, Johns Hopkins University, Whiting School of Engineering (part-time, April 2015 – present). Teaching environmental science and management of estuaries, with emphasis on Chesapeake Bay.

INTERNATIONAL AFFILIATION

Member of the Science and Policy Committee of the International Center for the Environmental Management of Enclosed Coastal Seas (EMECS) working in collaboration with scientists, environmental managers and government officials in other nations that are engaged in coastal pollution control and ecosystem restoration.

VOLUNTEER ACTIVITIES

Board of Directors, Blue Water Baltimore (Regional Water Quality NGO)

PREVIOUS EMPLOYMENT

BLUE WATER BALTIMORE

2631 Sisson Street, Baltimore, MD 21211

Interim Executive Director (part time, March, 2021 – November 2021).

Temporarily drafted by the Board of Directors to lead this environmental nonprofit organization and directing staff of 25 people working on water quality monitoring, environmental education, advocacy and restoration projects. Working with the Board of Directors to recruit and hire a new Executive Director.

KCI TECHNOLOGIES, INC.

936 Ridgebrook Rd. Sparks, MD 21254

Senior Scientist (part time, April 2015 – August 2018).

Environmental consultant working on various projects with University of Maryland, businesses and government agencies. Led project working on Guanabara Bay (Rio de Janeiro, Brazil) environmental diagnosis, development of a restoration plan framework based on Chesapeake Bay restoration and Environmental Report Card to monitor and report progress to elected officials and the public.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
1800 Washington Blvd. Baltimore MD 21230
Maryland Secretary of the Environment
December 2010 – January 2015.

Appointed Acting Secretary of the Environment December, 2010 by Maryland Governor Martin O'Malley and confirmed by the Maryland Senate as Secretary, to lead the Department's planning, regulatory, management and financing programs to protect public health, restore and protect air and water quality, clean up contaminated land and ensure proper management of hazardous and solid wastes, including direction of the Department's 1000 employees, $111 million operating and $191 million capital budgets.

Served as MD's Commissioner on the Susquehanna River Basin Commission and the Appalachian States' Low-Level Radioactive Waste Commission; Chairman of the Maryland Climate Change Commission; Represented the State as a member of the Chesapeake Bay Program Principal's Staff Committee, the Environmental Council of States, Regional Greenhouse Gas Initiative and other State, regional and national committees.

Represented the Administration before the State legislature and testified numerous times on behalf of Maryland's environmental programs before the U.S. Congress and Senate.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
Deputy Secretary
January 2007 - December 2010.

Together with the Secretary, led the Department's planning, regulatory, management and financing programs to protect public health, restore and protect air and water quality, clean up contaminated land and ensure proper management of hazardous and solid wastes, including direction of the Department's 1000 employees, $111 million operating and $191 million capital budgets.

Served as Chairman and Maryland Commissioner for the Interstate Commission on

the Potomac River Basin and Chairman and Maryland Commissioner for the Susquehanna River Basin Commission. Department's representative on the Maryland Bay Restoration Fund Advisory Committee and the Governor's Advisory Committee on the Management and Protection of the State's Water Resources. Served on the Board of Directors of the Climate Change Registry.

JOHNS HOPKINS UNIVERSITY
LECTURER (PART-TIME).
Spring 2004 – Fall 2007.

Developed and taught graduate course titled "Water Resources Management" in the JHU Whiting School of Engineering's Engineering for Professionals program. In 2007, converted the course to be taught fully on-line.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
Director, Water Management Administration
APRIL 2001-JANUARY 2007.

Served as the legally delegated representative of the Secretary of the Environment responsible for all regulatory, administrative and legal determinations on regulations and programs under the purview of the Water Management Administration, including regulation of water supply, water pollution control, erosion and sediment control, stormwater management, dam safety, wetlands and waterways protection. Led the Administration's 315 professional and support staff with a $32 million annual operating budget and $120 million capital budget for grants and loans for water supply, wastewater treatment, stormwater control and stream restoration projects.

Supervised the Administration's Deputy Director, the Manager of Regulatory Programs and Administrators of 7 major programs with functions including: ensuring that public drinking water systems provide a safe and adequate supply of water; regulating municipal and industrial wastewater discharges to prevent pollution of surface and groundwater; oversight and technical support for local health department's regulation of individual wells and septic systems; managing capital grant and revolving loan funded projects for construction of water supply and wastewater treatment facilities; reviewing local government water and sewer plans and wastewater system designs; oversight and technical support for federal, state and local sediment and stormwater pollution management; regulation of mining activities, restoring abandoned mines and mitigating acid mine drainage impacts; protecting and managing tidal and nontidal wetlands; regulating construction activities in waterways and floodplains and ensuring dam safety; providing compliance assistance to the regulated community; ensuring compliance with the

provisions of state and federal water laws and regulations through enforcement actions when necessary to protect the public health and the environment.

Department's lead technical representative for water-related issues in the development of Departmental legislation, review and development of position statements regarding legislation submitted by others and presenting Departmental testimony before the State Legislature.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
DIRECTOR, TECHNICAL AND REGULATORY SERVICES ADMINISTRATION.
May 1999-April 2001.

Responsible for the management of the Administration's staff including 140 professionals and support staff with an annual budget of over $15 million, providing scientific, engineering and other technical support to the Department of the Environment's regulatory programs and providing Departmental information technology services, including MDE's computer network support, home page on the world-wide web, geographic information systems and multi-media data base development. Responsible for managing the Department's water quality standards development and water quality monitoring programs; the State Shellfish Sanitation Program responsible for ensuring the bacterial quality of Maryland shellfish harvesting waters; emergency operations for oil and hazardous material spills, nuclear power plant emergency response and flood hazard mitigation; management of Maryland's Community Right-to-Know Program and Toxics Release Inventory; coordination of Maryland's Total Maximum Daily Load (TMDL) program as required under the federal Clean Water Act; providing technical support for environmental and public health risk assessments; representation on various inter-agency and inter-state technical groups such as the Chesapeake Bay Program, Coastal Bays Program, Dredged Material Management Committee, Patuxent River Commission, Anacostia Watershed Restoration Committee, Interstate Commission on the Potomac River Basin.

AWARDS

2014 – ADMIRAL OF THE CHESAPEAKE, PRESENTED BY MARYLAND GOVERNOR MARTIN O'MALLEY IN RECOGNITION OF 32 YEARS OF SERVICE ON MARYLAND'S CHESAPEAKE BAY RESTORATION PROGRAM

2009 – AWARD FOR DISTINGUISHED GOVERNMENT SERVICE, PRESENTED BY THE JOHNS HOPKINS UNIVERSITY

1992 – UNSUNG HERO AWARD, PRESENTED BY THE CHESAPEAKE EXECUTIVE COUNCIL (GOVERNORS OF PA, MD, VA, THE MAYOR OF THE DISTRICT OF COLUMBIA, THE

ADMINISTRATOR OF THE US EPA AND THE CHAIR OF THE CHESAPEAKE BAY COMMISSION)

Role in Maryland Environmental Legislation

As Director of two Administrations and then as Deputy Secretary and Secretary of the Environment, played a key role in the development, passage and implementation of significant State legislation that is the basis for major environmental programs in Maryland, including:

THE WATER QUALITY IMPROVEMENT ACT OF 1998. Created Maryland's mandatory nutrient management program for all farms. Started with nitrogen-based nutrient management that was part of an ongoing voluntary nutrient management program and after a phase in period of 5 years, shifted to nitrogen and phosphorus-based nutrient management.

THE CHILDREN'S ENVIRONMENTAL HEALTH AND PROTECTION RIGHTS ACT (2000). Created Maryland's Children's Health and Environmental Protection Advisory Council charged with advising the Governor and legislature regarding measures needed to protect children from environmental hazards and with reviewing all State laws and regulations to ensure children's health is protected. Council is co-chaired by Designees of the Secretaries of the Department of Health and Mental Hygiene and the Department of the Environment.

MARYLAND WATER CONSERVATION ACT (2001). Requires all permits for public water systems in Maryland to include specific provisions to ensure conservation of water supplies during treatment, storage and transmission to water users.

THE BAY RESTORATION FUND (2004). Established two dedicated funds financed by: 1) users of wastewater treatment plants and 2) users of onsite sewage treatment systems. Users were assessed a fee of $2.50 per month or $30 per year. The wastewater fund is used to finance upgrades to Maryland's 67 largest wastewater treatment plants to achieve state-of-the-art nutrient removal. The onsite treatment system fund is used to finance upgrades to existing onsite sewage treatment systems to remove nitrogen and to plant cover crops on agricultural cropland.

LOCAL GOVERNMENT PLANNING – WATER RESOURCES ELEMENT (2006). Requires local comprehensive land use plans to include a Water Resources Element that describes how the local government has taken the availability of water supply and the ability of receiving waters to accommodate wastewater discharges without violating water quality standards.

STORMWATER MANAGEMENT ACT OF 2007. Requires all new development and redevelopment projects in Maryland to employ Environmental Site Design to the maximum extent practicable to prevent stormwater runoff and associated pollution.

WETLANDS AND WATERWAYS PROGRAM FEES (2008). Requires all applicants for permits for construction activities that affect wetlands or waterways to pay reasonable fees to support the Department's wetlands and waterways program. Allowed the Department to restore program staff to ensure full protection of Maryland's wetland resources and ensure that the regulated community receives appropriate permits in a timely manner.

LIVING SHORELINE PROTECTION ACT OF 2008. Requires all shoreline erosion protection projects in Maryland to employ living shoreline techniques that establish natural vegetated shorelines, unless it can be demonstrated that the physical environment and erosive forces at the chosen location would prevent the successful establishment of a living shoreline.

CHESAPEAKE AND ATLANTIC COASTAL BAYS 2010 TRUST FUND (2008). Established a dedicated fund to be used for nonpoint source pollution control projects. The Fund is managed by the BayStat Panel, consisting of the Governor, his key staff and the Secretaries of Natural Resources, Environment, Agriculture, Planning and the Director of the Critical Areas Program.

GREENHOUSE GAS REDUCTION ACT OF 2009. Established a State goal to reduce greenhouse gas emissions by 25% from 2006 levels by 2020. Charged the Department of the Environment with developing a greenhouse gas reduction plan using a broad stakeholder involvement process starting in 2011, when a draft plan was submitted for public comments, and a final plan prepared during 2012.

SUSTAINABLE GROWTH AND PRESERVATION ACT OF 2012. Requires all counties in Maryland to designate Tiers for wastewater treatment in County Comprehensive Land Use Management Plans, including a Tier 4 area that restricts the development of major subdivisions on septic systems in order to protect rural and open space areas and prevent further water quality degradation in those areas.

BAY RESTORATION FUND (2012). Increased the Bay Restoration Fund fee from $2.50 to $5 per month in order to provide the funding needed to complete the upgrading of the State's 67 largest sewage treatment plants.

WATERSHED PROTECTION AND RESTORATION PROGRAM (2012). Requires the State's 9 most densely populated counties and Baltimore City to establish stormwater pollution remediation programs to be financed from a stormwater utility fee assessed to

property owners in an amount proportional to stormwater pollution impacts generated by their property.

OTHER EARLIER RESPONSIBILITIES:
MARYLAND DEPARTMENT OF THE ENVIRONMENT
DEPUTY DIRECTOR, TECHNICAL AND REGULATORY SERVICES ADMIN.
June 1997-May 1999.

With the Director, shared responsibility for the management of the Administration's staff including 100 professionals and other staff responsible for providing scientific, engineering and other technical support to the Department of the Environment's regulatory programs; managing the Department's emergency operations for oil and hazardous material spills, nuclear power plant emergency response and flood hazard mitigation; supporting Departmental information technology development, including MDE's home page on the world-wide web and geographic information systems and multi-media data base development; management of Maryland's Community Right-to-Know Program and Toxics Release Inventory; coordination of Maryland's Total Maximum Daily Load (TMDL) program as required under the federal Clean Water Act; providing technical support for environmental and public health risk assessments required for various air, water and land pollution problems; representation on various inter-agency and inter-state technical groups such as the Chesapeake Bay Program, Coastal Bays Program, Long-term Dredged Material Management Committee, Patuxent River Commission, Anacostia Watershed Restoration Committee, the Interstate Commission on the Potomac River Basin and other similar groups.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
Environmental Program Manager, Emergency Operations and Technical Support Program, Technical and Regulatory Services Administration.
July, 1995 – June, 1997

Directed the activities of 4 divisions including 29 emergency response, planning, scientific and engineering staff. Responsibilities included: overall coordination of MDE's emergency response activities related to air, water and waste pollution; direction of emergency management planning and response staff for hazardous materials releases, oil spills, nuclear power plant emergencies, floods and other natural disasters; direction of technical support staff for multi-media project reviews (State Clearinghouse), Maryland Federal Facilities technical liaison, coordination of MDE strategic planning and growth management activities, MDE's Regional Action Plan for Toxic Pollution, Chesapeake Bay Tributary Strategies and the Maryland

Environment 2000 Comparative Risk Project.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
Environmental Program Manager, Watershed Management Program, Chesapeake Bay and Watershed Management Administration. January, 1993 - July, 1995.

Directed the activities of two divisions including 22 scientific and engineering staff. Responsibilities included: monitoring of water quality and biological impacts of pollution and the effectiveness of restoration measures; evaluation and documentation of the cost-effectiveness of Maryland's point and nonpoint source pollution control programs; development of watershed restoration and protection policy recommendations and supporting technical documentation; direction of $1.7 million annual Clean Water Act § 319 nonpoint source pollution control grant; development and management of point source and developed land nonpoint source components of Maryland's Chesapeake Bay Tributary Nutrient Reduction Strategies; representation of the Department on State and inter-state technical and policy committees including the Chesapeake Bay Program.

MARYLAND DEPARTMENT OF THE ENVIRONMENT
***Division Chief, Watershed Projects Division, Chesapeake Bay and Special Projects Program*. January, 1988 – January, 1993.**

Supervised 7 scientific and engineering staff responsible for: nonpoint source monitoring, watershed pollution assessment projects, watershed modeling projects; development and management of the Small Creek and Estuary Restoration Cost-Share Program; representation of MDE on Chesapeake Bay technical committees.

MARYLAND DEPARTMENT OF HEALTH AND MENTAL HYGIENE, OFFICE OF ENVIRONMENTAL PROGRAMS – *Section Head, Watershed Monitoring and Modeling Section, Technical Analysis Division*. July, 1985 – January, 1988.

Supervised 4 scientific and engineering staff responsible for water quality monitoring and modeling projects designed to document the nature and extent of water quality problems in Maryland's streams and rivers and to document improvements due to pollution control programs. The Section staff were also responsible for watershed water quality model development and application to support waste load allocation studies conducted for the Patuxent, Monocacy and Chesapeake Bay Watersheds.

MARYLAND DEPARTMENT OF HEALTH AND MENTAL HYGIENE, OFFICE OF ENVIRONMENTAL PROGRAMS - ***Project Manager, Water Quality Section, May, 1983 - July, 1985.***

Responsible for the development and management of the Department's Patuxent Watershed Monitoring and Modeling Project, the Chesapeake Bay River Input Monitoring Program and other projects to document water quality conditions and predict water quality response to pollution controls. Supervised field sampling personnel, data processing, data analysis and technical report writing.

STATE UNIVERSITY OF NEW YORK AT STONY BROOK
Research Associate, Marine Sciences Research Center, June, 1981 - May, 1983.

Developed proposals and directed research projects on water quality and ecological implications of the disposal of contaminated dredged material, including the survey and analysis of municipal and industrial wastewater flows, nonpoint source pollution and their impact on sediment contamination and water quality.

JOHNS HOPKINS UNIVERSITY, BALTIMORE, MARYLAND
CHESAPEAKE BAY INSTITUTE
Research Technician. June, 1976-May, 1981.

Provided field, laboratory and data analysis support for various environmental research projects including investigations of low dissolved oxygen effects on the water intakes of the Calvert Cliffs Nuclear Power Plant, evaluation of alternate sewage treatment plant outfall locations on Maryland's Atlantic coast, evaluation of the hydrodynamic conditions in Chesapeake Bay tidal ponds.

Introduction

The Maryland Department of the Environment (MDE) routinely monitors shellfish harvesting waters for fecal coliform bacteria and conducts pollution source surveys to ensure that shellfish harvested in Maryland are safe for human consumption. In addition, MDE coordinates the State's Beach bacteria monitoring program. Beach sample collection and notification of advisories is delegated to the Counties in order to protect public health at Maryland's designated bathing beaches.

Fecal indicator bacteria are used in these programs since monitoring for actual pathogens is not feasible. It is assumed that if fecal indicator bacteria are present, then human pathogens may also be present. Since the primary goal of both the Shellfish and Beach programs is to ensure that public health concerns are addressed in a timely fashion, ongoing day-to-day management decisions by these programs are designed to be necessarily conservative. One such example is that beach advisories may be based on a single sampling event which shows a high level of indicator bacteria. However, bacteriological indicators are known to be variable in the environment and a single high measurement does not always coincide with fecal contamination. For this reason, this assessment methodology, developed for conducting Integrated Report (IR) assessments, will make use of larger longer-term sample sizes before making impairment determinations that could result in a Total Maximum Daily Load (TMDL). Doing this allows MDE to continue to protect public health in a timely fashion (by both the Shellfish and Beach programs) but also allows for a higher level of confidence to be used prior to initiating potentially costly TMDL development and implementation efforts. This helps to enhance the accuracy with which impairment determinations are made and enables the Department to focus on the highest priority impairments first.

Due to the complexities of collecting and assessing bacteriological indicator data, MDE strongly encourages groups to contact Heather Merritt (MDE) at Heather.Merritt@maryland.gov or (410) 537-3618 both when designing a sampling program and prior to submitting bacteria data for the Integrated Report. Ms. Merritt can provide guidance to groups interested in collected bacteria data so that this data is useful for the intended purposes.

For additional detail regarding monitoring and notification for Maryland's Shellfish Harvesting waters and Beaches Program please visit MDE's webpages at:

> Shellfish Harvesting Areas:
> https://mde.maryland.gov/programs/Marylander/fishandshellfish/Pages/index.aspx
>
> Beaches Program:
> https://mde.maryland.gov/programs/Water/Beaches/Pages/index.aspx.

Rules used by MDE to interpret bacteria data and apply the water quality standards are discussed below in the first three sections. The first section generally describes the protocols that MDE

uses. The second and third sections describe how bacteria monitoring data is assessed to determine support of the shellfish harvesting designated use and the water contact recreation use, respectively. The fourth section describes previous changes to the methodology and how MDE will provide information to the public on sewage overflows.

I. Protocols

Data are collected and analyzed using National Shellfish Sanitation Program with oversight from United States Food and Drug Administration (FDA) (for shellfish harvesting areas) or Environmental Protection Agency (EPA) (for recreational waters) approved methods, which include strict quality assurance and quality control (QA/QC) guidelines. Only Level 3 data[1] may be utilized for decision-making with respect to designated use support status. All other available data will be considered but may be used for prioritization, additional study, or revised monitoring. In all cases, it is critical that bacteria sampling be carried out in a way that is representative of conditions in time and space. High spatial and temporal variability suggest that infrequent or moderately elevated bacteriological levels alone do not necessarily represent a human health risk or impairment. The bacteriological standard is numeric but also includes a narrative component that permits the use of sanitary surveys and epidemiological studies. The methodology recognizes the inherent variability of the bacterial measurement and recognizes the inadequacies of indicator organisms. Most Probable Number (MPN) or Colonies Forming Units (CFU), reported as results used to express the level of bacteria, is not a direct count but a statistical estimation subject to a high degree of variability.

The current analytical methods used for bacteria sample analysis are specific to the use being evaluated (e.g. shellfish harvest vs. water contact). For the shellfish harvesting use, the Multiple Tube Fermentation method is used to measure fecal coliform (expressed as MPN/100 ml). For evaluating the recreational use the most commonly used tests for recreational waters are both MPN methods; the ONPG-MUG (Colilert) test measures *E. coli* and the MUG media (Enterolert) test measures enterococci.

II. Interpretation of Fecal Coliform Data for Assessing Use II Shellfish Harvesting Areas

The indicator and criteria used for shellfish (bivalve molluscan shellfish only) harvesting waters is established by the National Shellfish Sanitation Program (NSSP) and is promulgated in Code of Maryland Regulations (COMAR) 26.08.02.03-3 (COMAR 2019; NSSP 2017). In order to demonstrate support of the shellfish harvesting designated use, the measured level of fecal coliform in water must have a median of less than 14 MPN/100 ml and a 90th percentile of less than 49 MPN/100 ml, calculated from a minimum of 30 samples usually taken over a three-year

[1] For Maryland's Integrated Report, MDE evaluates submitted data according to data quality levels. The levels are based upon both the level of data quality and the authorized uses of the data provided to the agency, where Level 1 has the lowest and Level 3 has the highest data quality requirements. Level 3 datasets are used for regulatory decision-making purposes and are therefore legally defensible data. The data must be accompanied by a Quality Assurance Project Plan, and documentation of field sampling and/or laboratory testing protocols.

period. MDE conducts routine bacteria water quality sampling and pollution source surveys to assess shellfish harvesting areas so that waters can be assigned to one of three classifications used for protecting shellfish consumers. The following sections describe the different shellfish area classifications and how these classifications relate[2] to assessment categories on the IR.

A. Restricted and Prohibited (closed safety zone): A restricted classification for shellfish waters means that no direct shellfish harvesting is permitted in those waters. This classification is used in the following three scenarios:

    1. Shellfish harvesting areas that do not meet the NSSP bacteria water quality standard for an approved classification (a fecal coliform median of 14 MPN/100 ml and a 90th percentile of <49 MPN/100 ml) are classified as restricted and listed as impaired in Category 4 or 5 (depending on whether a TMDL was completed or not) of the IR.

    2. Shellfish harvesting waters located in the vicinity of wastewater treatment plant (WWTP) outfalls are classified as prohibited and a closed safety zone is established at the discharge point. This is a preventative public health protection measure and is required under the NSSP. However, these waters typically meet the standard for an approved classification under the NSSP because the discharge limit is less than 14 MPN/100 ml fecal coliform. If bacteria data shows violations with State standards it will be listed appropriately on the impaired (Category 4 or 5) part of the IR.

    3. The upper Chesapeake Bay[3] typically meets the standard for an approved classification but is restricted to shellfish harvesting for administrative reasons which are not based on water quality data. Water quality is routinely monitored in this area for fecal coliform. If bacteria data demonstrates that State standards are not being met, this area will be listed as impaired (Category 4 or 5) on the IR

B. Conditionally Approved Waters: Certain shellfish harvesting areas are classified as conditionally approved and are closed to harvesting for three days following a rainfall event of greater than or equal to one-inch in twenty-four hours. Conditionally approved harvesting areas generally meet the bacteriological water quality criteria for an approved classification (median of 14 MPN/100ml and 90th percentile <49MPN/100ml) at all other times and shellfish can be harvested from these areas when in the open status. When the water quality criteria for using a conditionally approved classification are not met, this area will be listed as impaired.

---

[2] Please note that shellfish area classifications do not directly relate to bacteria water quality. In some cases, certain shellfish area classifications are made based on administrative protection measures and not water quality data. In all cases, shellfish areas are assigned to categories on the IR based on water quality data alone.

[3] The upper Chesapeake Bay, only as it's referred to in this paragraph, is defined as all of the area north of a line running in a southeasterly direction from the Robin's Point Tower to the Pooles Island Range Light, then easterly to the Worton Point Tower.

C. Approved Waters: Waters classified as approved for shellfish harvesting meet the water quality standards for shellfish harvesting waters and are placed in Category 1 or 2 (meeting water quality standards) of the IR.

D. Shellfish Waters — Geographic Scale of Assessment
For the purposes of the IR, MDE will georeference shellfish harvesting impairments as polygonal bodies of water within the larger estuarine waters (i.e. Chesapeake Bay segments, Coastal Bays, etc.). The shape of these 'polygonal' areas of estuarine water will be determined by the spatial arrangement of monitoring stations and by nearby shoreline features.

III. Interpretation of Bacteria Data for Water Contact Recreation Use

Maryland has implemented the EPA recommended enterococcus (marine or freshwater) and *E. coli* (freshwater only) standards for all recreational waters. According to EPA's *Ambient Water Quality Criteria for Bacteria -1986*, the indicators *E. coli* and enterococcus have been found through epidemiological studies to have the best quantifiable relationship between the density of an indicator in the water and the potential human health risks associated with swimming in sewage-contaminated waters. "Indicator organisms are a fundamental monitoring tool used to measure both changes in environmental (water) quality or conditions and the potential presence of hard-to-detect pathogenic organisms. An indicator organism provides evidence of the potential presence or absence of a pathogenic organism that survives under similar physical, chemical, and nutrient conditions." (EPA 2002).

These criteria are used during the beach season by beach managers to issue advisories and to notify the public. A few high values of the indicators may or may not be indicative of impairment. Therefore, it is necessary to evaluate the results from multiple sampling events over time to adequately quantify water quality conditions. EPA's recreational criteria were developed for waters where primary contact recreation was designated and therefore apply to those activities. For water bodies where primary contact is not possible or permitted, MDE will prioritize these waters for sampling based on available resources.

Assessing Support of Water Contact Recreation Use

In 2012, the EPA issued the updated *Recreational Water Quality Criteria* (RWQC) document (EPA 2012) which includes recommendations for magnitude, duration, and frequency. The 2012 RWQC magnitude is expressed as two numeric concentration thresholds consisting of a geometric mean (GM) and a statistical threshold value (STV), which are presented in Table 1. Both of these numeric thresholds are used in Maryland's bacteria assessments and were adopted into Maryland's water quality standards. These criteria correspond to a level of water quality that is associated with an estimated illness rate of 36 per 1,000 primary contact recreators (EPA 2012). The listing methodology for water contact recreation use applies to all Maryland waters. The 2012 RWQC also provides optional Beach Action Values that are for use in the beaches

notification programs. These values are not used in determining use attainment, i.e., IR impairment listings.

Table 1. EPA Recreational Water Quality Criteria (EPA 2012).

Designated Use	Bacteria Indicator	GM (cfu/100ml)	STV (cfu/100ml)
Marine & Tidal, or Freshwaters Contact Recreation	Enterococci	≤ 35	No more than 10% > 130
Freshwater Contact Recreation	E. coli	≤ 126	No more than 10% > 410
Duration and Frequency: The waterbody GM should not be greater than the selected GM magnitude in any 90-day period. There should not be greater than a ten percent excursion frequency of the STV magnitude in the same 90-day period.			

Water bodies should be monitored at least weekly to evaluate the GM and STV during an annual 90-day assessment period. For each year or 90 day period, data are evaluated independently as either meeting or not meeting the criteria[4]. In a given year, if both the resulting GM and associated STV do not exceed the bacteria indicator criteria noted in Table 1, then the waterbody meets water quality criteria for that year. If either the resulting GM or the associated STV exceeds their respective bacteria indicator criteria then the waterbody does not meet water quality criteria for that year. The waterbody assessments for the Integrated Report are assessed using the most recent and consecutive two years of data. If both years meet water quality criteria, then the waterbody is listed on Category 2 as meeting some water quality standards. If both years do not meet the water quality criteria, then the waterbody is listed on Category 5 as impaired. If one year meets the water quality criteria and one year does not, then the waterbody is listed on Category 3 for insufficient information. Because of the variable nature of bacteria data, only data from the most recent ten-year period will be considered. If there aren't two consecutive years' worth of data in the most recent ten-year period, then the waterbody is listed on Category 3 for insufficient information. Listings can change each Integrated Reporting cycle based on a new year or multiple years' worth of data.

Geographic Scale of Assessment

Beaches - For the purposes of the Integrated Report, waters identified and assessed as beaches will be georeferenced as linear stretches of water, having only the dimension of length. As a

[4] State biologists reserve the right to use best professional judgment in the use of data collected during or after rain events. Rain and the subsequent stormwater runoff has been known to sometimes elevate levels of the bacteriological indicators without a source of fecal contamination. In other locales, rain events are known to cause sewage overflows and therefore samples collected in these locations are representative of the actual risk to public health.

result, the water body size reported for beaches will be expressed in miles. Since bathing beaches are typically narrow bands of water where water contact recreation occurs, this will help focus the georeferencing process to those areas of shoreline where beach access occurs.

Recreational Waters (not beaches) - Recreational waters, as the term is used here, generally refers to non-tidal flowing waters that may, from time to time, be used for full body contact recreation. For the purposes of the Integrated Report, when a bacterial monitoring station is assessed on non-tidal flowing waters, all upstream waters within the Maryland 8-digit watershed will be georeferenced as having the same assessment result. The only exception to this rule will be when there is an in-stream impoundment that significantly alters flow up and downstream of the dam. Recreational waters can also include tidal waters that may have had special assessments completed outside of the normal beach monitoring program. Assessments for these waters will be based on the spatial arrangement of monitoring stations and any nearby shoreline features. As a result, the geographic depiction of these assessments will show a polygonal body of water.

IV. Sewage Releases

In previous iterations of the Bacteria Assessment Methodology, there was a section that discussed sewage releases and how information on combined sewage overflows (CSOs) and sanitary sewage overflows (SSOs) was used in relation to water quality data on bacteria levels. However, after further consideration, the Department determined that this part of the methodology is not appropriate for 303(*d*) assessment purposes since there is insufficient scientific basis for determining that an overflow of 30,000 gallons was significant in a wide range of waterbody types, nor are there any federal regulatory requirements to list waters solely based on overflows. Such waters will not be listed in Category 5 of the IR so as to avoid overstating the potential water quality impairment where bacterial water quality data do not exist or do not support impairment. This will not impact the Department's ability to protect public health or to remedy faulty infrastructure.

DESIGN GUIDELINES
FOR
WASTEWATER FACILITIES

MARYLAND DEPARTMENT OF THE ENVIRONMENT
ENGINEERING AND CAPITAL PROJECTS PROGRAM

2016

Purpose:

- *Recommended Standards for Wastewater Facilities* (as revised) for Great Lakes-Upper Mississippi River Board of State and Provincial Public Health and Environmental Managers (10-State Standards) will continue to be the main source of guidance for the program's design review and construction permit functions. The 10-State Standards can be downloaded free from http://www.10statesstandards.com website, or purchased as a book from the Health Education Services (HES) at http://www.healthresearch.org/store.

- These guidelines are intended to serve as addenda to supplement the 10-State Standards.

- The 10-State Standards (as revised) and these guidelines supersede all other design guidelines for wastewater (sewerage facilities) previously issued by MDE.

- At the appearance of conflicting information, these guidelines supersede the 10-State Standards as they intended to provide further clarifications specific to MDE.

- Additional requirements beyond these guidelines and the 10-State Standards can be added by the facility's discharge permit and/or consent order or decree issued by MDE.

- If a local jurisdiction has more stringent requirements for any specific item, the more stringent requirements must be used for that item.

ADDENDUM TO CHAPTER 10
ENGINEERING REPORTS AND FACILITY PLANS

HYDRAULIC CAPACITY

Terminology and Typical Use:

Term	Description	Typical Design Use
Average Daily Flow (Current or Initial)	For existing facility, it's the current average daily flow based on the last three years data. This is done by averaging the daily flow for each year, then averaging the three years. For a proposed facility, it's the project initial flow.	To evaluate and address low flow conditions (minimum flows)
Design Average Flow (Design Capacity)	Average daily flow a facility is designed to successfully process	To develop maximum flowrates and peaking factors to be used for the design of equipment and unit processes.
Approved/Permitted Design Capacity	A treatment plant design flow approved by the County Water and Sewer Plans and permitted by the discharge permit with certain limits and conditions. It must be greater than or equal to a proposed design flow.	The maximum flow that can be evaluated to become the facility's new design capacity.
Diurnal Flow Pattern	The typical daily flow pattern for domestic wastewater with usually peaks occurring in the morning and evening.	Important in developing process control strategies for managing high flows.
Peak Hourly Flow	The largest volume of flow occurring within 1-hour period in the record examined.	Sizing of pumping facilities and conduits, sizing physical treatment units (ie grit chambers, screens, sedimentation tanks, filter hydraulic capacity). Sizing chlorine or other disinfection contact tanks. Also important in developing process control strategies for managing high flows.
Maximum or Peak Daily Flow	The largest volume of flow occurring within a 1-day period in the record examined.	Sizing of equalization tanks Sizing of sludge pumping system Sizing of chemical feed system
Maximum Monthly Flow	The average daily flows for the month with the highest total flow in the record examined.	Sizing of the bioreactor Sizing of the chemical storage tank Sizing of denitrification filter

Peaking Factor:

The peaking factor is used to forecast the maximum/peaking flows for the new proposed design capacity. The above average and maximum/peak flows are highly impacted by inflow/infiltration (I/I) and wet weather events. Therefore, the preferred method of estimating these values is by using actual data, which can account for any excessive I/I in the system and yield higher peaking factors than those of a typical system. When available, a record of three or more consecutive calendar years should be examined at an existing facility. Peaking factors should be calculated independently for each full consecutive calendar year examined, and then the highest of each type (hourly, daily, monthly) is selected.

$$\text{Peaking Factor (PF)} = \frac{\text{peak flow for the calendar year (hourly, daily, monthly)}}{\text{average daily flow for the calendar year}}$$

The following typical peaking factors (PF) should be used if there is not sufficient historical data available:

Design Capacity Range	Hourly PF	Daily PF	Monthly PF
0 to 0.25 MGD	4	3	2
0.25 to 16 MGD	$\frac{(3.2 \times \text{Design Capacity}^{5/6})}{\text{Design Capacity}}$	75% of Hourly PF	50% of Hourly PF, but not below 1.2
More than 16 MGD	2	1.5	1.2

Peak Flow = PF calculated above X Proposed Design Capacity

Proposed Design Capacity:

Proposed Design Capacity = Current Average Daily Flow (0 for new facilities)
+ Projected Future Flow

Projected Future Flow:

Future flows are projected based on 100 gallons per day per person, or 250 gallons per day per Equivalent Dwelling Unit (EDU). In addition, the following are the flow projections for different establishments:

Table I - Flow Projection Based Upon Gallons Per Person Per Day

Airports (per passenger)	5
Apartments-multiple family (per resident)	60
Bathhouses and swimming pools	10
Camps:	
Campground with central comfort stations	35
With flush toilets, no showers	25
Day camps (no meals served)	15
Resort camps (night and day) with limited plumbing	50
Luxury camps	100
Cottages and small dwellings with seasonal occupancy	50
Country clubs (per resident member)	100
Country clubs (per non-resident member present)	25
Dwellings:	
Boarding houses	50
additional for non-resident boarders	10
Luxury residences and estates	150
Multiple family dwellings (apartments)	60
Rooming houses	40
Single family dwellings	75-100
Factories (gallons per person, per shift, exclusive of industrial wastes)	35
Hospitals (per bed space)	350
Hotels with private baths (2 persons per room)	60
Hotels without private baths	50
Institutions other than hospitals (per bed space)	125
Laundries, self-service (gallons per wash, i.e., per customer)	50
Mobile home parks (per space)	250
Motels with bath, toilet and kitchen wastes (per bed space)	50
Motels (per bed space)	40
Picnic Parks (toilet wastes only) (per picnicker)	5
Picnic Parks with bathhouses, showers and flush toilets	10
Restaurants (per seat)	25
Restaurants (toilet and kitchen wastes per patron)	10
Restaurants (kitchen wastes per meal served)	3
Restaurants, additional for bars and cocktail lounges	2
Schools:	
Boarding	100
Day, without gyms, cafeterias or showers	15
Day, with gyms, cafeterias and showers	25
Day, with cafeterias, but without gyms or showers	20
Service Stations (per vehicle served)	10

Swimming pools and bathhouses	10
Theaters:	
Movie (per auditorium seat)	1
Drive-in (per car space)	5
Travel Trailer Parks without individual water and sewer hook-ups (per space)	50
Travel Trailer Parks with individual water and sewer hook-ups (per space)	100
Workers:	
Construction (at semi-permanent camps)	50
Day, at schools and offices (per shift)	15

An alternative method used to project average daily flows generated from commercial establishments, public service buildings, or dwelling units can be figured on the basis of total floor area, number of building units, or service seats multiplied by a statistical factor. Guiding factors are given in Table II.

Table II - Guiding Factors for Flow Projection Related with Commercial Establishments, Public Service Buildings, or Dwelling Units

Office Buildings	Gross Sq. Ft. x 0.09 = gpd
Medical Office Buildings	Gross Sq. Ft. x 0.62 = gpd
Warehouses	Gross Sq. Ft. x 0.03 = gpd
Retail Stores	Gross Sq. Ft. x 0.05 = gpd
Supermarkets	Gross Sq. Ft. x 0.20 = gpd
Drug Stores	Gross Sq. Ft. x 0.13 = gpd
Beauty Salons	Gross Sq. Ft. x 0.35 = gpd
Barber Shops	Gross Sq. Ft. x 0.20 = gpd
Department Store with Lunch Counter	Gross Sq. Ft. x 0.08 = gpd
Department Store without Lunch Counter	Gross Sq. Ft. x 0.04 = gpd
Banks	Gross Sq. Ft. x 0.04 = gpd
Service Stations	Gross Sq. Ft. x 0.18 = gpd
Laundries & Cleaners	Gross Sq. Ft. x 0.31 = gpd
Laundromats	Gross Sq. Ft. x 3.68 = gpd
Car Wash without Wastewater Recirculation Equipment.	Gross Sq. Ft. x 4.90 = gpd
Hotels	Gross Sq. Ft. x 0.25 = gpd
Motels	Gross Sq. Ft. x 0.23 = gpd
Dry Goods Stores	Gross Sq. Ft. x 0.05 = gpd
Shopping Centers	Gross Sq. Ft. x 0.18 = gpd

Flow projection for country clubs or public parks may be made on the basis of plumbing fixtures. The related statistical flow figures per unit of plumbing fixture are shown in Table III and Table IV.

Table III - Flow Projection for Country Clubs

	Gallons Per Day Per Fixture
Showers	500
Baths	300
Lavatories	100
Toilets	150
Urinals	100
Sinks	50

Table IV - Flow Projection for Public Parks
(During hours when park is open)

	Gallons Per Day Per Fixture
Flush toilets	35
Urinals	10
Showers	100
Faucets	15

ORGANIC CAPACITY
(For Wastewater Treatment Plant)

For existing facilities, 3-year data, if available should be evaluated, and average concentration is calculated in the treatment plant influent, primary effluent, and secondary effluent. For new wastewater treatment plant typical values are used or values from equivalent existing facility of similar capacity.

Average Organic/Mass Loading (Lbs/Day)
= Design Capacity (MGD) X Average Concentration (mg/l) X 8.34 (Conversion Factor)

Sustained Mass Loading (Lbs/Day)
= Average Mass Loading X PF (hourly, daily, monthly depending on the unit process being sized)

Computer Simulations:

Computer simulations have become more common in recent years, especially in the design of Biological and Enhanced Nutrient Removal processes. Simulators use mathematical models to allow designers to study kinetic as well as time-based solutions while determining the total mass balances of many constituents. Simulation results must be interpreted carefully given the potential limitations inherent in the calibration and validation of the computer model.

ADDENDA TO CHAPTER 30
DESIGN OF SEWERS

38.21 Minimum Distance from Water Supply Wells and other Water Supply Sources or Structures *(New Added Paragraph)*

To be consistent with COMAR 26.04.04.05, the proposed sewer line shall satisfy the following minimum horizontal distance from a water supply well and other water supply sources or structures:

(1) 100 feet from well utilizing unconfined aquifer, and surface water supply with "P" designation.

(2) 50 feet from well utilizing confined aquifer, or covered reservoir.

When it is impossible to obtain proper distance as stipulated above, the minimum horizontal separation can be reduced to 10 feet if one of the methods in Paragraph 38.4 (added below) is used, and the selected provision is extended 100 feet on both sides of an unconfined aquifer well or surface water supply with "P" designation (stream embankment may also be required), and 50 feet on both sides of a confined aquifer well or covered reservoir.

38.31 Horizontal and Vertical Separation *(Added to the Existing Paragraph)*

In addition to the above, one of the other methods in Paragraph 38.4 can be used if it is impossible to obtain the proper horizontal and vertical separation between the water and sewer lines.

38.32 Crossings *(Added to the Existing Paragraph)*

In addition to the above, one of the other methods in Paragraph 38.4 can be used if it is impossible to obtain the proper horizontal and vertical separation between the water and sewer lines. The selected provision shall be extended 10 feet on both sides of the crossing, measured perpendicular to the water main.

38.4 Methods to Address Minimum Separation Issues *(New Added Paragraph)*

When it is impossible to obtain proper horizontal and/or vertical separation as stipulated in the added 38.21 Paragraph above, and Paragraphs 38.31, and/or 38.32 of the 10-State Standards, one of the following methods can be used:

a. The sewer shall be designed and constructed equal to water pipe, of slip-on or mechanical joint pipe complying with Section 8.1 and Section 8.7 of the *Recommended Standards for Water Works*, and shall be pressure rated to at least 150 psi (1034 kPa) and pressure tested to ensure watertightness.

b. The sewer can be continuous, fused, or welded as long as it is equal to water pipe as described above.

c. Either the water main or the sewer line may be encased in concrete or other watertight carrier pipe as approved by MDE.

ADDENDUM TO CHAPTER 40
WASTEWATER PUMPING STATION

EMERGENCY OPERATION

Additional Measures for Facilities Located within Certain Critical Water Uses:

Per Paragraph 47.3 of Chapter 40 of the Recommended 10-State Standards (under Emergency Operation), the Maryland Department of Environment (MDE) hereby establishes the following supplemental design guidelines for wastewater pumping stations that can have a potential overflow that may affect public water supplies and other critical water uses identified by MDE. These supplemental guidelines apply to any existing station where pumping capacity is being increased to accommodate increased flows due to growth, and for proposed new pumping stations (not for the purpose of functional replacement); AND fall under at least one of the following categories:

1. Existing or new within 3 miles of a shellfish water

2. Existing or new within 3 miles of a bathing beach water

3. Existing or new within 3 miles of public water supply ("P" designation surface water)

4. Existing pumping stations within 3 miles of bacteria impaired water and has one or more overflow event(s) over the past 3 years that is/are attributable to a power outage, mechanical failure or human error

A. Case I

The wastewater pumping station is missing one of the four essential items: a telemetering alarm system, a standby pump unit, a stationary auxiliary power source, or a pump-around connection.

- MDE may allow a 24-hour emergency wastewater storage capacity as a substitute for the missing essential item.

B. Case II

The wastewater pumping station provides all four essential items:

1. A telemetering alarm system
2. A standby pump unit (internal)
3. A stationary auxiliary power source connected to a separate power feed substation or stationary generator
4. A pump-around connection coupling facility

AND

(a) For Pumping Capacity (Q_p) ≤ 150 gallons per minute (gpm), or serving Equivalent Dwelling Units (EDU) ≤ 200, no additional measure is required.

(b) For Pumping Capacity (Q_p) > 150 gallons per minute (gpm), or serving Equivalent Dwelling Units (EDU) > 200, one of the following items must be provided in addition to the four essential items listed above:

Option 1: A third power source must be provided by a separate feed line to a new power substation, by providing a new stationary generator, or by a stationary independently-powered pumping unit(s) with adequate capacity to maintain proper operation.

Option 2: An additional 2-hour wastewater storage capacity shall be provided for emergency need, based on the newly projected design average daily flow.

Emergency Wastewater Storage:

For existing wastewater pumping station, MDE may approve a wastewater emergency storage capacity with a detention time less than 2 hours, provided that all of the following circumstances are substantive and evidenced:

(1) Options 1 and 2 above are also not feasible;

(2) There is no physical means to provide the required storage capacity due to site restriction at the premise of the pumping station;

(3) The pumping station has had excellent operation records without Overflow of wastewaters at the premise of the station in the past five years; and

(4) An emergency plan ensuring that the maximum response time will be less than one hour to remedy the malfunction of the pumping station.

Emergency wastewater storage capacity defined as detention time is determined by the following:

Total Wastewater Storage Time + Wastewater Traveling Time = 2 Hours

(1) The traveling time of land overflow wastewaters will be calculated at 1 foot per second (fps).

(2) In water, the traveling time overflow wastewater will be calculated at 2 feet per seconds (fps).

(3) The wastewater storage time will be calculated by dividing the total storage capacity with the design average daily flow (Q_a).

Where, Q_a = design average daily flow, in gpm
Q_p = pumping capacity, in gpm

If Q_p = 0 to 694 gpm ➔ $Q_a = 0.25 \times Q_p$
If Q_p = 695 to 22,384 gpm ➔ $Q_a = 0.0668 \times Q_p^{1.2}$
If Q_p > 22,384 gpm ➔ $Q_a = 0.5 \times Q_p$

(4) The total storage capacity includes:

- the available excess storage in the wet well above the elevation of high water alarm to the elevation where the first sewer service connection is made or the sewer system's lowest ground elevation,
- the available storage in the wastewater collection system up to where the first sewer service connection is made or the sewer system's lowest ground elevation , and
- the storage basin provided, if necessary.

AMENDMENT TO CHAPTER 40
WASTEWATER PUMPING STATION

49.61 Friction Coefficient *(Amended Paragraph)*

Friction losses through force mains shall be based on the Hazen-Williams formula or other acceptable methods. When the Hazen-Williams formula is used, the value for "C" shall be 100 for unlined iron or steel pipe for design. For other smooth pipe materials such as PVC, polyethylene, lined ductile iron, etc., a higher "C" value may be allowed for design. Frictional loses should be evaluated over the life of the pipe.

ADDENDUM TO CHAPTER 50
WASTEWATER TREATMENT FACILITIES

ESSENTIAL FACILITIES

Special Requirements for Facilities Discharge to Shellfish Harvesting Waters:

Per COMAR 26.08.04.04.C (2) (c), these facilities shall incorporate a bypass control system, including a minimum 24-hour emergency holding facility,

- The facility shall provide for biocide residual control.
- The 24-hour emergency holding facility must be sized based on the design average flow of the plant.
- Retention or holding time of other unit processes used for other purposes cannot be counted toward this 24-hour emergency storage.
- Section 93.4 shall be used for pond construction details.
- Minimum freeboard shall be 3 feet. For small ponds of 5 acres or less, 2 feet may be acceptable.

ADDED CHAPTER 120
SUPPLEMENTAL DESIGN GUIDELINES FOR DRIP DISPERSAL OF TREATED WASTEWATER

Scope:

Drip dispersal is a method used to discharge treated wastewater by distributing it over an area of land at root zone depth for final polishing, reuse, and/or recharge of groundwater. The proposed drip dispersal system shall be capable of uniformly distributing the wastewater effluent over the required area of application.

Applicability:

These guidelines are applicable to the design of wastewater systems that receive discharge permits from the Maryland Department of the Environment (Department) and that employ drip dispersal discharge systems.

The Department's discharge permit must be issued and its limitations set before a construction permit can be reviewed and issued.

As for any construction permitted facility, the drip dispersal system design plans submitted to the Department for construction permit shall be signed and sealed by a Professional Engineer licensed by the State of Maryland. The system design engineer shall follow these guidelines and incorporate necessary manufacturing product specifications into the design document to ensure satisfactory performance of the drip dispersal system.

Pre-Treatment:

Wastewater effluent dispersed through this method must be treated to meet the water quality standards within the issued discharge permit limitations. The treatment process will be reviewed and approved for construction in accordance with the Department's Design Guidelines and the Recommended 10-State Standards.

Nitrogen removal capability by the vegetation planted at a drip irrigation field or other means is determined by the discharge permitting process and is accounted for in the set discharge permit limitations. The vegetation planted on the drip dispersal field shall provide a comparable nitrogen uptake rate as used in the Nitrogen Balance Calculation for achieving a zero nitrogen percolate concentration during the growing season.

Wastewater Effluent Dosing and Equalization Tank:

The treated wastewater effluent shall be discharged to the drip disposal system through a dosing tank that has sufficient volume to provide flow equalization. Storage requirements within the treatment and dispersal system shall be at least one full day-storage located between the treatment and dispersal systems.

The Wastewater Effluent Dosing and Equalization Tank will be reviewed and approved for construction in accordance with the Department's Design Guidelines and the Recommended 10-State Standards.

Drip System Dosing Pump and Filter:

The system is to be designed with the pumps, filters, and dispersal area to accommodate the following conditions:

1. Filter flushing
2. Zone dosing
3. Tubing network flushing

Dosing pump selected for the dispersal system shall be capable of delivering the design hydraulic flow. At least one standby pump must be provided and available for service at all times.

The filters shall be included as part of the drip dispersal system and meet the manufacturer's specifications as approved by the design engineer.

Wastewater Effluent Loading Rate:

The wastewater effluent loading rate will be determined and provided by the issued discharge permit and shall not exceed an annual average loading rate of two inches per week.

2 inch per week = 0.18 gal/ft^2/day

Dispersal Area Sizing:

The size of the required dispersal area is determined by the daily design flow (gpd) and the loading rate stipulated in the issued discharge permit.

Zone Layout:

Dispersal Zone, as defined by the National Onsite Wastewater Recycling Association (NOWRA), is the smallest unit of a drip dispersal system, consisting of a supply manifold, return manifold, drip laterals, and associated appurtenances, which can be loaded independently of all other parts of the dispersal system.

Zone width across contour is typically from 50 to 300 feet. Zone width is delineated by the following factors:

1. Site and soil evaluation.
2. Available distance down slope
3. Maximum linear feet of drip tubing as provided by the manufacturer

Drip Tubing (Dripper line) Runs and Laterals:

A length of dripper line across the contour is defined as a "run." The tubing should be installed on contour and laid out to drain itself through the emitters as evenly as possible so as not to cause localized overloading.

Typical Run Length = 50' to 300'

Lateral is a dripper line consisting of a run or series of runs extending from the supply manifold to the return manifold of a single dispersal zone. Lateral length is dependent on head loss, and the drip system design (i.e. dosing pump and filter).

Typical Dripper line Depth = 6 to 12 inches

Percent Run Time:

Each manufacturer offers different models with various dispersal dosing capacities. The selected model must be capable to accommodate the peak day flow within the desired Percent Run Time of less than 50%.

$$\text{Percent Run Time} = \frac{\text{Peak Day Flow (gpd)}}{\text{Dispersal Dosing Capacity (gpm)} \times 1440} \times 100\%$$

Dripper line Spacing:

Typical manufacturer recommendations call for drip tubing to be spaced 1 foot to 3 feet on center (2' o.c. is the most common).

Zone Dosing:

- A pressure regulator is required to maintain adequate residual pressure during dosing.
- The control system must allow for variable loading rate and/or dosing time at the individual zones.
- Individual zones shall be designed to be easily taken in and out of service for maintenance or repair.

Zone Forward Field Flushing:

Each drip zone must automatically undergo a periodic forward field flushing usually every 25 cycles or 15 days, whichever occurs first. Other flushing frequencies can be considered if recommended by the manufacturer. Control system must allow for adjustable flushing frequency.

A minimum velocity of 2 ft/sec should be used in the zone flushing.
A minimum velocity of 1 ft/sec is acceptable if the drip tubing is manufactured with antimicrobial inner lining to inhibit adhesion of biological growth on the inside walls of the tube and emitters.

Flush Residuals Required Treatment:

All filter flush and tubing network forward flush residuals are to return to the head of the pre-treatment system, or be treated by an acceptable side-treatment system before returning to the dosing station.

Air Release Valve:

An air release valve shall be provided for each zone at the highest elevation of the zone.

Minimum Required Horizontal Separation:

The following are the minimum horizontal separation distances required between the Drip Dispersal Area and other land features or components. Any exception may be considered by the Department using the Department's Design Guidelines and the Recommended 10-State Standards.

Land Feature or Component	Minimum Required Horizontal Separation Distances (in feet)
A flowing body of water	50
Well or suction line	100
Water service line	50
Occupied building	50
Property line	50
In-ground Swimming Pool	50

ADDED CHAPTER 130
RECOMMENDED BNR/ENR DESIGN CRITERIA

BNR TYPICAL DESIGN CRITERIA:

Usually two-stage reactor (anoxic/aerobic) would be sufficient to achieve BNR level of 8 mg/l TN.

Typical Design Criteria for Two-Stage BNR:

Parameter	Recommended
MLSS (mg/l)	3000-4000
Total HRT (hr)	12-16
Anoxic	2-4
Aerobic	8-12
MCRT (d)	15-40
F/M (g BOD/g MLVSS/d)	0.05-0.2
RAS (%Q)	50-100
Internal Recycle (%Q)	100-400
Anoxic Mix Power (hp/MG)	40-70

Typical Design Criteria For SBR BNR System:

Parameter	Recommended
BOD Load (Lbs/d/ft^3)	0.005-0.015
Cycle time (hr):	
Fill	1-3
Settle	0.75-1
Draw	0.5-1.5
MLSS (mg/l)	3000-5000
HRT (hr)	~6 per cycle per reactor
MCRT (d)	20-40
FM (g BOD/g MLVSS/d)	0.05-0.2

Additional Criteria:
Post-equalization basin with a storage capacity adequately for two decants should be provided for flows of 2.0 mgd or less, or when the total SBR system less than four (4) units.

BIOLAC Wave Oxidation Reactor BNR System:

- Nominal Hydraulic Detention Time = 36 hours
- Side-Water-Depth = 8 feet
- Free Board = 2 feet
- Aeration system and automatic control air valves shall be capable of achieving BNR.
- The reactors are earth structure lined with high quality of liners.

Typical Design Parameters for BNR Orbal/Oxidation Ditch:

Flow (mgd)	BOD Load (Lbs/d/ft^3)	MLSS (mg/l)	MCRT (d)	HRT (hr)	Side-Water Depth (ft)
<0.2	0.012	4000-5000	31-38	24	8-13
0.2 to 0.499	0.015	4000-5000	26-32	20	8-13
0.5 to 0.999	0.015-0.018	4000-5000	20-32	16.6-20	8-13
1.0 to 2.0	0.018	4000-5000	21-27	16.6	8-13
>2.0	0.02	5000-6000	24-29	15	8-13

Secondary Sedimentation Tanks for Conventional BNR:

Parameter	Recommended
Side Water Depth (ft)	12 to16
Hydraulic Overflow Rates (gpd/sq. ft.)	
Average Design Flow	400 to 700
Hourly Peak Flow	1000 to 1600
Solids Loading Rate (lbs/sq. ft.-day)	
Average Solids Loading Rate	24 to 36
Peak Solids Loading Rate	43

Secondary Sedimentation Tanks for Extended Aeration BNR:

Parameter	Recommended
Side Water Depth	12 to16
Hydraulic Overflow Rates (gpd/sq. ft.)	
Average Design Flow	200 to 400
Hourly Peak Flow	600 to 800
Solids Loading Rate (lbs/sq. ft.-day)	
Average Solids Loading Rate	15
Peak Solids Loading Rate	34

ENR TYPICAL DESIGN CRITERIA:

To achieve ENR, in general a four-stage reactor, or two-stage with denitrification filter would be needed. The biological process should be sized at 12° C will be funded

Four-Stage Bardenpho Process for ENR:

- The proposed four-stage Bardenpho process is intended to meet 3 mg/l TN. However, facilities for supplemental carbon and/or a conventional filtration process for polishing may be required to meet the nutrient goals of 3 mg/l TN and 0.3 mg/l TP.
- The width to length ratio of the reactor: 1:5
- Side-water-depth = 18 feet
- Free Board = 2 feet

Parameter	Recommended
MLSS (mg/l)	3000-5000
Total HRT (hr)	16-23 (~23 is used when high BOD with no primary)
1st Anoxic	2-4
Aerobic	8-12
2nd Anoxic	2-5
Re-aeration	0.5-1
MCRT (d)	10-40
F/M (g BOD/g MLVSS/d)	0.1-0.2
RAS (%Q)	100
Internal Recycle (%Q)	400-600
Anoxic Mix Power (hp/MG)	40-70

Carrousel Process for ENR:

- Nominal Hydraulic Detention Time = 21 hours
  1st Anoxic Zone = 3 hours
  Aerobic Zone = 15.5 hours
  2nd Anoxic Zone = 2 hours
  Re-aeration Zone = 0.5 hour
- Reactors are reinforced concrete structures.
- Side-Water-Depth = 14 feet
- MLSS = 4,000 mg/l

Conventional Filters

- The conventional filtration process is designed for polishing purpose.
- Filter Media Depth = 4 feet
- Hydraulic Loading Rate: 2.5 gpm/sq. ft. at average daily flow
- Hydraulic Loading Rate: 4.0 gpm/ sq. ft. at maximum month
- A conventional filtration process following the four-stage Bardenpho process may be required to achieve the level of 3 mg/l of TN and 0.3 mg/l of TP.

Denitrification Filters

I. Deep Bed Downflow Denitrification Filter:

Parameter	Recommended
Filter Depth	6 feet media depth plus 1.5 feet support gravel depth
Temperature	12 º C
Filter Influent DO (mg/l)	< 6 mg/l or as recommended by filter manufacturer
Nitrogen Volumetric Loading Rate for Annual Average	50 lbs NOx-N/1000 ft^3/day
Empty Bed Detention Time for Annual Average	20 minutes
Empty Bed Detention Time for Maximum Month	15 minutes
Hydraulic Loading Rate for Annual Average	2.2 gpm/ft^2
Hydraulic Loading Rate for Maximum Month	3.0 gpm/ft^2

II. Continuous Backwash Upflow Denitrification Filter:

Parameter	Recommended
Filter Depth	80 inches
Temperature	12 º C
Filter Influent DO (mg/l)	< 4 mg/l or as recommended by filter manufacturer
Nitrogen Volumetric Loading Rate for Annual Average	40 lbs NOx-N/1000 ft^3/day
Empty Bed Detention Time for Annual Average	20 minutes
Empty Bed Detention Time for Maximum Month	12 minutes
Hydraulic Loading Rate for Annual Average	2.2 gpm/ft^2
Hydraulic Loading Rate for Maximum Month	4.0 gpm/ft^2

Membrane Bioreactor (MBR)

Membrane Bioreactor (MBR) is a combination of suspended-growth activated sludge biological treatment and membrane filtration equipment performing the critical solid/liquid separation function that is traditionally accomplished using secondary clarifiers. To achieve ENR level of treatment, MBR needs to include a high performing nitrogen removal system such as Bardnepho, Johannesburg process, etc. MBR operates at high MLSS concentration almost double or triple the conventional activated sludge system, thereby allowing a smaller bioreactor to achieve the same level of treatment as the conventional system.

Typical MBR Design Parameters:

Parameter	Recommended
BOD Loading (Lbs/1,000 ft^3/day)	30-60
MLSS (mg/l)	8,000-15,000
F/M (g BOD/g MLVSS/day)	0.05-0.2
MCRT (day)	12-20
HRT (Hour)	6-15
Flux (gpd/ft^2)	8-15 (Temperature-Corrected at 12º C)
DO (mg/l)	Anoxic 0-.5 Aerobic 1.5-3 Membrane 2-6
Pore Size (μm)	0.1-0.4
RAS (Q)	3-6
Energy Consumption (KWh/1,000 gal)	0.1
Membrane Replacement	Every 3 to 5 years (Flux rate gradually declines overtime)
Pretreatment Requirements	1. Flow Equalization for peaking factor over 1.5-2.0 2. Fine Screening: 1-3 mm (0.04-0.12 in)

Facilities for Chemical Additions (Including Supplemental Carbon Source and Facilities for Phosphorus Removal):

- Chemical feed pumps shall be sized based on peak daily flow.
- Chapter 110 of the 10-State Standards shall be used for phosphorus removal by chemical treatment.
- In funding facilities for chemical addition, up to 30 days in storage capacity would be allowed for grant participation.

FOREWORD

In 1947, a "Committee on Development of Uniform Standards for Sewage Works" was created by the group now known as the Great Lakes - Upper Mississippi River Board of State and Provincial Public Health and Environmental Managers. This Committee, composed of a representative from each of the ten states, was assigned the responsibility to review existing standards for sewage works, to investigate the possibility of preparing joint standards to be adopted by the states represented, and to report its findings to the Board.

Based on this initial report, the Board authorized the Committee to prepare sewage works design standards, which were first published in 1951. They subsequently were revised and published again in 1960, 1968, 1971, 1973, 1978, 1990, 1997, and 2004. In 1977, the Province of Ontario was invited, as a Great Lakes participant, to serve on the Committee.

These standards have again been revised and are published herein as the 2014 edition. They are intended for use as a guide in the design and preparation of plans and specifications for wastewater facilities insofar as these standards are applicable to normal situations for an individual project.

The design criteria in these standards are intended for the more conventional municipal wastewater collection and treatment systems. Innovative approaches to collection and treatment, particularly for the very small municipal systems, are not included. The individual reviewing authority should be contacted for design guidance and criteria where such systems are being considered.

Lack of description or criteria for a unit process or equipment in these standards does not suggest it should not be used, but only that consideration by the reviewing authority will be on the basis of information submitted with the design. Engineering data that may be required for new process and application evaluation is included in Paragraph 53.2 of these standards. The contingency planning requirement in Paragraph 11.28(j) is intended to help users determine potential risk in meeting standards of performance on a long term basis, and to help determine the stage of development for technologies satisfying the criteria of Paragraph 53.2.

These standards are intended to suggest limiting values for items upon which an evaluation of the plans and specifications will be made by the reviewing authority; and to establish, as far as practicable, uniformity of practice among the several states and province. Statutory requirements, regulations, and guidelines among the states and province are not uniform and use of the standards must adjust itself to these variations. Users also should be cognizant of locally adopted regulations or standards and applicable federal requirements.

The term "shall" is used where practices are sufficiently standardized to permit specific delineation of requirements or where safeguarding of the public health or protection of water quality justifies such definite action. Other terms, such as "should," "recommended," and "preferred," indicate desirable procedures or methods, with deviations subject to individual consideration.

Definition of terms and their use in these standards is intended to be in accordance with GLOSSARY -- WATER AND WASTEWATER CONTROL ENGINEERING, jointly prepared by APHA, ASCE, AWWA and WPCF. The International Standard Units are in accordance with those recommended in National Institute of Standards and Technology (NIST) Guide for the Use of the International System of Units (SI). The customary units of expression used are generally in accordance with Manual of Practice No. 6, INTERNATIONAL STANDARD UNITS FOR WATER AND WASTEWATER PROCESSES, jointly prepared by AWWA, IWA and WEF.

CHAPTER 10
ENGINEERING REPORTS AND FACILITY PLANS

10. GENERAL

10.1 Engineering Services

Engineering services are performed in three steps:

a. Engineering Report or Facility Plan;

b. Preparation of construction plans, specifications, and contractual documents; and

c. Construction compliance, inspection, administration, and acceptance.

Chapter 10, Engineering Reports and Facility Plans, covers only item (a) above.

10.2 Preliminary Project Submittal

A preliminary project submittal may be necessary prior to the preparation of an Engineering Report or Facility Plan. This submittal needs to include:

a. A description of problems or developments which have resulted in consideration of a wastewater facilities project;

b. Identification of governmental and consultant representatives authorized to provide information and seek regulatory agency approvals and decisions regarding the project; and

c. Identification of potential treated wastewater discharge locations and flows for the purpose of regulatory agency determinations of suitable effluent quality requirements.

No approval for construction can be issued until final, detailed plans and specifications have been submitted and approved by the appropriate reviewing authority. Refer to Chapter 20.

11. ENGINEERING REPORT OR FACILITY PLAN

An Engineering Report or Facility Plan identifies and evaluates wastewater related problems; assembles basic information; presents criteria and assumptions; examines alternate projects (with preliminary layouts and cost estimates); describes system reliability for each unit operation with the largest unit out of service; describes financing methods; sets forth anticipated charges for users; reviews organizational and staffing requirements; offers a conclusion with a proposed project for client consideration; and outlines official actions, time schedules and procedures to implement the project. The document shall include sufficient detail to demonstrate that the proposed project meets applicable criteria.

The concept (including process description and sizing), factual data, and controlling assumptions and considerations for the functional planning of wastewater facilities are presented for each process unit and for the whole system. These data form the continuing technical basis for the detailed design and preparation of construction plans and specifications.

Architectural, structural, mechanical, and electrical designs are usually excluded. Sketches may be desirable to aid in presentation of a project. Outline specifications of process units, special equipment, etc., are occasionally included.

Engineering Reports shall be completed for minor collection system, pump station, and interceptor projects. Facility Plans shall be completed or have been completed for projects involving new, expanded, upgraded, or rehabilitated wastewater treatment facilities and major collection, interceptor sewer, and pump station projects. The determination of classification as major or minor collection interceptor sewer and pump station projects will be made by the reviewing authority based on review of recommended classification by the owner.

For federal, provincial, or state financed grant or loan projects, additional requirements may apply.

11.1 Engineering Reports

Engineering reports shall contain the following and any other pertinent information as required by the reviewing authority.

11.11 Problem Definition

Description of the existing system should include an evaluation of the conditions and problems needing correction.

11.12 Flows and Organic Loads

The anticipated design average and design peak flows and waste loads for the existing and ultimate conditions shall be established. The basis of the projection of initial and future flows and waste loads shall be included and shall reflect the existing or initial service area, and the anticipated future service area. More detail on flow and organic load information and the data needed for new collection systems are included in Paragraphs 11.24 and 11.25.

11.13 Impact on Existing Wastewater Facilities

The impact of the proposed project on all existing wastewater facilities (including gravity sewers, lift stations, and treatment facilities) shall be evaluated.

11.14 Project Description

A written description of the project is required.

11.15 Location Drawings

Drawings identifying the site of the project and the anticipated

location and alignment of proposed facilities are required.

11.16 Engineering Criteria

Engineering criteria to be used in design of the project shall be included.

11.17 Site Information

Project site information should include topography, soils, geologic conditions, depth to bedrock, groundwater level, floodway or floodplain considerations, and any other pertinent site information.

11.18 Alternative Selection

The reasons for selection of the proposed alternative, including any lift station sites, feasibility, and how the project fits into a long term plan, should be discussed.

11.19 Environmental Review

Consideration should be given to minimizing any potential adverse environmental effects of the proposed project. Compliance with the planning requirements of federal, provincial, state, and local regulatory agencies shall be documented, if appropriate.

11.2 Facility Plans

Facility Plans shall contain the following and any other pertinent information as required by the reviewing authority.

11.21 Problem Evaluation and Existing Facility Review

a. Descriptions of existing system including condition and evaluation of problems needing correction.

b. Summary of existing and previous local and regional wastewater facility and related planning documents.

11.22 Planning and Service Area

A description of the planning area and existing and potential future service areas shall be included.

11.23 Population Projection and Planning Period

Present and predicted population shall be based on a 20 year planning period. Phased construction of wastewater facilities should be considered in rapid growth areas. Sewers and other facilities with a design life in excess of 20 years should be designed for the extended period.

11.24 Hydraulic Capacity

11.241 Flow Definitions and Identification

The following flows for the design year shall be identified and used as a basis of design for sewers, lift stations, wastewater treatment plants, treatment units, and other wastewater handling facilities. Where any of the terms defined in this Paragraph are used in these design standards, the definition contained in this Paragraph applies.

a. Design Average Flow

The design average flow is the average of the daily volumes to be received for a continuous 12 month period expressed as a volume per unit time. However, the design average flow for facilities having critical seasonal high hydraulic loading periods (e.g., recreational areas, campuses, industrial facilities) shall be based on the average of the daily volumes to be received during the seasonal period.

b. Design Maximum Day Flow

The design maximum day flow is the largest volume of flow to be received during a continuous 24 hour period expressed as a volume per unit time.

c. Design Peak Hourly Flow

The design peak hourly flow is the largest volume of flow to be received during a one hour period expressed as a volume per unit time.

d. Design Peak Instantaneous Flow

The design peak instantaneous flow is the instantaneous maximum flow rate to be received.

11.242 Hydraulic Capacity for Wastewater Facilities to Serve Existing Collection Systems

a. Projections shall be made from actual flow data to the extent possible.

b. The probable degree of accuracy of data and projections for all critical design flow conditions shall be evaluated. This reliability estimation should include an evaluation of the accuracy of existing data, and an evaluation of the reliability of estimates of flow reduction anticipated due to infiltration/inflow (I/I) reduction, or flow increases

due to elimination of sewer bypasses and backups or hydraulic restrictions. To ensure a higher degree of accuracy, estimates of I/I reduction shall consider design precipitation events with representative runoff characteristics and groundwater elevations.

c. Critical data and methodology used shall be included. Graphical displays of critical peak wet weather flow data [refer to Paragraphs 11.241(b), 11.241(c) and 11.241(d)] should be included for a sustained wet weather flow period of significance to the project.

11.243 Hydraulic Capacity for Wastewater Facilities to Serve New Collection Systems

a. The sizing of wastewater facilities receiving flows from new wastewater collection systems shall be based on an average daily flow of 100 gallons (380 L) per capita plus wastewater flow from industrial plants and major institutional and commercial facilities unless water use data or other justification upon which to better estimate flow is provided.

b. The 100 gal/cap/d [380 L/(capita·d)] value shall be used in conjunction with a peaking factor from Figure 1 to cover normal infiltration for systems built with modern construction techniques. Refer to Section 31. However, an additional allowance should be made where conditions are unfavorable.

c. If the new collection system is to serve existing development the likelihood of I/I contributions from existing service lines and non-wastewater connections to those service lines shall be evaluated and wastewater facilities designed accordingly.

11.244 Combined Sewer Interceptors

In addition to the above requirements, interceptors for combined sewers shall have capacity to receive a sufficient quantity of combined wastewater for transport to treatment facilities to ensure attainment of the appropriate water quality standards.

11.25 Organic Capacity

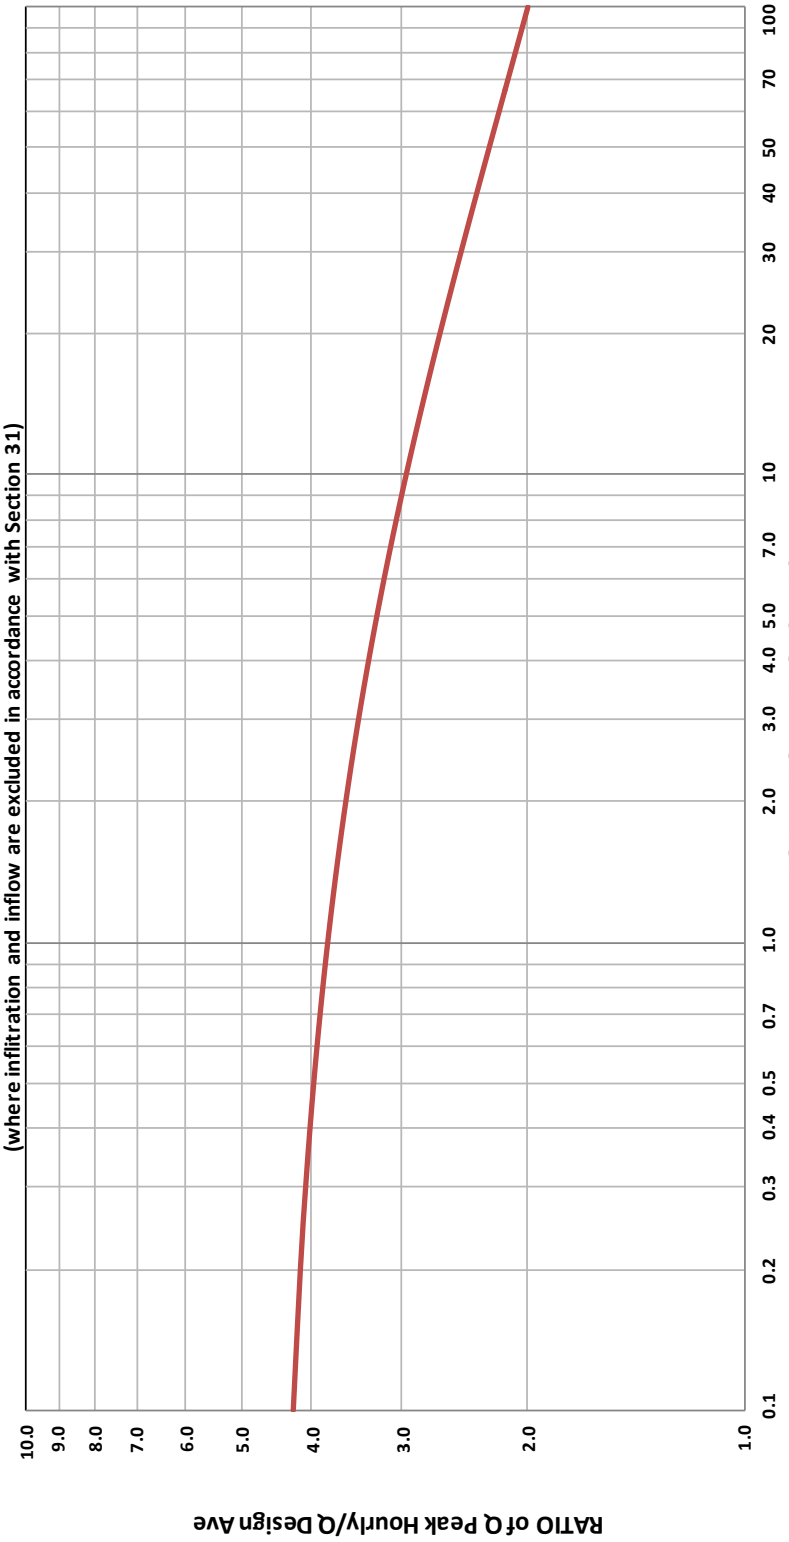
11.251 Organic Load Definitions and Identification

The following organic loads for the design year shall be identified and used as a basis for design of wastewater treatment facilities. Where any of the terms defined in this Paragraph are used in these design standards, the definition contained in this Paragraph applies.

FIGURE 1

RATIO OF PEAK HOURLY FLOW TO DESIGN AVERAGE FLOW

(where inflitration and inflow are excluded in accordance with Section 31)



Q peak hourly: Maximum Rate of Wastewater Flow (Peak Hourly Flow)

Q design ave: Design Average Daily Wastewater Flow

Source: Q Peak Hourly/Q Design Ave $= \frac{18+\sqrt{P}}{4+\sqrt{P}}$ (P= population in thousands)

Fair, G. M. and Geyer, J. C., "Water Supply and Waste-water Disposal"
1 st Ed., John Wiley & Sons, Inc., New York (1954), p. 136

a. Biochemical Oxygen Demand Defined

The 5-day Biochemical Oxygen Demand (BOD_5) is defined as the amount of oxygen required to stabilize biodegradable organic matter under aerobic conditions within a five day period in accordance with Standard Methods for the Examination of Water and Wastewater. Total 5-day Biochemical Oxygen Demand ($TBOD_5$) is equivalent to BOD_5 and is sometimes used in order to differentiate carbonaceous plus nitrogenous oxygen demand from strictly carbonaceous oxygen demand.

The Carbonaceous 5-day Biochemical Oxygen Demand ($CBOD_5$) is defined as BOD_5 less the nitrogenous oxygen demand of the wastewater. See Standard Methods for the Examination of Water and Wastewater.

b. Design Average BOD_5

The design average BOD_5 is generally the average of the organic load to be received for a continuous 12 month period for the design year expressed as weight per day. However, the design average BOD_5 for facilities having critical seasonal high loading periods (e.g., recreational areas, campuses, industrial facilities) shall be based on the average organic load to be received during the seasonal period.

c. Design Maximum Day BOD_5

The design maximum day BOD_5 is the largest amount of organic load to be received during a continuous 24 hour period expressed as weight per day.

d. Design Peak Hourly BOD_5

The design peak hourly BOD_5 is the largest amount of organic load to be received during a one hour period expressed as weight per day.

11.252 Design of Organic Capacity of Wastewater Treatment Facilities to Serve Existing Collection Systems

a. Projections shall be made from actual waste load data to the extent possible.

b. Projections shall be compared to those described in Paragraph 11.253 and an accounting made for significant variations from those values.

c. Impact of industrial sources shall be documented. For projects with significant industrial contributions, evidence of adequate pretreatment strategies shall be included along with documentation that industries are aware of the pretreatment limitations and user costs associated with the project. Documentation of the individual industrial participation in the project plan including user charges shall be provided.

d. Septage and leachate may contribute significant organic load and other materials which can cause operational problems and non-compliance with National Pollutant Discharge Elimination System (NPDES) permit limitations. If septage or leachate is to be discharged to the wastewater treatment facility, consult the state regulatory agency and the Appendix, Handling and Treatment of Septage at a Wastewater Treatment Plant.

11.253 Design of Organic Capacity of Wastewater Treatment Facilities to Serve New Collection Systems

a. Domestic wastewater treatment design shall be on the basis of at least 0.17 pounds (0.08 kg) of BOD_5 per capita per day, and 0.20 pounds (0.09 kg) of suspended solids per capita per day, unless information is submitted to justify alternate designs. If nitrification is required, 0.036 pounds (0.016 kg) TKN per capita per day may be used.

b. Where garbage grinders are commonly used in areas tributary to a domestic treatment plant, the design basis should be increased to 0.22 pounds (0.10 kg) of BOD_5 per capita per day, and 0.25 pounds (0.11 kg) of suspended solids per capita per day. If nitrification is required, 0.046 pounds (0.021 kg) TKN per capita per day may be used.

c. Industrial contributions. Refer to Paragraph 11.252(c).

d. Septage and Leachate. Refer to Paragraph 11.252(d).

e. Data from similar municipalities may be utilized in the case of new systems. However, thorough investigation that is adequately documented shall be provided to the reviewing authority to establish the reliability and applicability of such data.

11.26 Wastewater Treatment Facility Design Capacity

The wastewater treatment facility design capacity is the design average flow at the design average BOD_5. Refer to Paragraphs 11.24 and 11.25 for definitions and required peaking factors.

11.27 Initial Alternative Development

The process of selection of wastewater treatment alternatives for detailed evaluation should be discussed. All wastewater management alternatives considered, including no action, and the basis for the engineering judgment for selection of the alternatives chosen for detailed evaluation, should be included.

11.28 Detailed Alternative Evaluation

The following shall be included for the alternatives to be evaluated in detail.

a. Sewer System Revisions

Proposed revisions to the existing sewer system including adequacy of portions not being changed by the project shall be evaluated.

b. Wet Weather Flows

Facilities to transport and treat wet weather flows in a manner that complies with federal, state and local regulations shall be provided.

c. Wet Weather Flow Equalization

If the ratio of design peak hourly flow to design average flow is 3:1 or more, flow equalization shall be considered. This may be accomplished by either building a wet weather retention basin and gradually returning the excess flow to the treatment plant during off-peak periods or by providing a plant large enough to handle all flows.

d. Site Evaluation

Site evaluation shall consider the following criteria. When a site must be used which is critical with respect to the following items, appropriate measures shall be taken to minimize adverse impacts.

1. Compatibility of the treatment process with the present and planned future land use, including noise, potential odors, air quality, and anticipated sludge processing and disposal techniques, shall be considered.

Non-aerated lagoons should not be used if excessive sulfate is present in the wastewater.

Wastewater treatment facilities should be separate from habitation or any area likely to be built up within a reasonable future period and shall be separated in accordance with state and local requirements.

2. Zoning and other land use restrictions shall be identified.

3. The accessibility and topography of the site shall be evaluated.

4. Area for future plant expansion shall be identified.

5. Direction of prevailing wind shall be identified.

6. Flood considerations, including the 25 and 100 year flood levels, impact on floodplain and floodway, and compliance with applicable regulations regarding construction in flood-prone areas, shall be evaluated. Paragraph 51.2 contains requirements for protection from flooding.

7. Geologic information, depth to bedrock, karst features, or other geologic considerations of significance to the project shall be included. Lagoons shall not be located in karst areas unless the specific geologic and construction details are acceptable.

8. Protection of groundwater including public and private wells is of utmost importance. Demonstration that protection will be provided shall be included. The regulatory agency shall be contacted for required separation.

9. Soil type and suitability for construction and depth to normal and seasonal high groundwater shall be determined.

10. The location, depth, and discharge point of any field tile in the immediate area of the proposed site shall be identified.

11. Present and known future effluent quality requirements as determined by the regulatory agency shall be included.

12. Access to receiving stream for the outfall line shall be discussed and displayed.

13. A preliminary assessment of site availability shall be included.

e. Unit Sizing

Unit operation and unit process sizing and basis shall be provided.

f. Flow Diagram

Flow diagram of treatment facilities including all recycle flows shall be included.

g. Flexibility

Compliance with requirements of Paragraph 53.6 Arrangement of Units shall be assured.

h. Removal Efficiencies

Loadings to and removal efficiencies through each unit operation shall be provided in addition to total removal efficiency and effluent quality (both concentrations and mass).

i. Emergency Operation

Emergency operation requirements as outlined in Section 47 and Paragraph 56.1 shall be provided. State or local regulatory agencies may have more stringent requirements.

j. Technology Not Included In These Standards

Paragraph 53.2 outlines procedures for introducing and obtaining approval to use technology not included in these standards. Proposals to use technology not included in these standards shall address the requirements of Paragraph 53.2.

A contingency plan, in the event that such new technology fails to meet the expected performance, may be required by the reviewing authority in the absence of three separate and representative full scale installations successfully using the same technology. Each representative full scale installation should have sufficient monitoring and appropriate testing results that demonstrate reliable and effective compliance with the design performance criteria and have been operated for not less than three years at or near design capacity without major failure of either the process or equipment.

k. Sludge

The solids disposal options considered and method selected shall be included. This is critical to completion of a successful project. Compliance with requirements of Chapter 80, Sludge Processing, Storage, and Disposal shall be assured.

l. Treatment During Construction

A plan for the method and level of treatment (including sludge processing, storage and disposal) to be achieved during construction shall be developed and included in the Facility Plan submitted to the regulatory agency for review and approval. This approved treatment plan shall be implemented by inclusion in the plans and specifications to be bid for the project. Refer to Paragraph 20.15 and Section 21.

m. Operation and Maintenance

Portions of the project which involve complex operation or maintenance requirements shall be identified including laboratory requirements for operation, industrial sampling, and self-monitoring.

n. Cost Estimates

Cost estimates for capital and operation and maintenance (including basis), shall be included.

o. Environmental Review

Consideration shall be given to minimizing any potential adverse environmental effects of the proposed project. Compliance with planning requirements of federal, provincial, state, and local regulatory agencies shall be documented.

11.29 Final Project Selection

The project selected from the alternatives considered under Paragraph 11.28, including the financing considerations and recommendations for implementation of the plan, shall be set forth in the final Facility Plan document to be forwarded to the reviewing authority for review and approval.

12.0 PRE-DESIGN MEETING

A pre-design meeting is recommended for plant projects with the applicant, design engineer and reviewing authority in attendance to discuss subsequent changes to the engineering report or facilities plan approval, deviations from design standards, schedule of submittal and review, and applicable reliability

guidelines. Significant changes may require a Preliminary Project Submittal in accordance with Paragraph 10.2 and preparation of an Engineering Report or Facility Plan for review and approval.

CHAPTER 20
ENGINEERING PLANS AND SPECIFICATIONS

20. PLANS AND SUPPORT DOCUMENTS

Submissions to the reviewing authority shall include sealed plans, design criteria, the appropriate construction permit applications, review forms, and permit fee if required.

20.1 General

20.11 Plan Title

All plans for wastewater facilities shall bear a suitable title showing the name of the municipality, sewer district, or institution. They shall show the scale in feet or meters, a graphical scale, the north point, date, and the name and signature of the engineer, with the certificate number and imprint of the professional engineering seal. A space should be provided for signature and/or approval stamp of the appropriate reviewing authority.

20.12 Plan Format

The plans shall be clear and legible (suitable for microfilming). They shall be drawn to a scale that will permit all necessary information to be plainly shown. Generally, the size of the plans should not be larger than 30 inches x 42 inches (760 mm x 1070 mm). Datum used should be indicated. Locations and logs of test borings, when required, shall be shown on the plans. Blueprints shall not be submitted.

20.13 Plan Contents

Detail plans shall consist of plan views, elevations, sections, and supplementary views which, together with the specifications and general layouts, provide the working information for the contract and construction of the facilities. They also shall include dimensions and relative elevations of structures, the location and outline form of equipment, location and size of piping, water levels, and ground elevations.

20.14 Design Criteria

Design criteria shall be included with all plans and specifications and a hydraulic profile shall be included for all wastewater treatment facilities. For sewer and lift station projects, information shall be submitted to verify adequate downstream sewer, pump station and treatment plant capacity.

20.15 Operation During Construction

Project construction documents shall specify the procedure for operation during construction that complies with the plan required by Paragraph 11.28(l), Treatment During Construction.

20.2 Plans of Sewers

20.21 General Plan

A general plan of proposed and existing sewers shall be submitted for projects involving new sewer systems or substantial additions to existing systems. This plan shall show the following:

20.211 Geographical Features

a. Topography and elevations - Existing or proposed streets and all streams or water surfaces shall be clearly shown. Contour lines at suitable intervals should be included.

b. Streams - The direction of flow in all streams and the high and low water elevations of all water surfaces at sewer outlets and overflows shall be shown.

c. Boundaries - The boundary lines of the municipality or the sewer district and the area to be sewered shall be shown.

20.212 Sewers

The plan shall show the location, size, and direction of flow of relevant existing and proposed sanitary and combined sewers draining to the treatment facility concerned.

20.22 Detail Plans

Detail plans shall be submitted. Profiles should have a horizontal scale of not more than 100 feet to the inch (1200:1) and a vertical scale of not more than 10 feet to the inch (120:1). Plan views should be drawn to a corresponding horizontal scale and shall be shown on the same sheet. Plans and profiles shall show:

a. Location of streets and sewers;

b. Line of ground surface; size, material, and type of pipe; length between manholes; invert and surface elevation at each manhole; and grade of sewer between each two adjacent manholes (all manholes shall be numbered on the profile);

Where there is any question of the sewer being sufficiently deep to serve any residence, the elevation and location of the basement floor shall be plotted on the profile of the sewer which is to serve the residence in question. The engineer shall state that all sewers are sufficiently deep to serve adjacent basements except where otherwise noted on the plans;

c. Locations of all special features such as inverted siphons, concrete encasements, elevated sewers, etc.;

d. All known existing structures and utilities, both above and below ground, which might interfere with the proposed construction or require isolation setback, particularly water mains and water supply structures (i.e., wells, clear wells, basins, etc.), gas mains, storm drains, and telephone and power conduits; and

e. Special detail drawings, made to a scale to clearly show the nature of the design, shall be furnished to show the following particulars:

All stream crossings and sewer outlets, with elevations of the stream bed and high, normal, and low water levels;

Details of all special sewer joints and cross-sections; and

Details of all sewer appurtenances, such as manholes, lampholes, inspection chambers, inverted siphons, regulators, tide gates, and elevated sewers.

20.3 Plans of Wastewater Pumping Stations

20.31 Location Plan

A location plan shall be submitted for projects involving construction or revision of pumping stations. This plan shall show the following:

a. The location and extent of the tributary area;

b. Any municipal boundaries within the tributary area; and

c. The location of the pumping station and force main, and pertinent elevations.

20.32 Detail Plans

Detail plans shall be submitted showing the following, where applicable:

a. Topography of the site;

b. Existing pumping station;

c. Proposed pumping station, including provisions for installation of future pumps;

d. Elevation of high water at the site, and maximum elevation of wastewater in the collection system upon occasion of power failure;

e. Maximum hydraulic gradient in downstream gravity sewers when all installed pumps are in operation; and

f. Test borings and groundwater elevations.

20.4 Plans of Wastewater Treatment Plants

20.41 Location Plan

A location plan shall be submitted showing the wastewater treatment plant in relation to the remainder of the system. Sufficient topographic features shall be included to indicate its location with relation to streams and the point of discharge of treated effluent.

20.42 General Layout

Layouts of the proposed wastewater treatment plant shall be submitted, showing:

a. Topography of the site;

b. Size and location of plant structures;

c. Schematic flow diagram(s) showing the flow through various plant units, and showing utility systems serving the plant processes;

d. Piping, including any arrangements for bypassing individual units (materials handled and direction of flow through pipes shall be shown);

e. Hydraulic profiles showing the flow of wastewater, supernatant liquor, recycle streams, and sludge; and

f. Test borings and groundwater elevations.

20.43 Detail Plans

Detail plans shall show the following, where applicable:

a. Location, dimensions, and elevations of all existing and proposed plant facilities;

b. Elevations of high and low water level of the body of water to which the plant effluent is to be discharged;

c. Type, size, pertinent features, and operating capacity of all pumps, blowers, motors, and other mechanical devices;

d. Minimum, design average, and peak hourly hydraulic flow in profile;

e. Existing and design sludge storage volumes in plan and profile; and

f. Adequate description of any features not otherwise covered by the specifications or engineer's report.

21. SPECIFICATIONS

Complete signed and sealed technical specifications (see Paragraph 20.11) shall be submitted for the construction of sewers, wastewater pumping stations, wastewater treatment plants, and all other appurtenances, and shall accompany the plans.

The technical specifications accompanying construction drawings shall include, but not be limited to, specifications for the approved procedures for operation during construction in accordance with Paragraphs 11.28(l) and 20.15, and all construction information not shown on the drawings which is necessary to inform the builder in detail of the design requirements for the quality of materials, workmanship, and fabrication of the project.

The specifications shall also include the type, size, strength, operating characteristics, and rating of equipment; allowable infiltration; complete requirements for all mechanical and electrical equipment (including machinery, valves, piping, and jointing of pipe); electrical apparatus, wiring, instrumentation, and meters; laboratory fixtures and equipment; operating tools, construction materials; special filter materials (such as, stone, sand, gravel, or slag); miscellaneous appurtenances; chemicals when used; instructions for testing materials and equipment as necessary to meet design standards; and performance tests for the completed facilities and component units. It is suggested that these performance tests be conducted at design load conditions wherever practical.

22. REVISIONS TO APPROVED PLANS

Any deviations from approved plans or specifications affecting capacity, flow, operation of units, or point of discharge shall be approved, in writing, before such changes are made. Plans or specifications so revised should be submitted well in advance of any construction work which will be affected by such changes to permit sufficient time for review and approval. Structural revisions or other minor changes not affecting capacities, flows, or operation will be permitted during construction without approval. "As built" plans clearly showing such alterations shall be submitted to the reviewing authority at the completion of the work.

CHAPTER 30
DESIGN OF SEWERS

31. APPROVAL OF SEWERS

In general, the appropriate reviewing authority will approve plans for new systems, extensions to new areas, or replacement sanitary sewers only when designed upon the separate basis, where rain water from roofs, streets, and other areas and groundwater from foundation drains are excluded.

32. DESIGN CAPACITY AND DESIGN FLOW

In general, sewer capacities should be designed for the estimated ultimate tributary population, except when considering parts of the system that can be readily increased in capacity. Similarly, consideration should be given to the maximum anticipated capacity of institutions, industrial parks, etc. Where future relief sewers are planned, economic analysis of alternatives should accompany initial permit applications. See Paragraph 11.24.

33. DETAILS OF DESIGN AND CONSTRUCTION

33.1 Minimum Size

A public gravity sewer conveying raw wastewater shall not be less than 8 inches (200 mm) in diameter.

33.2 Depth

In general, sewers should be sufficiently deep to receive wastewater from basements and to prevent freezing. Insulation shall be provided for sewers that cannot be placed at a depth sufficient to prevent freezing.

33.3 Buoyancy

Buoyancy of sewers shall be considered. Flotation of the pipe shall be prevented with appropriate construction where high groundwater conditions are anticipated.

33.4 Slope

33.41 Recommended Minimum Slopes

All sewers shall be designed and constructed to give mean velocities, when flowing full, of not less than 2.0 feet per second (0.6 m/s), based on Manning's formula using an "n" value of 0.013. The following are the recommended minimum slopes that should be provided for sewers 42 inches (1050 mm) or less. However, slopes greater than these may be desirable for construction, to control sewer gases or to maintain self-cleansing velocities at all rates of flow within the design limits.

Nominal Sewer Size	Minimum Slope in Feet Per 100 Feet (m/100 m)
8 inch (200 mm)	0.40
10 inch (250 mm)	0.28
12 inch (300 mm)	0.22
15 inch (375 mm)	0.15
18 inch (450 mm)	0.12
21 inch (525 mm)	0.10
24 inch (600 mm)	0.08
27 inch (675 mm)	0.067
30 inch (750 mm)	0.058
33 inch (825 mm)	0.052
36 inch (900 mm)	0.046
39 inch (975 mm)	0.041
42 inch (1050 mm)	0.037

Sewers 48 inches (1200 mm) or larger should be designed and constructed to give mean velocities, when flowing full, of not less than 3.0 feet per second (0.9 m/s), based on Manning's formula using an "n" value of 0.013.

33.42 Minimum Flow Depths

Slopes that are slightly less than the recommended minimum slopes may be permitted. Such decreased slopes may be considered where the depth of flow will be 0.3 of the diameter or greater for the design average flow. The operating authority of a sewer system considering decreased slopes shall furnish the appropriate reviewing authority written assurance that any additional sewer maintenance required by reduced slopes will be provided.

33.43 Minimization of Solids Deposition

The pipe diameter and slope shall be selected to obtain the greatest practical velocities so as to minimize settling problems. Flatter slopes shall not be justified with oversize sewers. If the proposed slope is less than the minimum slope of the smallest pipe that can accommodate the design peak hourly flow, the actual depths and velocities at minimum, average, and design maximum day and peak hourly flow for each design section of the sewer shall be calculated by the design engineer and be included with the plans.

33.44 Slope Between Manholes

Sewers shall be laid with uniform slope between manholes.

33.45 High Velocity Protection

Where velocities greater than 10 feet per second (3 m/s) are attained, special provisions as necessary shall be made to avoid scour and protect against displacement caused by erosion or impact.

33.46 Steep Slope Protection

Sewers on 20 percent slopes or greater shall be anchored securely with concrete, or equal, anchors spaced as follows:

a. Not over 36 feet (11 m) center to center on grades of 20 percent up to 35 percent;

b. Not over 24 feet (7.3 m) center to center on grades of 35 percent up to 50 percent; and

c. Not over 16 feet (4.9 m) center to center on grades of 50 percent or greater.

33.5 Alignment

In general, sewers 24 inches (600 mm) or less shall be laid with straight alignment between manholes. Straight alignment shall be checked by either using a laser beam or lamping.

Curvilinear alignment of sewers larger than 24 inches (600 mm) may be considered on a case by case basis provided compression joints are specified and ASTM or specific pipe manufacturers' maximum allowable pipe joint deflection limits are not exceeded. Curvilinear sewers shall be limited to simple curves that start and end at manholes. When curvilinear sewers are proposed, the recommended minimum slopes indicated in Paragraph 33.41 shall be increased accordingly to provide a minimum velocity of 2.0 feet per second (0.6 m/s) when flowing full.

33.6 Changes in Pipe Size

When a smaller sewer joins a large one, the invert of the larger sewer should be lowered sufficiently to maintain the same energy gradient. An approximate method for securing these results is to place the 0.8 depth point of both sewers at the same elevation.

Sewer extensions should be designed for projected flows even when the diameter of the receiving sewer is less than the diameter of the proposed extension at a manhole constructed in accordance with Section 34. However, special consideration shall be given to an appropriate flow channel to minimize turbulence when there is a change in sewer size. The appropriate reviewing authority may require a schedule for construction of future downstream sewer relief.

33.7 Materials

Any generally accepted material for sewers may be given consideration, but the material selected should be adapted to local conditions, such as: character of industrial wastes; possibility of septicity; soil characteristics; exceptionally heavy external loadings, abrasion, corrosion, or similar problems.

Suitable couplings complying with ASTM specifications shall be used for joining dissimilar materials. The leakage limitations on these joints shall be in accordance with Paragraphs 33.94 or 33.95.

All sewers shall be designed to prevent damage from superimposed live, dead, and frost induced loads. Proper allowance for loads on the sewer shall be made because of soil and potential groundwater conditions, as well as the width and depth of trench. Where necessary, special bedding, haunching and initial backfill, concrete cradle, or other special construction shall be used to withstand anticipated superimposed loading or loss of trench wall stability. See ASTM D-2321 or ASTM C-12 as appropriate.

For new pipe materials for which ASTM standards have not been established, the design engineer shall provide complete pipe specifications and installation specifications developed on the basis of criteria adequately documented and certified in writing by the pipe manufacturer to be satisfactory for the specific detailed plans.

33.8 Installation

33.81 Standards

Installation specifications shall contain appropriate requirements based on the criteria, standards, and requirements established by industry in its technical publications. Requirements shall be set forth in the specifications for the pipe and methods of bedding and backfilling so as not to damage the pipe or its joints, impede cleaning operations and future tapping, create excessive side fill pressures and ovalation of the pipe, nor seriously impair flow capacity.

33.82 Trenching

a. The width of the trench shall be ample to allow the pipe to be laid and jointed properly and to allow the bedding and haunching to be placed and compacted to adequately support the pipe. The trench sides shall be kept as nearly vertical as possible. When wider trenches are specified, appropriate bedding class and pipe strength shall be used.

In unsupported, unstable soil the size and stiffness of the pipe, stiffness of the embedment and insitu soil and depth of cover shall be considered in determining the minimum trench width necessary to adequately support the pipe.

b. Ledge rock, boulders, and large stones shall be removed to provide a minimum clearance of 4 inches (100 mm) below and on each side of all pipe(s).

33.83 Bedding, Haunching, and Initial Backfill

a. Bedding Classes A, B, C, or crushed stone as described in ASTM C-12 shall be used and carefully compacted for all rigid pipe provided the proper strength pipe is used with the specified bedding to support the anticipated load, based on the type soil encountered and potential ground water conditions.

b. Embedment materials for bedding, haunching and initial backfill, Classes I, II, or III, as described in ASTM D-2321, shall be used provided the proper strength pipe is used with the specified bedding to support the anticipated load, based on the type soil encountered and potential groundwater conditions. The embedment materials shall be carefully compacted for all flexible pipe.

c. All water entering the excavations or other parts of the work shall be removed. No sanitary sewer shall be used for the disposal of trench water, unless specifically approved by the engineer, and then only if the trench water does not ultimately arrive at existing pumping or wastewater treatment facilities.

33.84 Final Backfill

a. Final backfill shall be of a suitable material removed from excavation except where other material is specified. Debris, frozen material, large clods or stones, organic matter, or other unstable materials shall not be used for final backfill within 2 feet (0.6 m) of the top of the pipe.

b. Final backfill shall be placed in such a manner so as not to disturb the alignment of the pipe.

33.85 Deflection Test

a. Deflection tests shall be performed on all flexible pipe. The tests shall be conducted after the final backfill has been in place at least 30 days to permit stabilization of the soil-pipe system.

b. No pipe shall exceed a deflection of 5 percent of the inside diameter. If deflection exceeds 5 percent, the pipe shall be excavated. Replacement or correction shall be accomplished in accordance with the requirements in the approved specifications.

c. The rigid ball or mandrel used for the deflection test shall have a diameter not less than 95 percent of the base inside diameter or average inside diameter of the pipe depending on which is specified in the ASTM Specification, including the appendix, to which the pipe is manufactured. The tests shall be performed without mechanical pulling devices.

33.9 Joints and Infiltration

33.91 Joints

The joint installation requirements and the materials used shall be included in the specifications. Sewer joints shall be designed to minimize infiltration and to prevent the entrance of roots throughout the life of the system.

33.92 Service Connections

Service connections to the sewer main shall be water tight and shall not protrude into the sewer. If a saddle type connection is used, it shall be a device designed to join with the types of pipe which are to be connected. All materials used to make service connections shall be compatible with each other and with the pipe materials to be joined and shall be corrosion proof.

33.93 Leakage Tests

Leakage tests shall be specified. This may include appropriate water or low pressure air testing. The testing methods selected should take into consideration the range in groundwater elevations during the testing and those anticipated during the design life of the sewer.

33.94 Water (Hydrostatic) Test

The leakage exfiltration or infiltration shall not exceed 100 gallons per inch of pipe diameter per mile per day [9 L/(mm of pipe diameter·km·d)] for any section of the system. An exfiltration or infiltration test shall be performed with a minimum positive head of 2 feet (0.6 m).

33.95 Air test

The air test shall, as a minimum, conform to the test procedure described in ASTM C-828 for clay pipe, ASTM C-924 for concrete pipe, and ASTM F-1417 for plastic pipe. For other materials, test procedures shall be approved by the regulatory agency.

34. MANHOLES

34.1 Location

Manholes shall be installed at the end of each line; at all changes in grade, size, or alignment; at all intersections; at distances not greater than 400 feet (120 m) for sewers that are 15 inches (375 mm) or less, and at 500 feet (150 m) for sewers that are 18 inches (450 mm) to 30 inches (750 mm). Distances up to 600 feet (185 m) may be approved in cases where adequate modern cleaning equipment for such spacing is provided. Greater spacing may be permitted in larger sewers. Cleanouts may be used only for special conditions and shall not be substituted for manholes nor installed at the end of laterals greater than 150 feet (45 m) in length.

34.2 Drop Type

A drop pipe shall be provided for a sewer entering a manhole at an elevation of 24 inches (610 mm) or more above the manhole invert. Where the difference in elevation between the incoming sewer and the manhole invert is less than 24 inches (610 mm), the invert shall be filleted to prevent solids deposition.

Drop manholes should be constructed with an outside drop connection. Inside drop connections (when necessary) shall be secured to the interior wall of the manhole and shall provide access for cleaning.

Due to the unequal earth pressures that would result from the backfilling operation in the vicinity of the manhole, the entire outside drop connection shall be encased in concrete.

34.3 Diameter

The minimum diameter of manholes shall be 48 inches (1,200 mm). Larger diameters are required for manholes with inside drops, and may be necessary for manholes with large diameter sewers or multiple pipes connecting at the manhole. A minimum access diameter of 24 inches (610 mm) shall be provided.

34.4 Flow Channel

The flow channel straight through a manhole should be made to conform as closely as possible in shape and slope to that of the connecting sewers. The channel walls should be formed or shaped to the full height of the crown of the outlet sewer in such a manner as to not obstruct maintenance, inspection, or flow in the sewers.

When curved flow channels are specified in manholes, including branch inlets, the minimum slopes indicated in Paragraph 33.41 should be increased to maintain acceptable velocities.

34.5 Bench

A bench shall be provided on each side of any manhole channel when the pipe diameter(s) are less than the manhole diameter. The bench should be

sloped no less than ½ inch per foot (40 mm/m) (4 percent). No lateral sewer, service connection, or drop manhole pipe shall discharge onto the surface of the bench.

34.6 Watertightness

Manholes shall be of the pre-cast concrete (as prescribed by ASTM C-478) or poured-in-place concrete type. Manhole lift holes and grade adjustment rings shall be sealed with non-shrinking mortar or other material approved by the regulatory agency.

Inlet and outlet pipes shall be joined to the manhole with a gasketed flexible watertight connection or another watertight connection arrangement that allows differential settlement of the pipe and manhole wall to take place.

Watertight manhole covers shall be used wherever the manhole tops may be flooded by street runoff or high water. Locked manhole covers may be desirable in isolated easement locations or where vandalism may be a problem.

34.7 Inspection and Testing

The specifications shall include a requirement for manhole inspection and testing for watertightness or damage prior to placing into service. Air testing, if specified for concrete sewer manholes, shall conform to the test procedures described in ASTM C-1244.

34.8 Corrosion Protection For Manholes

Where corrosive conditions due to septicity or other causes are anticipated, corrosion protection on the interior of the manholes shall be provided.

34.9 Electrical

Electrical equipment installed or used in manholes shall conform to Paragraph 42.35.

35. INVERTED SIPHONS

Inverted siphons shall have not less than two barrels, with a minimum pipe size of 6 inches (150 mm). They shall be provided with necessary appurtenances for maintenance, convenient flushing, and cleaning equipment. The inlet and discharge structures shall also have adequate clearances for cleaning equipment, inspection, and flushing. Design shall provide sufficient head and appropriate pipe sizes to secure velocities of at least 3.0 feet per second (0.9 m/s) for design average flows. The inlet and outlet details shall be so arranged that the design average flow is diverted to one barrel, and so that either barrel may be removed from service for cleaning. The vertical alignment should permit cleaning and maintenance.

36. SEWERS IN RELATION TO STREAMS

36.1 Location of Sewers in Streams

36.11 Cover Depth

The top of all sewers entering or crossing streams shall be at a sufficient depth below the natural bottom of the stream bed to protect the sewer line. In general, the following cover requirements shall be met:

a. One foot (0.3 m) of cover where the sewer is located in rock;

b. Three feet (0.9 m) of cover in other material. In major streams, more than 3 feet (0.9 m) of cover may be required; and

c. In paved stream channels, the top of the sewer line should be placed below the bottom of the channel pavement.

Less cover may be approved only if the proposed sewer crossing will not interfere with future modifications to the stream channel. Justification for requesting less cover shall be provided to the reviewing authority.

36.12 Horizontal Location

Sewers located along streams shall be located outside of the stream bed and at a sufficient distance to provide for future possible stream widening and to prevent pollution by siltation during construction.

36.13 Structures

The sewer outfalls, headwalls, manholes, gate boxes, or other structures shall be located so they do not interfere with the free discharge of flood flows of the stream.

36.14 Alignment

Sewers crossing streams should be designed to cross the stream as nearly perpendicular to the stream flow as possible and shall be free from change in grade. Sewer systems shall be designed to minimize the number of stream crossings.

36.2 Construction

36.21 Materials

Sewers entering or crossing streams shall be constructed of ductile iron pipe with mechanical joints; otherwise they shall be constructed so they will remain watertight and free from changes in alignment or grade. Material used to backfill the trench shall be

stone, coarse aggregate, washed gravel, or other materials which will not readily erode, cause siltation, damage the pipe during placement, or corrode the pipe.

36.22 Siltation and Erosion

Construction methods that will minimize siltation and erosion shall be employed. The design engineer shall include in the project specifications the method(s) to be employed in the construction of sewers in or near streams. Such methods shall provide adequate control of siltation and erosion by limiting unnecessary excavation, disturbing or uprooting trees and vegetation, dumping of soil or debris, or pumping silt-laden water into the stream. Specifications shall require that cleanup, grading, seeding, planting and/or restoration of all work areas shall begin immediately. Exposed areas shall not remain unprotected for more than seven days.

36.23 Alternative Construction Methods

When the alignment of a sewer crosses a stream, consideration shall be given to trenchless construction technologies as an alternative to open trench construction. Such designs may be approved by the reviewing authority on a case by case basis under the provisions of Paragraph 53.2.

37. AERIAL CROSSINGS

Support shall be provided for all joints in pipes utilized for aerial crossings. The supports shall be designed to prevent frost heave, overturning, and settlement.

Precautions against freezing, such as insulation and increased slope, shall be provided. Expansion jointing shall be provided between above ground and below ground sewers. Where buried sewers change to aerial sewers, special construction techniques shall be used to minimize frost heaving.

For aerial stream crossings, the impact of flood waters and debris shall be considered. The bottom of the pipe should be placed no lower than the elevation of the 50 year flood. Ductile iron pipe with mechanical joints is recommended.

38. PROTECTION OF WATER SUPPLIES

When wastewater sewers are proposed in the vicinity of any water supply facilities, requirements of the GLUMRB "Recommended Standards for Water Works" should be used to confirm acceptable isolation distances in addition to the following requirements.

38.1 Cross Connections Prohibited

There shall be no physical connections between a public or private potable water supply system and a sewer or appurtenance which would permit the passage of any wastewater or polluted water into the potable supply. No water pipe shall pass through or come into contact with any part of a sewer manhole.

38.2 Relation to Water Works Structures

While no general statement can be made to cover all conditions, it is generally recognized that sewers shall meet the requirements of the appropriate reviewing agency with respect to minimum distances from public water supply wells and other water supply sources or structures.

All existing waterworks units, such as basins, wells, or other treatment units, within 200 feet (60 m) of the proposed sewer shall be shown on the engineering plans.

Soil conditions in the vicinity of the proposed sewer within 200 feet (60 m) of waterworks units shall be determined and shown on the engineering plans.

38.3 Relation to Water Mains

38.31 Horizontal and Vertical Separation

Sewers shall be laid at least 10 feet (3 m) horizontally from any existing or proposed water main. The distance shall be measured edge to edge. For gravity sewers where it is not practical to maintain a 10 foot (3 m) separation, the appropriate reviewing agency may allow deviation on a case-by-case basis, if supported by data from the design engineer. Such deviation may allow installation of the gravity sewer closer to a water main, provided that the water main is in a separate trench or on an undisturbed earth shelf located on one side of the gravity sewer and at an elevation so the bottom of the water main is at least 18 inches (460 mm) above the top of the sewer.

If it is impossible to obtain proper horizontal and vertical separation as described above for gravity sewers, both the water main and gravity sewer shall be constructed of slip-on or mechanical joint pipe complying with Section 8.1 and Section 8.7 of the “Recommended Standards for Water Works – 2012 Edition” and shall be pressure rated to at least 150 psi (1034 kPa) and pressure tested to ensure watertightness.

38.32 Crossings

Sewers crossing water mains shall be laid to provide a minimum vertical distance of 18 inches (460 mm) between the outside of the water main and the outside of the sewer. This shall be the case where the water main is either above or below the sewer. The crossing shall be arranged so that the sewer joints will be equidistant and as far as possible from the water main joints. Where a water main crosses under a sewer, adequate structural support shall be provided for the sewer to maintain line and grade.

When it is impossible to obtain proper horizontal and vertical separation as stipulated above, one of the following methods shall be specified:

a. The sewer shall be designed and constructed equal to water pipe, as described in Paragraph 38.31.

b. Either the water main or the sewer line may be encased in a watertight carrier pipe that extends 10 feet (3 m) on both sides of the crossing, measured perpendicular to the water main. The carrier pipe shall be made of materials approved by the regulatory agency for use in water main construction.

CHAPTER 40
WASTEWATER PUMPING STATIONS

41. GENERAL

41.1 Flooding

Wastewater pumping station structures and electrical and mechanical equipment shall be protected from physical damage by the 100 year flood. Wastewater pumping stations should remain fully operational and accessible during the 25 year flood. Regulations of state, provincial and federal agencies regarding flood plain obstructions shall be considered.

41.2 Accessibility and Security

The pumping station shall be readily accessible by maintenance vehicles during all weather conditions. The facility should be located off the traffic way of streets and alleys. It is recommended that security fencing and access hatches with locks be provided.

41.3 Grit

Where it is necessary to pump wastewater prior to grit removal, the design of the wet well and pump station piping shall receive special consideration to avoid operational problems from the accumulation of grit.

41.4 Safety

Adequate provision shall be made to effectively protect maintenance personnel from hazards. Equipment for confined space entry in accordance with OSHA and regulatory agency requirements shall be provided for all wastewater pumping stations. Also refer to Section 57.

42. DESIGN

The following items should be given consideration in the design of wastewater pumping stations:

42.1 Type

Wastewater pumping stations in general use fall into four types: wet well/dry well, submersible, suction lift, and screw pump.

42.2 Structures

42.21 Separation

Dry wells, including their superstructure, shall be completely separated from the wet well. Common walls shall be gas tight.

42.22 Equipment Removal

Provisions shall be made to facilitate removing pumps, motors, and other mechanical and electrical equipment. Individual pump and

motor removal shall not interfere with the continued operation of remaining pumps.

42.23 Access and Safety Landings

42.231 Access

Suitable and safe means of access for persons wearing self-contained breathing apparatus shall be provided to dry wells, and to wet wells. Access to wet wells containing either bar screens or mechanical equipment requiring inspection or maintenance shall conform to Paragraph 61.13. Also refer to Section 57.

42.232 Safety Landings

For built-in-place pump stations, a stairway to the dry well shall be provided with rest landings at vertical intervals not to exceed 12 feet (3.7 m). For factory-built pump stations over 15 feet (4.6 m) deep, a rigidly fixed landing shall be provided at vertical intervals not to exceed 10 feet (3 m). Where a landing is used, a suitable and rigidly fixed barrier shall be provided to prevent individuals from falling past the intermediate landing to a lower level. A manlift or elevator may be used in lieu of landings in a factory-built station, provided emergency access is included in the design.

42.24 Buoyancy

Where high groundwater conditions are anticipated, buoyancy of the wastewater pumping station structures shall be considered and, if necessary, adequate provisions shall be made for protection.

42.25 Construction Materials

Materials shall be selected that are appropriate under conditions of exposure to hydrogen sulfide and other corrosive gases, greases, oils, and other constituents frequently present in wastewater. This is particularly important in the selection of metals and paints. Contact between dissimilar metals should be avoided or other provisions made to minimize galvanic action.

42.3 Pumps

42.31 Multiple Units

Multiple pumps shall be provided. Where only two units are provided, they shall be of the same size. Units shall have capacity such that, with any unit out of service, the remaining units will have capacity to handle the design peak hourly flow. All pumps should be tested by the manufacturer. These tests should include a hydrostatic test and an operating test.

42.32 Protection Against Clogging

42.321 Combined Wastewater

Pumps handling combined wastewater shall be preceded by readily accessible bar racks to protect the pumps from clogging or damage. Bar racks should have clear openings as provided in Paragraph 61.121. Where a bar rack is provided, a mechanical hoist shall also be provided. Where the size of the installation warrants, mechanically cleaned and/or duplicate bar racks shall be provided. Refer to Paragraphs 42.23 and 61.13.

42.322 Separate Sanitary Wastewater

Pumps handling separate sanitary wastewater from 30 inch (750 mm) diameter or larger sewers shall be protected with bar racks meeting the above requirements. Appropriate protection from clogging shall also be considered for small pumping stations. Refer to Paragraphs 42.23 and 61.13.

42.33 Pump Openings

Pumps handling raw wastewater shall be capable of passing solid spheres of at least 3 inches (80 mm) in diameter. Pump suction and discharge openings shall be at least 4 inches (100 mm) in diameter. An exception to the requirement for passing solid spheres of at least 3 inches (80 mm) in diameter may be made on a case by case basis when the design includes equivalent protection from clogging or damage (i.e., grinder pumps, etc.).

42.34 Priming

The pump shall be so placed that under normal operating conditions it will operate under a positive suction head, except as specified in Section 43.

42.35 Electrical Equipment

Electrical systems and components (e.g., motors, lights, cables, conduits, switch boxes, control circuits, etc.) in raw wastewater wet wells, or in enclosed or partially enclosed spaces where hazardous concentrations of flammable gases or vapors may be present, shall comply with the National Electrical Code requirements for Class I, Division 1, Group D locations. Equipment located in the wet well shall be suitable for use under corrosive conditions. Each flexible cable shall be provided with a watertight seal and separate strain relief. A fused disconnect switch located above ground shall be provided for the main power feed for all pumping stations. When such equipment is exposed to weather, it shall meet the requirements of weatherproof equipment NEMA 3R or 4, at a minimum. Lightning and surge protection systems should be considered. Lift station control panels located

outdoors shall be provided with a 110 volt power receptacle inside the control panel to facilitate maintenance. Ground Fault Circuit Interruption (GFCI) protection shall be provided for all outdoor outlets.

42.36 Intake

Each pump shall have an individual intake. Wet well and intake design should be such as to avoid turbulence near the intake and to prevent vortex formation.

42.37 Dry Well Dewatering

A sump pump equipped with dual check valves shall be provided in the dry well to remove leakage or drainage with discharge above the maximum high water level of the wet well. Water ejectors connected to a potable water supply will not be approved. All floor and walkway surfaces should have an adequate slope to a point of drainage. Pump seal leakage shall be piped or channeled directly to the sump. The sump pump shall be sized to remove the maximum pump seal water discharge that could occur in the event of a pump seal failure. Refer to Section 46.

42.38 Pumping Rates

The pumps and controls of main pumping stations, especially pumping stations operated as part of treatment facilities, should be selected to operate at varying delivery rates. Such stations should be designed to deliver as uniform a flow as practicable in order to minimize hydraulic surges. The station design capacity shall be based on the peak hourly flow determined in accordance with Paragraph 11.24 and should be adequate to maintain a minimum velocity of 2 feet per second (0.6 m/s) in the force main. Refer to Paragraph 49.1.

42.4 Controls

Water level control sensing devices should be located to prevent undue affects from turbulent flows entering the well or by the turbulent suction of the pumps. Bubbler type level monitoring systems shall include dual air compressors. Provision shall be made to automatically alternate the pumps in use. Suction lift stations should be designed to alternate pumps daily instead of each pumping cycle to extend the life of the priming equipment.

42.5 Valves

42.51 Suction Line

Suitable shutoff valves shall be placed on the suction line of dry pit pumps.

42.52 Discharge Line

Suitable shutoff and check valves shall be placed on the discharge line of each pump (except on screw pumps). The check valve shall be located between the shutoff valve and the pump. Check valves shall be suitable for the material being handled and shall be placed on the horizontal portion of discharge piping except for ball checks, which may be placed in the vertical run. Valves shall be capable of withstanding normal pressures and water hammer.

All shutoff and check valves shall be operable from floor level and accessible for maintenance. Outside levers are recommended on swing check valves.

42.6 Wet Wells

42.61 Divided Wells

Where continuity of pumping station operation is critical, consideration should be given to dividing the wet well into two interconnected sections to facilitate repairs and cleaning.

42.62 Size

The design fill time and minimum pump cycle time shall be considered in sizing the wet well. The effective volume of the wet well shall be based on the design average flow determined in accordance with Paragraph 11.24 and a filling time not to exceed 30 minutes, unless the facility is designed to provide flow equalization. The pump manufacturer's duty cycle recommendations shall be utilized in selecting the minimum cycle time. When the anticipated initial flow tributary to the pumping station is less than the design average flow, provisions should be made so that the fill time indicated is not exceeded for initial flows. When the wet well is designed for flow equalization as part of a treatment plant, provisions should be made to prevent septicity.

42.63 Floor Slope

The wet well floor shall have a minimum slope of 1 to 1 to the hopper bottom. The horizontal area of the hopper bottom shall be no greater than necessary for proper installation and function of the inlet.

42.64 Air Displacement

Covered wet wells shall have provisions for air displacement to the atmosphere, such as an inverted "j" tube or other means.

42.7 Safety Ventilation

42.71 General

Adequate ventilation shall be provided for all pump stations. Mechanical ventilation shall be provided for dry wells that are located below the ground surface. If screens or mechanical equipment requiring maintenance or inspection are located in the wet well, permanently installed ventilation is required. There shall be no interconnection between the wet well and dry well ventilation systems.

42.72 Air Inlets and Outlets

In dry wells over 15 feet (4.6 m) deep, multiple inlets and outlets are desirable. Dampers should not be used on exhaust or fresh air ducts. Fine screens or other obstructions in air ducts should be avoided to prevent clogging.

42.73 Electrical Controls

Switches for operation of ventilation equipment should be clearly marked and conveniently located. All intermittently operated ventilation equipment shall be interconnected with the respective pit lighting system. Consideration should be given to automatic controls where intermittent operation is used. The manual lighting/ventilation switch shall override the automatic controls. For a two speed ventilation system with automatic switch over where gas detection equipment is installed, consideration should be given to increasing the ventilation rate automatically in response to the detection of hazardous concentrations of gases or vapors.

42.74 Fans, Heating, and Dehumidification

The fan wheel shall be fabricated from non-sparking material. Automatic heating and dehumidification equipment shall be provided in all dry wells. The electrical equipment and components shall meet the requirements in Paragraph 42.35.

42.75 Wet Wells

Wet well ventilation may be either continuous or intermittent. Ventilation, if continuous, shall provide at least 12 complete air changes per hour; if intermittent, at least 30 complete air changes per hour. Air shall be forced into the wet well by mechanical means rather than solely exhausted from the wet well. The air change requirements shall be based on 100 percent fresh air. Portable ventilation equipment shall be provided for use at submersible pump stations and wet wells with no permanently installed ventilation equipment.

42.76 Dry Wells

Dry well ventilation may be either continuous or intermittent. Ventilation, if continuous, shall provide at least 6 complete air changes per hour; if intermittent, at least 30 complete air changes per hour. A system of two speed ventilation with an initial ventilation rate of 30 changes per hour for 10 minutes and automatic switch over to 6 changes per hour may be used to conserve heat. The air change requirements shall be based on 100 percent fresh air.

42.8 Flow Measurement

Suitable devices for measuring wastewater flow shall be provided at all pumping stations. Indicating, totalizing, and recording flow measurement shall be provided at pumping stations with a 350 gpm (22 L/s) or greater design peak hourly flow, determined in accordance with Paragraph 11.24, or pumping stations with variable frequency drives or screw pumps. Elapsed time meters, used in conjunction with annual pumping rate tests, may be acceptable for pump stations with constant output pumps and a design peak hourly flow up to 350 gpm (22 L/s), provided sufficient metering is configured to measure the duration of individual and simultaneous pump operation.

42.9 Water Supply

There shall be no physical connection between any potable water supply and a wastewater pumping station which, under any conditions, might cause contamination of the potable water supply. If a potable water supply is brought to the station, it shall comply with conditions stipulated under Paragraph 56.23.

43. SUCTION-LIFT PUMP STATIONS

Suction-lift pumps shall meet the applicable requirements of Section 42.

43.1 Pump Priming and Lift Requirements

Suction-lift pumps shall be of the self-priming or vacuum-priming type. Suction-lift pump stations using dynamic suction lifts exceeding the limits outlined in the following sections may be approved upon submission of factory certification of pump performance and detailed calculations indicating satisfactory performance under the proposed operating conditions. Such detailed calculations shall include static suction-lift as measured from "lead pump off" elevation to center line of pump suction, friction, and other hydraulic losses of the suction piping, vapor pressure of the liquid, altitude correction, required net positive suction head, and a safety factor of at least 6 feet (1.8 m).

43.11 Self-Priming Pumps

Self-priming pumps shall be capable of rapid priming and repriming at the "lead pump on" elevation. Such self-priming and repriming shall be accomplished automatically under design

operating conditions. Suction piping should not exceed the size of the pump suction and shall not exceed 25 feet (7.6 m) in total length. Priming lift at the "lead pump on" elevation shall include a safety factor of at least 4 feet (1.2 m) from the maximum allowable priming lift for the specific equipment at design operating conditions. The combined total of the dynamic suction-lift at the "pump off" elevation and the required net positive suction head at design operating conditions shall not exceed 22 feet (6.7 m).

43.12 Vacuum-Priming Pumps

Vacuum-priming pump stations shall be equipped with dual vacuum pumps capable of automatically and completely removing air from the suction-lift pump. The vacuum pumps shall be adequately protected from damage due to wastewater. The combined total of the dynamic suction-lift at the "pump off" elevation and the required net positive suction head at design operating conditions shall not exceed 22 feet (6.7 m).

43.2 Equipment, Wet Well Access, and Valve Location

The pump equipment compartment shall be above grade or offset and shall be effectively isolated from the wet well to prevent a hazardous and corrosive sewer atmosphere from entering the equipment compartment. Wet well access shall not be through the equipment compartment and shall be at least 24 inches (610 mm) in diameter. Gasketed replacement plates shall be provided to cover the opening to the wet well for pump units removed for servicing. Valves shall not be located in the wet well.

44. SUBMERSIBLE PUMP STATIONS - SPECIAL CONSIDERATIONS

Submersible pump stations shall meet the applicable requirements under Section 42, except as modified in this Section.

44.1 Construction

Submersible pumps and motors shall be designed specifically for raw wastewater use, including totally submerged operation during a portion of each pumping cycle, and shall meet the requirements of the National Electrical Code for such units. An effective method to detect shaft seal failure or potential seal failure shall be provided.

44.2 Pump Removal

Submersible pumps shall be readily removable and replaceable without personnel entering or dewatering the wet well or disconnecting any piping in the wet well.

44.3 Electrical Equipment

44.31 Power Supply and Control Circuitry

Electrical supply, control, and alarm circuits shall be designed to provide strain relief and to allow disconnection from outside the

wet well. Terminals and connectors shall be protected from corrosion by location outside the wet well or through use of watertight seals.

44.32 Controls

The motor control center shall be located outside the wet well, be readily accessible, and be protected by a conduit seal or other appropriate measures meeting the requirements of the National Electrical Code, to prevent the atmosphere of the wet well from gaining access to the control center. The seal shall be located so that the motor can be removed and electrically disconnected without disturbing the seal. When such equipment is exposed to weather, it shall meet the requirements of weatherproof equipment NEMA 3R or 4, at a minimum.

44.33 Power Cord

Pump motor power cords shall be designed for flexibility and serviceability under conditions of extra hard usage and shall meet the requirements of the National Electrical Code standards for flexible cords in wastewater pump stations. Ground fault interruption protection shall be used to de-energize the circuit in the event of any failure in the electrical integrity of the cable. Power cord terminal fittings shall be corrosion-resistant and constructed in a manner to prevent the entry of moisture into the cable, shall be provided with strain relief appurtenances, and shall be designed to facilitate field connecting.

44.4 Valves

Valves required under Paragraph 42.5 shall be located in a separate valve chamber. Provisions shall be made to remove or drain accumulated water from the valve chamber. The valve chamber may be dewatered to the wet well through a drain line with a gas and water tight valve. Check valves that are integral to the pump need not be located in a separate valve chamber provided that the valve can be removed from the wet well in accordance with Paragraph 44.2. Access shall be provided in accordance with Paragraph 42.231.

45. SCREW PUMP STATIONS - SPECIAL CONSIDERATIONS

Screw pumps shall meet the applicable requirements of Section 42.

45.1 Covers

Covers or other means of excluding direct sunlight shall be provided as necessary to eliminate adverse effects caused by temperature changes.

45.2 Pump Wells

A positive means of isolating individual screw pump wells shall be provided.

45.3 Bearings

Submerged bearings shall be lubricated by an automated system without pump well dewatering.

46. ALARM SYSTEMS

Alarm systems with a backup power source shall be provided for pumping stations. The alarm shall be activated in cases of power failure, dry well sump and wet well high water levels, pump failure, unauthorized entry, or any other cause of pump station malfunction. Pumping station alarm systems shall transmit and identify alarm conditions to a municipal facility that is staffed 24 hours a day. If such a facility is not available and a 24-hour holding capacity is not provided, the alarm shall be transmitted to municipal offices during normal working hours and to the home of the responsible person(s) in charge of the lift station during off-duty hours. Audio-visual alarm systems may be acceptable in some cases in lieu of a transmitting system depending upon location, station holding capacity and inspection frequency.

47. EMERGENCY OPERATION

47.1 Objective

The objective of emergency operation is to prevent the discharge of raw or partially treated wastewater to any waters and to protect public health by preventing back-up of wastewater and subsequent discharge to basements, streets, and other public and private property.

47.2 Emergency Pumping Capability

Emergency pumping capability is required unless on-system overflow prevention is provided by adequate storage capacity. Emergency pumping capability shall be accomplished by connection of the station to at least two independent utility substations, by provision of portable or in-place internal combustion engine equipment to generate electrical or mechanical energy, or by the provision of portable pumping equipment. Emergency pumping shall comply with the conditions stipulated in Paragraph 56.1. Such emergency standby systems shall have sufficient capacity to start up and maintain the total rated running capacity of the station. Regardless of the type of emergency standby system provided, a portable pump connection to the force main with rapid connection capabilities and appropriate valves shall be provided outside the dry well and wet well.

47.3 Emergency High Level Overflows

For use during possible periods of extensive power outages, mandatory power reductions, or uncontrollable emergency conditions, consideration should be given to providing a controlled, high-level wet well overflow to supplement alarm systems and emergency pumping capability in order to prevent backup of wastewater into basements, or other discharges that could cause severe adverse impacts on public interests, including public health and property damage. Where a high level overflow is utilized, consideration shall also be given to the installation of storage/detention

tanks or basins, which shall drain back to the station wet well. All structures capable of bypassing shall be controlled by a lockable, manually operated valve. Where such overflows are considered, the regulatory agency shall be contacted for the necessary treatment or storage requirements.

47.4 Equipment Requirements

47.41 General

The following general requirements shall apply to all internal combustion engines used to drive auxiliary pumps, service pumps through special drives, or electrical generating equipment:

47.411 Engine Protection

The engine shall be protected from operating conditions that would result in damage to equipment. Unless continuous manual supervision is planned, protective equipment shall be capable of shutting down the engine and activating an alarm as required in Section 46. Protective equipment shall monitor for conditions of low oil pressure and overheating. Oil pressure monitoring will not be required for engines with splash lubrication.

47.412 Size

The engine shall have adequate rated power to start and continuously operate under all connected loads.

47.413 Fuel Type

Reliability and ease of starting, especially during cold weather conditions, should be considered in the selection of the type of fuel. Where public utility gas is selected, consideration shall be given to a generator design that may be operated with an alternate fuel supply system in accordance with National Electric Code (701.11, 2008 Edition.)

47.414 Underground Fuel Storage

Underground fuel storage and piping facilities shall be constructed in accordance with applicable state, provincial, and federal regulations.

47.415 Engine Ventilation

The engine shall be located above grade and shall be provided with adequate ventilation of fuel vapors and exhaust gases.

47.416 Routine Start-up

All emergency equipment shall be provided with instructions indicating the need for regular starting and running of such units at full loads.

47.417 Protection of Equipment

Emergency equipment shall be protected from damage at the restoration of regular electrical power.

47.418 Air Quality

Regulations of state, provincial and federal agencies regarding air quality shall be considered.

47.419 Silencer

Noise control should be considered.

47.42 Engine-Driven Pumping Equipment

In addition to the general requirements of Paragraph 47.41, the following requirements shall apply to permanently-installed or portable engine-driven pumping equipment:

47.421 Pumping Capacity

Engine-driven pumps shall meet the design pumping requirements unless storage capacity is available for flows in excess of pump capacity. Pumps shall be designed for anticipated operating conditions, including suction lift if applicable.

47.422 Operation

The engine and pump shall be equipped for automatic start-up and operation of pumping equipment unless manual start-up and operation is justified. Provisions shall also be made for manual start-up. Where manual start-up and operation is justified, the storage capacity and the alarm system shall meet the requirements of Paragraphs 46 and 47.423.

47.423 Portable Pumping Equipment

Where part or all of the engine-driven pumping equipment is portable, sufficient storage capacity with an alarm system shall be provided to allow time for the detection of pump station failure and the transportation and hookup of the portable equipment.

47.43 Engine-Driven Generating Equipment

In addition to the general requirements of Paragraph 47.41, the following requirements shall apply to permanently-installed or portable engine-driven generating equipment:

47.431 Generating Capacity

a. Generating unit size shall be adequate to provide power for pump motor starting current and for lighting, ventilation, and other auxiliary equipment necessary for safety and the proper operation of the lift station.

b. The operation of only one pump during periods of auxiliary power supply shall be justified. Such justification may be made on the basis of the design peak hourly flows relative to single-pump capacity, the anticipated length of power outages, and the storage capacity.

c. Special sequencing controls shall be provided to start pump motors unless the generating equipment has capacity to start all pumps simultaneously with auxiliary equipment operating.

47.432 Operation

Provisions shall be made for automatic and manual start-up and load transfer unless only manual start-up and operation is justified. The generator shall be protected from operating conditions that could result in damage to equipment. Provisions should be considered to allow the engine to start and stabilize at operating speed before assuming the load. Where manual start-up and transfer is justified, the storage capacity and the alarm system shall meet the requirements of Paragraphs 46 and 47.433.

47.433 Portable Generating Equipment

Where portable generating equipment or manual transfer is provided, sufficient storage capacity, with an alarm system, shall be provided to allow time for the detection of pump station failure and the transportation and connection of generating equipment. Special electrical connections and double throw switches should be used to connect the portable generating equipment.

47.44 Independent Utility Substations

Where independent substations are used for emergency power, each separate substation and its associated distribution lines shall be capable of starting and operating the pump station at its rated capacity.

48. INSTRUCTIONS AND EQUIPMENT

Wastewater pumping stations and portable equipment shall be supplied with a complete set of operational instructions, including emergency procedures and maintenance schedules. Tools and spare parts shall be supplied as necessary.

49. FORCE MAINS

49.1 Velocity and Diameter

At design pumping rates, a cleansing velocity of at least 2 feet per second (0.6 m/s) should be maintained. A maximum velocity of 8 feet per second (2.4 m/s) is recommended to avoid high head loss and protect valves. The minimum force main diameter for raw wastewater shall not be less than 4 inches (100 mm).

49.2 Air and Vacuum Relief Valve

Air relief valves shall be placed at high points in the force main to prevent air locking. Vacuum relief valves may be necessary to relieve negative pressures on force mains. The force main configuration and head conditions should be evaluated as to the need for and placement of vacuum relief valves.

49.3 Termination

The force main shall enter the receiving manhole with a smooth flow transition to the gravity sewer system at a point not more than 1 foot (0.3 m) above the flow line. Corrosion protection for the receiving manhole shall be provided in accordance with Paragraph 34.8.

49.4 Pipe and Design Pressure

Pipe and joints shall be equal to water main strength materials suitable for design conditions. The force main, reaction blocking, and station piping shall be designed to withstand water hammer pressures and associated cyclic reversal of stresses that are expected with the cycling of wastewater lift stations. The use of surge valves, surge tanks or other suitable means to protect the force main against severe pressure changes shall be evaluated.

49.5 Special Construction

Force main construction near streams or water works structures and at water main crossings shall meet the applicable provisions of Sections 36, 37, and 38. There shall be at least a 10 foot (3 m) horizontal separation between water mains and sewer force mains.

49.6 Design Friction Losses

49.61 Friction Coefficient

Friction losses through force mains shall be based on the Hazen-

Williams formula or other acceptable methods. When the Hazen-Williams formula is used, the value for "C" shall be 100 for unlined iron or steel pipe for design. For other smooth pipe materials such as PVC, polyethylene, lined ductile iron, etc., a higher "C" value, not to exceed 120, may be allowed for design.

49.62 Maximum Power Requirements

When initially installed, force mains will have a significantly higher "C" factor. The effect of the higher "C" factor should be considered when calculating maximum power requirements and duty cycle time to prevent damage to the motor. The effects of higher discharge rates on selected pumps and downstream facilities should also be considered.

49.7 Identification

Where force mains are constructed of a material that might cause the forcemain to be confused with potable water mains, the force main shall be appropriately identified.

49.8 Leakage Testing

Leakage tests shall be specified including testing methods and leakage limits.

49.9 Maintenance Considerations

Isolation valves should be considered where force mains connect into a common force main. Cleanouts at low points and chambers for pig launching and catching should be considered for any force main to facilitate maintenance.

49.10 Cover

Force mains shall be covered with sufficient earth or other insulation to prevent freezing.

CHAPTER 50
WASTEWATER TREATMENT FACILITIES

51. PLANT LOCATION

51.1 General

Items to be considered when selecting a plant site are listed in Chapter 10.

51.2 Flood Protection

The treatment plant structures, electrical, and mechanical equipment shall be protected from physical damage by the one hundred (100) year flood. Treatment plants should remain fully operational and accessible during the twenty-five (25) year flood. This requirement applies to new construction and to existing facilities undergoing major modification. Flood plain regulations of state, province, and federal agencies shall be considered.

52. QUALITY OF EFFLUENT

The required degree of wastewater treatment shall be based on the effluent requirements and water quality standards established by the responsible province, state agency and/or appropriate federal regulations including discharge permit requirements.

53. DESIGN

53.1 Type of Treatment

Items to be considered in selection of the appropriate type of treatment are presented in Chapter 10.

The plant design shall provide the necessary flexibility to perform satisfactorily within the expected range of waste characteristics and volumes.

53.2 Required Engineering Data for New Process and Application Evaluation

The policy of the reviewing authority is to encourage rather than obstruct the development of any methods or equipment for treatment of wastewater. The lack of inclusion in these standards of some types of wastewater treatment processes or equipment should not be construed as precluding their use. The reviewing authority may approve other types of wastewater treatment processes and equipment under the condition that the operational reliability and effectiveness of the process or device shall have been demonstrated with one or more suitably-sized prototype units operating at their design load conditions, to the extent required.

To determine that such new processes and equipment or applications have a reasonable and substantial chance of success, the reviewing authority may require the following:

a. Monitoring observations, including test results and engineering evaluations, demonstrating the efficiency of such processes.

b. Detailed description of the test methods.

c. Testing, including appropriately-composited samples, under various ranges of strength and flow rates (including diurnal variations) and waste temperatures over a sufficient length of time to demonstrate performance under the range of climatic and other conditions which may be encountered in the area of the proposed installations.

d. Other appropriate information.

The reviewing authority may require that appropriate testing be conducted and evaluations be made under the supervision of a competent process engineer other than those employed by the manufacturer, patent holder or developer.

53.3 Design Period

The design period shall be clearly identified in the engineering report or facilities plan as required in Chapter 10.

53.4 Design Loads

53.41 Hydraulic Design

53.411 Critical Flow Conditions

Flow conditions critical to the design of the treatment plant are described in Chapter 10.

Initial low flow conditions shall be evaluated in the design to minimize operational problems with freezing, septicity, flow measurements and solids dropout. The design peak hourly flow shall be used to evaluate the effect of hydraulic peaks on unit processes, pumping, piping, settling tanks, etc.

53.412 Treatment Plant Design Capacity

The treatment plant design capacity shall be as described in Chapter 10. The plant design flow selected shall meet the appropriate effluent and water quality standards that are set forth in the discharge permit. The design of treatment units that are not subject to peak hourly flow requirements shall be based on the design average flow. For plants subject to high wet weather flows or overflow detention pumpback flows, the design maximum day flows that the plant is to treat on a sustained basis should be specified.

53.413 Flow Equalization

Facilities for the equalization of flows and organic shock load shall be considered at all plants which are critically affected by surge loadings. The sizing of the flow equalization facilities should be based on data obtained herein and from Chapter 10.

53.42 Organic Design

Organic loadings for wastewater treatment plant design shall be based on the information given in Chapter 10. The effects of septage flow which may be accepted at the plant shall be given consideration and appropriate facilities shall be included in the design. Refer to the Appendix.

53.43 Shock Effects

The shock effects of high concentrations and diurnal peaks for short periods of time on the treatment process, particularly for small treatment plants and batch processes, shall be considered.

53.5 Conduits

All piping and channels shall be designed to carry the maximum expected flows. The incoming sewer should be designed for unrestricted flow. Bottom corners of the channels, except final effluent channels, shall be filleted. Conduits shall be designed to avoid creation of pockets and corners where solids can accumulate.

Suitable gates or valves should be placed in channels to seal off unused sections which might accumulate solids. The use of shear gates, stop plates or stop planks is permitted where they can be used in place of gate valves or sluice gates. Non-corrodible materials shall be used for these control gates.

53.6 Arrangement of Units

Component parts of the plant should be arranged for greatest operating and maintenance convenience, flexibility, continuity of optimum effluent quality for water quality protection, economy of function, and ease of installation of future units.

Where duplicate units are provided, a central collection and distribution point including proportional flow splitting shall be provided for the wastewater flow before each unit operation. Exceptions to this central collection and distribution point requirement may be made on a case-by-case basis when the design incorporates more than one unit process in the same physical structure.

53.7 Flow Division Control

Flow division control facilities shall be provided as necessary to ensure organic and hydraulic loading control to plant process units and shall be designed for easy operator access, change, observation, and maintenance. The use of upflow division boxes equipped with adjustable sharp-crested weirs or similar devices is recommended. The use of valves for flow splitting is not acceptable. Appropriate flow measurement facilities shall be incorporated in the flow division control design.

54. PLANT DETAILS

54.1 Installation of Mechanical Equipment

The specifications should be written to ensure that the installation and initial operation of major items of mechanical equipment will be inspected and approved by a representative of the manufacturer.

54.2 Unit Bypasses

54.21 Removal from Service

Properly located and arranged bypass structures and piping shall be provided so that each unit of the plant can be removed from service independently. The bypass design shall facilitate plant operation during unit maintenance and emergency repair so as to minimize deterioration of effluent quality and ensure rapid process recovery upon return to normal operational mode.

Bypassing may be accomplished through the use of duplicate or multiple treatment units in any stage if the design peak instantaneous flow can be handled hydraulically with the largest unit out of service.

The actuation of all bypasses shall require manual action by operating personnel. All power-actuated bypasses shall be designed to permit manual operation in the event of power failure and shall be designed so that the valve will fail as is, upon failure of the power operator.

A fixed high water level bypass overflow should be provided in addition to a manually or power actuated bypass.

54.22 Unit Bypass During Construction

Unit bypassing during construction shall be in accordance with the requirements in Paragraphs 11.28(l), 20.15 and Section 21.

54.3 Unit Dewatering, Flotation Protection, and Plugging

Means such as drains or sumps shall be provided to completely dewater each unit to an appropriate point in the process. Due consideration shall be given to the possible need for hydrostatic pressure relief devices to

prevent flotation of structures. Pipes subject to plugging shall be provided with means for mechanical cleaning or flushing.

54.4 Construction Materials

Materials shall be selected that are appropriate under conditions of exposure to hydrogen sulfide and other corrosive gases, greases, oils, and other constituents frequently present in wastewater. This is particularly important in the selection of metals and paints. Contact between dissimilar materials should be avoided or other provisions made to minimize galvanic action.

54.5 Painting

The use of paints containing lead or mercury should be avoided. In order to facilitate identification of piping, particularly in the large plants, it is suggested that the different lines be color-coded. The following color scheme is recommended for purposes of standardization.

Raw sludge line - gray
Sludge recirculation suction line - brown with yellow bands
Sludge draw off line - brown with orange bands
Sludge recirculation discharge line - brown
Digested sludge line - black
Sludge gas line - red
Natural gas line - red
Nonpotable water line - purple
Potable water line - blue
Fire main - red
Chlorine line - yellow
Sulfur Dioxide - yellow with red bands
Sewage (wastewater) line - gray
Compressed air line - dark green
Process air line - light green
Water lines for heating digesters or buildings - blue with a 6-inch (150 mm) red band spaced 30 inches (760 mm) apart
Fuel oil/diesel - red
Plumbing drains and vents - black
Ferric Chloride - orange
Polymer - unpainted PVC

The contents and direction of flow shall be stenciled on the piping in a contrasting color.

54.6 Operating Equipment

A complete outfit of tools, accessories, and spare parts necessary for the plant operator's use shall be provided.

Readily accessible storage space and workbench facilities shall be provided. Consideration shall be given to provision of a garage for large equipment storage, maintenance, and repair.

54.7 Erosion Control During Construction

Effective site erosion control shall be provided during construction.

54.8 Grading and Landscaping

Upon completion of the plant, the ground shall be graded and sodded or seeded. All-weather walkways should be provided for access to all units. Where possible, steep slopes should be avoided to prevent erosion. Surface water shall not be permitted to drain into any unit. Particular care shall be taken to protect trickling filter beds, sludge beds, and intermittent sand filters from stormwater runoff. Provision should be made for landscaping, particularly when a plant must be located near residential areas.

55. PLANT OUTFALLS

55.1 Discharge Impact Control

The outfall sewer shall be designed to discharge to the receiving stream in a manner acceptable to the reviewing authority. Consideration should be given in each case to the following:

a. Preference for free fall or submerged discharge at the site selected;

b. Utilization of cascade aeration of effluent discharge to increase dissolved oxygen; and

c. Limited or complete across-stream dispersion as needed to protect aquatic life movement and growth in the immediate reaches of the receiving stream.

55.2 Protection and Maintenance

The outfall sewer shall be so constructed and protected against the effects of floodwater, tide, ice, or other hazards as to reasonably ensure its structural stability and freedom from stoppage. A manhole should be provided at the shore end of all gravity sewers that extend into the receiving waters. Hazards to navigation shall be considered in designing outfall sewers.

55.3 Sampling Provisions

All outfalls shall be designed so that a sample of the effluent can be obtained at a point after the final treatment process and before discharge to or mixing with the receiving waters. If disinfection is provided, a sampling point also should be located immediately prior to disinfection.

56. ESSENTIAL FACILITIES

56.1 Emergency Power Facilities

56.11 General

All plants shall be provided with an alternate source of electric power or pumping capability to allow continuity of operation during power failures, except as noted below. Refer to Paragraph 47.4 for design details. Methods of providing alternate sources include:

a. The connection of at least two independent power sources such as substations able to supply power without interruption. A power line from each substation and separate routes are recommended, and will be required unless documentation is received and approved by the reviewing authority verifying that a duplicate line is not necessary;

b. Portable or in-place internal combustion engine equipment which will generate electrical or mechanical energy; and

c. Portable pumping equipment when only emergency pumping is required.

56.12 Power for Aeration

Standby generating capacity normally is not required for aeration equipment used in the activated sludge process. In cases where a history of long-term (4 hours or more) power outages or reduced voltage have occurred, auxiliary power for minimum aeration of the activated sludge is required. Full power generating capacity may be required by the reviewing authority for waste discharges to certain critical stream segments such as upstream of bathing beaches, upstream of a public water supply intake or other similar situations.

56.13 Power for Disinfection

Continuous disinfection, where required, shall be provided during all power outages. Continuous dechlorination is required for systems that dechlorinate.

56.14 Power for Data Loggers

Computers configured to log data shall be supplied with an uninterruptable power supply (UPS). Each UPS shall monitor its own battery condition and issue alarms on low battery. UPSs configured to supply computers shall cause the computer to save all open files and data logging files, without overwriting existing files, at the time of primary power failure and again when a low battery condition occurs.

56.2 Water Supply

56.21 General

An adequate supply of potable water under pressure should be provided for use in the laboratory and for general cleanliness around the plant. No piping or other connections shall exist in any part of the treatment plant which, under any conditions, might cause the contamination of a potable water supply. The chemical quality should be checked for suitability for its intended uses such as in heat exchangers, chlorinators, etc.

56.22 Direct Connections

Potable water from a municipal or separate supply may be used directly at points above grade for the following hot and cold supplies:

a. Lavatory;
b. Water closet;
c. Laboratory sink (with vacuum breaker);
d. Shower;
e. Drinking fountain;
f. Eye wash fountain; and
g. Safety shower.

Hot water for any of the above units shall not be taken directly from a boiler used for supplying hot water to a sludge heat exchanger or digester heating unit.

56.23 Indirect Connections

Where a potable water supply is to be used for any purpose in a plant other than those listed in Paragraph 56.22, a break tank, pressure pump, and pressure tank shall be provided. Water shall be discharged to the tank through an air gap at least 6 inches (150 mm) above the maximum flood line or the spill line of the tank, whichever is higher.

A sign shall be permanently posted at every hose bib, faucet, hydrant, or sill cock located on the water system beyond the break tank to indicate that the water is not safe for drinking.

56.24 Separate Potable Water Supply

Where it is not possible to provide potable water from a public water supply, a separate well may be provided. Location and construction of the well shall comply with requirements of the governing state or province and local regulations. Requirements governing the use of the potable water supply are those contained in Paragraphs 56.22 and 56.23.

56.25 Separate Non-Potable Water Supply

Where a separate non-potable water supply is to be provided, a break tank will not be necessary, but all system outlets shall be posted with a permanent sign indicating the water is not safe for drinking.

56.3 Sanitary Facilities

Toilet, shower, lavatory, and locker facilities should be provided in sufficient numbers and at convenient locations to serve the expected plant personnel.

56.4 Floor Slope

Floor surfaces shall be sloped adequately to a point of drainage.

56.5 Stairways

Stairways shall be installed in lieu of ladders for access to units requiring routine inspection and maintenance, such as digesters, trickling filters, aeration tanks, clarifiers, tertiary filters, etc. Spiral or winding stairs are permitted only for secondary access where dual means of egress are provided.

Stairways shall have slopes between 30 and 40 degrees from the horizontal to facilitate carrying samples, tools, etc. Each tread and riser shall be of uniform dimension in each flight. Minimum tread run shall not be less than 9 inches (230 mm). The sum of the tread run and riser shall not be less than 17 inches (430 mm) nor more than 18 inches (460 mm). A stairway shall not have more than a 12-foot (3.7 m) continuous rise without a platform.

56.6 Flow Measurement

56.61 Location

Flow measurement facilities shall be provided to measure the following flows:

a. Plant influent or effluent flow;

b. Plant influent and effluent flows. If influent flow is significantly different from effluent flow, both shall be measured. This applies to installations such as lagoons, sequencing batch reactors, and plants with excess flow storage or flow equalization;

c. Excess flow treatment facility discharges;

d. Other flows required to be monitored under the provisions of the discharge permit; and

e. Other flows such as return activated sludge, waste activated sludge, recirculation, and recycle required for plant operational control.

56.62 Facilities

Indicating, totalizing, and recording flow measurement devices shall be provided for all mechanical plants. Flow measurement facilities for lagoon systems shall not be less than elapsed time meters used in conjunction with pumping rate tests or shall be calibrated weirs. All flow measurement equipment shall be sized to function effectively over the full range of flows expected and shall be protected against freezing.

See Paragraph 42.35 for the requirements concerning electrical systems and components located in enclosed or partially enclosed spaces where hazardous concentrations of flammable gases or vapors may be present.

56.63 Hydraulic Conditions

Flow measurement equipment including approach and discharge conduit configuration and critical control elevations shall be designed to ensure that the required hydraulic conditions necessary for accurate measurement are provided. Turbulence, eddy currents, air entrainment or any other aspect that upsets the normal hydraulic conditions that are necessary for accurate flow measurement shall be avoided.

56.7 Sampling Equipment

Effluent composite sampling equipment shall be provided at all mechanical plants with a design average flow of 0.1 mgd (380 m^3/d) or greater and at other facilities where it is necessary to meet discharge permit monitoring requirements. Composite sampling equipment shall also be provided as needed for influent sampling and for monitoring plant operations. The influent sampling point should be located prior to any process return flows.

Refer to Paragraph 42.35 for the requirements concerning electrical systems and components located in enclosed or partially enclosed spaces where hazardous concentrations of flammable gases or vapors may be present. This Paragraph shall be considered in the design and location of influent composite sampling equipment.

57. SAFETY

57.1 General

Adequate provision shall be made to effectively protect plant personnel and visitors from hazards. The following shall be provided to fulfill the particular needs of each plant:

a. Enclosure of the plant site with a fence and signs designed to discourage the entrance of unauthorized persons and animals;

b. Hand rails with toe-boards where appropriate and guards around tanks, trenches, pits, stairwells, and other hazardous structures where the top of the wall is less than 42 inches (1070 mm) above the surrounding ground level;

c. Gratings over appropriate areas of treatment units where access for maintenance is required;

d. First aid equipment;

e. "No Smoking" signs in hazardous areas;

f. Protective clothing and equipment as needed, such as self-contained breathing apparatus, gas detection equipment, goggles, gloves, hard hats, safety harnesses, hearing protectors, etc.;

g. Portable blowers and sufficient hose;

h. Portable lighting equipment complying with the National Electrical Code requirements;

i. Gas detectors listed and labeled for use in Class I, Division 1, Group D locations;

j. Appropriately-placed warning signs for slippery areas, non-potable water fixtures, low head clearance areas, open service manholes, hazardous chemical storage areas, flammable fuel storage areas, high noise areas, etc.;

k. Adequate ventilation in pump station areas in accordance with Paragraph 42.7;

l. Provisions for local lockout on stop motor controls;

m. Provisions for confined space entry and laboratory safety in accordance with OSHA and regulatory agency requirements; and

n. Adequate vector control.

57.2 Hazardous Chemical Handling

57.21 Containment Materials

The materials utilized for storage, piping, valves, pumping, metering, splash guards, etc., shall be specially selected considering the physical and chemical characteristics of each hazardous or corrosive chemical.

57.22 Secondary Containment

Chemical storage areas shall be enclosed in dikes or curbs which will contain the stored volume until it can be safely transferred to alternate storage or released to the wastewater at controlled rates which will not damage facilities, inhibit the treatment processes, or contribute to stream pollution. Liquid polymer should be similarly contained to reduce areas with slippery floors, especially to protect travelways. Non-slip floor surfaces are desirable in polymer-handling areas.

57.23 Liquefied Gas Chemicals

Areas intended for storage and handling of chlorine and sulfur dioxide and other hazardous gases shall be properly designed and isolated. Gas detection kits, alarms, controls, safety devices, and emergency repair kits shall be provided.

57.24 Splash Guards

All pumps or feeders for hazardous or corrosive chemicals shall have guards that will effectively prevent spray of chemicals into space occupied by personnel. The splash guards are in addition to guards to prevent injury from moving or rotating machinery parts.

57.25 Piping, Labeling, Coupling Guards, Location

All piping containing or transporting corrosive or hazardous chemicals shall be identified with labels every 10 feet (3 m) and with at least two labels in each room, closet, or pipe chase. Color-coding may also be used, but is not an adequate substitute for labeling.

All connections (flanged or other type), except those adjacent to storage or feeder areas, shall have guards which will direct any leakage away from space occupied by personnel. Pipes containing hazardous or corrosive chemicals should not be located above shoulder level except where continuous drip collection trays and coupling guards will eliminate chemical spray or dripping onto personnel.

57.26 Protective Clothing and Equipment

The following items of protective clothing or equipment shall be available and utilized for all operations or procedures where their use will minimize injury hazard to personnel:

a. Self-contained breathing apparatus recommended for protection against chlorine;

b. Chemical worker's goggles or other suitable goggles (safety glasses are insufficient);

c. Face masks or shields for use over goggles;

d. Dust masks to protect the lungs in dry chemical areas;

e. Rubber gloves;

f. Rubber aprons with leg straps;

g. Rubber boots (leather and wool clothing should be avoided near caustics); and

h. Safety harness and line.

57.27 Warning System and Signs

Facilities shall be provided for the automatic shutdown of pumps and sounding of alarms when failure occurs in a pressurized chemical discharge line.

Warning signs requiring the use of goggles shall be located near chemical stations, pumps, and other points of frequent hazard.

57.28 Dust Collection

Dust collection equipment shall be provided to protect personnel from dusts injurious to the lungs or skin and to prevent polymer dust from settling on walkways that can become slick when wet.

57.29 Eyewash Fountains and Safety Showers

Eyewash fountains and safety showers utilizing potable water shall be provided on each floor level or work location involving hazardous or corrosive chemical storage, mixing (or slaking), pumping, metering, or transportation unloading. These facilities shall be as close as practical to points of chemical exposure and shall be fully operable during all weather conditions.

Each eyewash fountain shall be supplied with water of moderate temperature 50°F to 90°F (10 °C to 32 °C) suitable to provide 15 to 30 minutes of continuous irrigation of the eyes. Each emergency shower shall be capable of discharging at least 20 gpm (1.3 L/s) of water at moderate temperature and should be at pressures of 30 psi to 50 psi (210 kPa to 345 kPa).

57.3 Hazardous Chemical Container Identification

The identification and hazard warning data included on shipping containers, when received, shall appear on all containers (regardless of size or type) used to store, carry, or use a hazardous substance. Wastewater and sludge sample containers should be adequately labeled. Below is an example of a suitable label to identify a wastewater sample as a hazardous substance:

RAW SEWAGE WASTEWATER

Sample point No. _____

Contains Harmful Bacteria.

May contain hazardous or toxic material.

Do not drink or swallow.

Avoid contact with openings or breaks in the skin.

58. LABORATORY

58.1 General

All treatment plants shall include a laboratory for making the necessary analytical determinations and operating control tests, except for plants utilizing only processes not requiring laboratory testing for plant control where satisfactory off-site laboratory provisions are made to meet the permit monitoring requirements. For plants where a fully equipped laboratory is not required, the requirements for utilities, fume hoods, etc., may be reduced. The laboratory shall have sufficient size, bench space, equipment, and supplies to perform all self-monitoring analytical work required by discharge permits, and to perform the process control tests necessary for good management of each treatment process included in the design.

The facilities and supplies necessary to perform analytical work to support industrial waste control programs will normally be included in the same laboratory. The laboratory arrangement should be sufficiently flexible to allow future expansion should more analytical work be needed. Laboratory instrumentation and size should reflect treatment plant size, staffing requirements, process complexity, and applicable certification requirements. Experience and training of plant operators should also be assessed when determining treatment plant laboratory needs.

Treatment plant laboratory needs may be divided into the following three general categories:

I. Plants performing only basic operational testing; this typically includes pH, temperature, and dissolved oxygen;

II. Plants performing more complex operational and permit laboratory tests including biochemical oxygen demand, suspended solids, and bacterial analysis, and;

III. Plants performing more complex operational, permit, industrial pretreatment, and multiple plant laboratory testing.

Expected minimum laboratory needs for these three plant classifications are outlined in this Section. However, in specific cases, laboratory needs may have to be modified or increased due to industrial monitoring needs or special process control requirements.

58.2 Category I: Plants performing only basic operational testing

58.21 Location and Space

A floor area up to 150 square feet (14 m^2) should be adequate. It is recommended that this be at the treatment site. Another location in the community utilizing space in an existing structure owned by the involved wastewater authority may be acceptable.

58.22 Design and Materials

The facility shall provide for electricity, water, heat, sufficient storage space, a sink, and a bench top. The lab components need not be of industrial grade materials. Laboratory equipment and glassware shall be of types recommended by Standard Methods for the Examination of Water and Wastewater and the reviewing authority.

58.3 Category II: Plants performing more complex operational and permit laboratory tests including biochemical oxygen demand, suspended solids, and bacterial analysis

58.31 Location and Space

The laboratory size should be based on providing adequate room for the equipment to be used. In general, the laboratories for this category of plant should provide a minimum of approximately 300 square feet (28 m^2) of floor space. Adequate bench space for each analyst shall be provided. The laboratory should be located at the treatment site on ground level. It shall be isolated from vibrating, noisy, or high-temperature machinery or equipment which might have adverse effects on the performance of laboratory staff or instruments.

58.32 Floors

Floor surfaces should be fire resistant and highly resistant to acids, alkalies, solvents, and salts.

58.33 Cabinets and Bench Tops

Laboratories in this category usually perform both discharge permit testing and operational control monitoring utilizing "acids" and "bases" in small quantities, such that laboratory grade metal cabinets and shelves are not mandatory. The cabinets and shelves selected may be of wood or other durable materials. Bench tops should be of acid resistant laboratory grade materials for protection of the underlying cabinets. Glass doors on wall-hung cabinets are recommended. One or more cupboard style base cabinets should be provided. Cabinets with drawers should be provided with rubber bumpers and stops to prevent accidental removal. Cabinets for Category II laboratories are not required to have gas, air,

vacuum, and electrical service fixtures. Built-in shelves should be adjustable.

58.34 Fume Hoods, Sinks, and Ventilation

58.341 Fume Hoods

Fume hoods shall be provided for laboratories where required analytical work results in the production of noxious fumes. Air intake should be balanced against all exhaust ventilation to maintain an overall positive pressure relative to atmospheric in the laboratory.

58.342 Sinks

A laboratory grade sink and drain trap shall be provided.

58.343 Ventilation

Laboratories should be air conditioned. In addition, separate exhaust ventilation should be provided.

58.35 Balance and Table

An analytical balance of the automated digital readout, single pan 0.1 milligram sensitivity type shall be provided. A heavy special-design balance table which will minimize vibration of the balance is recommended. This table shall be located as far as possible from windows, doors, or other sources of drafts or air movements, so as to minimize undesirable impacts from these sources upon the balance.

58.36 Equipment, Supplies, and Reagents

The laboratory shall be provided with all of the equipment, supplies, and reagents that are needed to carry out all of the facility's analytical testing requirements. If any required analytical testing produces malodorous or noxious fumes, the engineer should verify that the in-house analysis is more cost-effective than use of an independent off-site laboratory. Discharge permit, process control, and industrial waste monitoring requirements should be considered when specifying equipment needs. Composite samplers may be required to satisfy permit sampling requirements. References such as Standard Methods for the Examination of Water and Wastewater and the U.S.E.P.A. Analytical Procedures Manual should be consulted prior to specifying equipment items.

58.37 Utilities

58.371 Power Supply

Consideration should be given to providing line voltage regulation for the power supplied to laboratories using delicate instruments.

58.372 Laboratory Water

Reagent water of a purity suitable for analytical requirements shall be supplied to the laboratory. In general, reagent water prepared using an all glass distillation system is adequate. However, some analyses require deionization of the distilled water. Consideration should be given to softening the feed water to the still.

58.38 Safety

58.381 Equipment

Laboratories shall provide, as a minimum, the following: first aid equipment; protective clothing (including goggles, gloves, lab aprons, etc.); and a fire extinguisher.

58.382 Eyewash Fountains and Safety Showers

Eyewash fountains and safety showers utilizing potable water shall be provided in the laboratory. These should be as close as practical to work locations and shall be no more than 25 feet (7.6 m) from points of hazardous chemical exposure.

Each eyewash fountain shall be supplied with water of moderate temperature 50°F to 90°F (10 °C to 32 °C) suitable to provide 15 to 30 minutes of continuous irrigation of the eyes. Each emergency shower shall be capable of discharging at least 20 gpm (1.3 L/s) of water at a moderate temperature and should be at pressures of 30 psi to 50 psi (210 kPa to 345 kPa).

58.4 Category III: Plants performing more complex operational, permit, industrial pretreatment and multiple plant laboratory testing

58.41. Location and Space

The laboratory should be located at the treatment site on ground level, with environmental control as an important consideration. It shall be isolated from vibrating, noisy, or high temperature machinery or equipment which might have adverse effects on the performance of laboratory staff or instruments.

The laboratory facility needs for Category III plants should be described in the Engineering Report or Facility Plan. The

laboratory floor space and facility layout should be based on an evaluation of the complexity, volume, and variety of sample analyses expected during the design life of the plant including testing for process control, industrial pretreatment control, user charge monitoring, and discharge permit monitoring requirements.

Consideration shall be given to the necessity to provide separate (and possibly isolated) areas for some special laboratory equipment, glassware, and chemical storage. The analytical and sample storage areas should be isolated from all potential sources of contamination. It is recommended that the organic chemical facilities be isolated from other facilities. Adequate security shall be provided for sample storage areas. Provisions for the proper storage and disposal of chemical wastes shall be made. At large plants, office and administrative space needs should be considered.

For less complicated laboratory needs bench-top working surface should occupy at least 35 percent of the total laboratory floor space. Additional floor and bench space should be provided to facilitate the performance of analysis of industrial wastes, as required by the discharge permit and the utility's industrial waste pretreatment program. Ceiling height should be adequate to allow for the installation of wall mounted water stills, deionizers, distillation racks, hoods, and other equipment with extended height requirements.

58.42 Floors and Doors

58.421 Floors

Floor surfaces should be fire resistant and highly resistant to acids, alkalis, solvents, and salts.

Floor surfaces should be a single color for ease of locating dropped items. The structural floor shall be concrete with no basement.

58.422 Doors

Two exit doors should be located to permit straight egress from the laboratory, preferably at least one to outside the building. Doors should have a minimum width of 36 inches (915 mm) and shall open in the direction of exit traffic. Panic hardware should be used. They should have large glass windows for easy visibility of approaching or departing personnel. Automatic door closers should be installed; swinging doors should not be used.

Flush hardware should be provided on doors if cart traffic is anticipated. Kick plates are also recommended.

58.43 Cabinets and Bench Tops

58.431 Cabinets

Wall-hung cabinets are recommended for dust-free storage of instruments and glassware. Units with sliding glass doors are recommended. A reasonable proportion of cupboard style base cabinets and drawer units should be provided. All cabinet shelving should be acid resistant and adjustable.

Drawers should slide out so that entire contents are easily visible. They should be provided with rubber bumpers and stops to prevent accidental removal. Drawers should be supported on ball bearings or nylon rollers which pull easily in adjustable steel channels. All metal drawer fronts should be double-wall construction.

The laboratory furniture shall be supplied with adequate water, gas, air, and vacuum service fixtures; traps, strainers, plugs, and tailpieces, and electrical service fixtures.

58.432 Bench Tops

Bench tops should be constructed of materials resistant to attacks from normally used laboratory reagents. Generally, bench-top height should be 36 inches (915 mm). However, areas to be used exclusively for sit-down type operations should be 30 inches (760 mm) high and include kneehole space. One-inch (25 mm) overhangs and drip grooves should be provided to keep liquid spills from running along the face of the cabinet. Tops should be furnished in large sections, 1¼ inches (32 mm) thick. They should be field joined into a continuous surface with acid, alkali, and solvent-resistant cements which are at least as strong as the material of which the top is made.

58.44 Hoods

58.441 General

Fume hoods to promote safety shall be provided for laboratories where required analytical work results in the production of noxious fumes. Canopy hoods over heat-releasing equipment shall be provided.

58.442 Fume Hoods

a. Location

Fume hoods should be located where air disturbance at the face of the hood is minimal. Air disturbance may be created by persons walking past

the hood; by heating, ventilating, or air-conditioning systems; by drafts from opening or closing a door; etc.

Safety factors should be considered in locating a hood. If a hood is situated near a doorway, a secondary means of egress shall be provided. Bench surfaces should be available next to the hood so that chemicals need not be carried long distances.

b. Design and Materials

The selection, design, and materials of construction of fume hoods and their appropriate safety alarms shall be made by considering the variety of analytical work to be performed. The characteristics of the fumes, chemicals, gases, or vapors that will or may be released by the activities therein should be considered. Special design and construction is necessary if perchloric acid use is anticipated. Consideration should be given to providing more than one fume hood to minimize potential hazardous conditions throughout the laboratory. Air intake should be balanced against all exhaust ventilation to maintain an overall positive pressure relative to atmospheric in the laboratory.

Fume hoods are not appropriate for operation of heat-releasing equipment that does not contribute to hazards, unless they are provided in addition to those needed to perform hazardous tasks.

c. Fixtures

One sink should be provided inside each fume hood. A cup sink is usually adequate.

All switches, electrical outlets, and utility and baffle adjustment handles should be located outside the hood. Light fixtures should be explosion-proof.

d. Exhaust

Twenty-four hour continuous exhaust capability should be provided. Exhaust fans should be explosion-proof. Exhaust velocities should be checked when fume hoods are installed.

58.443 Canopy Hoods

Canopy hoods should be installed over the bench-top areas where hot plate, steam bath, or other heating equipment or heat-releasing instruments are used. The

canopy should be constructed of heat and corrosion resistant material.

58.45 Sinks, Ventilation, and Lighting

58.451 Sinks

The laboratory should have a minimum of two sinks (not including cup sinks). At least one of them should be a double-well sink with drainboards. A sink dedicated to hand washing should be provided. Additional sinks should be provided in separate work areas as needed, and identified for the use intended.

Sinks and traps should be made of epoxy resin or plastic materials highly resistant to acids, alkalies, solvents, and salts, and should be abrasion and heat resistant, non-absorbent, and lightweight. Traps should be made of glass, plastic, or lead when appropriate and easily accessible for cleaning. Waste openings should be located toward the back so that a standing overflow will not interfere.

All water fixtures on which hoses may be used should be provided with reduced zone pressure backflow preventers to prevent contamination of water lines.

58.452 Ventilation

Laboratories should be separately air conditioned, with external air supply for one hundred percent make-up volume. In addition, separate exhaust ventilation should be provided. Ventilation outlet locations should be remote from ventilation inlets. Consideration should be given to providing dehumidifiers. Air intake should be balanced against all supply air that is exhausted to maintain an overall positive pressure in the laboratory relative to atmospheric and other pressurized areas of the building which could be the source of airborne contaminants.

58.453 Lighting

Good lighting, free from shadows, shall be provided for reading dials, meniscuses, etc., throughout the laboratory.

Consideration shall be given to the effects of radio frequency interference when selecting luminary ballasts for laboratories using delicate instruments.

58.46 Balance and Table

An analytical balance of the automatic, digital readout, single pan, 0.1 milligram sensitivity type shall be provided. A heavy special-

design balance table which will minimize vibration of the balance shall be provided. The table shall be located as far as practical from windows, doors, or other sources of drafts or air movements, so as to minimize undesirable impacts from these sources upon the balance.

58.47 Microscope

A binocular or trinocular microscope with a 20 watt halogen light source, phase contrast condenser, mechanical stage, 10x, 40x and 100x phase contrast objectives, wastewater reticule eyepiece and centering telescope is recommended for process control at activated sludge plants.

58.48 Equipment, Supplies, and Reagents

The laboratory shall be provided with all of the equipment, supplies, and reagents that are needed to carry out all of the facility's analytical testing requirements. Discharge permit, process control, and industrial waste monitoring requirements should be considered when specifying equipment needs. Composite samplers may be required to satisfy permit sampling requirements. References such as Standard Methods for the Examination of Water and Wastewater and the U.S.E.P.A. Analytical Procedures Manual should be consulted prior to specifying equipment items.

58.49 Utilities and Services

58.491 Power Supply

Consideration should be given to providing line voltage regulation for power supplied to laboratories using delicate instruments.

58.492 Laboratory Water

Reagent water of a purity suitable for analytical requirements shall be supplied to the laboratory. In general, reagent water prepared using an all glass distillation system is adequate. However, some analyses require deionization of the distilled water. Consideration should be given to softening and/or deionizing the feed water to the still.

58.493 Gas and Vacuum

Natural or LP gas should be supplied to the laboratory. Digester gas should not be used.

An adequately-sized line source of vacuum with outlets available throughout the laboratory should be provided.

58.50 Safety

58.501 Equipment

Laboratories shall provide, as a minimum, the following: first aid equipment; protective clothing and equipment (such as goggles, safety glasses, full face shields, gloves, etc.); fire extinguishers; chemical spill kits; "No Smoking" signs in hazardous areas; and appropriately placed warning signs for slippery areas, non-potable water fixtures, hazardous chemical storage areas, flammable fuel storage areas, etc.

58.502 Eyewash Fountains and Safety Showers

Eyewash fountains and safety showers utilizing potable water shall be provided in the laboratory. These facilities are to be as close as practical to work locations and shall be no more than 25 feet (7.6 m) from points of hazardous chemical exposure.

Each eyewash fountain shall be supplied with water of moderate temperature 50°F to 90°F (10 °C to 32 °C), suitable to provide 15 to 30 minutes of continuous irrigation of the eyes. Each emergency shower shall be capable of discharging at least 20 gpm (1.3 L/s) of water at moderate temperature and should be at pressures of 30 psi to 50 psi (210 kPa to 345 kPa).

CHAPTER 60
SCREENING, GRIT REMOVAL, AND FLOW EQUALIZATION

61. SCREENING DEVICES

61.1 Coarse Screens

61.11 Where Required

Protection for pumps and other equipment shall be provided by trash racks, coarse bar racks, or coarse screens.

61.12 Design and Installation

61.121 Bar Spacing

Clear openings between bars should be no less than 1 inch (25 mm) for manually cleaned screens. Clear openings for mechanically cleaned screens may be smaller. Maximum clear openings should be 1¾ inches (45 mm).

61.122 Slope and Velocity

Manually cleaned screens should be placed on a slope of 30 to 45 degrees from the horizontal. Mechanically cleaned screens should be placed on a slope of 45 to 90 degrees from the horizontal.

At design average flow conditions, approach velocities should be no less than 1.25 feet per second (0.4 m/s), to prevent settling; and no greater than 3.0 fps (0.9 m/s) to prevent forcing material through the openings.

61.123 Channels

Dual channels shall be provided and equipped with the necessary gates to isolate flow from any screening unit. Provisions shall be made to facilitate dewatering each unit. The channel preceding and following the screen shall be shaped to eliminate stranding and settling of solids.

61.124 Auxiliary Screens

Where a single mechanically cleaned screen is used, an auxiliary manually cleaned screen shall be provided. Where two or more mechanically cleaned screens are used, the design shall provide for taking any unit out of service without sacrificing the capability to handle the design peak instantaneous flows.

61.125 Invert

The screen channel invert should be 3 to 6 inches (75 mm to 150 mm) below the invert of the incoming sewer.

61.126 Flow Distribution

Entrance channels should be designed to provide equal and uniform distribution of flow to the screens.

61.127 Backwater Effect on Flow Metering

Flow measurement devices should be selected for reliability and accuracy. The effect of changes in backwater elevation due to intermittent cleaning of screens should be considered in locations of flow measurement equipment.

61.128 Freeze Protection

Screening devices and screening storage areas shall be protected from freezing.

61.129 Screenings Removal and Disposal

A convenient and adequate means for removing screenings shall be provided. Hoisting or lifting equipment may be necessary depending on the depth of pit and amount of screenings or equipment to be lifted.

Facilities shall be provided for handling, storage, and disposal of screenings in a manner acceptable to the regulatory agency. Separate grinding of screenings and return to the wastewater flow is unacceptable.

Manually cleaned screening facilities shall include an accessible platform from which the operator may rake screenings easily and safely. Suitable drainage facilities shall be provided for both the platform and the screenings storage area.

61.13 Access and Ventilation

Screens located in pits more than 4 feet (1.2 m) deep shall be provided with stairway access. Access ladders are acceptable for pits less than 4 feet (1.2 m) deep, in lieu of stairways.

Screening devices, installed in a building where other equipment or offices are located, shall be isolated from the rest of the building, be provided with separate outside entrances, and be provided with separate and independent fresh air supply.

Fresh air shall be forced into enclosed screening device areas or open pits more than 4 feet (1.2 m) deep. Dampers should not be

used on exhaust or fresh air ducts and fine screens or other obstructions should be avoided to prevent clogging. Where continuous ventilation is required, at least 12 complete air changes per hour shall be provided. Where continuous ventilation would cause excessive heat loss, intermittent ventilation of at least 30 complete air changes per hour shall be provided when personnel enter the area. The air change requirements shall be based on 100 percent fresh air.

Switches for operation of ventilation equipment should be marked and conveniently located. All intermittently operated ventilation equipment shall be interconnected with the respective pit lighting system. The fan wheel shall be fabricated from non-sparking material. Explosion proof gas detectors shall be provided in accordance with Section 57.

61.14 Safety and Shields

61.141 Railings and Gratings

Manually cleaned screen channels shall be protected by guard railings and deck gratings, with adequate provisions for removal or opening to facilitate raking.

Mechanically cleaned screen channels shall be protected by guard railings and deck gratings. Consideration should also be given to temporary access arrangements to facilitate maintenance and repair.

61.142 Mechanical Devices

Mechanical screening equipment shall have adequate removable enclosures to protect personnel against accidental contact with moving parts and to prevent dripping in multi-level installations.

A positive means of locking out each mechanical device and temporary access for use during maintenance shall be provided.

61.143 Drainage

Floor design and drainage shall be provided to prevent slippery areas.

61.144 Lighting

Suitable lighting shall be provided in all work and access areas. Refer to Paragraph 61.152.

61.15 Electrical Equipment and Control Systems

61.151 Timing Devices

All mechanical units that are operated by timing devices shall be provided with auxiliary controls that will set the cleaning mechanism in operation at a preset high water elevation. If the cleaning mechanism fails to lower the high water, a warning should be signaled.

61.152 Electrical Equipment, Fixtures and Controls

Electrical equipment, fixtures and controls in the screening area where hazardous gases may accumulate shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations.

61.153 Manual Override

Automatic controls shall be supplemented by a manual override.

61.2 Fine Screens

61.21 General

Fine screens, as discussed in this Paragraph, have openings of approximately 1/16 inch (2 mm). The amount of material removed by fine screens is dependent on the waste stream being treated and screen opening size.

Fine screens should not be considered equivalent to primary sedimentation. However, they may be used in lieu of primary sedimentation where subsequent treatment units are designed on the basis of anticipated screen performance. Selection of screen capacity should consider flow restriction due to retained solids, gummy materials, frequency of cleaning, and extent of cleaning. Where fine screens are used, additional provision for removal of floatable oils and greases shall be considered.

61.22 Design

Tests should be conducted to determine BOD_5 and suspended solids removal efficiencies at the design maximum day flow and design maximum day BOD_5 loadings. Pilot testing for an extended time is preferred.

A minimum of two fine screens shall be provided with each unit being capable of independent operation. Capacity shall be provided to treat design peak instantaneous flow with one unit out of service.

Fine screens shall be preceded by a coarse bar screening device, shall be protected from freezing, and shall be located to facilitate

maintenance.

61.23 Electrical Equipment, Fixtures and Control

Electrical equipment, fixtures and controls in the screening area where hazardous gases may accumulate shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations.

61.24 Servicing

Hosing equipment shall be provided to facilitate cleaning. Provision shall be made for isolating and removing units from their location for servicing.

62. COMMINUTORS

62.1 General

Provisions for access, ventilation, shields, and safety shall be in accordance with Paragraphs 61.13, 61.14, and 61.15.

62.2 When Used

Comminutors may be used in lieu of screening devices to protect equipment where stringy substance accumulation on downstream equipment will not be a substantial problem.

62.3 Design Considerations

62.31 Location

Comminutors should be located downstream of grit removal equipment and be protected by a coarse screening device. Comminutors not preceded by grit removal equipment shall be protected by a 6 inch (150 mm) deep gravel trap.

62.32 Size

Comminutor capacity shall be adequate to handle design peak hourly flow.

62.33 Installation

A screened bypass channel shall be provided. The use of the bypass channel should be automatic for all comminutor failures.

Gates shall be provided in accordance with Paragraphs 61.123 and 61.124.

62.34 Servicing

Provisions shall be made to facilitate servicing units in place and to remove units from their location for servicing.

62.35 Electrical Controls and Motors

Electrical equipment in comminutor chambers where hazardous gases may accumulate shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations. Motors shall be protected against accidental submergence.

63 GRIT REMOVAL FACILITIES

63.1 When Required

Grit removal facilities should be provided for all wastewater treatment plants, and are required for plants receiving wastewater from either combined sewers or from sewer systems receiving substantial amounts of grit. If a plant serving a separate sewer system is designed without grit removal facilities, the design shall include provision for future installation. Consideration shall be given to possible damaging effects on pumps, comminutors, and other preceding equipment, and the need for additional storage capacity in treatment units where grit is likely to accumulate.

63.2 Location

63.21 General

Grit removal facilities should be located ahead of pumps and comminuting devices. Coarse bar racks should be placed ahead of grit removal facilities.

63.22 Housed Facilities

63.221 Ventilation

Refer to Paragraph 61.13. Fresh air shall be introduced continuously at a rate of at least 12 air changes per hour, or intermittently at a rate of at least 30 air changes per hour. Odor control facilities may also be warranted.

63.222 Access

Adequate stairway access to above or below grade facilities shall be provided.

63.223 Electrical

Electrical equipment in enclosed grit removal areas where hazardous gases may accumulate shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations. Explosion proof gas detectors shall be provided in accordance with Section 57.

63.23 Outside Facilities

Grit removal facilities located outside shall be protected from freezing.

63.3 Type and Number of Units

Plants treating waste from combined sewers should have at least two mechanically cleaned grit removal units, with provisions for bypassing. A single manually cleaned or mechanically cleaned grit chamber with bypass is acceptable for small wastewater treatment plants serving separate sanitary sewer systems. Facilities for larger plants serving separate sanitary sewers should have at least one mechanically cleaned unit with a bypass.

Facilities other than channel-type shall be provided with adequate and flexible controls for velocity and/or air supply devices and with grit collection and removal equipment. Aerated grit chambers should have air rates adjustable in the range of 3 to 8 cubic feet per minute per foot [4.7 L/(m·s) to 12.4 L/(m·s)] of tank length. Detention time in the tank should be in the range of 3 to 5 minutes at design peak hourly flows. Vortex-type grit chambers may also be considered.

63.4 Design Factors

63.41 General

The design effectiveness of a grit removal system shall be commensurate with the requirements of the subsequent process units.

63.42 Inlet

Inlet turbulence shall be minimized in channel-type units.

63.43 Velocity and Detention

Channel-type chambers shall be designed to control velocities during normal variations in flow as close as possible to 1 foot per second (0.3 m/s). The detention period shall be based on the size of particle to be removed. All aerated grit removal facilities should be provided with adequate control devices to regulate air supply and agitation.

63.44 Grit Washing

The need for grit washing should be determined by the method of grit handling and final disposal.

63.45 Dewatering

Provision shall be made for isolating and dewatering each unit. The design shall provide for complete draining and cleaning by means of a sloped bottom equipped with a drain sump.

63.46 Water

An adequate supply of water under pressure shall be provided for cleanup.

63.47 Grit Handling

Grit removal facilities located in deep pits should be provided with mechanical equipment for hoisting or transporting grit to ground level. Impervious, non-slip, working surfaces with adequate drainage shall be provided for grit handling areas. Grit transporting facilities shall be provided with protection against freezing and loss of material.

64. PREAERATION

Preaeration of wastewater to reduce septicity may be required in special cases.

65. FLOW EQUALIZATION

65.1 General

The use of flow equalization should be considered where significant variations in organic and hydraulic loadings are expected. The reviewing authority should be contacted for design requirements when wet weather storage facilities are considered. See also Paragraph 53.413.

65.2 Location

Equalization basins should be located downstream of pretreatment facilities such as bar screens, comminutors, and grit chambers.

65.3 Type

Flow equalization can be provided by using separate basins or on-line treatment units, such as aeration tanks. Equalization basins may be designed as either in-line or side-line units. Unused treatment units, such as sedimentation or aeration tanks, may be utilized as equalization basins during the early period of design life.

65.4 Size

Equalization basin capacity should be sufficient to effectively reduce expected flow and load variations to the extent deemed to be economically advantageous. With a diurnal flow pattern, the volume required to achieve the desired degree of equalization can be determined from a cumulative flow plot over a representative 24-hour period.

65.5 Operation

65.51 Mixing

Aeration or mechanical equipment shall be provided to maintain

adequate mixing. Corner fillets and hopper bottoms with draw-offs should be provided to alleviate the accumulation of sludge and grit.

65.52 Aeration

Aeration equipment shall be sufficient to maintain a minimum of 1.0 mg/L of dissolved oxygen in the mixed basin contents at all times. Air supply rates should be a minimum of 1.25 cfm/1000 gal [0.16 L/(m^3·s)] of storage capacity. The air supply should be isolated from other treatment plant aeration requirements to facilitate process aeration control, although process air supply equipment may be utilized as a source of standby aeration.

65.53 Controls

Inlets and outlets for all basin compartments shall be suitably equipped with accessible external valves, stop plates, weirs, or other devices to permit flow control and the removal of an individual unit from service. Facilities shall also be provided to measure and indicate liquid levels and flow rates.

65.6 Electrical

All electrical work in housed equalization basins, where hazardous concentrations of flammable gases or vapors may accumulate, shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations.

65.7 Access

Suitable access shall be provided to facilitate cleaning and the maintenance of equipment.

CHAPTER 70
SETTLING

71. GENERAL

71.1 Number of Units

Multiple settling units capable of independent operation are desirable and shall be provided in all plants where design average flows exceed 100,000 gallons/day (380 m^3/d). Plants not having multiple settling units shall include other provisions to assure continuity of treatment.

71.2 Flow Distribution

Effective flow splitting devices and control appurtenances (i.e., gates, splitter boxes, etc.) shall be provided to permit proper proportioning of flow and solids loading to each settling unit, throughout the expected range of flows. Refer to Paragraph 53.7.

72. DESIGN CONSIDERATIONS

72.1 Dimensions

The minimum length of flow from inlet to outlet shall be 10 feet (3 m) unless special provisions are made to prevent short circuiting. The vertical side water depths shall be designed to provide an adequate separation zone between the sludge blanket and the overflow weirs. The minimum side water depths shall be as follows:

Type of Settling Tank	Minimum Side Water Depth ft (m)
Primary	10 (3.0)
Secondary tank following activated sludge process*	12 (3.7)
Secondary tank following attached growth biological reactor*	10 (3.0)

* Greater side water depths are recommended for secondary clarifiers in excess of 4,000 square feet (372 m^2) surface area [equivalent to 70 feet (21 m) diameter]. Side water depths less than 12 feet (3.7 m) may be permitted for package plants with a design average flow less than 25,000 gallons per day (95 m^3/d), if justified based on successful operating experience.

72.2 Surface Overflow Rates

72.21 Primary Settling Tanks

Primary settling tank sizing should reflect the degree of solids removal needed and the need to avoid septic conditions during low flow periods. Sizing shall be calculated for both the design average and design peak hourly flow conditions, and the larger surface area determined shall be used. The following surface overflow rates should not be exceeded in the design:

Type of Primary Settling Tank	Surface Overflow Rates at: *	
	Design Average Flow gpd/ft^2 [m^3/(m^2·d)]	Design Peak Hourly Flow gpd/ft^2 [m^3/(m^2·d)]
Tanks not receiving waste activated sludge **	1,000 (41)	1,500 - 2,000 (61-81)
Tanks receiving waste activated sludge	700 (29)	1,200 (49)

* Surface overflow rates shall be calculated with all flows received at the settling tanks. Primary settling of normal domestic wastewater can be expected to remove approximately one-third of the influent BOD when operating at an overflow rate of 1,000 gallons per day/square foot [41 m^3/(m^2·d)].

** Anticipated BOD removal should be determined by laboratory tests and should consider the character of the wastes. Significant reduction in BOD removal efficiency will result when the peak hourly overflow rate exceeds 1,500 gallons per day/square foot [61 m^3/(m^2·d)].

72.22 Intermediate Settling Tanks

Surface overflow rates for intermediate settling tanks following series units of fixed film reactor processes should not exceed 1,200 gallons per day per square foot [49 m^3/(m^2·d)] based on the design peak hourly flow. Higher surface settling rates to 1,500 gallons per day per square foot [61 m^3/(m^2·d)] based on the design peak hourly flow may be permitted if such rates are shown to have no adverse effects on subsequent treatment units.

72.23 Final Settling Tanks

Settling tests shall be conducted wherever a pilot study of biological treatment is warranted by unusual waste characteristics, treatment requirements, or where proposed loadings go beyond the limits set forth in this Section.

72.231 Final Settling Tanks - Attached Growth Biological Reactors

Surface overflow rates for settling tanks following trickling filters or rotating biological contactors shall not exceed 1,200 gallons per day per square foot [49 $m^3/(m^2 \cdot d)$] based on the design peak hourly flow.

72.232 Final Settling Tanks - Activated Sludge

To perform properly while producing a concentrated return flow, activated sludge settling tanks shall be designed to meet thickening and solids separation requirements. Since the rate of recirculation of return sludge from the final settling tanks to the aeration or reaeration tanks is quite high in activated sludge processes, the surface and weir overflow rates should be adjusted for the various processes to minimize the problems with sludge loadings, density currents, inlet hydraulic turbulence, and occasional poor sludge settleability. The size of the settling tank shall be based on the larger of the surface areas determined for surface overflow rate and solids loading rate. The following design criteria shall not be exceeded:

Treatment Process	Surface Overflow Rate at Design Peak Hourly Flow* gpd/ft^2 [$m^3/(m^2 \cdot d)$]	Peak Solids Loading Rate*** lb/day/ft^2 [$kg/(m^2 \cdot d)$]
Conventional, Step Aeration, Complete Mix, Contact Stabilization, Carbonaceous Stage of Separate Stage Nitrification	1,200** (49)	40 (195)
Extended Aeration Single Stage Nitrification	1,000 (41)	35 (171)
2 Stage Nitrification	800 (33)	35 (171)
Activated Sludge with Chemical addition to Mixed Liquor for Phosphorus Removal	900**** (37)	As Above

* Based on influent flow only.

** Plants needing to meet 20 mg/L suspended solids should reduce the surface overflow rate to 1,000 gallons per day per square foot [41 $m^3/(m^2 \cdot d)$].

*** The clarifier peak solids loading rate shall be calculated based on the design maximum day flow rate plus the design maximum return sludge rate requirement and the design MLSS under aeration.

**** When phosphorus removal to a concentration of less than 1.0 mg/L is required.

72.3 Inlet Structures

Inlets and baffling shall be designed to dissipate the inlet velocity, to distribute the flow equally, both horizontally and vertically, and to prevent short circuiting. Provision of flocculation zones shall be considered for secondary settling tanks. Channels shall be designed to maintain a velocity of at least 1 foot per second (0.3 m/s) at one-half of the design average flow. Corner pockets and dead ends shall be eliminated and corner fillets or channeling shall be used where necessary. Provisions shall be made for the elimination or removal of floating materials that may accumulate in inlet structures.

72.4 Weirs

72.41 General

Overflow weirs shall be readily adjustable over the life of the structure to correct for differential settlement of the tank.

72.42 Location

Overflow weirs shall be located to optimize actual hydraulic detention time, and minimize short circuiting. Peripheral weirs shall be placed at least 1 foot (0.3 m) from the wall.

72.43 Design Rates

Weir loadings shall not exceed:

Average Plant Capacity	Loading Rate at Design Peak Hourly Flow gpd/lin ft [$m^3/(m \cdot d)$]
equal to or less than 1 mgd (3785 m^3/d)	20,000 (250)
greater than 1 mgd (3785 m^3/d)	30,000 (375)

If pumping is required, the pumps shall be operated as continuously as possible. Also, weir loadings should be related to pump delivery rates to avoid short circuiting.

72.44 Weir Troughs

Weir troughs shall be designed to prevent submergence at design peak hourly flow, and to maintain a velocity of at least 1 foot per second (0.3 m/s) at one-half design average flow.

72.5 Submerged Surface

The tops of troughs, beams, and similar submerged construction elements shall have a minimum slope of 1.4 vertical to 1 horizontal. The underside of such elements shall have a slope of 1 to 1 to prevent the accumulation of scum and solids.

72.6 Unit Dewatering

Unit dewatering features shall conform to the provisions outlined in Paragraph 54.3. The bypass design shall provide for distribution of the plant flow to the remaining settling units.

72.7 Freeboard

Walls of settling tanks shall extend at least 6 inches (150 mm) above the surrounding ground surface and shall provide not less than 12 inches (300 mm) of freeboard. Additional freeboard or the use of wind screens is recommended where larger settling tanks are subject to high velocity wind currents that would cause tank surface waves and inhibit effective scum removal.

73. SLUDGE AND SCUM REMOVAL

73.1 Scum Removal

Full surface mechanical scum collection and removal facilities, including baffling, shall be provided for all settling tanks. The unusual characteristics of scum that may adversely affect pumping, piping, sludge handling and disposal shall be recognized in the design. Provisions shall be made to remove scum from the wastewater treatment process and direct it to either a scum concentrator or to the sludge treatment process. Other special provisions for scum disposal may be necessary.

73.2 Sludge Removal

Mechanical sludge collection and withdrawal facilities shall be designed to assure rapid removal of the sludge. Suction withdrawal should be provided for activated sludge clarifiers over 60 feet (18 m) in diameter, especially for activated sludge plants that nitrify.

Each settling tank shall have independent sludge withdrawal lines to ensure adequate control of sludge wasting rates for each tank.

73.21 Sludge Hopper

The minimum slope of the side walls shall be 1.7 vertical to 1 horizontal. Hopper wall surfaces should be made smooth with rounded corners to aid in sludge removal. Hopper bottoms shall have a maximum dimension of 2 feet (0.6 m). Sludge hoppers with extra depth for sludge thickening are not acceptable.

73.22 Cross-Collectors

Cross-collectors serving one or more settling tanks may be useful in place of multiple sludge hoppers.

73.23 Sludge Removal Pipeline

Each sludge hopper shall have an individually valved sludge withdrawal line at least 6 inches (150 mm) in diameter. The static head available for the withdrawal of sludge shall be 30 inches (760 mm) or greater as necessary to maintain a 3 foot per second (0.9 m/s) velocity in the withdrawal pipe. Clearance between the end of the withdrawal line and the hopper walls shall be sufficient to prevent "bridging" of the sludge. Adequate provisions shall be made for rodding or back-flushing individual pipe runs. Provisions shall be made to allow for visual confirmation of return sludge. Piping shall be provided to return sludge for further processing.

73.24 Sludge Removal Control

Separate settling tank sludge lines may drain to a common sludge well.

Sludge wells equipped with telescoping valves or other appropriate equipment shall be provided for viewing, sampling, and controlling the rate of sludge withdrawal. A means of measuring the sludge removal rate shall be provided. Air-lift sludge removal will not be approved for the removal of primary sludges.

74. PROTECTIVE AND SERVICE FACILITIES

74.1 Operator Protection

All settling tanks shall be equipped to enhance safety for operators. Safety features shall appropriately include machinery covers, life lines, stairways, walkways, handrails, and slip resistant surfaces.

74.2 Mechanical Maintenance Access

The design shall provide for convenient and safe access to routine maintenance items such as gear boxes, scum removal mechanisms, baffles, weirs, inlet stilling baffle areas, and effluent channels.

74.3 Electrical Equipment, Fixtures and Controls

Electrical equipment, fixtures and controls in enclosed settling basins and scum tanks, where hazardous concentrations of flammable gases or vapors may accumulate, shall meet the requirements of the National Electrical Code for Class I, Division 1, Group D locations.

The fixtures and controls shall be located so as to provide convenient and safe access for operation and maintenance. Adequate area lighting shall be provided.

CHAPTER 80
SLUDGE PROCESSING, STORAGE, AND DISPOSAL

81. GENERAL

Facilities for processing sludge shall be provided at all mechanical wastewater treatment plants. Handling equipment shall be capable of processing sludge to a form suitable for ultimate disposal unless provisions acceptable to the regulatory agency are made for processing the sludge at an alternate location.

The reviewing authority should be contacted if sludge unit processes not described in this Chapter are being considered or are necessary to meet state, provincial, or federal sludge disposal requirements.

82. PROCESS SELECTION

The selection of sludge handling unit processes should be based, at a minimum, upon the following considerations:

a. Local land use;

b. System energy requirements;

c. Cost effectiveness of sludge thickening and dewatering;

d. Equipment complexity and staffing requirements;

e. Adverse effects of heavy metals and other sludge components upon the unit processes;

f. Sludge digestion or stabilization requirements, including appropriate pathogen and vector attraction reduction;

g. Side stream or return flow treatment requirements (e.g., digester or sludge storage facilities supernatant, dewatering unit filtrate, wet oxidation return flows);

h. Sludge storage requirements;

i. Methods of ultimate disposal; and

j. Back-up techniques of sludge handling and disposal.

83. SLUDGE THICKENERS

83.1 Design Considerations

Sludge thickeners to reduce the volume of sludge should be considered. The design of thickeners (gravity, dissolved-air flotation, centrifuge, and others) should consider the type and concentration of sludge, the sludge stabilization processes, storage requirements, the method of ultimate sludge disposal, chemical needs, and the cost of operation.

The use of gravity thickening tanks for unstabilized sludges is not recommended because of problems due to septicity unless provisions are made for adequate control of process operational problems and odors at the gravity thickener and any following unit processes.

Particular attention should be given to the pumping and piping of the concentrated sludge and possible onset of anaerobic conditions.

83.2 Prototype Studies

Process selection and unit process design parameters should be based on prototype studies. The reviewing authority will require such studies where the sizing of other plant units is dependent on thickener performance. Refer to Paragraph 53.2 for any new process determination.

84. ANAEROBIC SLUDGE DIGESTION

84.1 General

84.11 Multiple Units

Multiple units or alternate methods of sludge processing shall be provided. Facilities for sludge storage and supernatant separation in an additional unit may be required, depending on raw sludge concentration and disposal methods for sludge and supernatant.

84.12 Depth

If process design provides for supernatant withdrawal, the proportion of depth to diameter should allow for the formation of a reasonable depth of supernatant liquor. A minimum side water depth of 20 feet (6.1 m) is recommended.

84.13 Design Maintenance Provisions

To facilitate emptying, cleaning, and maintenance, the following features are desirable:

84.131 Slope

The tank bottom shall slope to drain toward the withdrawal pipe. For tanks equipped with a suction mechanism for sludge withdrawal, a bottom slope not less than 1 to 12 should be provided. Where the sludge is to be removed by gravity alone, the slope should be 1 to 4.

84.132 Access Manholes

At least 2 access manholes not less than 30 inches (760 mm) in diameter should be provided in the top of the tank, in addition to the gas dome. Stairways to reach the access manholes should be provided.

A separate side wall manhole shall be provided that is large enough to permit the use of mechanical equipment to remove grit and sand. The side wall access manhole should be low enough to facilitate heavy equipment handling and may be buried in the earthen bank insulation.

84.133 Safety

Non-sparking tools, rubber-soled shoes, safety harness, gas detectors for flammable and toxic gases, and at least two self-contained breathing units, as described in Paragraph 102.56, shall be provided for emergency use. Refer to other safety items as appropriate in Section 57.

84.14 Toxic Materials

If the anaerobic digestion process is proposed, the basis of design shall be supported by wastewater analyses to determine the presence of undesirable materials, such as high concentrations of sulfates or inhibitory concentrations of heavy metals.

84.2 Sludge Inlets, Outlets, Recirculation, and High Level Overflow

84.21 Multiple Inlets and Draw-Offs

Multiple sludge inlets and draw-offs and, where used, multiple recirculation suction and discharge points to facilitate flexible operation and effective mixing of the digester contents shall be provided unless adequate mixing facilities are provided within the digester.

84.22 Inlet Configurations

One inlet should discharge above the liquid level and be located at approximately the center of the tank to assist in scum breakup. The second inlet should be opposite to the suction line at approximately the 2/3 diameter point across the digester.

84.23 Inlet Discharge Location

Raw sludge inlet discharge points should be so located as to minimize short circuiting to the digested sludge or supernatant draw-offs.

84.24 Sludge Withdrawal

Sludge withdrawal to disposal should be from the bottom of the tank. The bottom withdrawal pipe should be interconnected with the necessary valving to the recirculation piping to increase operational flexibility when mixing the tank contents.

84.25 Emergency Overflow

An unvalved vented overflow shall be provided to prevent damage to the digestion tank and cover in case of accidental overfilling. This emergency overflow shall be piped to an appropriate point and at an appropriate rate in the treatment process or sidestream treatment facilities to minimize the impact on process units.

84.3 Tank Capacity

84.31 Rational Design

The total digestion tank capacity shall be determined by rational calculations based upon factors such as: volume of sludge added, percent solids, and character; the temperature to be maintained in the digesters; the degree or extent of mixing to be obtained; the degree of volatile solids reduction required; the solids retention time at peak loadings; method of sludge disposal; and the size of the installation with appropriate allowances for gas, scum, supernatant, and digested sludge storage. Secondary digesters of two-stage series digestion systems which are utilized for digested sludge storage and concentration shall not be credited in the calculations for volumes required for sludge digestion. Calculations should be submitted to justify the basis of design.

84.32 Standard Design

When such calculations are not submitted to justify the design based on the above factors, the minimum digestion tank capacity shall be as outlined below. These requirements assume that the raw sludge is derived from ordinary domestic wastewater, a digestion temperature is to be maintained in the range of 85°F to 95°F (29 °C to 35 °C), 40 to 50 percent volatile matter in the digested sludge, and that the digested sludge will be removed frequently from the process. (See also Paragraphs 84.11 and 89.11.)

84.321 Completely Mixed Systems

For digestion systems providing for intimate and effective mixing of the digester contents, the system may be loaded up to 80 pounds of volatile solids per 1000 cubic feet of volume per day [1.3 kg/(m^3·d)] in the active digestion units.

84.322 Moderately Mixed Systems

For digestion systems where mixing is accomplished only by circulating sludge through an external heat exchanger, the system may be loaded up to 40 pounds of volatile solids per 1000 cubic feet of volume per day [0.65 kg/(m^3·d)] in the active digestion units. This loading may be modified upward or downward depending upon the degree of mixing provided.

84.323 Multistage Systems

For digestion systems utilizing two stages (primary and secondary units), the first stage (primary) may be either completely mixed or moderately mixed and loaded in accordance with Paragraphs 84.321 or 84.322. The second stage (secondary) shall be designed for sludge storage, concentration, and gas collection and shall not be credited in the calculations for volumes required for sludge digestion.

84.324 Digester Mixing

Facilities for mixing the digester contents shall be provided where required for proper digestion by reason of loading rates or other features of the system. Where sludge recirculation pumps are used for mixing they shall be provided in accordance with appropriate requirements of Paragraph 87.1.

84.4 Gas Collection, Piping, and Appurtenances

84.41 General

All portions of the gas system, including the space above the tank, liquor, storage facilities, and piping shall be so designed that under all normal operating conditions, including sludge withdrawal, the gas will be maintained under pressure. All enclosed areas where any gas leakage might occur shall be adequately ventilated.

84.42 Safety Equipment

All necessary safety facilities shall be included where gas is produced. Pressure and vacuum relief valves and flame traps together with automatic safety shut off valves shall be provided and shall be protected from freezing. Water seal equipment shall not be installed. Safety equipment and gas compressors should be housed in a separate room with an exterior door.

84.43 Gas Piping and Condensate

Gas piping shall have a minimum diameter of 4 inches (100 mm). A smaller diameter pipe at the gas production meter is acceptable. Gas piping shall slope to condensation traps at low points. Float-controlled condensate traps shall not be used. Condensation traps shall be protected from freezing.

Tightly fitted self-closing doors should be provided at connecting passageways and tunnels that connect digestion facilities to other facilities to minimize the spread of gas. Piping galleries shall be ventilated in accordance with Paragraph 84.47.

84.44 Gas Utilization Equipment

Gas burning boilers, engines, etc., shall be located in well-ventilated rooms. Such rooms would not ordinarily be classified as a hazardous location if isolated from the digestion gallery. Gas lines to these units shall be provided with suitable flame traps.

84.45 Electrical Equipment, Fixtures, and Controls

Electrical equipment, fixtures and controls, in places enclosing and adjacent to anaerobic digestion appurtenances, where hazardous gases may accumulate shall comply with the National Electric Code for Class I, Division 1, Group D locations.

84.46 Waste Gas

84.461 Location

Waste gas burners shall be readily accessible and should be located at least 50 feet (15 m) away from any plant structure. Waste gas burners shall be of sufficient height and so located to prevent injury to personnel due to wind or downdraft conditions.

84.462 Pilot Light

All waste gas burners shall be equipped with automatic ignition such as a pilot light or a device using a photoelectric cell sensor. Consideration should be given to the use of natural or propane gas to ensure reliability of the pilot.

84.463 Gas Piping Slope

Gas piping shall be sloped at a minimum of 2 percent up to the waste gas burner with a condensate trap provided in a location not subject to freezing.

84.47 Ventilation

Any underground enclosures connecting with digestion tanks or containing sludge or gas piping or equipment shall be provided with forced ventilation for dry wells in accordance with Paragraphs 42.71 through 42.74 and 42.76. The ventilation rate for Class I, Division 2, Group D locations including enclosed areas without a gas tight partition from the digestion tank or areas containing gas compressors, sediment traps, drip traps, gas scrubbers, or pressure regulating and control valves, if continuous, shall be at least 12 complete air changes per hour.

84.48 Meter

A gas meter with bypass shall be provided to meter total gas production for each active digestion unit. Total gas production for

two-stage digestion systems operated in series may be measured by a single gas meter with proper interconnected gas piping.

Where multiple primary digestion units are utilized with a single secondary digestion unit, a gas meter shall be provided for each primary digestion unit. The secondary digestion unit may be interconnected with the gas measurement unit of one of the primary units. Interconnected gas piping shall be properly valved with gas tight gate valves to allow measurement of gas production from either digestion unit and maintenance of either digestion unit.

Gas meters may be of the orifice plate, turbine or vortex type. Positive displacement meters should not be utilized. The meter shall be specifically designed for contact with corrosive and dirty gases.

84.5 Digestion Tank Heating

84.51 Insulation

Wherever possible digestion tanks should be constructed above groundwater level and shall be suitably insulated to minimize heat loss. Maximum utilization of earthen bank insulation should be used.

84.52 Heating Facilities

Sludge may be heated by circulating the sludge through external heaters or by units located inside the digestion tank. Refer to Paragraph 84.522.

84.521 External Heating

Piping shall be designed to provide for the preheating of feed sludge before introduction into the digesters. Provisions shall be made in the layout of the piping and valving to facilitate heat exchanger tube removal and cleaning of the lines. Heat exchanger sludge piping should be sized for peak heat transfer requirements. Heat exchangers should have a heating capacity of 130 percent of the calculated peak heating requirement to account for the occurrence of sludge tube fouling.

84.522 Other Heating Methods

a. Hot water heating coils affixed to the walls of the digester or other types of internal heating equipment that require emptying the digester contents for repair shall not be used.

b. Other systems and devices have been developed recently to provide both mixing and heating of anaerobic digester contents. These systems will be reviewed on their own merits. Operating data

detailing their reliability, operation, and maintenance characteristics will be required. Refer to Paragraph 53.2.

84.53 Heating Capacity

84.531 Capacity

Sufficient heating capacity shall be provided to consistently maintain the design sludge temperature, considering insulation provisions and ambient cold weather conditions. Where digestion tank gas is used for other purposes, an auxiliary fuel may be required. The design operating temperature should be in the range of 85°F to 100°F (29 °C to 38 °C) where optimum mesophilic digestion is required.

84.532 Standby Requirements

The provision of standby heating capacity or the use of multiple units sized to provide the heating requirements shall be considered, unless acceptable alternative means of handling raw sludge are provided for the extended period that a digestion process outage is experienced due to heat loss.

84.54 Hot Water Internal Heating Controls

84.541 Mixing Valves

A suitable automatic mixing valve shall be provided to temper the boiler water with return water so that the inlet water to the removable heat jacket or coil in the digester can be held below a temperature at which caking will be accentuated. Manual control should also be provided by suitable bypass valves.

84.542 Boiler Controls

The boiler should be provided with suitable automatic controls to maintain the boiler temperature at approximately 180°F (82 °C) to minimize corrosion and to shut off the main gas supply in the event of pilot burner or electrical failure, low boiler water level, low gas pressure, or excessive boiler water temperature or pressure.

84.543 Boiler Water Pumps

Boiler water pumps shall be sealed and sized to meet the operating conditions of temperature, operating head, and flow rate. Duplicate units shall be provided.

84.544 Thermometers

Thermometers shall be provided to show inlet and outlet temperatures of the sludge, hot water feed, hot water return, and boiler water.

84.545 Water Supply

The chemical quality should be checked for suitability for use as a water supply. Refer to Paragraph 56.23 for required break tank for indirect water supply connections.

84.55 External Heater Operating Controls

All controls necessary to ensure effective and safe operation are required. Provision for duplicate units in critical elements should be considered.

84.6 Supernatant Withdrawal

Where supernatant separation is to be used to concentrate sludge in the digester units and increase digester solids retention time, the design shall provide for ease of operation and positive control of supernatant quality.

84.61 Piping Size

Supernatant piping should not be less than 6 inches (150 mm) in diameter.

84.62 Withdrawal Arrangements

84.621 Withdrawal Levels

Supernatant withdrawal piping should be arranged so that withdrawal can be made from three or more levels in the tank. An unvalved vented overflow shall be provided. The emergency overflow shall be piped to an appropriate point and at an appropriate rate in the treatment process or side stream treatment units to minimize the impact on process units.

84.622 Withdrawal Selection

On fixed cover tanks, the supernatant withdrawal level should be selected by means of interchangeable extensions at the discharge end of the piping.

84.623 Supernatant Selector

A fixed screen supernatant selector or similar type device shall be limited for use in an unmixed secondary digestion unit. If such a supernatant selector is provided, provisions shall be made for at least one other draw-off level located in the supernatant zone of the tank, in

addition to the unvalved emergency supernatant draw-off pipe. High pressure back-wash facilities shall be provided.

84.63 Sampling

Provision shall be made for sampling at each supernatant draw-off level. Sampling pipes should be at least 1½ inches (40 mm) in diameter and should terminate at a suitably sized sampling sink or basin.

84.64 Supernatant Disposal

Supernatant return and disposal facilities should be designed to alleviate adverse hydraulic and organic effects on plant operations. If nutrient removal (e.g., phosphorus, ammonia nitrogen) must be accomplished at a plant, a separate supernatant side stream treatment system should be provided.

84.7 Anaerobic Digestion Sludge Production

For calculating design sludge handling and disposal needs, sludge production values from a two-stage anaerobic digestion process shall be based on a maximum solids concentration of 5 percent without additional thickening. The solids production values on a dry weight basis shall be based on the following for the listed processes:

Primary plus waste activated sludge - at least 0.12 lb/P.E./day [0.05 kg/(P.E.·d)].

Primary plus fixed film sludge - at least 0.09 lb/P.E./day [0.04 kg/(P.E.·d)].

85. AEROBIC SLUDGE DIGESTION

85.1 General

An aerobic sludge digestion system shall include provisions for digestion, supernatant separation, sludge concentration, and any necessary sludge storage. These provisions may be accomplished by separate tanks or processes or in the digestion tanks.

85.2 Multiple Units

Multiple digestion units capable of independent operation are desirable and shall be provided in all plants where the design average flow exceeds 100,000 gallons per day (380 m^3/d). All plants not having multiple units shall provide alternate sludge handling and disposal methods.

85.3 Tank Capacity

85.31 Volume Required

The following digestion tank capacities are based on a solids concentration of 2 percent with supernatant separation performed in a separate tank. If supernatant separation is performed in the digestion tank, a minimum of 25 percent additional volume shall be provided. These capacities shall be provided unless sludge thickening facilities (refer to Section 83) are utilized to thicken the feed solids concentration to greater than 2 percent. If such thickening is provided, the digestion volumes may be decreased proportionally.

	Volume/Population Equivalent
Sludge Source	ft^3/P.E. (m^3/P.E.)
Waste activated sludge -- no primary settling	4.5 (0.13)*
Primary plus waste activated sludge	4.0 (0.11)*
Waste activated sludge exclusive of primary sludge	2.0 (0.06)*
Extended aeration activated sludge	3.0 (0.09)
Primary plus attached growth biological reactor sludge	3.0 (0.09)

* These volumes also apply to waste activated sludge from single stage nitrification facilities with less than 24 hours detention time based on design average flow.

85.32 Effect of Temperature on Volume

The volumes in Paragraph 85.31 are based on digester temperatures of 59°F (15 °C) and a solids retention time of 27 days. Aerobic digesters should be covered to minimize heat loss for colder temperature applications. Additional volume or supplemental heat may be required if the land application disposal method is used in order to meet the applicable U.S. EPA requirements. Refer to Paragraph 85.9 for necessary sludge storage.

85.4 Mixing

Aerobic digesters shall be provided with mixing equipment that can maintain solids in suspension and ensure complete mixing of the digester contents. Refer to Paragraph 85.5.

85.5 Air Requirements

Sufficient air shall be provided to keep the solids in suspension and maintain dissolved oxygen between 1 mg/L and 2 mg/L. For minimum mixing and oxygen requirements, an air supply of 30 cfm/1000 ft^3 [0.5 $L/(m^3 \cdot s)$] of tank volume shall be provided with the largest blower out of service. If diffusers are used, the nonclog type should be provided, and they should be designed to permit continuity of service. If mechanical turbine aerators are utilized, at least two turbine aerators per tank shall be provided to permit continuity of service. Mechanical aerators are not recommended for use in aerobic digesters where freezing conditions will cause ice build-up on the aerator and support structures.

85.6 Supernatant Separation and Scum and Grease Removal

85.61 Supernatant Separation

Facilities shall be provided for effective separation or decanting of supernatant. Separate facilities are recommended; however, supernatant separation may be accomplished in the digestion tank if additional volume is provided per Paragraph 85.3. The supernatant drawoff unit shall be designed to prevent recycle of scum and grease back to plant process units. Provision should be made to withdraw supernatant from multiple levels of the supernatant withdrawal zone.

85.62 Scum and Grease Removal

Facilities shall be provided for the effective collection of scum and grease from the aerobic digester for final disposal, to prevent its recycle back to the plant process, and to prevent long term accumulation and potential discharge in the effluent.

85.7 High Level Emergency Overflow

An unvalved high level overflow and any necessary piping shall be provided to return digester overflow back to the head of the plant or to the aeration process in case of accidental overfilling. Design considerations related to the digester overflow shall include waste sludge rate and duration during the period the plant is unattended, potential effects on plant process units, discharge location of the emergency overflow, and potential discharge of suspended solids in the plant effluent.

85.8 Aerobic Digestion Sludge Production

For calculating design sludge handling and disposal needs, sludge production values from aerobic digesters shall be based on a maximum solids concentration of 2 percent without additional thickening. The solids production values on a dry weight basis shall be based on the following for the listed processes:

Primary plus waste activated sludge - at least 0.16 lb/P.E./day [0.07 kg/(P.E.·d)].

Primary plus fixed film sludge - at least 0.12 lb/P.E./day [0.05 kg/(P.E.·d)].

85.9 Digested Sludge Storage Volume

85.91 Sludge Storage Volume

Sludge storage shall be provided in accordance with Section 89 to accommodate daily sludge production volumes and as an operational buffer for unit outage and adverse weather conditions. Designs shall not utilize increased sludge age in the activated sludge system as a means of storage.

85.92 Liquid Sludge Storage

Liquid sludge storage facilities shall be based on the following values unless digested sludge thickening facilities are utilized (refer to Section 83) to provide solids concentrations of greater than 2 percent.

Sludge Source	Volume/Population Equivalent ft^3/P.E./day [m^3/(P.E.·d)]
Waste activated sludge -- no primary settling, primary plus waste activated sludge, and extended aeration activated sludge	0.13 (0.004)
Waste activated sludge exclusive of primary sludge	0.06 (0.002)
Primary plus attached growth biological reactor sludge	0.10 (0.003)

85.10 Autothermal Thermophilic Aerobic Digestion

Thermophilic digestion temperature should be maintained between 122°F and 158°F (50 °C and 70 °C). Systems may be either single or multiple stage. The sludge should be thickened prior to treatment in the digestion tanks. The digestion tanks should be suitably insulated to minimize heat loss.

86. HIGH pH STABILIZATION

86.1 General

Alkaline material may be added to liquid primary or secondary sludges for sludge stabilization in lieu of digestion facilities; to supplement existing digestion facilities; or for interim sludge handling. There is no direct reduction of organic matter or sludge solids with the high pH stabilization process. There is an increase in the mass of dry sludge solids. Without supplemental dewatering, additional volumes of sludge will be generated.

The design shall account for the increased sludge quantities for storage, handling, transportation, and disposal methods and associated costs.

86.2 Operational Criteria

Sufficient alkaline material shall be added to liquid sludge in order to produce a homogeneous mixture with a minimum pH of 12 after two hours of vigorous mixing. Facilities for adding supplemental alkaline material shall be provided to maintain the pH of the sludge during interim sludge storage periods.

86.3 Odor Control and Ventilation

Odor control facilities shall be provided for sludge mixing and treated sludge storage tanks when located within 1/2 mile (0.8 km) of residential or commercial areas. The reviewing authority should be contacted for design and air pollution control objectives to be met for various types of air scrubber units. Ventilation shall be provided for indoor sludge mixing, storage or processing facilities in accordance with Paragraph 42.75.

86.4 Mixing Tanks and Equipment

86.41 Tanks

Mixing tanks may be designed to operate as either a batch or continuous flow process. A minimum of two tanks shall be provided. The tanks shall provide a minimum of two hours contact time in each tank. The following items shall also be considered in determining the number and size of tanks:

a. peak sludge flow rates;

b. storage between batches;

c. dewatering or thickening performed in tanks;

d. repeating sludge treatment due to pH decay of stored sludge;

e. sludge thickening prior to sludge treatment; and

f. type of mixing device used and its associated maintenance or repair requirements.

86.42 Equipment

Mixing equipment shall be designed to provide vigorous agitation within the mixing tank, maintain solids in suspension, and provide for a homogeneous mixture of the sludge solids and alkaline material. Mixing may be accomplished either by diffused air or mechanical mixers. If diffused aeration is used, an air supply of 30 cfm/1000 ft^3 [0.5 L/(m^3·s)] of mixing tank volume shall be provided with the largest blower out of service. When diffusers are used, the nonclog type should be provided, and they should be designed to permit continuity of service. If mechanical mixers are

used, the impellers shall be designed to minimize fouling with debris in the sludge and consideration shall be made to provide continuity of service during freezing weather conditions.

86.5 Chemical Feed and Storage Equipment

86.51 General

Alkaline material is caustic in nature and can cause eye and tissue injury. Equipment for handling or storing alkaline material shall be designed for adequate operator safety. Refer to Section 57 for proper safety precautions. Storage, slaking, and feed equipment should be sealed as airtight as practical to prevent contact of alkaline material with atmospheric carbon dioxide and water vapor and to prevent the escape of dust material. All equipment and associated transfer lines or piping shall be accessible for cleaning.

86.52 Feed and Slaking Equipment

The design of the feeding equipment shall be determined by the treatment plant size, type of alkaline material used, slaking required, and operator requirements. Equipment may be either of batch or automated type. Automated feeders may be of the volumetric or gravimetric type depending on accuracy, reliability, and maintenance requirements. Manually operated batch slaking of quicklime (CaO) should be avoided unless adequate protective clothing and equipment are provided. At small plants, hydrated lime [$Ca(OH)_2$] should be used instead of quicklime due to safety and labor-saving reasons. Feed and slaking equipment shall be sized to handle a minimum of 150% of the peak sludge flow rate including sludge that may need to be retreated due to pH decay. Duplicate units shall be provided.

86.53 Chemical Storage Facilities

Alkaline materials may be delivered either in bag or bulk form depending upon the amount of material used. Material delivered in bags shall be stored indoors and elevated above floor level. Bags should be of the multi-wall moisture-proof type. Dry bulk storage containers shall be as airtight as practical and shall contain a mechanical agitation mechanism. Storage facilities shall be sized to provide a minimum of a 30-day supply.

86.6 Sludge Storage

Refer to Section 89 for general design considerations for sludge storage facilities. The design shall incorporate the following considerations for the storage of high pH stabilized sludge:

86.61 Liquid Sludge

Liquid high pH stabilized sludge shall not be stored in a lagoon. Said sludge shall be stored in a tank or vessel equipped with rapid sludge withdrawal mechanisms for sludge disposal or retreatment.

Provisions shall be made for adding alkaline material in the storage tank. Mixing equipment in accordance with Paragraph 86.42 above shall be provided in all storage tanks.

86.62 Dewatered Sludge

On-site storage of dewatered high pH stabilized sludge should be limited to 30 days. Provisions for rapid retreatment or disposal of dewatered sludge stored on-site shall be made in case of sludge pH decay.

86.63 Off-Site Storage

There shall be no off-site storage of high pH stabilized sludge unless specifically allowed by the regulatory agency.

86.7 Disposal

Immediate sludge disposal methods and options are recommended to be utilized in order to reduce the sludge inventory on the treatment plant site and the amount of sludge that may need to be retreated to prevent odors if sludge pH decay occurs. If the land application disposal option is utilized for high pH stabilized sludge, said sludge should be incorporated into the soil during the same day of delivery to the site.

87. SLUDGE PUMPS AND PIPING

87.1 Sludge Pumps

87.11 Capacity

Pump capacities shall be adequate but not excessive. Provisions for varying pump capacity should be made. A rational basis of design shall be provided with the plan documents.

87.12 Duplicate Units

Duplicate units shall be provided at all installations.

87.13 Type

Plunger pumps, screw feed pumps or other types of pumps with demonstrated solids handling capability shall be provided for handling raw sludge. Where centrifugal pumps are used, a parallel positive displacement pump shall be provided as an alternate to pump heavy sludge concentrations, such as primary or thickened sludge, that may exceed the pumping head of the centrifugal pump.

87.14 Minimum Head

A minimum positive head of 24 inches (610 mm) shall be provided at the suction side of centrifugal type pumps and should be provided for all types of sludge pumps. Maximum suction lifts should not exceed 10 feet (3 m) for plunger pumps.

87.15 Sampling Facilities

Unless sludge sampling facilities are provided, quick-closing sampling valves shall be installed at the sludge pumps. The size of valve and piping should be at least 1½ inches (40 mm) and terminate at a suitably sized sampling sink or floor drain.

87.2 Sludge Piping

87.21 Size and Head

Digested sludge withdrawal piping should have a minimum diameter of 8 inches (200 mm) for gravity withdrawal and 6 inches (150 mm) for pump suction and discharge lines. Where withdrawal is by gravity, the available head on the discharge pipe should be at least 4 feet (1.2 m), preferably more. Undigested sludge withdrawal piping shall be sized in accordance with Paragraph 73.23.

87.22 Slope and Flushing Requirements

Gravity piping should be laid on uniform grade and alignment. Slope on gravity discharge piping should not be less than 3 percent for primary sludges and all sludges thickened to greater than 2 percent solids. Slope on gravity discharge piping should not be less than 2 percent for aerobically digested sludge or waste activated sludge with less than 2 percent solids. Cleanouts shall be provided for all gravity sludge piping. Provisions shall be made for draining and flushing discharge lines. All sludge piping shall be suitably located or otherwise adequately protected to prevent freezing.

87.23 Supports

Special consideration shall be given to the corrosion resistance and permanence of supporting systems for piping located inside the digestion tank.

88. SLUDGE DEWATERING

88.1 General

On-site sludge dewatering facilities shall be provided for all plants, although the following requirements may be reduced with on-site liquid sludge storage facilities or approved off-site sludge disposal.

For calculating design sludge handling and disposal needs for sludge stabilization processes other than described in Paragraphs 84.7 for anaerobic digestion and 85.8 for aerobic digestion, a rational basis of design for sludge production values shall be developed and provided to the reviewing authority for approval on a case-by-case basis.

88.2 Sludge Drying Beds

88.21 Applicability

Sludge drying beds may be used for dewatering well digested sludge from either the anaerobic or aerobic process. Due to the large volume of sludge produced by the aerobic digestion process, consideration should be given to using a combination of dewatering systems or other means of ultimate sludge disposal.

88.22 Unit Sizing

Sludge drying bed area shall be calculated on a rational basis with the following items considered:

a. The volume of wet sludge produced by existing and proposed processes.

b. Depth of wet sludge drawn to the drying beds. For design calculation purposes, a maximum depth of 8 inches (200 mm) shall be utilized. For operational purposes, the depth of sludge placed on the drying bed may increase or decrease from the design depth based on the percent solids content and type of digestion utilized.

c. Total digester volume and other wet sludge storage facilities.

d. Degree of sludge thickening provided after digestion.

e. The maximum drawing depth of sludge which can be removed from the digester or other sludge storage facilities without causing process or structural problems.

f. The time required on the bed to produce a removable cake. Adequate provision shall be made for sludge dewatering and/or sludge disposal facilities for those periods of time during which outside drying of sludge on beds is hindered by weather.

g. Capacities of auxiliary dewatering facilities.

88.23 Percolation Type Bed Components

88.231 Gravel

The lower course of gravel around the underdrains should be properly graded, should be at least 12 inches (300 mm) in depth, extending at least 6 inches (150 mm) above the top of the underdrains, and should be placed in two or more layers. The top layer of at least 3 inches (80 mm) should consist of gravel 1/8 to 1/4 inch (3 mm to 6 mm) in size.

88.232 Sand

The top course should consist of at least 9 to 12 inches (230 mm to 300 mm) of clean, hard, and washed coarse sand. The effective size of the sand should be in the range of 0.8 mm to 1.5 mm. The finished sand surface should be level.

88.233 Underdrains

Underdrains should be at least 4 inches (100 mm) in diameter laid with open joints. Perforated pipe may also be used. Underdrains should be spaced not more than 20 feet (6.1 m) apart and sloped at a minimum of 1 percent. Lateral tiles should be spaced at 8 to 10 feet (2.4 m to 3.0 m). Various pipe materials may be selected provided the pipe is corrosion resistant and appropriately bedded to ensure that the underdrains are not damaged by sludge removal equipment.

88.234 Additional Dewatering Provisions

Consideration shall be given to provide a means of decanting the supernatant of sludge placed on the sludge drying beds. More effective decanting of supernatant may be accomplished with polymer treatment of sludge.

88.235 Seal

The bottom of the percolation bed shall be sealed in a manner approved by the reviewing authority.

88.24 Walls

Walls should extend 18 inches (460 mm) above and at least 9 inches (230 mm) below the surface of the sludge drying bed. Outer walls shall be water tight down to the bottom of the bed and extend at least 4 inches (100 mm) above the outside grade elevation to prevent soil from washing into the beds.

88.25 Sludge Removal

Each sludge drying bed shall be constructed so as to be readily and completely accessible to mechanical equipment for cleaning and sand replacement. Concrete runways spaced to accommodate mechanical equipment shall be provided. Special attention should be given to assure adequate access to the areas adjacent to the sidewalls. Entrance ramps down to the level of the sand bed shall be provided. These ramps should be high enough to eliminate the need for an entrance end wall for the sludge bed.

88.3 Mechanical Dewatering Facilities

88.31 General

Provision shall be made to maintain sufficient continuity of service so that sludge may be dewatered without accumulation beyond storage capacity. The number of vacuum filters, centrifuges, filter presses, belt filters, other mechanical dewatering facilities, or combinations thereof should be sufficient to dewater the sludge produced with the largest unit out of service. Unless other standby wet sludge facilities are available, adequate storage facilities of at least 4 days production volume, in addition to any other sludge storage needs, shall be provided. Documentation shall be submitted justifying the basis of design of mechanical dewatering facilities.

88.32 Water Supply Protection

Provisions for water supply to mechanical dewatering facilities shall be in accordance with Paragraph 56.23.

88.33 Auxiliary Facilities for Vacuum Filters

Back-up vacuum and filtrate pumps shall be provided. It is permissible to have uninstalled back-up vacuum and filtrate pumps for every three or less vacuum filters, provided that the installed units can easily be removed and replaced. At least one filter media replacement unit shall be provided.

88.34 Ventilation

Adequate facilities shall be provided for ventilation of the dewatering area in accordance with Paragraph 42.75. The exhaust air should be properly conditioned to avoid odor nuisance.

88.35 Chemical Handling Enclosures

Lime-mixing facilities should be completely enclosed to prevent the escape of lime dust. Chemical handling equipment should be automated to eliminate the manual lifting requirement. Refer to Section 57.

88.4 Drainage and Filtrate Disposal

Drainage from sludge drying beds or filtrate from other dewatering units shall be returned to the wastewater treatment process at appropriate points and rates. Sampling equipment shall be provided as needed to monitor drainage and filtrate waste streams. See also Paragraphs 56.7 and 84.64.

88.5 Other Dewatering Facilities

If other methods of sludge dewatering are proposed, a detailed description of the process and design data shall accompany the plans. Refer to Paragraph 53.2 for any new process determinations.

89. SLUDGE STORAGE AND DISPOSAL

89.1 Storage

89.11 General

Sludge storage facilities shall be provided at all mechanical treatment plants. Appropriate storage facilities may consist of any combination of drying beds, lagoons, separate tanks, additional volume in sludge stabilization units, pad areas or other means to store either liquid or dried sludge. Refer to Paragraphs 88.2 and 89.2 for drying bed and lagoon design criteria, respectively.

The design shall provide for odor control in sludge storage tanks and sludge lagoons including aeration, covering, or other appropriate means.

89.12 Volume

Rational calculations justifying the number of days of storage to be provided shall be submitted and shall be based on the total sludge handling and disposal system. Refer to Paragraphs 84.7 and 85.8 for anaerobically and aerobically digested sludge production values. Sludge production values for other stabilization processes should be justified in the basis of design. If the land application method of sludge disposal is the only means of disposal utilized at a treatment plant, storage shall be provided based on the following considerations, at a minimum:

a. Inclement weather effects on access to the application land;

b. Temperatures including frozen ground and stored sludge cake conditions;

c. Haul road restrictions including spring thawing conditions;

d. Area seasonal rainfall patterns;

e. Cropping practices on available land;

f. Potential for increased sludge volumes from industrial sources during the design life of the plant;

g. Available area for expanding sludge storage; and

h. Appropriate pathogen reduction and vector attraction reduction requirements.

A minimum range of 120 to 180 days storage should be provided for the design life of the plant unless a different period is approved by the reviewing authority. Refer to Paragraph 89.33 for other sludge land application considerations.

89.2 Sludge Storage Lagoons

89.21 General

Sludge storage lagoons may be permitted only upon proof that the character of the digested sludge and the design mode of operation are such that offensive odors will not result. Where sludge lagoons are permitted, adequate provisions shall be made for other acceptable sludge handling methods in the event of upset or failure of the sludge digestion process.

89.22 Location

Sludge lagoons shall be located as far as practicable from inhabited areas or areas likely to be inhabited during the lifetime of the structures. Siting of sludge lagoons shall comply with the requirements of the reviewing authority.

89.23 Seal

Adequate provisions shall be made to seal the sludge lagoon bottoms and embankments in accordance with the requirements of Paragraph 93.422 to prevent leaching into adjacent soils or ground water. The seal shall be protected to prevent damage from sludge removal activities. Groundwater monitoring may be required by the reviewing authority in accordance with Paragraph 93.65.

89.24 Access

Provisions shall be made for pumping or heavy equipment access for sludge removal from the sludge lagoon on a routine basis.

89.25 Supernatant Disposal

Lagoon supernatant shall be returned to the wastewater treatment process at appropriate points and rates. Sampling equipment shall be provided as needed to monitor supernatant waste streams. See also Paragraphs 56.7 and 84.64.

89.3 Disposal

89.31 General

Drainage facilities for sludge vehicle transfer stations shall be provided to allow any spillage or washdown material to be collected and returned to the wastewater treatment plant or sludge storage facility.

89.32 Sanitary Landfilling

Sludge and sludge residues may be disposed of in approved sanitary landfills under the terms and conditions of the regulatory agency.

89.33 Land Application

The reviewing authority should be contacted for specific design and approval requirements governing the land application of municipal sludges. Additional operating criteria may be obtained from applicable federal regulations. Sludge may be utilized as a soil conditioner for agricultural, horticultural, or reclamation purposes. Important design considerations include, but are not necessarily limited to: sludge stabilization process, appropriate pathogen and vector attraction reduction, sludge characteristics including the presence of inorganic and organic chemicals, application site characteristics (soils, groundwater elevations, setback distance requirements, etc.), local topography and hydrology, cropping practices, spreading and incorporation techniques, population density and odor control, and local groundwater quality and usage.

Sludge mixing equipment or other provisions to assist in the monitoring of land applied sludge should be considered in the design of sludge handling and storage facilities.

Due to inclement weather and cropping practices, alternative sludge disposal options are recommended to ensure the sludge is properly managed.

Sludge should not be applied to land which is used for growing food crops to be eaten raw, such as leafed vegetables and root crops.

89.34 Sludge Lagoons for Disposal

Sludge lagoons should not be used for ultimate disposal of sludge due to odor potential, area and volume required, and possible long term problems from groundwater contamination. The regulatory agency shall be contacted for the acceptability of lagoons for final disposal.

89.35 Other Disposal Methods

If other methods of sludge disposal are proposed, a detailed description of the technique and design data shall accompany the plans. Refer to Paragraph 53.2 for any new process determinations.

CHAPTER 90
BIOLOGICAL TREATMENT

91. TRICKLING FILTERS

91.1 General

Trickling filters may be used for treatment of wastewater amenable to treatment by aerobic biological processes. The trickling filter is a non-submerged attached-growth process. Trickling filters shall be preceded by effective settling tanks equipped with scum and grease collecting devices, or other suitable pretreatment facilities. Trickling filters shall be designed to provide for reduction in carbonaceous and/or nitrogenous oxygen demand in accordance with water quality standards and objectives for the receiving waters as established by the appropriate reviewing authority, or to properly condition the wastewater for subsequent treatment processes. Multi-stage filters should be considered if needed to meet more stringent effluent standards.

91.2 Hydraulics

91.21 Distribution

91.211 Uniformity

The wastewater may be distributed over the filter by rotary distributors or other suitable devices that will ensure uniform distribution to the surface area. At design average flow, the deviation from a calculated uniformly distributed volume per square foot of the filter surface shall not exceed plus or minus 10 percent at any point. All hydraulic factors involving proper distribution of wastewater on the filters shall be carefully calculated. Such calculations shall be submitted to the appropriate reviewing authority.

Reverse reaction nozzles, hydraulic brakes or motor-driven distributor arms shall be provided for rotary distributors to ensure that the maximum speed recommended by the distributor manufacturer is not exceeded and to attain the desired media dosing rate.

91.212 Head Requirements

For reaction type distributors, a minimum head of 24 inches (610 mm) between low water level in the siphon chamber and center of the arms is required. Similar allowance in design shall be provided for added pumping head requirements where pumping to the reaction type distributor is used.

91.213 Clearance

A minimum clearance of 12 inches (305 mm) between filter media and the bottom of the distributor arms shall be provided.

91.22 Dosing

Wastewater may be applied to the filter by siphons, pumps or gravity discharge from preceding treatment units when suitable flow characteristics have been developed. Application of the wastewater shall be practically continuous. The piping system shall be designed for recirculation.

91.23 Piping System

The piping system, including dosing equipment and distributor, shall be designed to provide capacity for the design peak hourly flow, including recirculation required under Paragraph 91.55.

91.3 Media

91.31 Quality

The trickling filter media may be crushed rock, slag, or manufactured material. The media shall be durable, resistant to spalling or flaking, and relatively insoluble in wastewater. The top 18 inches (460 mm) shall have a loss of not more than 10 percent according to the 20-cycle, sodium sulfate soundness test, as prescribed by ASCE Manual of Engineering Practice, Number 13. The balance is to pass a 10-cycle sodium sulfate soundness test using the ASCE Manual criteria. Slag media shall be free from iron or other leachable materials that will adversely affect the process or effluent quality. Manufactured media shall be resistant to ultraviolet degradation, disintegration, erosion, aging, all common acids and alkalis, organic compounds, and fungus or biological attack. Such media shall be structurally capable of supporting a person's weight or a suitable access walkway shall be provided to allow for distributor maintenance.

91.32 Depth

Trickling filter media shall have a minimum depth of 6 feet (1.8 m) above the underdrains. Rock and/or slag filter media depths shall not exceed 10 feet (3 m). Manufactured filter media depths should not exceed the recommendations of the manufacturer. Forced ventilation should be considered in accordance with Paragraph 91.43.

91.33 Size, Grading, and Handling of Media

91.331 Rock, Slag, and Similar Media

Rock, slag, and similar media shall not contain more than 5 percent by weight of pieces whose longest dimension is three times the least dimension. The media shall be free from thin, elongated and flat pieces, dust, clay, sand or fine material, and shall conform to the following size and grading when mechanically graded over a vibrating screen with square openings.

Passing 4½ inch (115 mm) screen - 100% by weight
Retained on 3 inch (75 mm) screen - 95-100% by weight
Passing 2 inch (50 mm) screen - 0-2% by weight
Passing 1 inch (25 mm) screen - 0-1% by weight

91.332 Manufactured Media

Media suitability shall be evaluated on the basis of experience with installations handling similar wastes and loadings. To ensure sufficient void clearances, media with specific surface areas of no more than 30 square feet per cubic foot (100 m^2/m^3) are acceptable for filters employed for carbonaceous reduction, and 45 square feet per cubic foot (150 m^2/m^3) for second stage ammonia reduction.

91.333 Handling and Placing of Media

Material delivered to the filter site shall be stored on wood-planked or other approved clean, hard-surfaced areas. All material shall be rehandled at the filter site and no material shall be dumped directly into the filter. Crushed rock, slag, and similar media shall be washed and rescreened or forked at the filter site to remove all fines. Such material shall be placed by hand to a depth of 12 inches (305 mm) above the tile underdrains. The remainder of the material may be placed by means of belt conveyors or equally effective methods approved by the engineer. All material shall be carefully placed so as not to damage the underdrains. Manufactured media shall be handled and placed as approved by the engineer. Trucks, tractors, and other heavy equipment shall not be driven over the filter during or after construction.

91.4 Underdrainage System

91.41 Arrangement

Underdrains with semicircular inverts or equivalent should be provided. The underdrainage system shall cover the entire floor of the filter. Inlet openings into the underdrains shall have an

unsubmerged gross combined area equal to at least 15 percent of the surface area of the filter.

91.42 Hydraulic Capacity

The underdrains shall have a minimum slope of 1 percent. Effluent channels shall be designed to produce a minimum velocity of 2 feet per second (0.6 m/s) at design average flow rates of application to the filter, including recirculated flows. Refer to Paragraph 91.43.

91.43 Ventilation

The underdrainage system, effluent channels, and effluent pipe shall be designed to permit free passage of air. The size of drains, channels, and pipe should be such that not more than 50 percent of their cross-sectional area will be submerged under the design peak instantaneous flow, including proposed or possible future recirculated flows.

Forced ventilation should be provided for covered trickling filters to ensure adequate oxygen for process requirements. Windows or simple louvered mechanisms so arranged to ensure air distribution throughout the enclosure shall be provided. The design of the ventilation facilities shall provide for operator control of air flow in accordance with outside seasonal temperature. Design computations showing the adequacy of air flow to satisfy process oxygen requirements shall be submitted.

91.44 Flushing

Provision should be made for flushing the underdrains unless high rate recirculation is utilized. In small rock and slag filters, use of a peripheral head channel with vertical vents is acceptable for flushing purposes. Inspection facilities should be provided.

91.5 Special Features

91.51 Flooding

Appropriate valves, sluice gates, or other structures shall be provided to enable flooding of filters comprised of rock or slag media for filter fly control.

91.52 Freeboard

A freeboard of 4 feet (1.2 m) or more should be provided for tall, manufactured filters to contain windblown spray. At least 6 foot (1.8 m) headroom for distributor maintenance should be provided for covered filters.

91.53 Maintenance

All distribution devices, underdrains, channels, and pipes shall be installed so that they may be properly maintained, flushed and/or drained.

91.54 Winter Protection

Covers shall be provided to maintain operation and treatment efficiencies when climatic conditions are expected to result in problems due to cold temperatures.

91.55 Recirculation

The piping system shall be designed for recirculation as required to achieve the design efficiency. The recirculation rate shall be variable and subject to plant operator control at the range of 0.5:1 up to 4:1 (ratio of recirculation rate versus design average flow). A minimum of two recirculation pumps shall be provided.

91.56 Recirculation Measurement

Devices shall be provided to permit measurement of the filter recirculation rate. Elapsed time meters and pump head recording devices are acceptable for facilities treating less than 1 mgd (3,785 m^3/d). The design of the recirculation facilities shall provide for both continuity of service and the range of recirculation ratios. Reduced recirculation rates for periods of brief pump outages may be acceptable depending on water quality requirements.

91.57 Ventilation Ports

The underdrainage ventilation ports shall be designed to ensure that the interior flow will be retained inside the trickling filter.

91.6 Rotary Distributor Seals

Mercury seals shall not be permitted. Ease of seal replacement shall be considered in the design to ensure continuity of operation.

91.7 Unit Sizing

Required volumes of filter media shall be based on pilot testing with the particular wastewater or any of the various empirical design equations that have been verified through actual full scale experience. Such calculations shall be submitted if pilot testing is not utilized. Pilot testing is recommended to verify performance predictions based on the various design equations, particularly when significant amounts of industrial wastes are present.

Trickling filter design shall consider peak organic load conditions including the oxygen demands due to recycle flows (i.e., sludge dewatering filtrate, anaerobic digester supernatant, etc.) resulting from high concentrations of BOD_5 and TKN associated with such flows. The

volume of media determined from either pilot plant studies or the use of acceptable design equations shall be based on the design maximum day BOD_5 loading rate rather than the design average BOD_5 rate. Refer to Paragraph 11.251.

92. ACTIVATED SLUDGE

92.1 General

92.11 Applicability

92.111 Biodegradable Wastewaters

The activated sludge process and its various modifications may be used where wastewater is amenable to biological treatment and the biological solids are separated from the treated water. It is a suspended growth type process that relies on secondary clarification for removal of effluent suspended solids while producing a concentrated return activated sludge flow.

92.112 Operational Requirement

The activated sludge process requires close attention and competent operating supervision, including routine laboratory testing for monitoring and process control. These requirements shall be considered when proposing this type of treatment.

92.113 Energy Requirements

The activated sludge process requires major energy usage to meet aeration demands. Energy costs and potential mandatory emergency public power reduction events in relation to critical water quality conditions shall be carefully evaluated. Capability of energy usage phasedown while still maintaining process viability, both under normal and emergency energy availability conditions, shall be included in the activated sludge process design.

92.12 Specific Process Selection

The activated sludge process and its several modifications may be employed to accomplish varied degrees of removal of suspended solids and reduction of carbonaceous and/or nitrogenous oxygen demand. Choice of the process most applicable will be influenced by the degree and consistency of treatment required, type of wastewater to be treated, proposed plant size, anticipated degree of operation and maintenance, and operating and capital costs. All designs shall provide for flexibility in operation and should provide for operation in various modes, if feasible.

92.13 Winter Protection

In severe climates, protection against freezing shall be provided to ensure continuity of operation and performance. Insulation of the tanks by earthen banks should be considered.

92.2 Pretreatment

Where primary settling tanks are not used, effective removal or exclusion of grit, debris, excessive oil or grease, and screening of solids shall be accomplished prior to the activated sludge process. Screening devices with clear openings of 1/4 inch (6 mm) or less shall be provided.

Where primary settling is used, provision shall be made for discharging raw wastewater directly to the aeration tanks to facilitate plant start-up and operation during the initial stages of the plant's design life.

92.3 Aeration

92.31 Capacities and Permissible Loadings

The size of the aeration tank for any particular adaptation of the process shall be determined by full scale experience, pilot plant studies, or rational calculations based mainly on solids retention time, food to microorganism (F/M) ratio and mixed liquor suspended solids levels. Other factors, such as size of treatment plant, diurnal load variations, and degree of treatment required, shall also be considered. When designing for nitrification, temperature, alkalinity, pH, and reactor dissolved oxygen shall be considered.

Calculations should be submitted to justify the basis of the aeration tank capacity design. Calculations using process design values differing substantially from those in the accompanying table should reference actual operational plants. Mixed liquor suspended solids levels greater than 5,000 mg/L may be allowed providing adequate data is submitted showing the aeration and clarification systems are capable of supporting such levels.

When process design calculations are not submitted, the aeration tank capacities and permissible loadings shown in the following table shall be used for the several adaptations of the processes. These values apply to plants receiving diurnal load ratios of design peak hourly BOD_5 to design average BOD_5 ranging from about 2:1 to 4:1. The utilization of flow equalization facilities to reduce the diurnal design peak hourly BOD_5 organic load may be considered by the appropriate reviewing authority as justification to approve organic loading rates that exceed those specified in the table.

PERMISSIBLE AERATION TANK CAPACITIES AND LOADINGS

Process	*Aeration Tank Organic Loading lb BOD_5/d/1000 ft^3 [kg BOD_5/ (m^3·d)]**	F/M Ratio lb BOD_5/d/lb MLVSS [kg BOD_5/(kg MLVSS·d)]**	MLSS*** mg/L
Conventional Step Aeration Complete Mix	40 (0.64)	0.2-0.5	1,000-3,000
Contact Stabilization	50****(0.80)	0.2-0.6	1,000-3,000
Extended Aeration Single Stage Nitrification	15 (0.24)	0.05-0.1	3,000-5,000

* Volumetric loadings are based on the influent organic load to the aeration tank at plant design average BOD_5.

** Refer to 11.251(a) for definition of BOD_5.

*** Maximum MLSS values are dependent upon the surface area provided for final sedimentation, the rate of sludge return, and the aeration process.

**** Total aeration capacity includes both contact and reaeration capacities. Normally the contact zone equals 30 to 35% of the total aeration capacity.

92.32 Arrangement of Aeration Tanks

a. Dimensions

The dimensions of each independent mixed liquor aeration tank or return sludge reaeration tank shall be such as to maintain effective mixing and utilization of air. Liquid depths should not be less than 10 feet (3 m) or more than 30 feet (9 m) except in special design cases. Horizontally mixed aeration tanks shall have a depth of not less than 5.5 feet (1.7 m).

b. Short-circuiting

For very small tanks or tanks with a special configuration, the shape of the tank, the location of the influent and sludge return, and the installation of aeration equipment should provide for positive control to prevent short-circuiting of the wastewater through the tank.

92.321 Number of Units

Total aeration tank volume shall be divided among two or more units, capable of independent operation, when

required by the appropriate reviewing authority to meet applicable effluent limitations and reliability guidelines.

92.322 Inlets and Outlets

a. Controls

Inlets and outlets for each aeration tank unit shall be suitably equipped with valves, gates, stop plates, weirs, or other devices that allow for flow control to any unit and to maintain a reasonably constant liquid level. The effluent weir for a horizontally mixed aeration tank system shall be easily adjustable by mechanical means and shall be sized based on the design peak instantaneous flow plus the maximum return sludge flow. Refer to Paragraph 92.41. The hydraulic properties of the system shall permit the design peak instantaneous flow to be carried with any single aeration tank unit out of service.

b. Conduits

Channels and pipes carrying liquids with solids in suspension shall be designed to maintain self-cleansing velocities or shall be agitated to keep such solids in suspension at all rates of flow within the design limits. Adequate provisions should be made to drain segments of channels which are not being used due to alternate flow patterns.

92.323 Freeboard

All aeration tanks should have a freeboard of not less than 18 inches (460 mm). However, if a mechanical surface aerator is used, the freeboard should be not less than 3 feet (0.9 m) to protect against windblown spray freezing on walkways, etc.

92.33 Aeration Equipment

92.331 General

Oxygen requirements generally depend on maximum diurnal organic loading (design peak hourly BOD_5 as described in Paragraph 11.251), degree of treatment, and level of suspended solids concentration to be maintained in the aeration tank mixed liquor. Aeration equipment shall be capable of maintaining a minimum of 2.0 mg/L of dissolved oxygen in the mixed liquor at all times and provide thorough mixing of the mixed liquor. In the absence of experimentally determined values, the design oxygen requirements for all activated sludge processes shall be 1.1 lb O_2/lb design peak hourly BOD_5 (1.1 kg

O_2/kg design peak hourly BOD_5) applied to the aeration tanks, with the exception of the extended aeration process, for which the value shall be 1.5 lb O_2/lb design peak hourly BOD_5 (1.5 kg O_2/kg design peak hourly BOD_5) to include endogenous respiration requirements.

Where nitrification is required or will occur, such as within the extended aeration process, the oxygen requirement for oxidizing ammonia shall be added to the above design oxygen requirements for carbonaceous BOD_5 removal and, where applicable, endogenous respiration requirements. The nitrogenous oxygen demand (NOD) shall be taken as 4.6 times the diurnal peak hourly TKN content of the influent. In addition, the oxygen demands due to recycle flows (i.e., sludge dewatering filtrate, anaerobic digester supernatant, etc.) shall be considered due to the high concentrations of BOD_5 and TKN associated with such flows.

Careful consideration should be given to maximizing oxygen utilization per unit of power input. Unless flow equalization is provided, the aeration system should be designed to match the diurnal organic load variation while economizing on power input. Refer to Paragraph 92.31.

92.332 Diffused Air Systems

The diffused air system shall be designed according to either of the two methods described below in (a) and (b), augmented as required by consideration of items (c) through (h):

a. Having determined the oxygen requirements per Paragraph 92.331, air requirements for a diffused air system shall be determined using any of the well known equations and incorporating such factors as:

   1. Tank depth;
   2. Alpha factor of wastewater;
   3. Beta factor of wastewater;
   4. Certified aeration device oxygen transfer efficiency;
   5. Minimum aeration tank dissolved oxygen concentration;
   6. Critical wastewater temperature; and
   7. Altitude of plant.

   In the absence of experimentally determined alpha and beta factors, wastewater oxygen transfer efficiency shall be assumed to be not greater than 50 percent of clean water oxygen transfer efficiency for plants treating primarily (90% or greater) domestic wastewater. Treatment plants where the

wastewater contains higher percentages of industrial wastes shall use a correspondingly lower percentage of clean water efficiency and shall have calculations submitted to justify such a percentage. The design oxygen transfer efficiency should be included in the specifications.

b. Normal air requirements for all activated sludge processes except extended aeration (assuming equipment capable of transmitting to the mixed liquor the amount of oxygen required in Paragraph 92.331) shall be considered to be 1,500 cubic feet at standard conditions of pressure, temperature, and humidity per pound of BOD_5 aeration tank loading (94 m^3/kg BOD_5). For the extended aeration process, the value shall be 2,050 cubic feet per pound of BOD_5 (128 m^3/kg of BOD_5).

c. The air required for channels, pumps, aerobic digesters or other air-use demand and to satisfy oxygen demands due to recycle flows (e.g., sludge dewatering filtrate, anaerobic digester supernatant) shall be added to the air requirements calculated above.

d. The specified capacity of blowers or air compressors, particularly centrifugal blowers, should take into account that the air intake temperature may reach 115°F (46 °C) or higher and that the pressure may be less than normal. The specified capacity of the motor drive should also take into account that the intake air may be -20°F (-29 °C) or less and may require oversizing of the motor or a means of reducing the rate of air delivery to prevent overheating or damage to the motor.

e. The blowers shall be provided in multiple units, so arranged and in such capacities as to meet the maximum air demand with the single largest unit out of service. The design shall also provide for varying the volume of air delivered in proportion to the load demand of the plant. Aeration equipment shall be easily adjustable in increments and shall maintain solids in suspension within these limits.

f. Diffuser systems shall be capable of providing for 200 percent of the design average day oxygen demand. The air diffusion piping and diffuser system shall be capable of delivering normal air requirements with minimal friction losses.

Air piping systems should be designed such that total head loss from blower outlet (or silencer outlet

where used) to the diffuser inlet does not exceed 0.5 psi (3.4 kPa) at average operating conditions.

The spacing of diffusers should be in accordance with the oxygen requirements through the length of the channel or tank, and should be designed to facilitate adjustment of their spacing without major revisions to air header piping.

All plants employing less than four independent aeration tanks shall be designed to incorporate removable diffusers that can be serviced and/or replaced without dewatering the tank.

g. Individual assembly units of diffusers shall be equipped with control valves, preferably with indicator markings, for throttling or for complete shutoff. Diffusers in any single assembly shall have substantially uniform pressure loss.

h. Air filters shall be provided in numbers, arrangements, and capacities to furnish at all times an air supply sufficiently free from dust to prevent damage to blowers and clogging of the diffuser system used.

92.333 Mechanical Aeration Systems

a. Oxygen Transfer Performance

The mechanism and drive unit shall be designed for the expected conditions in the aeration tank in terms of the power performance. Certified testing shall be provided to verify mechanical aerator performance. Refer to applicable provisions of Paragraph 92.332. In the absence of specific design information, the oxygen requirements shall be calculated using a transfer rate not to exceed 2 pounds of oxygen per horsepower per hour [1.22 kg O_2/(kW·h)] in clean water under standard test conditions. Design transfer efficiencies shall be included in the specifications.

b. Design Requirements

A mechanical aeration system shall accomplish the following:

1. Maintain a minimum of 2.0 mg/L of dissolved oxygen in the mixed liquor at all times throughout the tank or basin;

2. Maintain all biological solids in suspension (for a horizontally mixed aeration tank

system an average velocity of 1 foot per second (0.3 m/s) shall be maintained);

3. Meet maximum oxygen demand and maintain process performance with the largest unit out of service;

4. Provide for varying the amount of oxygen transferred in proportion to the load demand on the activated sludge process; and

5. Allow for motors, gear housing, bearings, grease fittings, etc., to be easily accessible and protected from inundation and spray as necessary for proper functioning of the unit.

c. Winter Protection

Where extended cold weather conditions occur, the aerator mechanism and associated structure shall be protected from freezing due to splashing and spray. Due to high heat loss, subsequent treatment units shall be protected from freezing.

92.4 Return Sludge Equipment

92.41 Return Sludge Rate

The minimum permissible withdrawal rate of return sludge from the final settling tank is a function of the concentration of suspended solids in the mixed liquor entering it, the sludge volume index of these solids, and the length of time these solids are retained in the settling tank. Since undue retention of solids in the final settling tanks may be deleterious to both the aeration and sedimentation phases of the activated sludge process, the rate of sludge return expressed as a percentage of the design average flow of wastewater should generally be variable between the limits set forth as follows:

Type of Process	% Design Average Flow	
	Minimum	Maximum
Conventional, Step Aeration or Complete Mix	15	100
Contact Stabilization	50	150
Single Stage Nitrification	50	150
Extended Aeration	50	150
Carbonaceous Stage of Separate Stage Nitrification	15	100
Nitrification Stage of Separate Stage Nitrification	50	200

The rate of sludge return shall be varied by means of variable speed motors, drives, or timers (small plants) to pump sludge at the above rates. All designs shall provide for flexibility in operation and should provide for operation in various process modes, if feasible.

92.42 Return Sludge Pumps

If motor drive return sludge pumps are used, the maximum return sludge capacity shall be obtained with the largest pump out of service. A positive head should be provided on pump suctions. Pumps should have at least 3 inch (80 mm) suction and discharge openings.

If air lifts are used for returning sludge from each settling tank hopper, no standby unit will be required provided the design of the air lifts facilitates their rapid and easy cleaning and provided other suitable standby measures are provided. Air lifts should be at least 3 inches (80 mm) in diameter.

92.43 Return Sludge Piping

Discharge piping should be at least 4 inches (100 mm) in diameter and should be designed to maintain a velocity of not less than 2 feet per second (0.6 m/s) when return sludge facilities are operating at normal return sludge rates. Suitable devices for observing, sampling, and controlling return activated sludge flow from each settling tank hopper shall be provided, as outlined in Paragraph 73.24.

92.44 Waste Sludge Facilities

Waste sludge control facilities should have a capacity of at least 25 percent of the design average rate of wastewater flow and function satisfactorily at rates of 0.5 percent of design average wastewater flow or a minimum of 10 gallons per minute (0.6 L/s), whichever is larger. Means for observing, measuring, sampling, and controlling waste activated sludge flow shall be provided. Waste sludge may be discharged to the primary settling tank, sludge digestion tank, sludge thickening or dewatering processes, storage tank, or any practical combination of these units.

92.5 Measuring Devices

Devices should be installed in all plants for indicating flow rates of raw wastewater or primary effluent, return sludge, and air to each tank unit. For plants designed for design average wastewater flows of 1 mgd (3,785 m^3/d) or more, these devices should totalize and record, as well as indicate flows. Where the design provides for all return sludge to be mixed with the raw wastewater (or primary effluent) at one location, then the mixed liquor flow rate to each aeration unit should be measured.

92.6 Biological Nutrient Removal

Biological Nutrient Removal (BNR) processes may be approved at the discretion of the reviewing authority on a case-by-case basis under the provisions of Paragraph 53.2. Many proprietary BNR systems are available and vendors should be consulted for design details. The design shall meet the applicable requirements under Chapters 50, 70 and 90, except as modified in this Paragraph.

All BNR designs shall provide for flexibility in operation and should provide for operation in various modes, if feasible. Vital components for internal mixed liquor recycle and mechanical mixing systems shall meet the guidelines for continuity of treatment established by the reviewing authority.

92.61 Definitions

The following terms shall be used by the design engineer to describe biological nutrient removal processes in an Engineering Report or Facility Plan.

a. Aerobic (or Oxic) Condition Defined

A condition in which free and dissolved oxygen is available in an aqueous environment.

b. Anoxic Condition Defined

A condition in which oxygen is only available in a combined form, such as nitrate (NO_3^-), nitrite (NO_2^-), or sulfate (SO_4^{--}), in an aqueous environment.

c. Anaerobic Condition Defined

A condition in which free, dissolved and combined oxygen are not available in an aqueous environment.

92.62 Biological Phosphorus Removal

A number of process configurations for enhanced biological phosphorus removal (BPR) have been developed as alternatives to phosphorus removal by chemical treatment (outlined in Section 111). BPR microorganisms incorporate phosphorus into their cell mass in excess of their metabolic requirements, allowing them to remove phosphorus from wastewater. Exposure of activated sludge microorganisms to alternating anaerobic and aerobic conditions allows BPR microorganisms to proliferate in numbers sufficient to remove phosphorus.

The design shall ensure that readily biodegradable organic matter in sufficient quantities is available in an anaerobic environment to promote the growth of BPR microorganisms. The amount of readily biodegradable organic matter can be increased by fermentation of wastewater or sludge or by the addition of a supplemental carbon source such as methanol or acetic acid.

To create truly anaerobic conditions, both oxygen and nitrate shall be excluded. Many BPR configurations include the denitrification process to limit the nitrate concentration in anaerobic zones.

Sludge containing the excess phosphorus from the BPR microorganisms can be wasted, or the excess phosphorus can be removed from the sludge by a sidestream treatment process. The BPR process may require chemical treatment as a backup system or for polishing to achieve very low effluent phosphorus levels. The BPR process is often combined with nitrification and denitrification processes.

92.63 Biological Nitrogen Removal

Biological nitrogen removal is accomplished by biological oxidation of ammonia to nitrate (nitrification) followed by biological denitrification of nitrate to nitrogen gas.

92.631 Nitrification

Biological nitrification is used to remove ammonia to meet effluent requirements or as the first step in nitrogen removal. Ammonia is oxidized to nitrite and then to nitrate by nitrifying bacteria in an aerobic environment. Nitrification consumes alkalinity.

Nitrification can be achieved with either a single stage nitrification process (combined carbonaceous oxidation and nitrification) or with a separate stage nitrification process. In each case, suspended growth, attached

growth or hybrid systems can be used. Temperature, alkalinity, pH and dissolved oxygen shall be considered in nitrification design.

92.632 Denitrification

Denitrification is the biological process where bacteria convert nitrate to nitrogen gas under anoxic conditions. Denitrification generates alkalinity and therefore restores some of the alkalinity consumed during nitrification.

A soluble carbon source is required to drive the denitrification process. The carbon requirements for denitrification may be provided by influent wastewater or by an external source such as methanol.

92.64 Combined Biological Nitrogen and Phosphorus Removal

A number of BNR processes have been developed for the combined removal of nitrogen and phosphorus. Many of these are proprietary and use a form of the activated sludge process. Combinations of anaerobic, anoxic and aerobic zones or compartments are designed to accomplish biological nitrogen and phosphorus removal.

92.7 Sequencing Batch Reactors

The fill and draw mode of the activated sludge process commonly termed the Sequencing Batch Reactor may be approved at the discretion of the reviewing authority on a case-by-case basis under the provisions of Paragraph 53.2. The design shall be based on experience at other facilities and shall meet the applicable requirements under Chapters 50, 70 and 90, except as modified in this Paragraph. Continuity and reliability of treatment equal to that of the continuous flow through modes of the activated sludge process shall be provided. Supplemental treatment units may be required to meet applicable effluent limitations and reliability guidelines. The reviewing authority should be contacted for design guidance and criteria where such systems are being considered. See also Section 65 where in-line flow equalization units are provided in addition to the decantable volume.

a. Design F/M ratios in the range of 0.05 to 0.1 are permissible. The aeration tank volumetric loading should not exceed 15 lb BOD_5/d/1000 ft^3 [0.24 kg $BOD_5/(m^3 \cdot d)$]. The reactor MLSS and MLVSS concentrations and aeration tank volumetric loading should be calculated at the low-water level.

b. More than two tanks should be provided.

c. The decantable volume and decanter capacity of the sequencing batch reactor system with the largest basin out of service should be sized to pass at least 75 percent of the design maximum day flow without changing cycle times. A decantable volume of at least 4 hours with the largest basin out of service based on 100 percent of the design

maximum day flow is permissible.

d. System reliability with any single aeration tank unit out of service and the instantaneous delivery of flow shall be evaluated in the design of decanter weirs and approach velocities. The treated effluent from each reactor should be free of scum and should have a suspended solids concentration no greater than 30 mg/L at any time. See Paragraphs 53.413 and 72.43. Scum removal shall be provided. An adequate zone of separation between the sludge blanket and the decanter(s) shall be maintained throughout the decant phase.

e. Decanters that draw the treated effluent from near the water surface throughout the decant phase are recommended.

f. Solids management to accommodate tank dewatering shall be considered.

g. The blowers shall be provided in multiple units, so arranged and in such capacities as to meet the maximum air demand in the oxic portions of the fill/react and react phases of the cycle with the single largest unit out of service. See Paragraph 92.332(e).

h. Mechanical mixing independent of aeration shall be provided for all systems where biological phosphorus removal or denitrification is required. The mixing equipment should be sized to thoroughly mix the entire tank from a settled condition within 5 minutes without aeration.

i. The design effluent quality performance requirements for the plant should be sufficiently stringent to ensure acceptable effluent quality from any reactor. Flow paced composite sampling equipment and continuous turbidity metering for separately monitoring the effluent quality from each tank may be required by the regulatory agency. All 24-hour effluent quality composite samples for compliance reporting or monitoring plant operations shall be flow-paced and include samples collected at the beginning and end of each decant phase. A programmable logic controller (PLC) shall be provided. Multiple PLCs should be provided as necessary to ensure rapid process recovery and minimize the deterioration of effluent quality from the failure of a single controller. An uninterruptible power supply with electrical surge protection shall be provided for each PLC to retain program memory (i.e., process control program, last-known set points and measured process/equipment status, etc.) through a power loss. A hard-wired backup for manual override shall be provided in addition to automatic process control. Both automatic and manual controls shall allow independent operation of each tank. In addition, a fail-safe control that cannot be adjusted by the operator shall be provided, allowing at least 20 minutes of settling between the react and decant phases.

93. WASTEWATER TREATMENT PONDS

93.1 General

This Section deals with generally used variations of treatment ponds capable of achieving secondary treatment including controlled-discharge pond systems, flow-through pond systems and aerated pond systems. Ponds utilized for equalization, percolation, evaporation, and sludge storage are not discussed in this Section. The term "pond" is used in this Section to include the total earthen treatment facility and the term "cell" is used to designate the individual units of the total facility.

93.2 Location

93.21 Surface Runoff

Adequate provision shall be made to divert stormwater runoff around the pond and protect pond embankments from erosion.

93.22 Ground Water Separation

A minimum separation of 4 feet (1.2 m) between the bottom of the pond and the maximum ground water elevation should be maintained.

93.23 Bedrock Separation

A minimum separation of 10 feet (3.0 m) between the pond bottom and any bedrock formation is recommended.

93.3 Basis of Design

93.31 Area and Loadings for Controlled-Discharge Facultative Treatment Pond Systems

Pond design for design average BOD_5 loading may range from 15 to 35 pounds per acre per day [17 kg/(ha·d) to 40 kg/(ha·d)] at the mean operating depth in the primary cells and at least 180 days detention time between the minimum and maximum operating depths of the entire pond system, as described in Paragraph 93.416. Refer to Paragraph 11.251. The detention time and organic loading rate shall depend on climatic conditions and effluent discharge limits.

93.32 Area and Loadings for Flow-Through Facultative Treatment Ponds Systems

Pond design for design average BOD_5 loading may vary from 15 to 35 pounds per acre per day [17 kg/(ha·d) to 40 kg/(ha·d)] for the primary cell(s). Refer to Paragraph 11.251. The major design considerations for BOD_5 loading shall be directly related to the climatic conditions.

Design variables such as pond depth, multiple units, detention time, and additional treatment units shall be considered with respect to applicable standards for BOD_5, total suspended solids (TSS), bacteria, dissolved oxygen and pH.

A detention time of 90 to120 days should be provided; however, this shall be properly related to other design considerations. It should be noted that the major factor in the design is the duration of the cold weather period [water temperature less than 40°F (5 °C)].

93.33 Aerated Treatment Pond Systems

For the development of final design parameters, it is recommended that actual experimental data be obtained. However, the aerated treatment pond system design for minimum detention time may be estimated using the following formula, applied separately to each aerated cell:

$$t = \frac{E}{2.3k_1 \times (100 - E)}$$

t = hydraulic detention time, days

E = percent of BOD_5 to be removed in an aerated cell

k_1 = reaction coefficient, aerated pond, base 10. For normal domestic wastewater, the k_1 value may be assumed to be 0.12/day at 68°F (20 °C) and 0.06/day at 34°F (1 °C).

The reaction rate coefficient for domestic wastewater which includes some industrial wastes, other wastes, and partially treated wastewater shall be determined experimentally for the various conditions that might be encountered in the aerated pond cells. Conversion of the reaction rate coefficient at other temperatures shall be made based on experimental data.

The design should consider the effect of any return sludge. Additional storage volume for 20 years of operation should be considered for sludge, and in northern climates, for ice cover.

Oxygen requirements generally will depend on the design average BOD_5 loading, the degree of treatment, and the concentration of suspended solids to be maintained. Aeration equipment shall be capable of maintaining a minimum dissolved oxygen level of 2 mg/L in the cells at all times. Suitable protection from weather shall be provided for electrical controls. Aerated pond cells shall be followed by a polishing cell with a volume of at least 0.3 of the total volume of the aerated cells.

See Paragraph 92.33 for details on aeration equipment.

93.34 Industrial Wastes

Consideration shall be given to the type and effects of industrial wastes on the treatment process. In some cases it may be necessary to pretreat industrial or other discharges to the wastewater treatment pond.

Industrial wastes shall not be discharged to ponds without assessment of the effects such substances may have upon the treatment process and discharge requirements in accordance with state and federal laws.

93.35 Number of Cells Required

At a minimum, a wastewater treatment pond system should consist of three cells designed to facilitate both series and parallel operations. The maximum size of a pond cell should be 40 acres (16 ha). Two-cell systems may be utilized in very small installations where authorized by the regulatory agency.

All pond systems should be designed with piping flexibility to permit isolation of any cell without affecting the transfer and discharge capabilities of the total system. The piping should be arranged such that effluent from any primary cell cannot be discharged directly to the receiving stream. In addition, the ability to discharge the influent waste load to a minimum of two cells and/or all primary cells in the system should be provided.

93.351 Controlled-Discharge Facultative Treatment Pond Systems

For controlled-discharge pond systems, the area specified as the primary cells should be equally divided into two cells. The third or secondary cell volume should, as a minimum, be equal to the volume of each of the primary cells.

In addition, the design should permit for adequate elevation difference between primary and secondary cells to allow for gravity filling of the secondary from the primary. Where this is not feasible, pumping facilities shall be provided.

93.352 Flow-Through Facultative Treatment Pond Systems

At a minimum, primary cells shall provide adequate hydraulic detention time to maximize BOD_5 removal. Secondary cells should then be provided for additional detention time with depths to 8 feet (2.4 m) to facilitate solids reduction. Design should also consider recirculation within the system.

93.353 Aerated Treatment Pond Systems

A minimum of two aerated cells, plus a polishing cell, are required. A tapered mode of aeration is recommended. The first two aerated cells should be of equal size and no one aerated cell should provide more than 50 percent of the total required volume.

93.36 Pond Shape

The shape of all cells should be such that there are no narrow or elongated portions. Round, square or rectangular cells (length not exceeding three times the width) are considered most desirable. No islands, peninsulas, or coves shall be permitted. Dikes should be rounded at corners to minimize accumulations of floating materials. Common-wall dike construction, wherever possible, is strongly encouraged.

93.4 Pond Construction Details

93.41 Embankments and Dikes

93.411 Material

Dikes shall be constructed of relatively impervious soil and compacted to at least 95 percent Standard Proctor Density to form a stable structure. Vegetation and other unsuitable materials shall be removed from the area where the embankment is to be placed.

93.412 Top Width

The minimum dike width shall be 8 feet (2.4 m) to permit access for maintenance vehicles.

93.413 Maximum Slopes

Inner and outer dike slopes shall not be steeper than 1 vertical to 3 horizontal (1:3).

93.414 Minimum Slopes

Inner slopes should not be flatter than 1 vertical to 4 horizontal (1:4). Flatter slopes can be specified for larger installations because of wave action, but such slopes have the disadvantage of added shallow areas that are conducive to emergent vegetation. Outer slopes shall be sufficient to prevent surface runoff from entering the pond.

93.415 Freeboard

Minimum freeboard shall be 3 feet (0.9 m). For small systems, 2 feet (0.6 m) may be acceptable.

93.416 Design Depth

The minimum operating depth should be sufficient to prevent the growth of aquatic plants and damage to the dikes, pond bottom, control structures, aeration equipment, and other appurtenances. In no case shall the minimum pond depth be less than 2 feet (0.6 m).

a. Controlled-Discharge and Flow-Through Facultative Treatment Pond Systems

The maximum water depth shall be 6 feet (1.8 m) in the primary cells. Greater depths in subsequent cells are permissible, but supplemental aeration or mixing may be necessary.

b. Aerated Treatment Pond Systems

The design water depth should be 10 to 15 feet (3 m to 4.6 m). This depth limitation may be altered depending on the aeration equipment, wastewater strength, and climatic conditions.

93.417 Erosion Control

A justification and detailed discussion of the method of erosion control encompassing all relative factors such as pond location and size, seal material, topography, prevailing winds, cost breakdown, application procedures, etc., shall be provided.

a. Seeding

The dikes shall have a covered layer of at least 4 inches (100 mm) of fertile topsoil to promote establishment of an adequate vegetative cover wherever riprap is not utilized. Prior to prefilling (in accordance with Paragraph 93.424), adequate vegetation shall be established on dikes from the outside toe to 2 feet (0.6 m) above the pond bottom on the interior as measured on the slope. Perennial-type, low-growing, spreading grasses that minimize erosion and can be mowed are most satisfactory for seeding on dikes. In general, alfalfa and other long-rooted crops should not be used for seeding since their roots are apt to impair the water-holding efficiency of the dikes.

b. Additional Erosion Protection

Riprap or some other acceptable method of erosion control shall be provided as a minimum around all piping entrances and exits. For aerated cells, the

design should ensure erosion protection on the slopes and bottoms in the areas where turbulence will occur. Additional erosion control may also be necessary on the exterior dike slope to protect the embankment from erosion due to severe flooding of a watercourse.

c. Alternate Erosion Protection

Alternate erosion control on the interior dike slopes may be necessary for ponds that are subject to severe wave action. In these cases, riprap or an acceptable equal shall be placed from at least 1 foot (0.3 m) above the high water mark to 2 feet (0.6 m) below the low water mark (measured on the vertical).

93.42 Pond Bottom

93.421 Soil

The soil used to construct the pond bottom (not including the seal) and dike cores shall be relatively incompressible, tight, and compacted at or up to 4 percent above the optimum water content to at least 95 percent Standard Proctor Density.

93.422 Seal

Ponds shall be sealed such that seepage loss through the seal is as low as practicably possible. Seals consisting of soils, bentonite, or synthetic liners may be considered, provided the permeability, durability, and integrity of the proposed material can be satisfactorily demonstrated for anticipated conditions. Results of a testing program which substantiates the adequacy of the proposed seal shall be incorporated into and/or accompany the engineering report. Standard ASTM International procedures or acceptable similar methods shall be used for all tests.

To achieve an adequate seal in pond systems using soil, bentonite, or other seal materials, the hydraulic conductivity (k) in centimeters per second specified for the seal shall not exceed the value derived from the following expression, where L equals the thickness of the seal in centimeters.

$$k = 2.6 \times 10^{-9} L$$

The "k" obtained by the above expression corresponds to a percolation rate of pond water of less than 500 gallons per day per acre [4.7 $m^3/(ha \cdot d)$] at a water depth of 6 feet

(1.8 m) and a liner thickness of 1 foot (0.3 m), using the Darcy's law equation.

For a seal consisting of a synthetic liner, seepage loss through the liner shall not exceed the quantity equivalent to seepage loss through an adequate soil seal.

93.423 Uniformity

The pond bottom shall be as level as possible at all points. Finished elevations shall not be more than 3 inches (75 mm) from the average elevation of the bottom.

93.424 Prefilling

Prefilling the pond should be considered in order to protect the liner, to prevent weed growth, to reduce odor, and to maintain moisture content of the seal. However, the dikes shall be completely prepared as described in Paragraphs 93.417 (a) and (b) before the introduction of water.

93.43 Influent Lines

93.431 Material

Generally accepted material for underground sewer construction will be given consideration for the influent line to the pond. Unlined corrugated metal pipe should be avoided due to corrosion problems. In material selection, consideration shall be given to the characteristics of the wastewater, exceptionally heavy external loadings, abrasion, soft foundations, buoyancy and similar problems.

93.432 Manhole

A manhole or vented cleanout wye shall be installed prior to entrance of the influent line into the primary cell and shall be located as close to the dike as topography permits. Its invert shall be at least 6 inches (150 mm) above the maximum operating level of the pond and shall provide sufficient hydraulic head without surcharging the manhole.

93.433 Flow Distribution

Flow distribution structures shall be designed to effectively split hydraulic and organic loads equally to primary cells.

93.434 Placement

Influent lines may be located along the bottom of the pond with the top of the pipe just below the average upper elevation of the pond seal or liner. However, the full seal depth shall be maintained below the bottom of the pipe and throughout the transition area from the bottom of the pipe to the pond bottom.

In situations where pipes penetrate the pond seal, provisions to prevent seepage (such as anti-seep collars) shall be made.

93.435 Point of Discharge

All primary cells shall have individual influent lines which terminate approximately at the midpoint of the width and at approximately two-thirds the length away from the outlet structure so as to minimize short-circuiting of the wastewater.

All aerated cells shall have influent lines which distribute the load within the mixing zone of the aeration equipment.

93.436 Influent Discharge Apron

The influent line shall discharge horizontally into a shallow, saucer-shaped depression.

The end of the discharge line shall rest on a suitable concrete apron large enough to prevent the terminal influent velocity at the end of the apron from causing soil erosion. A minimum size apron of 2 feet (0.6 m) square shall be provided.

93.44 Control Structures and Interconnecting Piping

93.441 Structure

Where possible, facilities design shall consider the use of multi-purpose control structures to facilitate normal operational functions such as drawdown and flow distribution, flow and depth measurement, sampling, pumps for recirculation, chemical additions and mixing, and minimization of the number of construction sites within the dikes.

As a minimum, control structures shall be: (a) accessible for maintenance and adjustment of controls; (b) adequately ventilated for safety and to minimize corrosion; (c) locked to discourage vandalism; (d) contain controls to permit water level and flow rate control, and complete shutoff; (e) constructed of non-corrodible

materials (metal-on-metal contact in controls should be of similar alloys to discourage electrochemical reactions); and (f) located to minimize short-circuiting within the cell and avoid freezing and ice damage.

Recommended devices to regulate water level are valves, slide tubes or dual slide gates. Stop logs shall not be used to regulate water levels. Regulators should be designed so that they can be preset to prevent the pond surface elevation from dropping below the desired operational level.

93.442 Piping

All piping shall be of ductile iron or other acceptable material. Pipes should be anchored with adequate erosion control.

In situations where pipes penetrate the pond seal, provisions to prevent seepage (such as anti-seep collars) shall be made.

a. Drawdown Structure Piping

1. Submerged Takeoffs

For ponds designed for shallow or variable depth operations, submerged takeoffs are recommended. Intakes shall be located a minimum of 10 feet (3.0 m) from the toe of the dike and 2 feet (0.6 m) from the top of the seal, and shall employ vertical withdrawal.

2. Multi-Level Takeoffs

For ponds that are designed deep enough to permit stratification of pond content, multiple takeoffs are recommended. There shall be a minimum of 3 withdrawal pipes at different elevations. The bottom pipe shall conform to a submerged takeoff. The other pipes may utilize a horizontal entrance, provided that the design includes provisions to ensure that scum and floating materials shall not be drawn off with the cell effluent. Adequate structural support shall be provided.

3. Near Surface Takeoffs

For use under constant discharge conditions and/or for relatively shallow ponds under warm weather conditions, near surface overflow-type withdrawal is recommended. Pond design should evaluate a floating weir

box or slide tube entrance with baffles for scum control and should permit adequate drawoff approximately 2 feet (0.6 m) below the water surface.

4. Emergency Overflow

To prevent overtopping of dikes, emergency overflow should be provided with capacity to carry the expected peak instantaneous flow.

b. Hydraulic Capacity

The hydraulic capacity for continuous discharge structures and piping shall allow for a minimum of 250 percent of the design maximum day flow of the wastewater treatment system.

The hydraulic capacity for controlled-discharge pond systems shall permit transfer of water at a minimum rate of 6 inches (150 mm) of pond water depth per day at the available head.

93.5 Sludge Removal and Disposal

Sludge removal may be required when upgrading an existing pond system to ensure the best effluent quality. The final disposal site shall be acceptable to the regulatory agency. Transferring sludge from an existing pond into a new primary pond cell for disposal is unacceptable.

Controlled discharge facultative treatment pond systems should provide a sludge storage volume which does not exceed one half of the minimum operating depth of the primary cells.

The pond system following sludge removal shall remain sealed and shall meet applicable seepage loss requirements.

93.6 Miscellaneous

93.61 Fencing

The pond area shall be enclosed with an adequate fence to prevent entry by livestock and discourage trespassing. Fencing should not obstruct maintenance vehicle traffic on top of the dikes. A vehicle access gate of sufficient width to accommodate mowing equipment shall be provided. All access gates shall be provided with locks.

93.62 Access

An all-weather access road shall be provided to the pond site to allow year-round maintenance of the facility.

93.63 Warning Signs

Appropriate permanent signs shall be provided along the fence around the pond to designate the nature of the facility and advise against trespassing. At least one sign shall be provided on each side of the site and one sign shall be provided for every 500 feet (150 m) of its perimeter.

93.64 Flow Measurement

Flow measurement requirements are presented in Paragraph 56.6. Effective weather protection shall be provided for the recording equipment.

93.65 Groundwater Monitoring

An approved system of wells or lysimeters may be required around the perimeter of the pond site to facilitate groundwater monitoring. The need for such monitoring will be determined on a case-by-case basis.

93.66 Pond Level Gauges

Pond level gauges shall be provided.

93.67 Service Building

A service building for laboratory and maintenance equipment shall be provided, if required. Refer to Section 58.

94. OTHER BIOLOGICAL SYSTEMS

94.1 General

Biological treatment processes not included in these standards may be considered in accordance with Paragraph 53.2.

CHAPTER 100
DISINFECTION

101. GENERAL

Disinfection of the effluent shall be provided as necessary to meet applicable standards. The design shall consider meeting both the bacterial standards and the disinfectant residual limit in the effluent. The disinfection process should be selected after due consideration of waste characteristics, type of treatment process provided prior to disinfection, waste flow rates, pH of waste, disinfectant demand rates, current technology application, cost of equipment and chemicals, power cost, and maintenance requirements.

Chlorine is the most commonly used chemical for wastewater disinfection. The forms most often used are liquid chlorine and calcium or sodium hypochlorite. Other disinfectants, including chlorine dioxide, ozone, bromine, or ultraviolet disinfection, may be accepted by the reviewing authority in individual cases. If halogens are utilized, it may be necessary to dehalogenate if the residual level in the effluent exceeds effluent limitations or would impair the natural aquatic habitat of the receiving stream.

Where a disinfection process other than chlorine is proposed, supporting data from pilot plant installations or similar full scale installations may be required as a basis for the design of the system. Refer to Paragraph 53.2.

102. CHLORINE DISINFECTION

102.1 Type

Chlorine is available for disinfection in gas, liquid (hypochlorite solution), and solid (hypochlorite tablet) forms. The type of chlorine should be carefully evaluated during the facility planning process. The use of chlorine gas or liquid will be most dependent on the size of the facility and the chlorine dose required. Large quantities of chlorine, such as are contained in ton cylinders and tank cars, can present a considerable hazard to plant personnel and to the surrounding area should such containers develop leaks. Both monetary cost and the potential public exposure to chlorine should be considered when making the final determination.

102.2 Dosage

For disinfection, the capacity shall be adequate to produce an effluent that will meet the applicable bacterial limits specified by the regulatory agency for that installation. Required disinfection capacity will vary, depending on the uses and points of application of the disinfection chemical. The chlorination system shall be designed on a rational basis and calculations justifying the equipment sizing and number of units shall be submitted for the whole operating range of flow rates for the type of control to be used. System design considerations shall include the controlling wastewater flow meter (sensitivity and location), telemetering equipment and chlorination controls. For normal domestic wastewater, the following may be used as a guide in sizing chlorination facilities.

Type of Treatment	Dosage
Trickling filter plant effluent	10 mg/L
Activated sludge plant effluent	8 mg/L
Tertiary filtration effluent	6 mg/L
Nitrified effluent	6 mg/L

102.3 Containers

102.31 Cylinders

One hundred fifty pound (68 kg) cylinders are typically used where chlorine gas consumption is less than 150 pounds per day (68 kg/d). Cylinders should be stored in an upright position with adequate support brackets and chains at 2/3 of cylinder height for each cylinder.

102.32 Ton Containers

The use of one-ton (907 kg) containers should be considered where the average daily chlorine consumption is over 150 pounds (68 kg).

102.33 Tank Cars

At large installations, the use of tank cars, generally accompanied by evaporators, may be considered. Area wide public safety shall be evaluated. No interruption of chlorination shall be permitted during tank car switching.

The tank car being used for the chlorine supply shall be located on a dead end, level track that is a private siding. The tank car shall be protected from accidental bumping by other railway cars by a locked derail device, a closed locked switch or both. The area shall be clearly posted "DANGER-CHLORINE". The tank car shall be secured by adequate fencing that includes gates provided with locks for personnel and rail access.

The tank car site shall be provided with a suitable operating platform at the unloading point for easy access to the protective housing or the tank car for the connection of flexible feedlines and valve operation. Adequate area lighting shall be provided for night time operation and maintenance.

102.34 Liquid Hypochlorite Solutions

Storage containers for hypochlorite solutions shall be of sturdy, non-metallic lined construction and shall be provided with secure tank tops and pressure relief and overflow piping. The overflow piping should be provided with a water seal or other device to

prevent tanks from venting to the indoors. Storage tanks should be either located or vented outside. Provision shall be made for adequate protection from light and extreme temperatures. Tanks shall be located where leakage will not cause corrosion or damage to other equipment. A means of secondary containment shall be provided to contain spills and facilitate cleanup. Due to deterioration of hypochlorite solutions over time, it is recommended that containers not be sized to hold more than one month's needs. At larger facilities and locations where delivery is not a problem, it may be desirable to limit on-site storage to one week. Refer to Section 57.

102.35 Dry Hypochlorite Compounds

Dry hypochlorite compounds should be kept in tightly closed containers and stored in a cool, dry location. Some means of dust control should be considered, depending on the size of the facility and the quantity of compound used. Refer to Section 57.

102.4 Equipment

102.41 Scales

Scales for weighing cylinders and containers shall be provided at all plants using chlorine gas. At large plants, scales of the indicating and recording type are recommended. At a minimum, a platform scale shall be provided. Scales shall be of corrosion-resistant material.

102.42 Evaporators

Where manifolding of several cylinders or ton containers will be required to evaporate sufficient chlorine, consideration should be given to the installation of evaporators to produce the quantity of gas required.

102.43 Mixing

The disinfectant shall be positively mixed as rapidly as possible, with a complete mix being effected in 3 seconds. This may be accomplished by either the use of turbulent flow regime or a mechanical flash mixer.

102.44 Contact Period and Tank

For a chlorination system, a minimum contact period of 15 minutes at design peak hourly flow or maximum rate of pumpage shall be provided after thorough mixing. When evaluating existing chlorine contact tanks, field tracer studies should be performed to assure adequate contact time.

The chlorine contact tank shall be constructed so as to reduce short-circuiting of flow to a practical minimum. Tanks not provided with continuous mixing shall be provided with "over-

and-under" or "end-around" baffling to minimize short-circuiting.

The tank should be designed to facilitate maintenance and cleaning without reducing effectiveness of disinfection. Duplicate tanks, mechanical scrapers, or portable deck-level vacuum cleaning equipment shall be provided. Consideration should be given to providing skimming devices on all contact tanks. Covered tanks are discouraged.

102.45 Piping and Connections

Piping systems should be as simple as possible, specifically selected and manufactured to be suitable for chlorine service, with a minimum number of joints. Piping should be well supported and protected against temperature extremes.

Due to the corrosiveness of wet chlorine, all lines designated to handle dry chlorine shall be protected from the entrance of water or air containing water. Even minute traces of water added to chlorine results in a corrosive attack. Low pressure lines made of hard rubber, saran-lined, rubber-lined, polyethylene, polyvinylchloride (PVC), or other approved materials are satisfactory for wet chlorine or aqueous solutions of chlorine.

The chlorine system piping shall be color coded and labeled to distinguish it from other plant piping. Refer to Paragraph 54.5. Where sulfur dioxide is used, the piping and fittings for chlorine and sulfur dioxide systems shall be designed so that interconnection between the two systems cannot occur.

102.46 Standby Equipment and Spare Parts

Standby equipment of sufficient capacity should be available to replace the largest unit during shutdowns. Spare parts shall be available for all disinfection equipment to replace parts which are subject to wear and breakage.

102.47 Chlorinator Water Supply

An ample supply of water shall be available for operating the chlorinator. Where a booster pump is required, duplicate equipment should be provided, and, when necessary, standby power as well. Protection of a potable water supply shall conform to the requirements of Paragraph 56.2. Adequately filtered plant effluent should be considered for use in the chlorinator.

102.48 Leak Detection and Controls

A bottle of 56 percent ammonium hydroxide solution shall be available for detecting chlorine leaks. Where one-ton (907 kg) containers or tank cars are used, a leak repair kit approved by the Chlorine Institute shall be provided. Consideration should be

given to the provision of caustic soda solution reaction tanks for absorbing the contents of leaking one-ton (907 kg) containers where such containers are in use. Consideration should be given to the installation of automatic gas detection and related alarm equipment.

102.5 Housing

102.51 Feed and Storage Rooms

If gas chlorination equipment or chlorine cylinders are to be in a building used for other purposes, a gas-tight room shall separate this equipment from any other portion of the building. Floor drains from the chlorine room should not be connected to floor drains from other rooms. Doors to this room shall open only to the outside of the building, and shall be equipped with panic hardware. Rooms shall be at ground level and should permit easy access to all equipment.

Storage areas for one-ton (907 kg) cylinders should be separated from the feed area. In addition, the storage area shall have designated areas for "full" and "empty" cylinders. Chlorination equipment should be situated as close to the application point as reasonably possible. For additional safety considerations, refer to Section 57.

102.52 Inspection Window

A clear glass, gas-tight, window shall be installed in an exterior door or interior wall of the chlorinator room to permit the units to be viewed without entering the room.

102.53 Heat

Rooms containing disinfection equipment shall be provided with a means of heating so that a temperature of at least 60°F (16 °C) can be maintained. The room should be protected from excess heat. Cylinders shall be kept at essentially room temperature. If liquid hypochlorite solution is used, the containers may be located in an unheated area.

102.54 Ventilation

With chlorination systems, forced, mechanical ventilation shall be installed which will provide one complete fresh air change per minute when the room is occupied. The entrance to the air exhaust duct from the room shall be near the floor. The point of discharge shall be so located as not to contaminate the air inlet to any buildings or present a hazard at the access to the chlorinator room or other inhabited areas. Air inlets shall be so located as to provide cross ventilation with air and at such temperature that will not adversely affect the chlorination equipment. The outside air inlet shall be at least three feet above grade. The vent hose from the chlorinator shall discharge to the outside atmosphere

above grade. Where public exposure may be extensive, scrubbers may be required on ventilation discharge.

102.55 Electrical Controls and Ambient Gas Detectors

Switches for fans and lights shall be outside of the room at the entrance. A labeled signal light indicating fan operation should be provided at each entrance, if the fan can be controlled from more than one point. An ambient chlorine gas detector should be provided in the chlorine storage room. The gas detector should be interlocked with the fan and audible or visual alarms.

102.56 Protective and Respiratory Gear

Respiratory air-pac protection equipment that meets the requirements of the National Institute for Occupational Safety and Health (NIOSH) shall be available where chlorine gas is handled, and shall be stored at a convenient location, but not inside any room where chlorine is used or stored. Instructions for using the equipment shall be posted. The units shall use compressed air, have at least 30-minute capacity and be compatible with the units used by the fire department responsible for the plant.

102.6 Sampling and Control

102.61 Sampling

Facilities shall be included for sampling disinfected effluent after the contact chamber as monitoring requirements warrant. In large installations, or where stream conditions warrant, provisions should be made for continuous monitoring of effluent chlorine residual.

102.62 Testing and Control

Equipment shall be provided for measuring chlorine residual using accepted test procedures. The installation of demonstrated effective facilities for automatic chlorine residual analysis, recording, and proportioning systems should be considered at all large installations.

Equipment shall also be provided for measuring bacterial organisms using accepted test procedures as required by the regulatory agency.

103. DECHLORINATION

103.1 Types

Dechlorination of wastewater effluent may be necessary to reduce the toxicity due to chlorine residuals. The most common dechlorination chemicals are sulfur compounds, particularly sulfur dioxide gas or

aqueous solutions of sulfite or bisulfite. Tablet dechlorination systems are also available for small facilities.

The type of dechlorination system should be carefully selected considering criteria including: type of chemical storage required, amount of chemical needed, ease of operation, compatibility with existing equipment, and safety.

103.2 Dosage

The dosage of dechlorination chemical should depend on the residual chlorine in the effluent, the final residual chlorine limit, and the particular form of the dechlorinating chemical used. The most common dechlorinating agent is sulfite. The following forms of the compound are commonly used and yield sulfite (SO_2) when dissolved in water.

Dechlorination Chemical	Theoretical mg/L Required to Neutralize 1 mg/L Cl_2
Sodium thiosulfate (solution)	0.56
Sodium sulfite (tablet)	1.78
Sulfur dioxide (gas)	0.9
Sodium meta bisulfite (solution)	1.34
Sodium bisulfite (solution)	1.46

Theoretical values may be used for initial approximations, to size feed equipment with the consideration that under good mixing conditions 10% excess dechlorinating chemical is required above theoretical values. Excess sulfur dioxide may consume oxygen at a maximum of 1.0 mg dissolved oxygen for every 4 mg SO_2.

The liquid solutions come in various strengths. These solutions may need to be further diluted to provide the proper dose of sulfite.

103.3 Containers

Depending on the chemical selected for dechlorination, the storage containers will vary from gas cylinders, liquid in 50 gallon (190 L) drums or dry compounds. Dilution tanks and mixing tanks are required when using dry compounds and may be required when using liquid compounds to deliver the proper dosage. Solution containers should be covered to prevent evaporation and spills.

103.4 Feed Equipment, Mixing, and Contact Requirements

103.41 Equipment

In general, the same type of feeding equipment used for chlorine gas may be used with minor modifications for sulfur dioxide gas. However, the manufacturer should be contacted for specific

equipment recommendations. No equipment should be alternately used for the two gases. The common type of dechlorination feed equipment utilizing sulfur compounds include a vacuum solution feed of sulfur dioxide gas and a positive displacement pump for aqueous solutions of sulfite or bisulfite.

The selection of the type of feed equipment utilizing sulfur compounds shall include consideration of the operator safety and overall public safety relative to the wastewater treatment plant's proximity to populated areas and the security of gas cylinder storage. The selection and design of sulfur dioxide feeding equipment shall take into account that the gas reliquifies quite easily. Special precautions shall be taken when using ton containers to prevent reliquefaction.

Where necessary to meet the operating ranges, multiple units shall be provided for adequate peak capacity and to provide a sufficiently low feed rate on turn down to avoid depletion of the dissolved oxygen concentrations in the receiving waters.

103.42 Mixing Requirements

The dechlorination reaction with free or combined chlorine will generally occur within 15 to 20 seconds. The dechlorination chemical should be introduced at a point in the process where the hydraulic turbulence is adequate to assure thorough and complete mixing. If no such point exists, mechanical mixing shall be provided. The high solubility of SO_2 prevents it from escaping during turbulence.

103.43 Contact Time

A minimum of 30 seconds for mixing and contact time shall be provided at the design peak hourly flow or maximum rate of pumpage. A suitable sampling point shall be provided downstream of the contact zone. Consideration shall be given to a means of reaeration to assure maintenance of an acceptable dissolved oxygen concentration in the stream following sulfonation.

103.44 Standby Equipment and Spare Parts

The same requirements apply as for chlorination systems. See Paragraph 102.46.

103.45 Sulfonator Water Supply

The same requirements apply as for chlorination systems. See Paragraph 102.47.

103.5 Housing Requirements

103.51 Feed and Storage Rooms

The requirements for housing SO_2 gas equipment shall follow the same guidelines as used for chlorine gas. Refer to Paragraph 102.5 for specific details.

When using solutions of the dechlorinating compounds, the solutions may be stored in a room that meets the safety and handling requirements set forth in Section 57. The mixing, storage, and solution delivery areas shall be designed to contain or route solution spillage or leakage away from traffic areas to an appropriate containment unit.

103.52 Protective and Respiratory Gear

The respiratory air-pac protection equipment is the same as for chlorine. See Paragraph 102.56. Leak repair kits of the type used for chlorine gas that are equipped with gasket material suitable for service with sulfur dioxide gas may be used (refer to The Compressed Gas Association Publication CGA G-3-1995, "Sulfur Dioxide"). For additional safety considerations, see Section 57.

103.6 Sampling and Control

103.61 Sampling

Facilities shall be included for sampling the dechlorinated effluent for residual chlorine. Provisions shall be made to monitor for dissolved oxygen concentration after sulfonation when required by the regulatory agency.

103.62 Testing and Control

Provision shall be made for manual or automatic control of sulfonator feed rates based on chlorine residual measurement or flow.

104. ULTRAVIOLET DISINFECTION

104.1 General

Ultraviolet (UV) disinfection process design, operating data, and experience are developed, but design standards are not well established. Expected performance of the UV disinfection units for the full operating range of flow rates shall be based upon experience at similar full scale installations or thoroughly documented prototype testing with the particular wastewater. Critical parameters for UV disinfection units are dependent upon manufacturers' design, lamp selection, tube materials, ballasts, configuration, control systems, and associated appurtenances. Proposals on this disinfection process will be reviewed on a case-by-case

basis at the discretion of the reviewing authority under the provisions of Paragraph 53.2.

104.2 Lamp Type

UV disinfection lamps should be low pressure-low intensity, low pressure-high intensity or medium pressure-high intensity.

104.3 Channel Design and Hydraulics

Open channel designs with modular UV disinfection units that can be removed from the flow are required. At least two banks in series shall be provided in each channel for disinfection reliability and to ensure uninterrupted service during tube cleaning or other required maintenance. The hydraulic properties of the system shall be designed to simulate plug flow conditions without short circuiting under the full operating flow range. In addition, water level control shall be provided to achieve the necessary exposure. Also refer to Paragraphs 54.2 and 54.3. Closed chamber units will be reviewed on a case by case basis in accordance with Paragraph 53.2.

104.4 Transmittance

This process should be limited to a high quality effluent having at least 65% UV radiation transmittance at 254 nanometers wave length, and BOD_5 and suspended solids concentrations no greater than 30 mg/L at any time.

104.5 Dosage

The UV dosage shall be based on the design peak hourly flow. As a general guide in system sizing for an activated sludge effluent with the characteristics described in Paragraph 104.4, a UV dosage not less than 30 $(mW \cdot s)/cm^2$ may be used after adjustments for maximum tube fouling, lamp output reduction after 8,760 hours of operation, and other energy absorption losses.

104.6 Operations, Safety and Alarm System

Operator safety (electrical hazards and exposure to UV radiation) and tube cleaning frequency shall be considered. An alarm system shall be provided to separately indicate lamp failure, low UV intensity and any other cause of UV disinfection unit failure.

104.7 Electrical Controls

A programmable logic controller (PLC) shall be provided. Multiple PLCs should be provided as necessary to ensure rapid recovery and minimize the deterioration of effluent quality from the failure of a single controller. An uninterruptable power supply with electrical surge protection shall be provided for each PLC to retain program memory (i.e. process control program, last known set-points and measured process/equipment status etc.) through a power loss. A hard-wired backup for manual override shall be provided in addition to automatic process control. Both automatic and

manual controls shall allow independent operation of each UV disinfection unit.

105. OZONE DISINFECTION

Ozone systems for disinfection should be evaluated on a case-by-case basis. Design standards, operating data, and experience for this process are not well established. Therefore, design of these systems should be based upon experience at similar full scale installations or thoroughly documented prototype testing with the particular wastewater.

CHAPTER 110
SUPPLEMENTAL TREATMENT PROCESSES

111. PHOSPHORUS REMOVAL BY CHEMICAL TREATMENT

111.1 General

111.11 Method

Addition of aluminum salts, iron salts, or lime may be used for the chemical removal of soluble phosphorus. The phosphorus reacts with the aluminum, iron, or calcium ions to form insoluble compounds. These insoluble compounds may be flocculated with or without the addition of a coagulant aid (such as a polyelectrolyte) to facilitate separation by sedimentation, or sedimentation followed by filtration.

111.12 Design Basis

111.121 Preliminary Testing

Laboratory, pilot, or full scale studies of various chemicals, feed points, and treatment processes are recommended for existing plant facilities to determine the achievable performance level, cost-effective design criteria, and ranges of required chemical dosages.

The selection of a treatment process and chemical dosage for a new facility should be based on such factors as influent wastewater characteristics, the proposed chemical, effluent requirements, and anticipated treatment efficiency.

111.122 System Flexibility

Systems shall be designed with sufficient flexibility to allow for several operational adjustments in chemical feed locations, chemical feed rates, and for feeding alternate chemical compounds.

111.2 Process Requirements

111.21 Dosage

The design chemical dosage shall include the amount needed to react with the phosphorus in the wastewater, the amount required to drive the chemical reaction to the desired state of completion, including consideration of competing reactions, and the amount required due to inefficiencies in mixing or dispersion. Excessive chemical dosage should be avoided.

111.22 Chemical Selection

The choice of aluminum salts, iron salts, or lime should be based on the wastewater characteristics, chemical availability and handling, sludge processing and disposal methods, and the economics of the total system.

When lime is used, it may be necessary to neutralize the high pH prior to subsequent treatment in secondary biological systems or prior to discharge in those flow schemes where lime treatment is the final step in the treatment process. Problems associated with lime usage, handling, and sludge production and dewatering shall be evaluated.

111.23 Chemical Feed Points

Selection of chemical feed points shall include consideration of the chemicals used in the process, necessary reaction times between precipitant chemical and polyelectrolyte additions, and the wastewater treatment processes and components utilized. Flexibility in feed locations shall be provided to optimize chemical usage and overall treatment efficiency.

111.24 Flash Mixing

Each chemical shall be mixed rapidly and uniformly with the wastewater flow stream. Where separate mixing basins are provided, they should be equipped with mechanical mixing devices. The detention period should be at least 30 seconds.

When a chemical solution is added on a batch basis to the contents of a secondary cell of a controlled-discharge facultative treatment pond system, a means of adequate dispersal and mixing should be provided, such as an outboard (propeller driven) motorboat.

111.25 Flocculation

The particle size of the precipitate formed by chemical treatment may be very small. Consideration should be given in the process design to the addition of synthetic polyelectrolytes to aid settling. The flocculation equipment should be adjustable in order to obtain optimum floc growth, control deposition of solids, and prevent floc destruction.

111.26 Liquid - Solids Separation

The velocity through pipes or conduits from flocculation basins to settling basins should not exceed 1.5 feet per second (0.5 m/s) in order to minimize floc destruction. Entrance works to settling basins should also be designed to minimize floc shear.

Settling basin design shall be in accordance with the criteria outlined in Chapter 70. For design of the sludge handling

system, special consideration should be given to the type and volume of sludge generated in the phosphorus removal process.

111.27 Filtration

Effluent filtration, such as with granular media filters or membrane separation technologies, shall be considered in conjunction with chemical treatment where effluent phosphorus concentrations of less than 1 mg/L must be achieved.

111.3 Feed Systems

111.31 Location

All liquid chemical mixing and feed installations should be installed on corrosion-resistant pedestals and elevated above the highest liquid level anticipated during emergency conditions.

The chemical feed equipment shall be designed to meet the maximum dosage requirements for the design conditions.

Lime feed equipment should be located so as to minimize the length of slurry conduits. All slurry conduits shall be accessible for cleaning.

111.32 Liquid Chemical Feed System

Liquid chemical feed pumps should be of the positive displacement type with variable feed rate. Pumps shall be selected to feed the full range of chemical quantities required for the anticipated phosphorus mass loading conditions with the largest unit out of service. Consideration should be given to systems including pumps and piping that will feed either iron or aluminum compounds to provide flexibility. Refer to Paragraph 111.51.

Screens and valves shall be provided on the chemical feed pump suction lines.

An air break or anti-siphon device shall be provided where the chemical solution stream discharges to the transport water stream to prevent an induction effect resulting in overfeed.

Consideration shall be given to providing pacing equipment to optimize chemical feed rates.

111.33 Dry Chemical Feed System

Each dry chemical feeder shall be equipped with a dissolver which is capable of providing a minimum retention time of 5 minutes at the maximum feed rate.

Polyelectrolyte feed installations should be equipped with two solution vessels and transfer piping for solution make-up and daily operation.

Make-up tanks shall be provided with an eductor funnel or other appropriate arrangement for wetting the polymer during the preparation of the stock feed solution. Adequate mixing should be provided by a large-diameter low-speed mixer.

111.4 Storage Facilities

111.41 Size

Storage facilities shall be sufficient to ensure that an adequate supply of the chemical is available at all times. Exact storage size requirements will depend on size of shipment, length of delivery time, and process requirements. Storage for a minimum supply of 10 days should be provided.

111.42 Location and Containment

The liquid chemical storage tank and tank fill connections shall be located within a containment structure that has a capacity exceeding the total volume of all storage vessels. Valves on discharge lines shall be located adjacent to the storage tank and within the containment structure. Refer to Paragraph 57.2.

Auxiliary facilities within the containment area, including pumps and controls, shall be located above the highest anticipated liquid level. Containment areas shall be sloped to a sump area and shall not contain floor drains.

Bag storage should be located near the solution make-up point to avoid unnecessary transportation and housekeeping problems.

111.43 Accessories

Platforms, stairs, and railings shall be provided as necessary, to afford convenient and safe access to all filling connections, storage tank entries, and measuring devices.

Storage tanks shall be provided with reasonable access to facilitate cleaning.

111.5 Other Requirements

111.51 Materials

All chemical feed equipment and storage facilities shall be constructed of materials resistant to chemical attack by all chemicals normally used for phosphorus removal. Refer to Section 57.

111.52 Temperature, Humidity, and Dust Control

Precautions shall be taken to prevent chemical storage tanks and feed lines from reaching temperatures likely to result in freezing or chemical crystallization at the concentrations employed. A heated enclosure or insulation may be required. Consideration shall be given to temperature, humidity, and dust control in all chemical feed room areas.

111.53 Cleaning

Consideration shall be given to the accessibility of piping. Piping should be installed with plugging wyes, tees or crosses with removable plugs at changes in direction to facilitate cleaning.

111.54 Filling Drains and Draw-Off

Above-bottom drawoff from chemical storage or feed tanks shall be provided to avoid withdrawal of settled solids into the feed system. A bottom drain shall also be installed for periodic removal of accumulated settled solids. Provisions shall be made in the fill lines to prevent back siphonage of chemical tank contents.

111.6 Safety and Hazardous Chemical Handling

The chemical handling facilities shall meet the appropriate safety and hazardous chemical handling facilities requirements of Section 57.

111.7 Sludge Handling

Consideration shall be given to the type and additional capacity of the sludge handling facilities that will be needed when chemicals are added. Refer to Chapter 80.

112. HIGH RATE EFFLUENT FILTRATION

112.1 General

112.11 Applicability

Granular media filters may be used as an advanced treatment device for the removal of residual suspended solids from secondary effluents. Filters may be necessary where effluent concentrations of less than 20 mg/L of suspended solids and/or 1.0 mg/L of phosphorus must be achieved or to obtain adequate turbidity reduction for urban water reuse. A pre-treatment process such as chemical coagulation, flocculation and sedimentation, or other acceptable process should precede the filter units where effluent suspended solids requirements are less than 10 mg/L.

112.12 Design Considerations

Care should be given in designing pipes or conduits ahead of filter units, if applicable, to minimize shearing of floc particles. Consideration should be given in the plant design to provide flow equalization facilities to moderate filter influent quality and quantity.

112.2 Filter Types

Filters may be of the gravity type or pressure type. Pressure filters shall be provided with ready and convenient access to the media for inspection or cleaning. Where abnormal quantities of greases or similar solids that result in filter plugging are expected, filters should be of the gravity type.

112.3 Filtration Rates

112.31 Allowable Rates

Filtration rates shall not exceed 5 gpm/sq ft [3.40 L/(m^2·s)] based on the design peak hourly flow rate applied to the filter units. The expected design maximum suspended solids loading to the filter should also be considered in determining the necessary filter area.

112.32 Number of Units

Total filter area shall be provided in two or more units, and the filtration rate shall be calculated on the total available filter area with one unit out of service.

112.4 Backwash

112.41 Backwash Rate

The backwash rate shall be adequate to fluidize and expand each media layer by a minimum of 20 percent based on the media selected. The backwash system shall be capable of providing variable backwash rates. Minimum and maximum backwash rates shall be based on demonstrated satisfactory field experience under similar conditions. The design shall provide for a minimum backwash period of 10 minutes.

112.42 Backwash Pumps

Pumps for backwashing filter units shall be sized and interconnected to provide the required backwash rate to any filter with the largest pump out of service. Filtered water from the clear well or chlorine tank shall be used as the source of backwash water. Waste filter backwash shall be adequately treated.

112.43 Backwash Surge Control

The rate of return of waste filter backwash water to treatment units shall be controlled so that the rate does not exceed 15 percent of the design average daily flow rate to the treatment unit. The hydraulic and organic load from waste backwash water shall be considered in the overall design of the treatment plant. Surge tanks shall have a minimum capacity of two backwash volumes, although additional capacity should be considered to allow for operational flexibility. Where waste backwash water is returned for treatment by pumping, adequate pumping capacity shall be provided with the largest unit out of service.

112.44 Backwash Water Storage

Total backwash water storage capacity provided in an effluent clearwell or other unit shall equal or exceed the volume required for two complete backwash cycles.

112.5 Filter Media Selection

Selection of proper filter media type and size will depend on the required effluent quality, the type of treatment provided prior to filtration, the filtration rate selected, and filter configuration. In dual- or multi-media filters, media size selection shall consider compatibility among media. Media shall be selected and provided to meet specific conditions and requirements relative to the project under consideration. The selection and sizing of the media shall be based on demonstrated satisfactory field experience under similar conditions. All media shall have a uniformity coefficient of 1.7 or less. The uniformity coefficient, effective size, depth, and type of media shall be set forth in the specifications.

112.6 Filter Appurtenances

The filters shall be equipped with washwater troughs, surface wash or air scouring equipment, means of measurement and positive control of the backwash rate, equipment for measuring filter head loss, positive means of shutting off flow to a filter being backwashed, and filter influent and effluent sampling points. If automatic controls are provided, there shall be a manual override for operating equipment, including each individual valve essential to the filter operation. The underdrain system shall be designed for uniform distribution of backwash water (and air, if provided) without danger of clogging from solids in the backwash water. If air is to be used for filter backwash, separate backwash blower(s) shall be provided. Provision shall be made to allow for periodic chlorination of the filter influent or backwash water to control slime growth. When chemical disinfection is not provided at the plant, manual dosage of chlorine compounds is acceptable.

112.7 Access and Housing

Each filter unit shall be designed and installed so that there is ready and convenient access to all components and the media surface for inspection

and maintenance, without taking other units out of service. Housing for filter units shall be provided. The housing shall be constructed of suitable corrosion-resistant materials. All controls shall be enclosed and the structure housing filters, controls, and equipment shall be provided with adequate heat and ventilation equipment to minimize problems with excess humidity.

112.8 Proprietary Equipment

Where proprietary filtration equipment not conforming to the preceding requirements is proposed, data which supports the capability of the equipment to meet effluent requirements under design conditions shall be provided. Such proprietary equipment will be reviewed on a case-by-case basis at the discretion of the regulatory agency. Refer to Paragraph 53.2.

APPENDIX
HANDLING AND TREATMENT OF SEPTAGE AT A WASTEWATER TREATMENT PLANT

General

One method of septage disposal is the discharge to a municipal wastewater treatment plant. All plants require special design considerations prior to the acceptance of septage.

Definition

Septage is a general term for the contents removed from septic tanks, portable vault toilets, privy vaults, holding tanks, very small wastewater treatment plants, or semi-public facilities (i.e., schools, motels, mobile home parks, campgrounds, small commercial endeavors) receiving wastewater from domestic sources.

Non-domestic (industrial) wastes are not included in the definition and are not covered by this appendix.

Contents from grease traps should not be hauled to most municipal wastewater treatment plants for disposal.

Characteristics

Compared to raw domestic wastewater from a conventional municipal sewer collection system, septage usually is quite high in organics, grease, hair, stringy material, scum, grit, solids, and other extraneous debris. Substantial quantities of phosphorus, ammonia nitrogen, bacterial growth inhibitors, and cleaning materials may be present in septage, depending on the source. Tables No. 1 and No. 2 (Tables 3-4 and 3-8 from the U.S. EPA Handbook entitled "Septage Treatment and Disposal" 1984, EPA-625/6-84-009 reprinted herein) give a comparison of some of the common parameters for septage and municipal wastewater.

Data for local septage to be received should be collected for design of septage receiving and treatment systems. The characteristics of septage should be expected to vary widely from load to load depending on the source.

Treatment

Septage is normally considered treatable at a plant. However, unless proper engineering planning and design is provided, septage may represent a shock loading or have other adverse impacts on plant processes and effluent quality which will be influenced by many factors, including the following:

a. Capacity (mgd) (m^3/d) of the plant relative to the amount and rate of septage directed to the plant;

b. Unused plant capacity available (above current sewer collection system loadings) to treat septage loadings;

c. Sensitivity of the treatment plant process to daily fluctuations in loadings brought about by the addition of septage;

d. Slug septage loadings of BOD, ammonia nitrogen, or phosphorus which may cause process upset, odor nuisance, aeration tank/aerated digester foaming, or pass through to the effluent;

e. The point of introduction of the septage into the plant process. Feasible alternative points of feed to the treatment units shall be evaluated including feed to the sludge processing units provided the unit function will not be adversely affected;

f. The ability to control feed rates of septage to the plant for off peak loading periods; and,

g. The volume and concentrations of bacterial growth inhibitors in septage from some portable vault toilets and recreational dump station holding tanks.

The permitted plant effluent limits shall be considered when evaluating these factors.

Considerations

An adequate engineering evaluation shall be made of the existing plant and the anticipated septage loading prior to receiving septage at the plant. The regulatory agency shall be contacted to obtain the appropriate approvals prior to the acceptance of septage. For proposed plant expansion and upgrading, the Engineering Report or Facility Plan (refer to Chapter 10) shall include anticipated septage loading when addressing treatment plant sizing and process selection. The following items should be included, as appropriate, in the engineering evaluation and facility planning:

a. The uninterrupted and satisfactory treatment (within the plant regulatory limits) of waste loads from the sewer system shall not be adversely affected by the addition of septage to the plant;

b. In general, the smaller the plant design capacity relative to the septage loading, the more subject the plant will be to upset and potential violation of permitted discharge effluent limits;

c. Allocation of organic plant capacity originally planned for future growth;

d. For plants to be expanded and upgraded, the sensitivity of the treatment process to receiving septage and the impact on discharge parameter limits should be jointly considered;

e. An evaluation of available plant operating personnel and the staffing requirements necessary when septage is to be received. Plant staff should be present when septage is received and unloaded. Added laboratory work associated with receiving septage for treatment should be included in the staffing and laboratory facilities evaluation;

f. The space for constructing septage receiving facilities that are to be off-line from the raw wastewater from the sewer system. Other plant activity and traffic flow should be considered when locating the septage receiving facility and the septage hauler unloading area; and,

g. The impact of the septage handling and treatment on the plant sludge handling and processing units and ultimate sludge disposal procedures.

Receiving Facility

The design of the septage receiving station at the plant should provide for the following elements:

a. A hard surface haul truck unloading ramp sloped to a drain to allow ready cleaning of any spillage and washing of the haul tank, connector hoses, and fittings. The ramp drainage shall be tributary to treatment facilities and shall exclude excessive stormwater;

b. A flexible hose fitted with easy connect coupling to provide for direct connection from the haul truck outlet to minimize spillage and help control odors;

c. Washdown water with ample pressure, hose, and spray nozzle for convenient cleaning of the septage receiving station and haul trucks. The use of chlorinated effluent may be considered for this purpose. If a potable water source is used, it shall be protected in accordance with Paragraph 56.2;

d. An adequate off-line septage receiving tank designed to provide complete draining and cleaning by means of a sloped bottom equipped with a drain sump should be provided. The design should give consideration to adequate mixing for testing, uniformity of septage strength, chemical addition (if necessary), for treatability and odor control. The capability to collect a representative sample of any truck load of waste accepted for discharge at the plant shall be provided. The operator shall have authority to prevent and/or stop any disposal that is likely to cause an effluent violation;

e. Screening, grit, and grease removal of the septage as appropriate to protect the treatment units;

f. Pumps for handling the septage should be nonclogging and capable of passing 3-inch (75 mm) diameter solids;

g. Valving and piping for operational flexibility to allow the control of the flow rate and point of septage discharge to the plant;

h. Safety features to protect the operational personnel. Refer to Section 57; and

i. Laboratory and staffing capability to determine the septage strength and/or toxicity to the treatment processes and provisions for operation reports to include the plant load attributed to septage.

TABLE NO. 1*

PHYSICAL AND CHEMICAL CHARACTERISTICS OF SEPTAGE, AS FOUND IN THE LITERATURE, WITH SUGGESTED DESIGN VALUES[a,b]

	United States (5) (9-19)				Europe/Canada (4) (20)					
Parameter	Average	Minimum	Maximum	Variance	Average	Minimum	Maximum	Variance	EPA Mean	Suggested Design Value

This Implementation Plan (IP) has been prepared to address the bacteria problem in the Jones Falls that has the potential to negatively affect human health and the recreational use of the streams in the watershed. The amount of bacteria that needs to be reduced has been determined by a Total Maximum Daily Load (TMDL) developed by Maryland Department of the Environment and, after a public comment period, submitted to US Environmental Protection Agency (EPA) – Region 3 for review and approval. EPA approved the TMDL in 2008. Final TMDL documents can be found at MDE's website under Current Status of TMDL Development in Maryland. See the document is entitled Total Maximum Daily Loads of Fecal Bactria for the Non-Tidal Jones Falls Basin in Baltimore City and Baltimore County, Maryland.

1.1 What is a TMDL

A TMDL has two different meanings. It is the document that is produced by MDE when any Maryland waterbody is listed on the state's 303(d) list of impaired and threatened waters. MDE must then submit the TMDL to EPA for approval. Any time a TMDL document is developed, extensive scientific study is done on the pollutant of concern in the listed waterbody. This study is done with the goal of finding the maximum load of the pollutant that the waterbody can receive and still meet Maryland's water quality standards. It is often thought of as a "pollution diet" for the watershed. All of the studying and monitoring that is done in preparing the TMDL document boils down to a single maximum load number that will be the target for pollution reduction in the waterbody. This number is also called a TMDL. In other words, the goal of the TMDL document is to justify the TMDL number, which can be found within the TMDL document.

The TMDL number is expressed as a sum of all the different sources of the pollutant plus a Margin of Safety (MOS). The MOS values help to account for any lack of knowledge or understanding concerning the relationship between loads and water quality and also for any rounding errors in the TMDL calculation (calculation format shown below). Expressing the TMDL in terms of this simple equation makes it easier to see where pollution reduction efforts need to be focused. In other words, which sources can be reduced to reach the final TMDL number, by how much they need to be reduced, and which pollution sources are not practical for reduction. The sources that make up the final TMDL number are categorized as either Load Allocation (LA) or Waste Load Allocation (WLA). LAs are all nonpoint source loads, meaning that they do not come from a single source or pipe. LAs include agricultural runoff, forest runoff, and upstream loads. WLAs are all point source loads, meaning that they do come from a single traceable source. WLAs are further categorized as process water or stormwater. Process water WLA comes from sources that have permits allowing them to release a specific amount of a pollutant into the water. They include individual industrial facilities, individual municipal facilities, and mineral mining facilities. Stormwater WLA is any stormwater that is regulated by a municipal separate storm sewer systems permit (MS4), water from industrial facilities permitted to release stormwater, and all runoff from construction sites. All Baltimore County urban stormwater is regulated under Baltimore County's MS4 permit. That means that stomwater WLA includes all of the water that runs to any storm drain within the watershed area. The MOS is the final part of the equation. The MOS can be implicit, meaning that the final TMDL was calculated in such a way that it accounted for any errors without needing to tack an

explicit MOS to the end of the sum of load sources equation. When an explicit MOS is necessary, it is assumed that a 5% reduction of the final TMDL number will be sufficient.

TMDL Sum of Load Sources Equation:

$$\text{TMDL} = \text{LA} + \text{WLA}_{\text{Stormwater}} + \text{WLA}_{\text{Process Water}} + \text{MOS}$$

1.1.1 How is the Final TMDL Determined

The process of determining the TMDL number can be very complex. Pollution data are regularly collected throughout Maryland by many different federal, state, and local government agencies as well as universities and watershed organizations. The agency or organization may send individuals out to the stream to collect and measure information about the watershed as part of a study or regular monitoring program. Data are also collected from the many different monitoring stations that are located throughout Maryland's watersheds. Some of these monitoring stations have been collecting water data for tens of years. The U.S. Geological Survey and the Maryland Department of Natural Resources monitoring stations are often used as the data source for Maryland TMDLs. To find out who is keeping an eye on your watershed see MDE's Water Quality Monitoring Web Page.

Complex scientific models are often used to help find a practical number for the total reduction. Models often use existing monitoring data and observations about the watershed area in a calculation that determines the TMDL number. The type of model used and the complexity of the model varies by pollutant, waterbody type, and complexity of flow conditions. The specific model used for this TMDL is explained in Section 3.

In all cases, scientists first find a baseline load for the pollutant. The baseline load is how much of the pollutant is in the waterbody at the time of the study, before restoration actions specifically developed to reach the TMDL number are implemented. The calculated target number, that is the TMDL, is the final goal. It could be thought of as the finish line in the TMDL process. That is not to say that other restoration efforts will not continue once that target is reached, but that the waterbody will be able to meet state water quality standards and can be removed from the list of impaired and threatened waters for that particular pollutant .

When calculating the TMDL number, a percent reduction and load reduction are usually calculated as well. The load reduction is the difference between the baseline load and the TMDL target. Think of it as the amount that needs to be removed from the system in order to reach the target. The percent reduction is the percentage of the baseline load that needs to be removed in order to reach the TMDL target.

1.2 Geographic Area

Pollution reduction goals are determined by watershed. A watershed is all the land area where all of the water that runs off that land and all the water running under that land drain into the same place. Everything within a watershed is linked by a common water destination. Watersheds exist at many levels: some very large, and some quite small. Identifying your watershed is similar to identifying your current location on a map. You could say you are in the United States, or that you are in Maryland, or that you are in your kitchen at your specific street address. Similarly, you could say that you are in the Mid-Atlantic Region Watershed, which drains to the Atlantic Ocean, Long Island Sound and Riviere Richelieu, a tributary of the St.

PIA 23-172 Hazen - 00782

Lawrence River. You could also say that you are in the Upper Chesapeake Bay Watershed, which includes the area of drainage to the Chesapeake Bay that is north of the Maryland-Virginia line. Both would describe a watershed that you are located in. However, watersheds can become much more specific.

A system was established by the U.S. Geologic Survey for dividing the U.S. into successively smaller hydrologic units. Each hydrologic unit is identified by a Hydrologic Unit Code (HUC), which range from two to twelve digits. The smaller the scale of the watershed, the more digits it has in its code. For example, the Mid-Atlantic Region is a 2-digit watershed and the Upper Chesapeake Bay is a 4-digit watershed. The 6-digit unit, also known as the "basins" unit, is to serve as the common scale for watershed assessments at the national level, but the condition of these basins can be determined based on an aggregation of assessments of even smaller watershed units. Maryland has chosen to go the route of assessing smaller watershed units. As a result, TMDLs are determined at the 8-digit watershed scale. For a further explanation of HUCs or to see maps of watersheds at different HUC levels, go to: USGS Hydrologic Unit Maps. If you would like to know which Maryland 8-digit watershed you are located in, go to MDE's Find My Watershed Map.

It is important to note that 8-digit watersheds can overlap multiple counties and may, therefore, have several regulating authorities.

1.2.1 Jones Falls Geographic Area

The Jones Falls is an 8-digit (02-13-09-04) watershed that covers a total land area of 34,122 acres. The watershed originates in Baltimore County and flows through Baltimore City to the tidal waters of the Northwest Branch (Inner Harbor) of Baltimore Harbor. The Baltimore County portion of the watershed comprises 25,399 acres or 76% of the land area of the watershed (Figure 1.1).

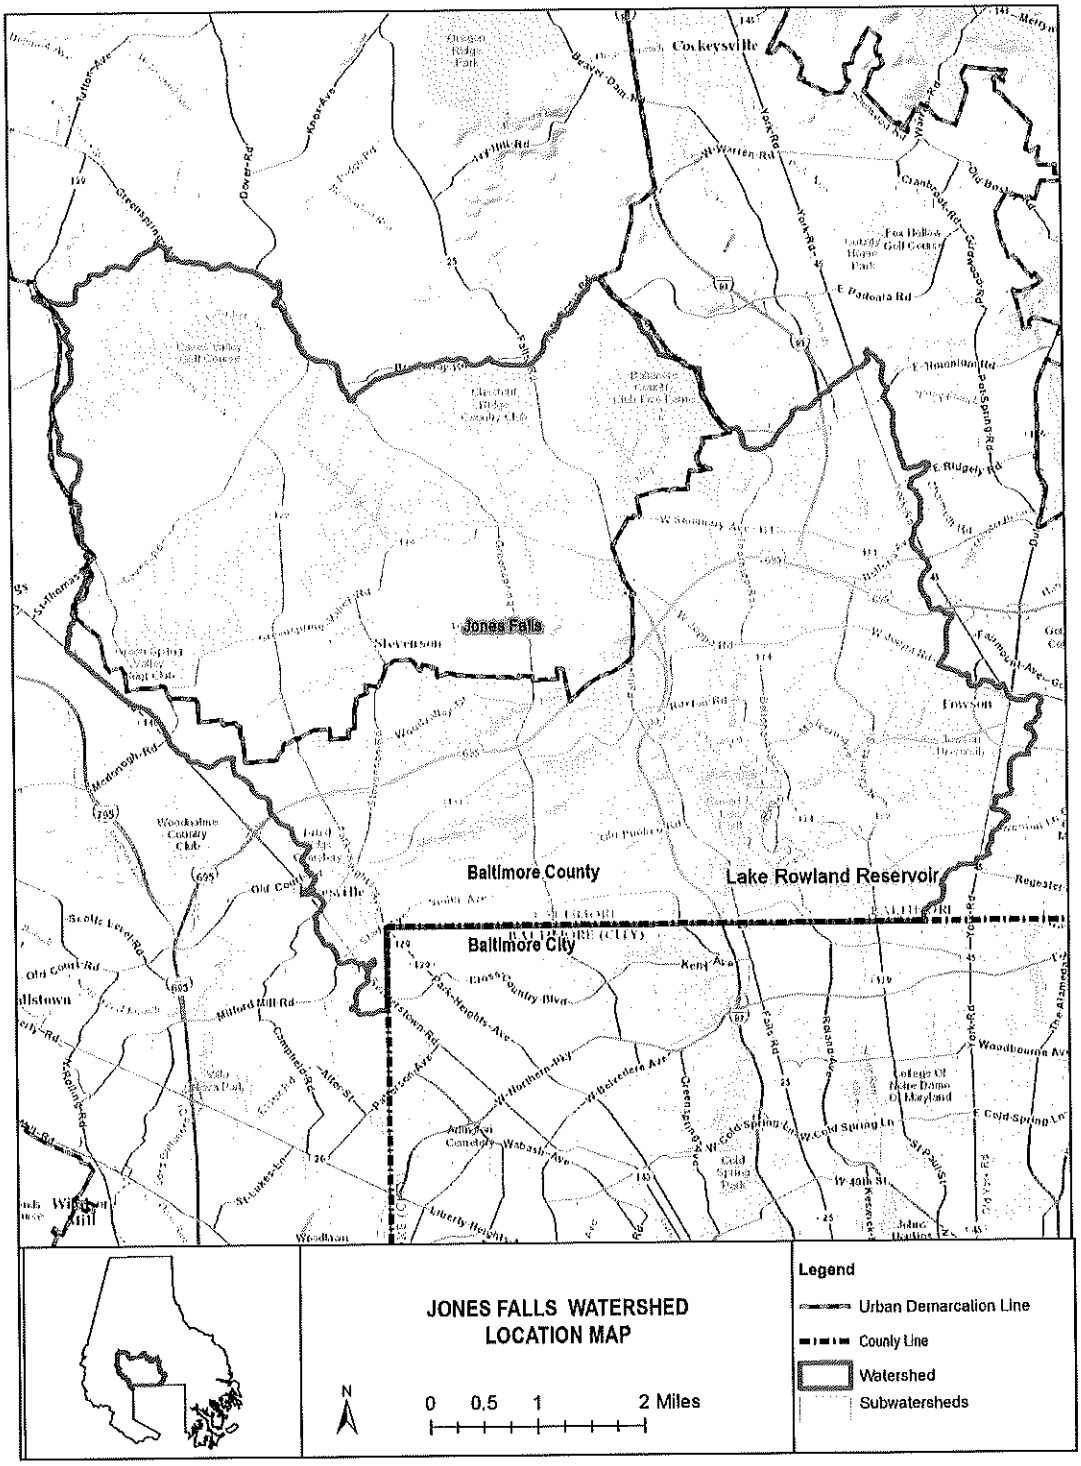

Figure 1.1: Jones Falls Watershed, Baltimore County Portion

1.3 Goal of the TMDL Implementation Actions

TMDL Implementation Plan Objective:

Through a cooperative effort of Baltimore County Department of Environmental Protection and Sustainability, other county agencies, local watershed associations, and the general public, to provide a comprehensive plan of action for achieving TMDL targets and ultimately restoring the health of Baltimore County waters to acceptable water quality standards.

Water quality standard for bacteria in the Jones Falls: geometric mean for *E. coli* of 126 MPN/100 ml.

1.4 Document Organization

The Baltimore County TMDL implementation plans provide the following information to explain the necessity of the TMDL Implementation Plan and to develop a management strategy that will be followed in order to meet county TMDL reduction targets. The County will take an adaptive management approach that will include periodic assessments to determine progress and identify changes needed in the management strategy to meet the reduction targets in a timely, cost effective manner.

Section 1 - Introduction

This Introduction states the pollutant that is being addressed by the TMDL IP, and the watershed for which the IP was developed. It provides a background on what a TMDL is and how the TMDL is determined. A general description of the geographic area for the specific IP is provided. The Introduction also states the overall goal of the TMDL IP and summarizes the actions that have been identified to bring Baltimore County to that goal. It also includes a brief summary of the contents of the thirteen sections of the TMDL Implementation Plan.

Section 2 - Regulatory Policy and Planning

This part of the document describes the administration and legal authority that mandates the development of Baltimore County's TMDL implementation plan and oversees its fulfillment. It will provide a background of how various regulating authorities and policies are related to the requirement to develop a TMDL Implementation Plan. It will also summarize the various planning guidance documents that have been produced to assist in the development of TMDL Implementation Plans and how TMDL Implementation Plans fit in the overall Baltimore County planning context.

Section 3 - TMDL Summary

The section summarizes the original TMDL document that was submitted by MDE and approved by the EPA. The summary includes: when the TMDL was developed, what is impaired, why the TMDL was developed, a description of the analysis process that was used to determine the total maximum daily load targets, the baseline year of data collection and analysis, the results from that analysis, and a further break down of the target loads by source sector.

Section 4 - Literature Summary

Each TMDL IP will address a specific pollutant. This part of the document provides an overview of the pollutant that is summarized from published literature. The literature summary includes known sources of the pollutant, the impacts associated with the pollutant, the pathways and

PIA 23-172 Hazen - 00785

transformations of the pollutant, and other relevant ecological processes that affect how the pollutant can be controlled and regulated.

Section 6 – Existing Data Summary

This section will include a summary of Baltimore County's existing monitoring data that will be pertinent to the pollutant in question. It may also include some data received from sources other than Baltimore County, such as data from the Maryland Department of the Environment, or other relevant sources.

Section 5 - Watershed Characterization

Characterization of the watershed will include geographical and technical information for the portion of the watershed that is specific to each TMDL IP. Each characterization will describe the watershed acreage, population size, geology and soils, topography, land use, streams, infrastructure related to watershed pollution sources, implemented restoration projects since the baseline year, and changes in pollutant load since the baseline year.

Section 7 - Summary of Existing Restoration Plans

Previous planning efforts will be summarized in this section. Water Quality Management Plans (WQMP) and Small Watershed Action Plans (SWAP) applicable to the IP area are identified. The process and goals for SWAP development are explained.

Section 8 - Best Management Practice Efficiencies

This section is an explanation of the best management practices that will be used for removing the particular pollutant and the known efficiency of those best management practices. A table will be found in this section of BMPs and the known reduction efficiency for the pollutants that can be reduced by each BMP. BMP efficiencies will also include a discussion of the uncertainty and research needs for BMPs.

Section 9 - Implementation

The implementation section will provide a description of programmatic, management, and restoration actions; and pollutant load reduction calculations to meet the pollutant reduction target for the specific pollutant. For each of the programmatic, management, and restoration actions there will be a list of responsible parties, actions, timeframe of actions, and performance standards.

Section 10 - Assessment of Implementation Progress

Assessment of implementation progress will give Baltimore County a formal method of reporting on the development of implementation and of describing the progressive success of implementation actions. The section will include a description of tracking and reporting mechanisms, and a monitoring plan that includes progress monitoring as well as BMP effectiveness monitoring.

Section 11 - Continuing Public Outreach Plan

This part of the document will be a continuing public outreach plan. It will encourage public involvement in the implementation process, extending beyond the finalization of this document.

Section 12 - References

A list of references used in the creation of this document will be provided.

Section 2 - Legal Authority, Policy, and Planning Framework

The Legal Authority, Policy, and Planning Framework section will present, in brief, the background on the legal requirements that pertain to the development of Total Maximum Daily Loads (TMDLs), and the preparation of TMDL Implementation Plans. This section will also cover the planning framework for the development of the TMDL Implementation Plans (IP). Furthermore, this section is intended to provide the context for the development of this TMDL Implementation Plan and understanding of the linkage between water quality and the TMDL. Whether at the federal or state level there are a number of processes at work that result in the regulations that must be followed to remain within the law. First, legislation is passed by an elected governing body (e.g. Congress, state legislature), and once passed and signed by the executive branch, they become Acts (laws), such as the Clean Water Act. In order to provide guidelines in maintaining compliance with these laws, it is often necessary that regulations be issued to specify the law's requirements. A regulation is a rule issued by a government agency that provides details on how legislation will be implemented, and may set specific minimum requirements for the public to meet if they are to be considered in compliance with the law. These regulations may come in various forms, such as the Code of Federal Regulations (CFR), or Code of Maryland Regulations (COMAR). The information that follows is generally taken from CFR and COMAR.

Under the CFR, Title 40 encompasses the regulations enforced by the U.S. Environmental Protection Agency (EPA). These regulations include not only those related to water quality, but also air quality, noise, and a variety of land based regulations (oil operations, etc.)

2.1 Regulatory and Policy Framework

The ultimate regulatory authority for protecting and restoring water quality rests with the federal government through legislative passage of the Clean Water Act in 1972 and subsequent amendments. Prior to the Clean Water Act (1972), the Federal Water Pollution Control Act (1948) served as the basis for controlling water pollution. The Clean Water Act significantly amended the Federal Water Pollution Control Act and established the basic structure for regulating discharges of pollutants into the waters of the United States. Major amendments were enacted in 1977 and 1987 that further strengthened and expanded the Clean Water Act of 1972. The 1987 amendments incorporated the requirement that stormwater discharges from urban (municipal) areas be required to obtain a permit for discharge and that stormwater discharges from industrial sources also be permitted. There have been a number of minor amendments and reauthorizations over the years that have resulted in the law as it now stands.

There are several significant provisions of the Clean Water Act that pertain to TMDLs. These provisions include the requirement that states adopt Water Quality Standards by designating waterbody uses and set criteria that protect those uses. The Clean Water Act also requires states to assess their waters and provide a list (known as the 303(d) list) of waters that are impaired. The list specifies the impairing substance and requires that a TMDL be developed to address the impairment.

Through policy (memos dated November 22, 2002 and November 12, 2010) the EPA has indicated that the pollutant loads attributable to regulated stormwater discharges are to be included in the Waste Load Allocation as a point source discharge and not as part of the non-point load. The initial memo also affirmed that the Water Quality-Based Effluent Limitations

(WQBELs) in Municipal Separate Storm Sewer System (MS4) permits may be expressed in the form of Best Management Practices (BMPs) and not as numeric limits for stormwater discharges. The second memo clarified that when the MS4 permits are expressed in the form of BMPs, the permit should contain objectives and measurable elements (e.g., schedule for BMP installation or level of BMP performance). By providing both an expected level of BMP performance and a schedule of implementation of the various practices, Baltimore County will have addressed this requirement. This plan once approved by Maryland Department of the Environment (MDE) will be enforceable under the terms of the permit.

2.2 Maryland Use Designations and Water Quality Standards

In conformance with the Clean Water Act, the State of Maryland has developed use designations for all of the waters in Maryland, along with water quality standards to maintain the use designations.

Designated uses define an intended human and aquatic life goal for a waterbody. It takes into account what is considered the attainable use for the waterbody, for protection of aquatic communities and wildlife, use as a public water supply, and human uses, such as recreation, agriculture, industry, and navigation. Water quality standards include both the Use Designation and Water Quality Criteria (numeric standards). Water Quality Criteria are developed to protect the uses of a waterbody.

2.2.1 Use Class Designations

Every stream, lake, reservoir, and tidal waterbody in Maryland has been assigned a Use Designation. The Use Designation is linked to specific water quality standards that will enable the Designated Use of the waterbody to be met. A listing of the Use Designations follows:

- Use I: Water contact recreation, and protection of nontidal warm water aquatic life.
- Use II: Support of estuarine and marine aquatic life and shellfish harvesting (not all subcategories apply to each tidal water segment)
    - Shellfish harvesting subcategory
    - Seasonal migratory fish spawning and nursery subcategory (Chesapeake Bay only)
    - Seasonal shallow-water submerged aquatic vegetation subcategory (Chesapeake Bay only)
    - Open-water fish and shellfish subcategory (Chesapeake Bay only)
    - Seasonal deep-water fish and shellfish subcategory (Chesapeake Bay only)
    - Seasonal deep-channel refuge use (Chesapeake Bay only)
- Use III: Nontidal cold water – usually considered natural trout waters
- Use IV: Recreational trout waters – waters stocked with trout

PIA 23-172 Hazen - 00788

The letter "P" may follow any of the Use Designations, if the surface waters are used for public water supply. There may be a mix of Use Classes within a single 8-digit watershed; for example, Gwynns Falls has Use I, Use III, and Use IV Designations depending on the subwatershed.

Table 2.1: Designated Uses and Applicable Use Classes

Designated Uses	Use Classes							
	I	I-P	II	II-P	III	III-P	IV	IV-P
Growth and propagation of fish (not trout), other aquatic life and wildlife	✓	✓	✓	✓	✓	✓	✓	✓
Water contact sports	✓	✓	✓	✓	✓	✓	✓	✓
Leisure activities involving direct contact with surface water	✓	✓	✓	✓	✓	✓	✓	✓
Fishing	✓	✓	✓	✓	✓	✓	✓	✓
Agricultural water supply	✓	✓	✓	✓	✓	✓	✓	✓
Industrial water supply	✓	✓	✓	✓	✓	✓	✓	✓
Propagation and harvesting of shellfish			✓	✓				
Seasonal migratory fish spawning and nursery use			✓	✓				
Seasonal shallow-water submerged aquatic vegetation use			✓	✓				
Seasonal deep-water fish and shellfish use			✓	✓				
Seasonal deep-channel refuge use			✓	✓				
Growth and propagation of trout					✓	✓		
Capable of supporting adult trout for a put and take fishery							✓	✓
Public water supply		✓		✓		✓		✓

2.2.2 Water Quality Criteria

Water quality criteria are developed to protect the uses designated for each waterbody. Certain standards apply over all uses, while some standards are specific to a particular use. The criteria are based on scientific data that indicate threats to aquatic life or human health. For the protection of aquatic communities the criteria have been developed for fresh water, estuarine water, and salt water. The criteria have been further based on acute levels (have an immediate negative effect) and chronic levels (have longer term effects). The human health criteria are based on drinking water levels, organism consumption levels, or a combination of drinking water and organism consumption levels, or recreational contact bacteria levels.

Dissolved oxygen criteria for all Use Designations is 5 mg/L, except for Use II Designations and special criteria for drinking water reservoir hypolimnion waters (bottom waters of the reservoir).

Bacteria criteria are based on human health concerns, and apply to all Uses, with additional bacteria criteria applicable in shellfish waters. Since none of the local TMDLs are related to the shellfish criteria, they are not discussed here. The human health criteria are based on either the geometric mean of 5 samples or single sample criteria based on the frequency of full body contact, these criteria are displayed in Table 2.2. For the freshwater bacteria TMDLs the indicator bacteria *E. coli* has been used in the development of the TMDL, therefore it serves as the water quality end point. The human health recreational contact bacteria criteria are displayed in Table 2.2. The table displays both the geometric mean for bacteria and single sample maximum allowable bacteria concentrations based on the frequency of full body contact.

PIA 23-172 Hazen - 00789

Table 2.2: Bacteria Criteria for Human Health (MPN/100 ml)

Indicator	Steady State Geometric Mean Density	Single Sample Maximum Allowable Density			
		Frequent Full Body Contact Recreation	Moderately Frequent Full Body Contact Recreation	Occasional Full Body Contact Recreation	Infrequent Full Body Contact Recreation
Freshwater (Either Apply)					
Enterococci	33	61	78	107	151
E. coli	126	235	298	410	576
Marine					
Enterococci	35	104	158	275	500

2.3 Planning Guidance

In March of 2008 the EPA released a guidance document on the development of watershed plans entitled *Handbook for Developing Watershed Plans to Restore and Protect Our Waters*. The handbook laid out nine minimum elements to be included in watershed plans, commonly called the "a through i" criteria. The criteria include:

a. An identification of the causes and sources or groups of sources that will need to be controlled to achieve the load reductions estimated in the watershed plan.

b. Estimates of pollutant load reductions expected through implementation of proposed Nonpoint Source (NPS) management measures.

c. A description of the NPS management measures that will need to be implemented.

d. An estimate of the amounts of technical and financial assistance needed to implement the plan.

e. An information/education component that will be used to enhance public understanding and encourage participation.

f. A schedule for implementing the NPS management measures.

g. A description of interim, measurable milestones for the NPS management measures.

h. A set of criteria to determine load reductions and track substantial progress towards attaining water quality standards.

i. A monitoring component to evaluate effectiveness of the implementation efforts over time.

EPA now evaluates watershed plans on the basis of the above criteria in consideration of its grant funding. The State of Maryland is also increasingly using the above criteria for funding consideration. Baltimore County has used these criteria since the publication of the handbook in the development of its Small Watershed Action Plans; and will use the criteria in the development of this TMDL Implementation Plan.

MDE developed a guidance document in conjunction with local government representatives entitled *Maryland's 2006 TMDL Implementation Guidance for Local Governments*, which provides a framework for the development of TMDL Implementation Plans. MDE has also provided guidance on the development of TMDL Implementation Plans related to specific pollutants. Guidance for specific pollutants includes:

- PCBs

- Bacteria
- Mercury
- Trash

These guidance documents have been taken into consideration in the development of the Baltimore County TMDL Implementation Plans.

2.4 Water Quality Standards Related to This Implementation Plan

The Jones Falls (02-13-09-04) watershed has a Use I and Use III Designation in Baltimore County. Use I includes water contact recreation and protection of warm water fisheries, while Use III includes water contact recreation and cold water fisheries. The water quality criteria applicable to the bacteria TMDL are those related to bacteria, specifically, the *E. coli* criteria above in Table 2.2. The bacteria criteria are designed to protect humans from health issues that may arise from water contact recreation.

The ultimate water quality endpoint is the attainment of an *E. coli* geometric mean concentration of 126 MPN for all weather conditions and during all seasons. Since the majority of human recreation water contact occurs during dry weather and in the warm seasons, the 126 MPN criteria target will be applied to those conditions. In addition, Baltimore County will use the frequency of full body contact criteria for single samples as measures of progress. Streams, unlike swimming beaches will not have frequent full body contact, but much more limited contact. The targets for interim periods are displayed in Table 2.3.

Table 2.3: Five Year Interim Targets for Single Sample and Geometric Mean Bacteria Densities

Single Sample Target				
Weather Condition	**2020**	**2025**	**2030**	**3035**
Dry	576	410	298	235
Wet	NA	NA	NA	NA
Geometric Mean Target				
Dry	477	360	243	126
Wet	6,880	4,630	2,380	126

PIA 23-172 Hazen - 00791

The TMDL summary provides context for the TMDL implementation plan. It is necessary to understand some basic information from the original TMDL document that preceded this particular implementation plan. The TMDL document describes the condition of the watershed at the time that the baseline load of the pollutant was calculated. The baseline load is simply a measurement of the amount of the pollutant that was in the waterbody during a specific time. The baseline load provides a starting pollutant measurement for the county to reduce from, in order to meet the TMDL target. The term TMDL is also used to describe the specific numeric load target, which is explained in detail within the TMDL document. The original TMDL document provides a detailed justification for choosing the TMDL target number. This justification is a description of the entire technical process including monitoring methods and calculations. The following section is a simplification of that section of the TMDL document and a brief explanation of why the TMDL was developed for the specific pollutant in this watershed.

3.1 TMDL Background

- **The Problem:** The TMDL was developed because the steady state geometric mean of *E.coli* in the Jones Falls watershed was found to be above the state water quality standard of 126MPN/ 100ml for freshwater.

The Jones Falls watershed was listed as being impaired by bacteria in 2002. MDE developed the TMDL and submitted it to EPA in 2006. It was approved by EPA in 2008.

The requirements for listing a watershed as category 5 for fecal bacteria, also known as the 303(d) list, are as follows for all uses:

- A steady state geometric mean must be calculated with data from the past two to five years
- The data must be from samples that were collected during the beach season in dry, steady state conditions
- The resulting steady state geometric mean is greater than 35 cfu/100 ml enterococci in marine/estuarine waters, 33 cfu/100 ml enterococci in freshwater, or 126 cfu/100 ml *E. coli* in freshwater

The geometric mean target for freshwater equates to an approximate risk of 8 illnesses per 1,000 swimmers at freshwater beaches. This means that for every thousand people that swim in the waterbody, approximately 8 people will get sick. This is only an approximation, as every individual person has a different susceptibility to disease and illness.

The TMDL analysis specifically looked at *E.coli* as the indicator of water impairment. Bacteria data was collected at Department of Natural Resources CORE monitoring stations to identify impairment. Additional monitoring was conducted at five stations throughout Jones Falls from October 2002 to June 2003. Bacteria counts were highly variable and ranged from 10 to 10,000 MPN/ 100ml. Any bacteria counts greater that 126 MPN/100ml indicates an approximate risk of illness greater than 8 per 1,000 swimmers.

The baseline year is 2003 based on the final year of bacteria monitoring used to develop the Jones Falls bacteria TMDL.

3.2 TMDL Development

The first step in the process of developing the annual average TMDLs was to find base line condition loads for each of five bacteria monitoring stations that were located in the Jones Falls watershed. The challenge was that the rate of water flow for and river and stream naturally fluctuates very regularly and it is important for baseline loads to be calculated for the average flow rate. Rates of flow were classified as high flow or mid/low flow. These classifications were called the flow strata. First, annual average geometric means were calculated for each sub-watershed's flow strata (high flow and mid/ low flow). A flow analysis of several watersheds throughout Maryland found that flows between the 20th and 28th percentile represented average daily flows. Accordingly, for the purposes of this analysis, flows above the 25th percentile were designated as high flow and flows below the 25th percentile were designated as mid/low flows. The flow levels and the steady state geometric mean data were used to calculate an annual weighted geometric mean for each of the five stations that is unbiased by flow strata.

The data was used to calculate a bias correction factor, which would ultimately be used to calculate a base line load for each station. The bias correction factor is simply a calculated number that is used in the final base line load calculation to ensure that the base line load is representative of the natural duration of high flow and mid/low flow conditions.

Federal regulations require that TMDLs take critical condition into account, meaning the condition when the waterbody is most vulnerable. For this TMDL, the critical condition was accounted for by assessing the time period when water contact recreation is expected, i.e., seasonal conditions from May 1st through Sept 30th. Accordingly, steady state and weighted geometric means were also calculated for the seasonal bacterial load. Calculating seasonal conditions is also helpful because water quality standards are measured under these conditions. The calculation for the seasonal condition was necessary for estimating reductions needed to meet water quality standards.

Bacteria source tracking (BST) was used to identify relative contributions of different bacteria sources at the four stations in the Jones falls watershed. Samples were collected once per month for one year. Samples that have known fecal sources are collected from the watershed. A technique known as antibiotic resistance analysis (ARA) is used to identify patterns of antibiotic resistance displayed in the known samples. The antibiotic resistance patterns can then be compared to patterns in water samples containing bacteria of unknown origin. The BST can identify probable sources of bacteria by matching the antibiotic resistance patterns of known bacteria origins to the unknown samples. In order to accurately represent the expected contribution of each source at each station, a stratified weighted mean of the samples was calculated. The stratified weighted mean accounted for the proportion of high to mid/low flow volume. Table 3.1 displays the results for the annual monitoring data by flow stratum and the weighted percent contribution from the various sources. Fecal bacteria source loads were also calculated at each station for the seasonal period. These results are presented in Table 3.2.

Table 3.1: Distribution of Bacteria by Source (%) – Annual Data

Station	Flow Stratum	% Pets	% Human	% Livestock	% Wildlife	% Unknown

	Low	21	51	12	4	12
	Weighted	22	52	10	3	13

The majority of bacteria in the Jones Falls was from human sources at all monitoring stations. It was assumed that human sources would have the highest risk of causing gastrointestinal illness, so those sources were targeted for the highest reductions. Maximum practicable reduction (MPR) targets were determined, based on available literature and best professional judgment, for each bacteria source by sub-watershed. The sub-watersheds are the stream segments in between the monitoring stations within the Jones Falls. Any area where a waste water treatment plant is located upstream to a watershed segment, human bacteria levels for that segment were considered to be at the MPR because the loads have already been permitted. In the case of bacteria sources from domestic animal waste, the MPR was based on the success of education and public outreach. Wild life sources were given a 0% MPR because there are no programmatic approaches to reduce wildlife waste in order to meet water quality standards. The MPRs were, thus, assigned the following values: 95% Human sources, 75% Domestic sources, 75% Livestock sources, and 0% Wildlife sources.

PIA 23-172 Hazen - 00794

In the MPR scenario, none of the five monitored segments were able to meet water quality standards using the values listed above. This means that there is no practicable solution. In this case, another scenario was applied where the allowable reduction for each of the five source categories was increased to 98%. The results indicate that the Jones Falls watershed can only meet water quality standards in a scenario where reductions exceed the maximum practicable reduction.

3.3 TMDL Results

Part of the development of the bacteria TMDL is to calculate a baseline load as the starting point. For the Gwynns Falls watershed the baseline load was calculated based on monitoring data for each of the four monitoring points, with the load calculated for both high low and low from conditions. Table 3.3 presents the results.

Table 3.3: Gwynns Falls – Annual Steady-State Geometric Means by Station and Flow Condition

Monitoring Station	Flow	N	Annual Steady-State Geometric Mean (MPN/100 ml)	Annual Overall Geometric Mean (MPN/100 ml)

The TMDL calculated the seasonal dry weather period (May 1st – September 30th) steady state geometric mean for each of the five stations. These results were used to calculate the reductions needed to meet the bacteria water quality standards, as this is the period and weather conditions when human contact with the water are most likely to occur. The results are presented in Table 3.4

Table 3.4: Seasonal (May 1st – September 30th) Dry Weather Steady-State Geometric Means by Station (MPN/100 ml)

Jones Falls Total TMDL

3.4 TMDL Reductions Targets by Source Sector

The Jones Falls TMDL for fecal bacteria is made up of the following components:

- LA : Load Allocation for nonpoint sources not transported or discharged by stormwater systems
- WLA : LNB Waste Load Allocations for point sources, including waste water treatment plants (WWTPs), NPDES regulated stormwater discharges (MS4 permitted stormwater), and combined sewer overflows (CSOs)
- MOS : Margin of Safety was accounted for in this TMDL by estimating the loading capacity of the streams on a more stringent water quality criteria. The 126MPN/100ml criteria for *E.coli* was reduced by 5% to 119.7MPN/100ml.

Table 3.6: Jones Falls TMDL summary by source category

(Billion MPN *E. coli*/year)					
TMDL =	**LA +**	**WWTP WLA +**	**MS4 WLA +**	**CSOs WLA +**	**MOS**
28,234,210	**6,570**	**18**	**236,491**	**0.0**	**Incorporated**

Potential source contributions for TMDL allocation categories were identified as follows:

Wildlife	X	X		

PIA 23-172 Hazen - 00797

Section 4 - Literature Summary

This review pertains to direct and indirect effects of bacteria on fresh water rivers and streams, specifically those effects that are relevant to the Jones Falls. This is not intended to be an exhaustive review of primary literature, but rather a summary of the sources, pathways and biological effects of bacteria in non-tidal watersheds from literature available to Baltimore County Department of Environmental Protection and Sustainability.

When we talk about bacteria in the watershed, we are specifically referring to fecal bacteria. That includes human feces, pet feces, livestock feces, and fecal matter from wild animals. The land use of a region determines which type of fecal bacteria may be a concern. Human and pet fecal matter can be a concern in both urban and rural areas, but urban areas may contribute a higher concentration of these sources of waste. Livestock waste is primarily a concern in rural land use areas. Forested areas contribute waste from wild animals, but this is considered the natural or background condition of fecal bacteria input to the watershed.

There is a wide variety of microorganisms that can be found in fecal matter. Most microorganisms do not cause disease to humans and wildlife, but some can be hazardous (US Geological Survey 2007) (World Health Organization 2003) . These disease causing microorganisms are known as pathogens. There is no specified number of pathogen cells that will make an individual sick (US Geological Survey 2007). Every person has a different state of health and immune system, which determines how susceptible his or her body is to disease. For this reason, water quality standards for bacteria are based on approximate risk of illness per 1,000 swimmers. The water quality standard is discussed in detail in the TMDL summary section. There is no way to say exactly how much bacteria will make someone sick, but it is possible to approximate the risk from a large sample of people (Maryland Department of The Environment 2009). For more information on the risk of pathogens in recreational water use see the Center for Disease Control and Prevention website on recreational water: Oceans Lakes and Rivers.

Pathogenic microorganisms can cause gastrointestinal infection from accidental ingestion of polluted water. Certain pathogenic organisms from fecal sources can also cause infections of the upper respiratory tract, ears, eyes, nasal passages, and skin (World Health Organization 2003). Infections due to recreational water contact are generally mild; however, this makes them hard to detect and attribute to water exposure (World Health Organization 2003).

Because there are so many different types of pathogens that cause many different symptoms of illness, indicator organisms are used to estimate the overall risk of illness instead of testing the water for each individual pathogen. Index organisms are also measured instead of testing for pathogens because each variety of possible pathogens requires a unique test. Tests are costly and time consuming and, therefore, testing for individual pathogens is not practical for routine monitoring (US Geological Survey 2007).

Escherichia coli (E.coli) is an index organism that is used to approximate the presence of illness causing organisms in fresh water. *E. coli* are bacteria that normally inhabit the human gut. Most *E.coli* are harmless and are actually healthy for the human intestinal tract (Centers for Disease Control and Prevention 2012). However, some are pathogenic and cause illness, in most cases diarrhea. These diarrhea causing *E.coli* are the bacteria that are associated with contaminated water (Centers for Disease Control and Prevention 2012) (World Health Organization 2003). In the late 1970s and early 1980s the USEPA conducted a study determining that *E.coli* has the strongest relationships to gastrointestinal illness in freshwater swimmers when compared to other possible fecal bacteria indicators (US Geological Survey 2007). For more information on bacteria monitoring and source tracking, see MDE's Bacterial Water Quality Monitoring page.

Bacteria enters the water mainly through feces, which is traceable to its sources through a source identification test as discussed in the TMDL summary section. Bacteria comes from both point and nonpoint sources. Nonpoint sources of pollution are those sources that do not have one discharge point but occur as runoff flows into streams. Manure spreading, the grazing of livestock, pet and wildlife deposition, and failed septic systems all create sources of bacteria that are transported to waterways as a nonpoint source. Point sources of fecal waste enter the stream or river through a pipe.

Municipal Separate Storm Sewer Systems (MS4) are point sources of stormwater discharge. This category includes Baltimore County's storm drain system. Fecal bacteria enter the watershed through the storm sewer system when domestic and wildlife wastes are washed into the local water (Clary, et al. 2008). Pet waste should always be disposed of properly, as it can wash into storm drains even when not directly dumped in or left near drains. Pet waste left in yards or on sidewalks will eventually contaminate the nearest storm drain.

Human wastes can enter water ways as a point source through illicit connections of sanitary sewers to stormwater sewers, and sanitary sewer overflows (Clary, et al. 2008). Illicit connections occur when individuals, intentionally or unintentionally, connect their sanitary sewer pipes to the storm sewer pipe. The sanitary sewer is meant to transport fecal waste to a sewage treatment plant where the water can be treated before returning it to a river or stream. The storm sewer system is not filtered. It runs directly under roadways and land to rivers and streams. Illicit connections allow the fecal waste to flow, completely unfiltered, into streams and rivers introducing pathogens directly into the waterbody. The Baltimore County Department of Environmental Protection and Sustainability Watershed Management and Monitoring Program is responsible for testing for the presence of illicit connections in the county.

Sanitary Sewer Overflows (SSO) are another source of human fecal bacteria pollution. They occur when the sewage system reaches capacity and overflows. The untreated sewage from these systems can flow into and contaminate local waters (Clary, et al. 2008). The Baltimore County Public Works Bureau of Utilities is responsible for construction, repair and maintenance of the sanitary sewer and storm sewer systems.

Human waste can also enter the waterbody as a nonpoint source through failed septic systems and damaged sanitary sewer pipes. The drainage from these systems makes its way through the drainage field and eventually into local waters.

PIA 23-172 Hazen - 00799

Livestock wastes enter waterways through runoff from farms as result of manure spreading and grazing livestock. Grazing cows contribute 47 L of manure daily to pastures (Walker, et al. 1990). The manure left from grazing animals, and all of its bacteria, are swept by rain water into the nearest waterbody or storm drain. Manure spreading contributes to water pollution in a similar way, but the manure is spread over the entire surface of a field. Certain best management practices can reduce the amount of runoff from these sites such as runoff control practices, and long term storage of waste, which allows some bacteria to die off and allows manure to be applied during appropriate weather conditions to reduce runoff (Walker, et al. 1990). For more information on agricultural BMPs see the Maryland Department of Agriculture's Watershed Implementation Plan strategies.

This section summarizes the characterization of the Jones Falls watershed. Section 5.1 describes the natural landscape and Section 5.2 describes the human modified landscape.

5.1 The Natural Landscape

5.1.1 Location

The Jones Falls watershed is located in the Patapsco River region of the Chesapeake Bay watershed in portions of Baltimore County and Baltimore City, Maryland. The Jones Falls watershed comprises approximately 25,933 acres within Baltimore County. The Jones Falls mainstem flows east and south from its headwaters in Garrison, Maryland to its discharge into the Inner Harbor in downtown Baltimore. Several tributaries drain to the Jones Falls including Moores Branch, Roland Run, Towson Run, Western Run, and Stony Run. An impoundment is located at Lake Roland, just north of the Baltimore County/City boundary. Figure 5.1 shows the location of the Jones Falls watershed.

This IP will discuss the characteristics of the portions of the Jones Falls watershed located within Baltimore County.

PIA 23-172 Hazen - 00801

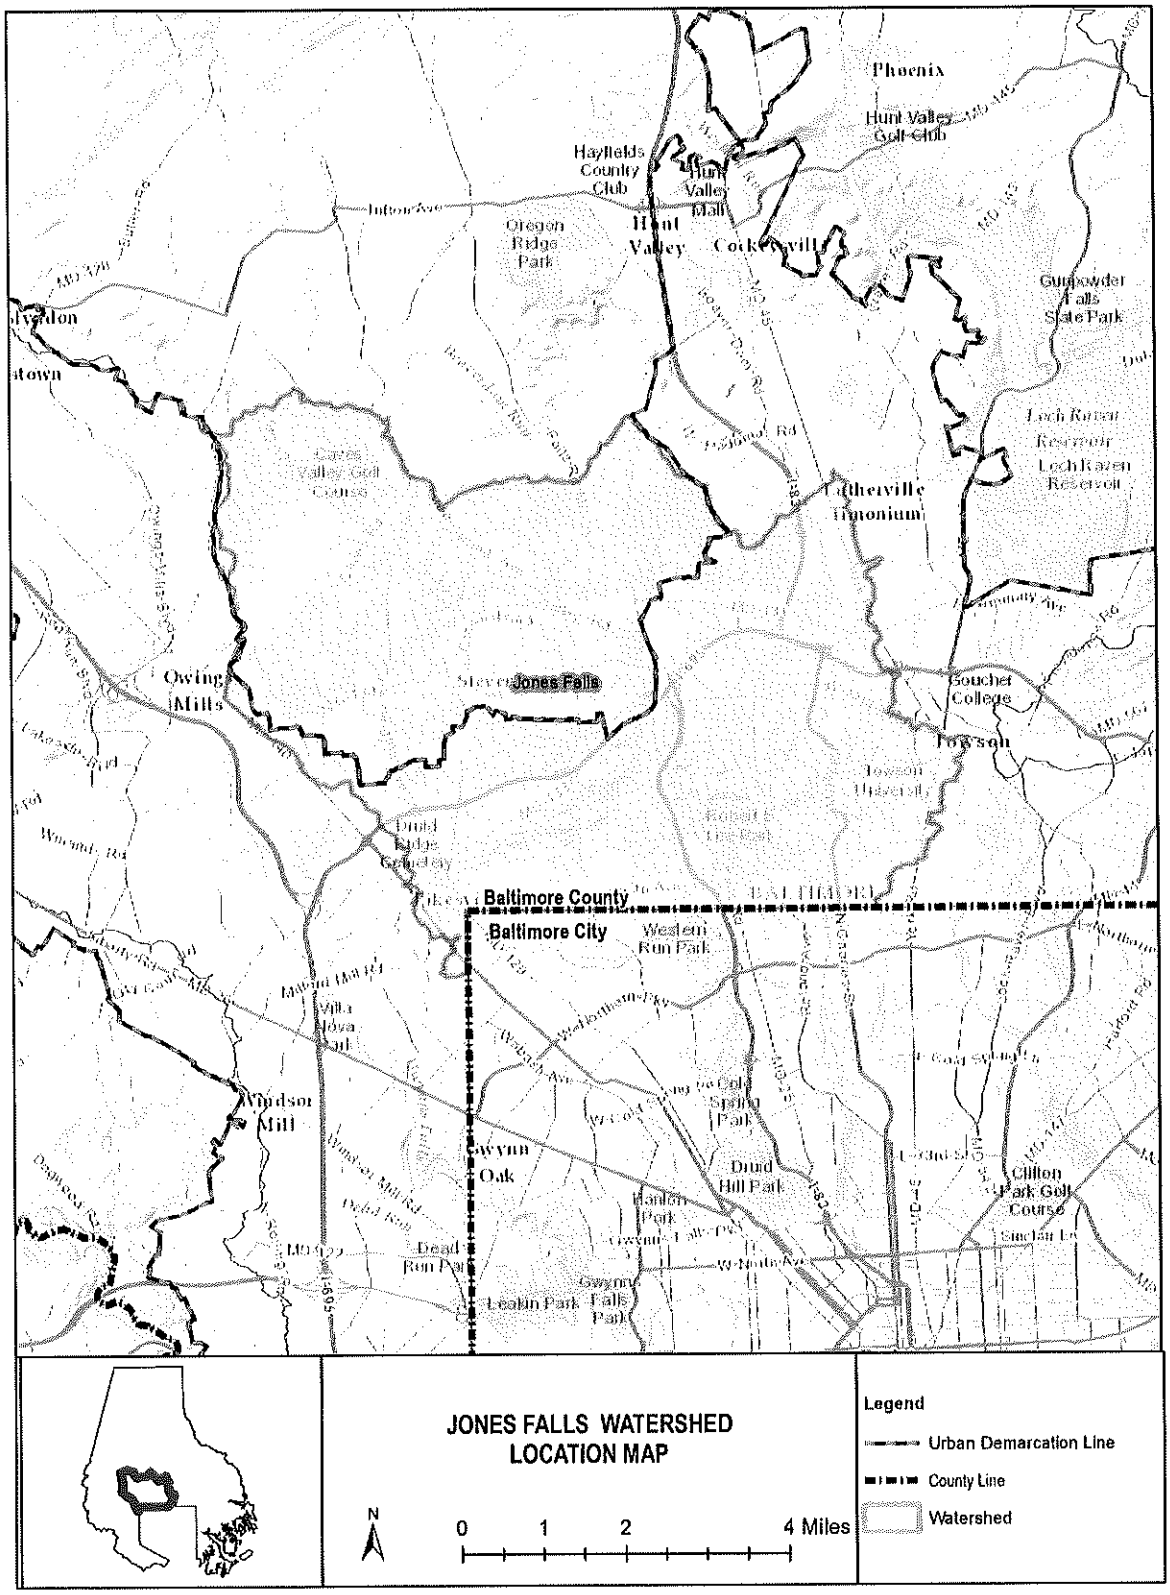

Figure 5.1: General Location Map of the Jones Falls Watershed

PIA 23-172 Hazen - 00802

5.1.2 Geology/Soils

Geology

A majority (97%) of the Jones Falls watershed is located within the Piedmont physiographic province while 3% lies within the Coastal Plain physiographic province. The natural Piedmont landscape is characterized by rolling hills, thick soils on deeply weathered crystalline bedrock, and abundant forest litter that minimizes overland flow. The natural Coastal Plain is relatively flatter with soils formed from sedimentary deposits. The dominant geological formations in the Jones Falls watershed within Baltimore County are Loch Raven Schist (30%), Baltimore Gneiss (25%), and Cockeysville Marble (24%).

Soils

Soil type and moisture conditions greatly affect how land may be used and the potential for vegetation and habitat on the land. Soil conditions are also one determining factor for water quality and quantity in streams and rivers. Soils are an important factor to incorporate in targeting projects aimed at improving water quality or habitat. The type of soil has a major effect on runoff due to its infiltration rate (USDA-NRCS Unknown). Infiltration is the flow of water through the soil surface into the soil.

The Natural Resource Conservation Service classifies soils into four Hydrologic Soil Groups (HSGs) based on the soil's runoff potential. Runoff potential is the opposite of infiltration capacity; soils with high infiltration capacity will have low runoff potential, and vice versa. The four HSG's are A, B, C and D, where A's generally have the lowest runoff potential and D's have the greatest runoff potential. Dual hydrologic soil groups can be assigned as well. This happens when certain wet soils are placed in group D based solely on the presence of a water table within 24 inches of the surface even though the saturated hydraulic conductivity may be favorable for water transmission. If these soils can be adequately drained, then they are assigned to dual hydrologic soil groups (A/D, B/D, and C/D) based on their saturated hydraulic conductivity and the water table depth when drained (USDA-NRCS 2009). When the rate of rainfall exceeds the infiltration rate, the excess water will start flowing over the soil surface and runoff begins (USDA-NRCS Unknown).

Runoff is the portion of precipitation that makes its way toward waterways as surface or subsurface flow. Runoff occurs after the evaporation, interception, infiltration and surface retention occur. The more runoff that occurs, the more likely nutrients, pollutants and pathogens are likely to enter waterways. Table 5.1 shows the percentage of each HSG in the Loch Raven Watershed within Baltimore County.

Table 5.1: Hydrologic Soil Group Data for the Jones Falls Watershed in Baltimore County

Hydrologic Soil Group (% of Baltimore County Portion of Watershed							
A	**B**	**C**	**D**	**A/D**	**B/D**	**C/D**	**No Group**
3.7	62.9	19.8	10.8	0.0	0.1	0.0	2.6

5.1.3 Stream Systems

Stream systems are a watershed's circulatory system, and the most visible attribute of the hydrological cycle. The stream system is an intrinsic part of the landscape, and closely reflects conditions on the land. Streams are a fundamental natural resource, with myriad benefits for plants, animals, and humans. Maintaining a healthy stream system is a priority for many

individuals and organizations, and requires insuring that stream flows and water quality closely mimic the conditions found in un-impacted watersheds. Streams are the flowing surface waters, and are distinct from both groundwater and standing surface water (such as lakes), though they are connected with both of them.

The Jones Falls watershed contains approximately 154 miles of streams, all of which drain to the Baltimore Harbor, which is a part of the larger Chesapeake Bay watershed. A number of tributaries drain to the Jones Fall mainstem, including North Branch Jones Falls, Dipping Pond Run, Deep Run, Slaughterhouse Run, Moores Branch, Roland Run, Towson Run, Western Run, and Stony Run.

5.1.4 Livestock

Livestock refers to agriculture-related animals and are associated with pasture, feeding operations, and breeding and training facilities. In 2003, there were 1,015 acres of pasture in the Baltimore County portion of the Jones Falls watershed: in 2011, there were 957 acres (Table 5.2). Currently, pasture represents approximately 3.7% of the Baltimore County portion of the watershed. Using the most recent land use data from Maryland Department of Planning (2010), land classified as feeding operations and agricultural buildings was summarized. Feeding operations include cattle feed lots, holding lots for animals, hog feeding lots, and poultry houses. Agricultural buildings include breeding and training facilities, storage facilities, built-up areas associated with a farmstead, small farm ponds and commercial fishing areas. In 2008, in the Baltimore County portion of the Jones Falls watershed, there were zero acres classified as feeding operations and 14.4 acres classified as agricultural buildings.

5.1.5 Wildlife

Wildlife, mammals and waterfowl, are present in both the developed and undeveloped areas of the watershed. At this time, Baltimore County does not have a way to quantify the amount of wildlife in any given area.

5.2 The Human Modified Landscape

The natural landscape has been modified for human use over time. The intensity of this modification has increased, starting with the colonization of Maryland in the 1600s. This modification has resulted in environmental impacts to both the terrestrial and aquatic ecosystems. This section will provide a characterization of the human modified landscape and how that modification is associated with impacts to the natural ecosystem. The characterization will progress from the general characteristics of land use and land cover to specific issues including population, drinking water and wastewater, storm water systems, and sanitary sewer overflows, all of which contribute to bacteria in the watershed.

5.2.1 Land Use: Baseline and Current

The land use of an area has an influence on the water quality of the watershed. Forested land absorbs nutrients and slows the flow of water into streams. Roads, parking areas, roofs and other human constructions are collectively called impervious surface. Impervious surfaces block the natural seepage of rain into the ground. Unlike many natural surfaces, impervious surfaces typically concentrate stormwater runoff, accelerate flow rates and direct stormwater to the nearest stream. This can cause bank erosion and destruction of in-stream and riparian habitat. Watersheds with small amounts of impervious surface tend to have better water quality in local streams than watersheds with greater amounts of impervious surface.

Approximately 54% of the Baltimore County portion of the Jones Falls lies within the Urban Rural Demarcation Line (URDL) and 46% lies outside the URDL. The URDL is a growth limit line established in 1967 which prohibits public water and sewer outside the line to relegate growth to the inner suburbs.

The Jones Falls watershed is comprised of 25,933 acres or 40.5 square miles of land within Baltimore County. Land use data from the USGS National Land Cover Database (Jin, 2013) from 2001, 2006, and 2011 was combined with Baltimore County impervious surface data from 1995, 1996, 1997, 2001, 2005, and 2011. This combined land use land cover data was used to interpolate the baseline (2003) land use for Jones Falls. The land use distribution for Jones Falls for 2003 and current (using 2011 data) is shown in Table 5.2.

Table 5.2: Land Use in Jones Falls Watershed in Baltimore County at Baseline and Present

Land Type	2003 (Baseline year) Acres	2003 (Baseline year) Percent	Current (2011 data) Acres	Current (2011 data) Percent	Change since Baseline Acres	Change since Baseline Percent
Crop	1,122	4.33	1,131	4.36	+9	+0.80
Extractive	13	0.05	5	0.02	-8	-61.54
Forest	10,061	38.80	9,880	38.10	-181	-1.80
Pasture	1,015	3.91	957	3.69	-58	-5.71
Urban Impervious	3,753	14.47	4,131	15.93	+378	+10.07
Urban Pervious	9,896	38.16	9,747	37.59	-149	-1.51
Water	73	0.28	83	0.32	+10	+13.70

Land classified as crop includes cultivated crops. Pasture refers to land used as pasture and as hay. Extractive land use includes barren land and anything that is bare rock, sand, or clay. Land classified as forest includes forests, natural meadows/grassland, and wetlands. Urban impervious is developed land, including any structure (houses, shopping centers, etc.), roads, parking areas, and pavement. Urban pervious is any developed land cover that is not impervious including turf, gardens, bare soil, mulch, hedges, shrubs, and trees. Water includes any ponds, reservoirs, or other open water bodies in the watershed.

5.2.2 Population

Census block data from the 2000 US Census and 2010 US Census was used to determine the population in the watershed. Data from the 2000 US Census was interpolated in order to estimate the population for 2003, which is the baseline year for the TMDL and therefore important to understand the conditions at the time the TMDL was developed. The 2010 Census is the most recent census therefore there is not more recent data. Population for 2003 and 2010 and the percent change over time in the Jones Falls watershed Areas are shown in Table 5.3.

Table 5.3: Population of Jones Falls Watershed in Baltimore County

2003 (Baseline year)	Current (2010 data)	Percent change
61,924	64,881	4.77

5.2.3 Infrastructure

5.2.3.1 Wastewater

Wastewater created through human use must be treated and properly disposed of. This may be accomplished in two ways, either through individual wastewater treatment systems (septic systems) or through public conveyance to a treatment facility. Residential wastewater consists of all of the water that is typically used by residents, including, wash water, bathing water, human waste deposal water, and any other rinse water (paint brush, floor washing, etc). Industrial operations must also dispose of any water used as part of their operation. Depending on the operation the water could contain any number of contaminants, including pathogens, metals, organic compounds, detergents, or synthetic compounds. All of these wastes have the potential to harm the natural environment.

5.2.3.2 Septic Systems

Properly functioning septic systems provide treatment for virtually all of the phosphorus, but leak nitrogen in the form of nitrates. Depending on the location of the system the nitrates may either be reduced or eliminated through denitrification as the water passes through riparian buffers, particularly forested riparian buffers. Failing systems can result in increased contamination of the aquatic environment through increased releases of nitrogen, phosphorus, and other chemicals. They can also result in increased bacterial contamination of the waterways and potential for human health concerns.

Using the Bay Restoration Fund 2014 data, we estimate 15.8% of the population of the Jones Falls watershed within Baltimore County are using septic systems.

5.2.3.3 Public Sewer System

A public sewer system conveys wastewater from individual residences or businesses to a facility that treats the wastewater prior to discharge. The part of the system that is in the public right-of-way is owned and maintained by the County government. The public system consists of the gravity piping system, access manholes, pumping stations, and force mains. Private property owners are responsible for the maintenance of the pipes and cleanouts located on their property.

Wastewater, like water, naturally flows downhill through pipes. These pipes are referred to as gravity pipes. However, sometimes it is necessary to be able to force the water in another direction, therefore creating a pressurized pipe or a force main. This scenario occurs in low lying areas. In order for the water to go against gravity, a pump is needed which is kept in a pump station. Table 5.4 shows length of sewer gravity pipe, pressurized pipe, and number of pumps stations in the Jones Falls watershed in Baltimore County.

Table 5.4: Sanitary Sewer Infrastructure in the Jones Falls Watershed in Baltimore County

Length of Gravity Pipe (miles)	Length of Pressurized Pipe (miles)	Number of Pump Stations
228.5	9.5	28

5.2.3.4 Sanitary Sewer Overflows (SSOs)

Environmental impacts associated with the public sewer system are usually the result of sewage overflows. These sanitary sewer overflows (SSOs) usually result from blockages within the sewage system, pumping station failure, or rainwater inflows exceeding the capacity of the pipe. There are several factors that may contribute to SSOs from a sewer system, including pipe capacity, operations and maintenance effectiveness, sewer design, age of system, pipe materials, geology and building codes. The U.S. EPA reports there are at least 40,000 of these incidents per year in the United States of America (U.S. EPA 2012). The environmental and human health

consequences of these overflows can be serious. *E. Coli* bacteria and other pathogens can be present, posing health risks to individuals who may come in contact with contaminated water. Sewer overflows can also contain high levels of nitrogen and phosphorus that are toxic to aquatic life and feed organisms that deplete oxygen in waterways. High levels of sediment are also present in these overflows, which can clog streams and block sunlight from reaching essential aquatic plants. As of September 2005, Baltimore County is under a consent decree with the U.S. Environmental Protection Agency to repair, replace or rehabilitate the system with the goal of eliminating all overflow structures to be completed by March 2020. Between 2000 and 2013, there were 108 SSOs totaling 637,866 gallons. See Figure 5.2 for the distribution of SSO in Jones Falls watershed in Baltimore County from 2000-2013. Figure 5.3 shows the volume of SSOs per year and Figure 5.4 shows the number of the SSOs by cause in the Baltimore County portion of the Jones Falls watershed.

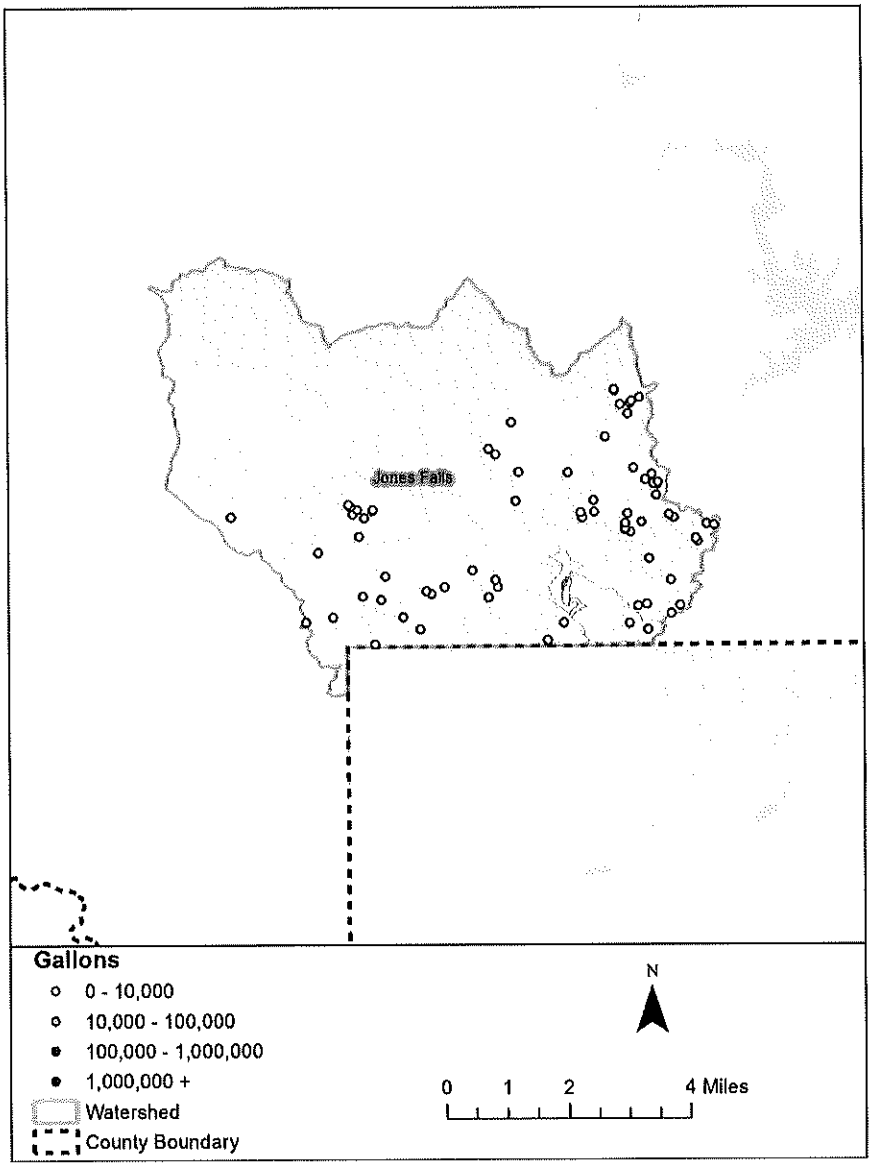

Figure 5.2: Location of SSOs in Jones Falls Watershed from 2000-2013

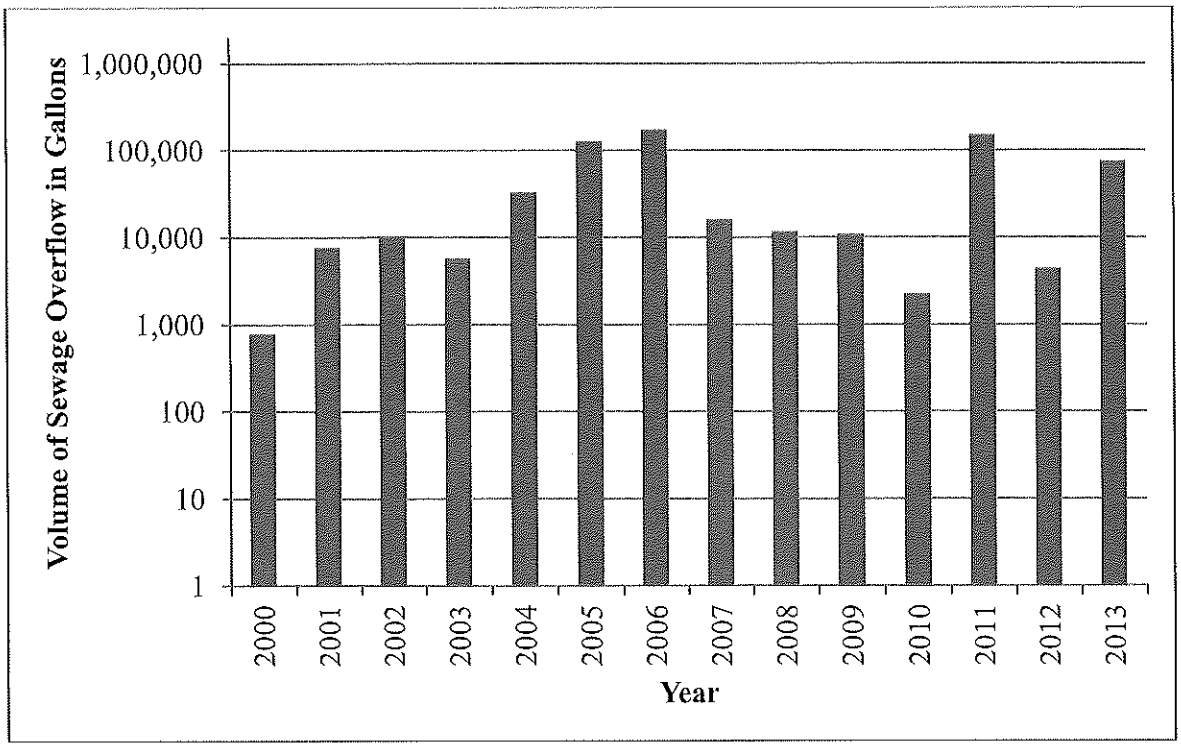

Figure 5.3: Volume of SSOs in Jones Falls Watershed per Year from 2000-2013

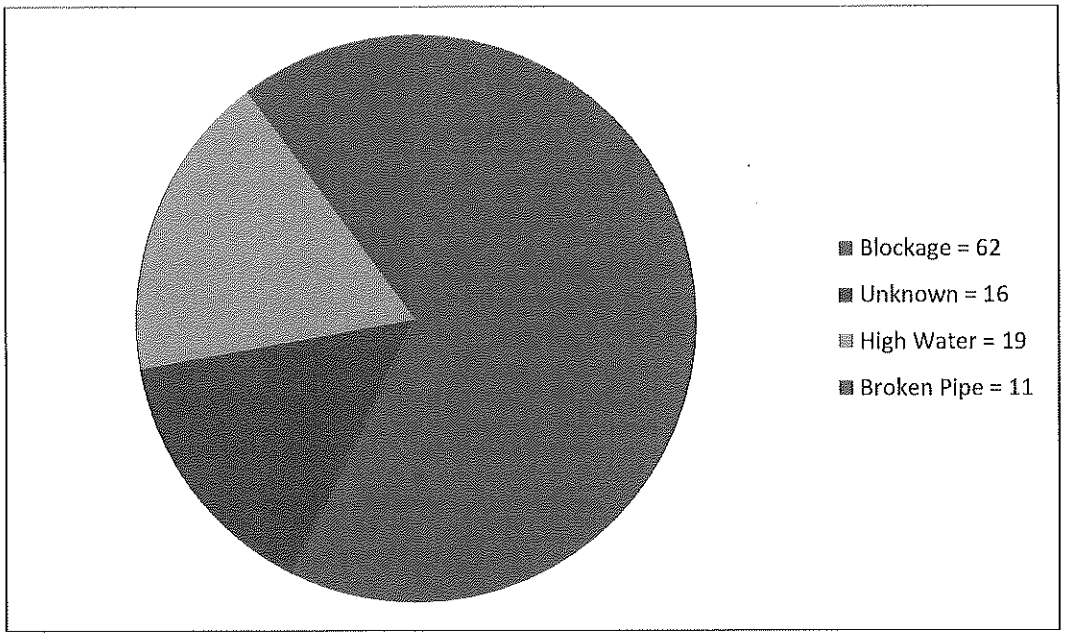

Figure 5.4: SSOs by Cause from 2000-2013

PIA 23-172 Hazen - 00808

Baltimore County conducts bacteria water quality sampling for *Escherichia coli* (*E. coli*) in the Jones Falls watershed. This section discusses the data results from the monthly Bacteria Trend Monitoring Program. Major sources of *E. coli*, as described in the TMDL are domestic animals, humans, livestock, and wildlife.

6.1. Baltimore County Bacteria Trend Monitoring Program

Baltimore County EPS has coordinated with Baltimore City Surface Water Management Division to monitor bacteria trend levels over time at 5 monitoring locations within Jones Falls watershed, beginning in June 2010. This is part of the Bacteria Trend Monitoring Program that includes Baltimore County, Baltimore City, and Carroll County to monitor bacteria trends over time at 32 monitoring locations within one subwatershed and six major watersheds. The bacteria trend monitoring program was developed in response to the development of bacteria TMDLs in Herring Run, Gwynns Falls, Loch Raven, Prettyboy, Jones Falls, Liberty Reservoir, and the Lower North Branch of the Patapsco watersheds. Bacteria monitoring began in June 2010, with 16 sites in Baltimore County, and 11 sites in Baltimore City. Bacteria monitoring in Carroll County began in 2012 and includes 5 sites in Carroll County. Jones Falls trend monitoring samples are collected on the first Thursday of every month by Baltimore City, and are brought to the Baltimore County EPS lab for *E. coli* analysis using IDEXX methodology. Table 6.1 shows the latitude/longitude locations of the current bacteria monitoring stations within the Jones Falls watershed. Figure 6.1 shows the locations of the monitoring sites for the entire trend monitoring program. There are five bacteria trend monitoring sites in the Jones Falls. Two of the monitoring sites are in the city and three are in the county.

6.1.1 Summary of Data Results

Samples are collected on the first Thursday of every month, except in circumstances of severe weather. Table 6.2 presents the number of samples and the geometric mean for high (wet) flow and low (dry) flow by year. It also presents the geometric mean of all samples by year regardless of condition. The table is stratified by annual data (includes all data collected for the year) and seasonal data (includes only those samples collected between May 1st and September 30th each year). Geometric means below the water quality standard (126 MPN) are highlighted in green. These results are displayed graphically in Figures 6.2 through 6.6.

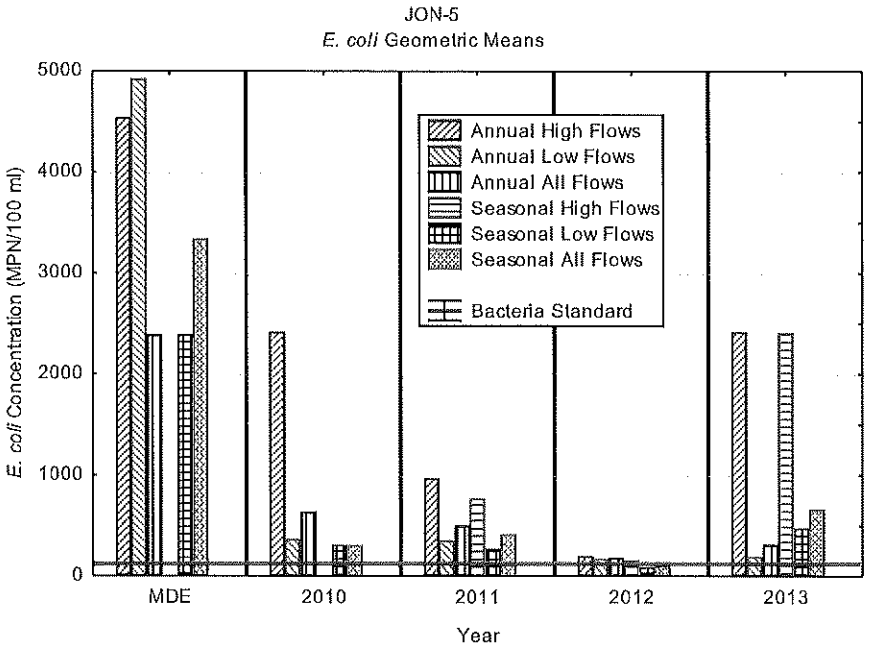

Figure 6.6: *E. coli* Geometric Mean Concentrations at Site JON-5 for both Annual and Seasonal Flow Periods Stratified by Flow Condition, MDE Results Added for Comparison

JON-1 (JON0039): This site is the located in Baltimore City on the mainstem of the Jones Falls and is the lowest monitoring point on the mainstem. It receives drainage from both Baltimore County and Baltimore City. The monitoring site is located above the confluence with Stoney Run. While the data indicate an improving trend over the four years of monitoring on an annual for both high and low flow and low flows on a seasonal basis, the geometric mean for all conditions is still higher than the water quality standard of 126 MPN/100 ml for *E. coli*. The Maryland Department of the Environment (MDE) data for this site indicted a geometric mean of 372 MPN/100ml for dry weather seasonal samples based on monitoring conducted between 10/2002 and 6/2003. A weighted mean for dry weather seasonal sampling for the four years of monitoring conducted by Baltimore County resulted in a value of 630 MPN/100ml. This would indicate the conditions are worsening at this station based on the difference between the two monitoring periods. The TMDL requires a 95.3% reduction of bacteria at this site.

JON-2 (JON0082): This monitoring site is located on the mainstem of Jones Falls in Baltimore County, below the Lake Roland dam. The entire drainage area is in Baltimore County. The Baltimore County monitoring indicated that this site has displayed continuing improvement for both low flow and high flow on an annual and a seasonal basis. Bacteria geometric mean water quality standards were met for both flow types on both the annual and seasonal basis. The MDE data for this site indicated a seasonal dry weather geometric mean of 139 MPN/100ml for this site. The four years of Baltimore County data resulted in a geometric mean of 84 MPN/100 ml for the dry weather seasonal data. This would indicate that there has been improvement at this site. The TMDL indicated a reduction of 95.3% reduction necessary for meeting bacteria water quality standards in the drainage area to this site. Based on the Baltimore County monitoring data, this site may have had enough bacteria reduction to meet the bacteria water quality

standards. Monitoring will continue at this site to confirm that bacteria water quality standards are being met.

JON-3 (JON0184): This is located on the mainstem of Jones Falls in Baltimore County upstream of Lake Roland at the Serrento Run USGS gage. The entire drainage area is in Baltimore County. The Baltimore County monitoring data indicates that the bacteria concentrations are improving, particularly for low flow conditions. Based on the annual data, bacteria water quality standards were met for low flow conditions and for all of the sample data, but not for the high flow conditions. However, on a seasonal basis while improving bacteria concentrations were found, the bacteria water quality standards were not met. The MDE data indicated a seasonal dry weather concentration of 501 MPN/100ml for this site, while the Baltimore County data, geometric mean for four years shows a concentration of 401 MPN/100ml indicating slight improvement. The TMDL requires 92.4% reduction for meeting bacteria water quality standards at this site.

JON-4 (UQQ005): This site is located in Baltimore County on Roland Run upstream from Lake Roland. The entire drainage is in Baltimore County and represents an urban subwatershed. The Baltimore County monitoring data indicates improving trends for low flow on both an annual basis and a seasonal basis. The annual low flow geometric means have met the bacteria water quality standards for the last three years (2011-2013). However, the seasonal low flow, while improving has yet to meet the bacteria water quality standards. The MDE data indicated a seasonal dry weather concentration of 872 MPN/100ml for this site, while the Baltimore County data for the four years of monitoring resulted in a geometric mean concentration of 374 MPN/100ml; indicating improvement at this site. The TMDL indicated a 92.1% reduction is necessary for meeting bacteria water quality standards at this site.

JON-5 (SRU0005): This site is located on Stoney Run in Baltimore City. A very small portion of the drainage area is in Baltimore County just above the city line. The data are somewhat variable on an annual basis, but a general improvement in low flow bacteria concentrations occurred the first three years of the monitoring program with an increase in 2013. Continued monitoring will determine if there is a consistent improvement of bacteria concentrations at this site. The MDE data indicated a seasonal dry weather concentration of 2,394 MPN/100ml at this site based on monitoring in 2002-2003, while the Baltimore County data for the four years of monitoring results in a geometric mean of 247 MPN/100 ml for the seasonal dry weather samples. This would indicate a significant improvement between the two monitoring periods. The TMDL indicated a 97.8% reduction in bacteria loads as necessary to meet bacteria water quality standards.

In addition to analyzing the data for the geometric means, the data were analyzed based on the single sample exceedance for seasonal data (May 1st to September 30th). Single sample exceedance standards are based on frequency of full body contact, ranging from infrequent (576 MPN) to frequent (235). The objective in the control of bacteria is to not only meet the geometric mean water quality standards, but to also meet the single sample water quality standards. This is particularly important for the low flow (dry weather) component of the flow regime, as this is when human recreational use of water is most likely to occur. Table 6.3 presents the results of the analysis by station, by year and by flow regime. The zero percent exceedances are highlighted in green.

Table 6.3: Frequency of Exceedance of Single Sample Water Quality Standards

Site	Year	N	Percent Single Sample Exceedance (MPN)

		Flow Type		576		410		298		235

	2011	2	3	50%	33%	50%	33%	50%	33%	100%	33%
	2012	1	4	0%	0%	0%	0%	0%	25%	0%	25%
	2013	1	4	100%	25%	100%	25%	100%	25%	100%	75%

The frequency of exceedance data shows improvement for station JON-2. These data indicate that dry weather and wet weather bacteria concentrations may not be a concern at station JON-2. This site is below the Lake Roland dam and may benefit from treatment by the Lake Roland waters. The other four sites are more variable in results with no specific trends noted.

The bacteria trend monitoring program will continue until such time as all bacteria water quality standards are met in the Jones Falls watershed.

6.4 Summary of Current Condition

Based on the results of the current trend monitoring program, sampling indicates that while improvements have occurred, additional work is necessary to meet the bacteria water quality standards, particularly with respect to high flow concentrations.

PIA 23-172 Hazen - 00816

Baltimore County has already developed management plans that aim to remove certain pollutants in parts of the Jones Falls watershed. Section 7.1 is a brief summary of the Northeastern Jones Falls Small Watershed Action Plan (SWAP). Section 7.2 is a brief overview of the Lower Jones Falls SWAP and section 7.3 is a description of the Jones Falls Watershed Management Plan. SWAPs include local based goals and objectives that are beyond the scope of the TMDL IP. All completed SWAP documents and their appendices are available online. Past studies, including these SWAPs and the Watershed Management Plan, were used to inform the Implementation Plan. The following subsections provide more specific information for each plan within the Jones Falls watershed.

7.1 Northeastern Jones Falls Small Watershed Action Plan, 2012

The *Northeastern Jones Falls SWAP* addresses a 10.9 square mile portion of the Jones Falls watershed, making up the north eastern part of the Jones Falls watershed that is within Baltimore County. Northeastern Jones Falls includes the four sub-watersheds: Roland Run, Ruxton Run, Towson Run, and the Lake Roland Direct Drainage. The Northeastern Jones falls represents 19% of the entire Jones Falls watershed.

The SWAP is a strategy for restoring the Northeastern Jones Falls. It was developed, in 2012, by Baltimore County Department of Environmental Protection and Sustainability with extensive input from county citizens, county agencies, members of watershed associations, and various institutions. The action plan outlines recommendations for watershed restoration, describes management strategies for each of the four sub watersheds, and identifies priority projects for implementation. The plan also includes cost estimates for certain potential actions and a schedule for implementation over a 13 year timeline. Financial and technical partners are suggested for implementation of various potential actions.

7.1.1 SWAP Vision and Goals

Northeastern Jones Falls SWAP Vision:

The Northeastern Jones Falls Steering Committee adopted the following vision statement that served as a guide in the development of the SWAP:

We envision a healthy, vibrant Northeastern Jones Falls watershed, which protects high quality streams and is supportive of diverse aquatic life. Our watershed conserves treasured natural resources and maintains and celebrates our residential character and landscape for today and for future generations.

Northeasten Jones Falls SWAP Goals:

- Goal 1: Improve and Maintain Clean Water
- Goal 2: Enhance Stream Riparian Corridors for Water Quality and Habitat Value
- Goal 3: Increase Citizen Participation with Restoration Projects
- Goal 4: Encourage Collaboration with the Institutional Landowners and Baltimore County EPS on Restoration Projects
- Goal 5: Enhance Natural Resources on Public Property
- Goal 6: Maintain the Residential Character of the Watershed

PIA 23-172 Hazen - 00817

7.2 Lower Jones Falls Watershed Small Watershed Action Plan, 2008

The *Lower Jones Falls SWAP* addresses the southern portion of the Jones Falls watershed, including the area that crosses over into Baltimore City. The area includes six sub-watersheds and makes up 45% of the Jones Falls watershed. The Lower Jones falls is 25.9 square miles of the entire 58 square miles of the Jones Falls watershed.

This small watershed action plan was developed by a partnership between Baltimore County, Baltimore City, the Herring Run and Jones Falls Watershed Associations, and the Center for Watershed Protection Inc. The plan presents results of a thorough watershed assessment by sub-watershed, conceptual storm water retrofit project plans, overall watershed recommendations, and a draft schedule for implementation with anticipated benefits of implementation.

7.2.1 SWAP Goals

The stakeholder meetings resulted in the following set of goals to guide recommendations for the lower Jones Falls SWAP:

- Goal 1: Improve conditions in stream to achieve standards of swimmable, fishable, and water contact recreation in streams by 2022.
- Goal 2: Improve the condition of the biology in the stream by planting more stream buffers along streams and removing concrete stream channels.
- Goal 3: Implement effective watershed education.
- Goal 4: Increase the involvement of the population
- Goal 5: Disconnect impervious surfaces from the storm drain system
- Goal 6: Integrate stormwater and watershed planning goals in new and redevelopment.
- Goal 7: Continue collaboration between Baltimore City/County, watershed groups and citizens.
- Goal 8: Engage the business community in restoration
- Goal 9: Improve management of natural and turf areas

7.3 Jones Falls Watershed Management Plan (1998)

The WQMP for Jones Falls is a document that details Capital Improvement Projects (CIPs) that the County could consider to improve water quality. These Management Plans focused on County-specific actions, and not citizen-based initiatives. The plans outlined in the WQMP may be useful for determining CIPs that the County may still implement through this plan and in the future. The SWAPs include some additional CIPs along with various citizen-based plans that can reinforce the efforts of the County. The full plan is available for review at the EPS offices at 111 W. Chesapeake Ave. Towson, MD 21204.

PIA 23-172 Hazen - 00818

This section provides an overview of pollutant reduction measures and their predicted effectiveness. This overview is meant to serve as a guide to aid in selecting the most efficient possible BMPs that may be implemented to meet the pollutant reduction goals required by the TMDL. This review utilizes conservative estimates of BMP efficiency for planning purposes, as exact types of BMPs (e.g. structural BMPs) will not be chosen until appropriate on-site analysis is complete. It is possible that only some of the listed actions in this section will be selected for inclusion in Section 9 of this Implementation Plan

Bacteria can be removed from or inactivated in surface waters and stormwater through several treatment mechanisms by implementing Best Management Practices (BMPs). Treatment mechanisms include ultraviolet light (from sunlight), sedimentation, settling, plant uptake, drying, temperature, and filtration. Bacteria require specific environmental conditions to thrive and survive (Clary et al. 2010; Hathaway and Hunt 2008). BMPs commonly have moist soils and readily available nutrients, conditions that may be conducive to pathogen persistence. In some instances, BMPs can be sources of pathogens. This occurs in BMPs which attract wildlife including deer, waterfowl, rodents, and domestic animals which defecate in and around the BMP resulting in direct pathogen inputs to the system (Hathaway and Hunt 2008).

Removal efficiencies are typically calculated by comparing contaminant concentrations or loads entering and exiting a structural control (US DOI 2002). Removal efficiencies of structural controls depend on many factors including the type and design; site characteristics such as soil type, catchment size, land use, percent impervious area, storm size and intensity, bypass issues, maintenance and upkeep of the systems, and retention time (US DOI 2002). BMP systems rather than individual BMP installation tends to work better (Haynes 2006).

Several sources were consulted including the International BMP Database, research studies, and other existing TMDL implementation plans. Below is a description of several BMPs that have been studied for removal of bacteria and Table 8.1 summarizes the efficiencies of each BMP.

8.1 Types of Best Management Practices for Addressing Bacteria

8.1.1 Sanitary Sewer Repairs

Sanitary Sewer Overflows (SSOs) occur when the capacity of a sanitary sewer is exceeded. There are several factors that may contribute to SSOs from a sewer system, including pipe capacity, operations and maintenance effectiveness, sewer design, age of system, pipe materials, geology and building codes. As of September 2005, Baltimore County is under a consent decree with the U.S. Environmental Protection Agency (EPA) to repair, replace or rehabilitate the system with the goal of eliminating all overflow structures to be completed by March 2020 (US EPA et al. 2006). It is assumed that there will be a 95% bacteria efficiency removal.

8.1.2 Grass Swales/Bioswale

Grass swales are vegetated open channels designed to treat stormwater runoff by slowing the water to allow sedimentation and filtering as the water flows along these channels. Grass swales are typically located along roads because they are linear. They should be sited on relatively flat sites as steep slopes encourage erosion. Grass swales typically do not have a high efficiency of bacteria removal, in fact several studies have shown a negative bacteria removal efficiency (-50%) which indicates more bacteria left the system than entered (US EPA 2012a). This may be

because swales are attractive to animals and are not necessarily intended to completely dry between storms, potentially providing an environment where pathogens can persist (Hathaway and Hunt 2008).

8.1.3 Riparian Buffer Zones

Riparian buffer zones are vegetated areas along streams to reduce erosion, sedimentation, and pollution of water (US EPA 2012a). Densely vegetative cover removes pollutants through detention of runoff, filtration by the vegetation, and infiltration into soil (BoyerND). The effectiveness of buffers for reducing bacteria pollution, however, is dependent on the type of vegetation and the width of the buffer. Typically, the wider the buffer, the more pollution reduced. The VA DEQ Guide reports a bacteria removal efficiency of 43-57% (VA DECR and VA DEQ 2003).

8.1.4 Dry Detention Ponds

Dry detention ponds are basins whose outlets have been designed to detain stormwater runoff for some minimum time (e.g., 24 hours) to allow particles and associated pollutants to settle. They do not have a large permanent pool of water but are often designed with small pools at the inlet and outlet of the basin or can be completely dry between precipitation events (Hathaway et al. 2009; US EPA 2012a). The primary pollutant removal mechanisms are sedimentation, drying, and sun exposure (Hathaway et al. 2009). Studies show detention ponds have a bacteria removal efficiency of 25% (VA DECR and VA DEQ 2003).

8.1.5 Retention Ponds/Wet Ponds

Retention ponds/wet ponds are basins where influent runoff enters the pond and theoretically replaces captured runoff from prior events (the principle of plug flow) (Hathaway et al. 2009). The wet pond retains the runoff for 1-2 days and then slowly drains (Hathaway and Hunt 2008). Bacteria removal is facilitated through settling (sedimentation), plant uptake and sun exposure (Hathaway et al. 2009; Hathaway and Hunt 2008). According to Emmons and Olivier Resources, Inc. and the EPA, literature review studies cite average bacteria removal rates of 65-70% (Tilman et al. 2011; US EPA 2012a).

8.1.6 Bioretention/Biofiltration Ponds

Bioretention areas function as filtration and infiltration BMPs. Storm water enters the system and passes through a permeable soil media where pollutants are filtered, similar to sand filter systems, and are also vegetated. The system may pond water; however, it is drained within 12–24 hours. Tree box filters are smaller versions of bioretention systems which are installed along sidewalks as vegetated catch basins. The actual collection or entry point is typically a concrete structure with a catch basin or gutter opening integrated with the street curbing. Treated runoff is filtered into the groundwater or transported to the storm sewer system. The bioretention system is intended to dry out between storm events (Hathaway et al. 2009). Literature review studies cite average bacteria removal rates of 70% (Tilman et al. 2011).

8.1.7 Wetland Treatment Systems

Wetland treatment systems consist of a wetland constructed with the purpose of treating wastewater or stormwater inputs. The wetlands may be vegetated, open water, or a combination (Tilman et al. 2011). These BMPs promote sedimentation like wet ponds, but provide more exposure of captured stormwater to wetland soils and plants in a shallow system (Hathaway et al.

2009). Sun exposure in the open areas and natural die-off are thought to reduce the bacteria population (Tilman et al. 2011). Research studies found average measured bacteria removal efficiencies for wetland systems of 79% (Tilman et al. 2011). The level of bacteria reduction has been shown to increase as the treatment time (e.g., longer than 1-2 days) increases (Khatiwada and Polprasert 1999).

8.1.8 Sand Filters

Sand filters are a storm water treatment practice designed to remove sediment and pollutants from the first flush of runoff from pavement and impervious areas after a rain or storm event (Boyer ND). Runoff first enters a sedimentation chamber before flowing through a column of soil. Sand chamber is dry between events. Treatment mechanisms relevant to pathogen removal include drying, sedimentation and filtration (Hathaway and Hunt 2008). Stormwater Best Management practices database (2010) indicated that sand filters are effective in removing from 36 to 83% of the bacteria in urban runoff.

8.1.9 Infiltration Basin

An infiltration basin is a shallow vegetated open impoundment where incoming stormwater runoff is stored until it gradually infiltrates into the soil. Runoff enters the basin and bacteria are removed through detention and filtration. Limitations include the need for permeable soils to reduce the potential for clogging and the need for regular maintenance. The VA DEQ Guidance Manual cites infiltration basins can provide 50% bacteria removal efficiency (VA DECR and VA DEQ 2003).

8.1.10 Infiltration Trench

An infiltration trench is an excavated trench that has been lined with filter fabric and backfilled with stone to form an underground basin or reservoir (Boyer Year Unknown; VA DECR and VA DEQ 2003). Stormwater runoff is directed into the trench through the use of grass areas or pretreatment devices. Trenches tend to be more suitable for ultra-urban situations, where the soil has low permeability (Boyer Year Unknown). The VA DEQ Guidance Manual cites infiltration trenches can provide 50% bacteria removal efficiency (VA DECR and VA DEQ 2003).

8.1.11 Porous Pavement

Porous or pervious pavement allows rainfall to percolate through it to the subbase, providing storage and enhancing soil infiltration that can be used to reduce runoff and combined sewer overflows. The water stored in the subbase then gradually infiltrates the subsoil (VA DECR and VA DEQ 2003). According to the VA DEQ Guidance Manual (2003), porous pavement can provide 50% bacteria removal efficiency.

8.1.12 Stream Bank Protection and Stabilization

Waterways that are being eroded can be stabilized by constructing bulkheads, using riprap, gabion systems or establishing vegetation which can reduce the amount of bacteria, nutrients, and sediment from entering the waterway (VA DECR and VA DEQ 2003). Stream bank protection and stabilization can provide for 40-75% bacteria removal efficiency (40% without fencing and 75% with fencing) (VA DECR and VA DEQ 2003).

8.1.13 Public Education – Pet Waste

Public education and outreach are important tools for reducing bacterial pollution due to pet waste. A pet waste education program would educate pet owners to better understand the importance of appropriate pet waste management practices. This program will include the development and distribution of educational materials and the promotion of pet waste BMPs. Public education for pet waste can provide for 25% bacteria removal efficiency (VADEQ 2013).

8.1.14 Street Sweeping

There are three types of street sweepers commonly used: mechanical, vacuum-assisted, and regenerative air (US DOI 2002). The most common type of sweeper, the mechanical sweeper, lifts dirt off the street by a rotating broom and feeds it to a hopper by a conveyor system. A water spray is often used to control dust. Vacuum-assisted sweepers combine a mechanical sweeper with a high-power vacuum. Some use a water spray to control dust. Regenerative-air sweepers combine a mechanical sweeper to loosen dirt with forced air to dislodge the remaining dirt. Street sweeping frequency is an important variable in the effectiveness of removing contaminants (US DOI 2002). For example, sweeping the street at least once between storms is important to remove contaminants before they are washed away by storms. Removal efficiencies are highest for suspended solids, intermediate for removal of lead, and lowest for fecal coliform bacteria and total phosphorus (US DOI 2002). Multiple passes with the street sweeper and the speed of the street sweeper also can affect the removal capabilities. Simulation models developed by USGS show a fecal coliform removal efficiency of 1.3-5.3%, depending on sweeping frequency and land use (US DOI 2002).

8.1.15 Redevelopment

Redevelopment consists of applying new uses to previously occupied urban space. This can sometimes involve a change in zoning or land use all together, or simply finding new uses for existing structures. In many cases this can allow for a site that previously had no water quality treatment practices to incorporate them into the new development.

Table 8.1: Reduction Efficiencies for BMPs treating Bacteria

Best Management Practice	Efficiency
Sanitary Sewer Overflow repairs	100%
Grass swale	-50%
Riparian buffer zone	43-57%
Dry detention ponds	25%
Retention ponds	65-70%
Bioretention/Biofiltration ponds	70%
Wetland treatment systems	79%
Sand filters	30%
Infiltration basin	50%
Infiltration trench	50%
Porous pavement	50%
Stream bank protection and stabilization (no fencing)	40%
Stream bank protection and stabilization (with fencing)	75%
Public education – pet waste	25%
Street sweeping	1.3-5.3%
Redevelopment	Varies

PIA 23-172 Hazen - 00822

Please note, while some BMPs provide ranges, the lowest efficiency have been used in calculations to determine the acres treated by each BMP.

8.2 Agricultural and Septic System BMPs

8.2.1 Animal Waste Storage Facility

A waste storage area is made by constructing an embankment and/or excavating a pit or dugout, or by fabricating a structure in order to temporarily store wastes such as manure, wastewater, and contaminated runoff (Peterson et al. 2011). An optimal use of waste storage is to improve the timing of manure applications so that manure nutrients are distributed to fields based on crop and soil needs, instead of repeated applications on the same field based on convenience (Peterson et al. 2011). Long-term manure storage (6-30 weeks) resulted in the reducing *E. coli* by 97% (Peterson et al. 2011).

8.2.2 Exclusionary Fencing

Livestock with access to streams introduces direct deposits of fecal matter and bacteria into the waterway. By limiting access of livestock to waterways with a constructed barrier has 75% bacterial removal efficiency (VA DECR and VA DEQ 2003).

8.2.3 Livestock Water Crossing Facility

Providing a controlled crossing for livestock and/or farm machinery in order to prevent streambed erosion and reduce sediment can also reduce bacteria in streams (VA DECR and VA DEQ 2003). Stream crossings can reduce *E. coli* 46% when combined with other practices (Peterson et al. 2011).

8.2.4 Alternative Water Sources

Providing livestock access to an off-stream drinking water source such as a trough or pond system decreases the amount of direct livestock use of streams for drinking and other activities (Peterson et al. 2011). An off-stream alternative water supply can result in a 85% bacteria removal efficiency (Peterson et al. 2011).

8.2.5 Range and Pasture Management

Range and pasture management refers to systems of practices to protect the vegetative cover on improved pasture and native rangelands. It includes practices such as seeding or reseeding, brush management (mechanical, chemical, physical, or biological), proper stocking rates and proper grazing use, and deferred rotational systems. Range and pasture management results in 50% bacteria removal efficiency (VA DECR and VA DEQ 2003).

8.2.6 Septic System Pump-Out

The greatest threat to surface water bacteria impairment originates from system failure when septage comes to the soil surface and results in overland flow (VA DECR and VA DEQ 2003). A typical septic system consists of a tank that receives waste from a residence or business, and a drain field or subsurface absorption system consisting of a series of percolation lines for the disposal of the liquid effluent. Solids (sludge) that remain after decomposition by bacteria in the tank must be pumped out periodically in order to prevent septic failure. Regular septic system pump-outs can result in 5% bacteria removal efficiency (VA DECR and VA DEQ 2003).

PIA 23-172 Hazen - 00823

Table 8.2: Reduction Efficiencies for Bacteria for Agricultural and Septic BMPs

Best Management Practice	Bacteria Removal Efficiency
Animal waste storage facility	97-99%
Exclusionary fencing	75%
Livestock water crossing facility	46%
Alternative water sources	85%
Range and pasture management	50%
Septic pump-out	5%

8.3 Discussion of Uncertainty

Literature reviews have shown that pathogen removal appears to vary not only by BMP type, but also among similar BMP types at various locations (Clary et al. 2010; Hathaway and Hunt 2008). For example, there is considerable variability in the effectiveness of wet ponds, and it is believed that properly designing and maintaining ponds may help to improve their performance (Clary et al. 2010; US EPA 2012). Based on the performance data available to date in the BMP Database for fecal indicator bacteria, only general inferences regarding BMP selection are appropriate at this time. General recommendations as a result of the analysis include:

- In general, bioretention and sand filters appear to have ability to remove pathogens; these systems have little input from animals due to their lack of standing water, eliminating a common attraction for waterfowl (Clary et al. 2010; Hathaway and Hunt 2008).
- Conversely detention ponds and grass swales have not been shown to be very effective. Swales are attractive to animals and are not necessarily intended to completely dry between storms, potentially providing an environment where pathogens can persist (Clary et al. 2010; Hathaway and Hunt 2008).
- Seasonal distribution of samples may affect conclusions drawn related to BMP performance (Clary et al. 2010). For example, winter concentrations of fecal indicator bacteria may be lower than summer concentrations (Clary et al. 2010).

The majority of conventional stormwater BMPs in the BMP Database do not appear to be effective at reducing fecal indicator bacteria concentrations to primary contact stream standards, which is the ultimate target of TMDLs. Because the data are limited, both in the number of data points and the representativeness of the data, rigorous statistical conclusions cannot be drawn based on available data. Significantly more studies are needed for all BMP types to increase the confidence of performance estimates with regard to bacteria (Clary et al. 2010).

8.4 Alternative BMPs

8.4.1 Sanitary Sewer Lateral Line Program

The consent decree addresses sanitary sewer pipes that are located on public property. The connection between private owners and the county portion are referred to as lateral lines. These lateral lines are also prone to leaking which can result in bacteria entering waterways. If water quality standards are not achieved through the consent decree and other BMPs to address bacteria, the County will assess the feasibility of developing a program to monitor bacteria that may be the result of leaking lateral lines.

8.4.2 Stormtech Isolator Row

Stormtech Isolator Row is a manufactured treatment device that uses a series of subsurface chambers over geotextile fabric and crushed stone for filtration of pollutants beneath parking lots or other infrastructure. Over time, an organic filter cake forms between the chamber and geotextile fabric for enhanced chemical sorption. More research is needed to determine the bacteria removal efficiency.

In this section you will find a list of actions that together become one scenario as to how the county could reach the pollutant load target. While EPS has developed this scenario, progress will be assessed on an annual basis through results of implementation actions and monitoring data. It is intended that the IP will be reviewed on a five-year cycle for potential revisions. The county takes an adaptive management approach to all watershed planning efforts.

Adaptive management is a decision process that promotes flexible decision making that be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood (U.S Department of the Interior 2009). The tools that Baltimore County will use in adaptive management are the tracking of implementation progress through the various actions proposed in the strategy in this section, identification of barriers that prevent targeted actions from occurring, and an enhanced monitoring program to measure progress in both reductions and meeting water quality standards. While this will be an on-going process, there will be a formal review of the strategy at five year intervals to determine if changes are needed or if the strategies are on track.

The actions are broken out into three separate sections. Programmatic actions are actions that do not have a measureable load reduction, but create the condition necessary to reduce the pollutant. Some of these actions require a plan for program development because they are new programs that have not yet been developed by the county. Management actions are actions that require regular actions on county property. Restoration actions are new control measures aimed to reduce pollutant loads. Finally, you can find a discussion of the reductions, which states the year by which the reduction load will be met and describes other factors that play into meeting the water quality criteria.

The actions discussed in this section are to be implemented in addition to currently in-progress or completed programs and restoration actions. Some actions in some parts of Baltimore County have already been completed, such as certain stream restorations, or riparian area reforestations, but there are still many projects in need of completion before water quality goals are met. The Jones Falls watershed is located in parts of Baltimore County and Baltimore City. While the TMDL document requires a reduction for the entire watershed, actions described in this implementation section will be limited to what Baltimore County may oversee, as we cannot direct reduction efforts in other jurisdictions.

Of the 34,122 acre Jones Falls watershed, only 25,933 acres are included within Baltimore County's jurisdiction which is equal to roughly 76% of the watershed. Baltimore County assumes that it is responsible for reducing its *E. coli* load by 12,265.6 billion MPN/year, which is 76% of the 16,139 billion MPN/year that needs reducing for the watershed as a whole. A reduction of 94.9% is necessary for the entire Jones Falls to meet the water quality endpoint of 119.7 MPN/100 ml (5% lower than 126 MPN/ 100 ml to account for margin of safety). Table 9.1 summarizes the reductions needed by station. This section includes many actions that were planned in the SWAP and also discussed in Section 7 of this document.

Table 9.1: Annual Average TMDL and Percent Reduction by Sub-Watershed

Subwatershed	*E. coli* Baseline Load (BillionMPN/year)	Target Load Reduction (BillionMPN/year)	Long-Term Average *E. coli* TMDL Load (BillionMPN/year)	% Required Reduction

JON0184	1,206,325	1,115,075	91,250	**92.4%**
UQQ0005	133,955	123,370	10,585	**92.1%**
JON0082sub	887,315	845,340	41,975	**95.3%**
JON0039sub	3,340,480	1,184,260	156,220	**95.3%**
SRU0005	636,560	622,960	13,870	**97.8%**
Total	**6,204,270**	**5,890,735**	**313,900**	**94.4%**

As discussed in Section 3, it can be seen that high levels of bacteria in the water coincide with high flow rates. This is likely the result of bacteria being washed into the waterways during storm events. High concentrations of bacteria also coincide with warmer times of year. It is expected that human contact will occur most frequently during times of low flow, as storm events (high flow) are not as conducive to water contact recreation. The actions outlined in this section will target reducing bacteria counts during all conditions to acceptable levels, while prioritizing the meeting of Water Quality Standards (WQS) for times most suited to water contact recreation.

While the final target will be to achieve water quality standards for all flow conditions and for annual and seasonal periods, by the end of 20 years of implementation, there will be five year interim goals that will help track progress to the end goal. Table 9.2 shows the interim targets for *E. coli* concentrations when measured both by single samples and by the calculated geometric mean from longer term monitoring. The single sample targets are based on dry weather samples only. Meeting the single sample target means that all dry samples will be less than the level for each of the interim milestones. For example, by 2025 the target is for all dry weather samples to be less than 410 MPN/100 ml.

Table 9.2: Five Year Interim Targets for Single Sample and Geometric Mean *E. coli* Densities

Single Sample Target (MPN/100 ml)				
Weather Condition	**2020**	**2025**	**2030**	**2035**
Dry	576	410	298	235
Wet	NA	NA	NA	NA
Geometric Mean Target (MPN/100 ml)				
Dry	477	360	243	126
Wet	6,880	4,630	2,380	126

9.1 Action Types

The actions below are divided into programmatic actions, management actions, and restoration actions. Programmatic actions are actions that do not directly result in load reductions, but create the necessary conditions for load reduction. Management actions are those where there is regular management of county property, such as, street sweeping, and sanitary sewer maintenance. Restoration actions include the development of new control measures aimed to reduce pollutant loads as well as retrofits of existing stormwater management facilities. There are many actions that may be taken that would have an explicitly indirect impact on bacteria, however with no ability to prove the cause/effect relationship of these actions, they will be omitted (e.g. stream restorations).

9.1.1 Programmatic Actions

Programmatic actions are those that do not directly result in load reductions, but create the necessary conditions for load reduction. Actions within this category might include public education and outreach activities, monitoring, or supporting specific legislation. These actions

PIA 23-172 Hazen - 00827

will move Baltimore County closer to achieving TMDL targets; however, there is currently no way to attribute a predictable pollutant load reduction to programmatic actions. Some programmatic actions, such as investigation and monitoring, are necessary to implement management and restoration actions or make those actions more efficient. Other programmatic actions, such as education and outreach actions, are predicted to increase the load reduction over time through BMP implementation by individual citizens. The exact load reduction is not predictable because the participation rate for individual home owners installing BMPs, as a result of public education, is not yet known.

9.1.2 Monitoring and Reporting Actions

As a subset of programmatic actions, the monitoring and reporting actions will provide the means for determining progress made in meeting the load reductions. Some of the monitoring actions will be used to better target programs for remediation.

9.1.3 Management Actions

Management actions are those where there is regular management of county property, such as, street sweeping. It does not include the development of new control measures, such as, retrofitting highway yards. Management actions have predictable load reductions, which can be used to calculate the contribution of each action toward meeting the overall load reduction required by the TMDL.

9.1.4 Restoration Actions

Restoration actions include the development of new control measures aimed to reduce pollutant loads as well as retrofits of existing stormwater management facilities. It may include reforestation actions as well as any stormwater control measures that do not require regular management on county property. Restoration actions will have predictable load reductions, which will be used to calculate the contribution of each action toward meeting the overall load reduction required by the TMDL.

PIA 23-172 Hazen - 00828

9.2 Reductions by Source

The various sources of bacteria will require different management practices to achieve the overall reductions needed to meet bacteria water quality standards. The relative contributions were calculated by MDE for the fours sources; human, domestic pet, livestock, and wildlife. These relative contributions were used to calculate the *E. coli* baseline bacteria loads. Section 3 provides more information on the methods used to determine the relative contribution from sources and the calculation of the baseline loads. The information displayed in Table 9.3 was derived from Table 4.7.1 in the TMDL document.

Table 9.3: Distribution of Sources of *E. coli* Bacteria Loads (MPN/100ml) and % Relative Contribution

Station	Domestic Pet		Human		Livestock		Wildlife		Total Load	% Reduction
	%	Load	%	Load	%	Load	%	Load		
JON0184	27.4%	906.5	52.0%	1,719.2	16.3%	538.1	4.3%	141.5	3,305.3	**92.4%**
UQQ0005	16.8%	61.6	70.5%	258.6	7.4%	27.1	5.3%	19.3	366.6	**92.1%**
JON0082sub	24.1%	585.5	57.8%	1,404.7	13.2%	321.8	4.9%	118.7	2,430.7	**95.3%**
JON0039sub	19.9%	1,816.7	67.5%	6,175.6	9.1%	832.3	3.6%	327.3	9,151.9	**95.3%**
SRU0005	13.8%	240.4	80.1%	1,396.2	5.4%	94.1	0.7%	13.0	1743.7	**97.8%**
Watershed	**16.8%**		**54.6%**		**11.4%**		**3.4%**		**16,998.2**	**94.4%**

*Percentages by source do not equal 100% because the remainder is from unknown bacteria sources

9.2.1 Reductions to Human Sources

Human sources may be some of the more important bacteria sources to focus on reducing, as human fecal matter is the most probable transporter of human pathogens. Based on annual weighted average measurements in the TMDL document, approximately 54.6% of the Jones Falls inputs are from humans. The Jones Falls is serviced by sewer systems and a small portion by septic systems. Failing septic systems, leaking infrastructure, and Sanitary Sewer Overflows (SSOs) all contribute to human fecal bacteria inputs. SSOs, in the sewered portion of the watershed, are expected to be largely addressed by Baltimore County's continuing compliance with the consent decree to eliminate all SSOs within the County by March 2020. According to MDE, the Most Practicable Reduction (MPR) for reduction of human bacteria inputs is 95%. For all subwatersheds in the Jones Falls, water quality standards could not be met based on MPRs. Fecal bacteria reductions from human sources would need to reach 98% in order to meet water quality standards.

9.2.2 Reductions to Domestic Pet Sources

Based on annual weighted average measurements in the TMDL document, approximately 16.8% of total bacteria inputs to the watershed come from domestic pet sources. A large contributor of the domestic bacteria in Jones Falls comes from pet owners failing to pick up dog waste, and from runoff carrying that dog waste into streams and tributaries. MDE states the maximum possible reduction for this type of bacteria input is 75%. The majority of reductions to domestic bacteria inputs are expected to come from a focus on educational programs to promote behavioral change in pet owners. For all of the Jones Falls subwatersheds, necessary reductions matched the MPR.

9.2.3 Reductions to Livestock Sources

According to the TMDL document, livestock accounted for 11.4% of bacteria inputs to the Jones Falls watershed. MDE states the maximum possible reduction for this type of bacteria input is

75%. For all of the Jones Falls subwatersheds, necessary reductions matched the MPR. Reductions to livestock bacteria inputs can be met using sediment reducing BMPs.

9.2.4 Reductions to Wildlife Sources

Based on annual weighted average measurements in the TMDL document, approximately 3.4% of total bacteria inputs to the watershed come from wildlife sources. They are not subject to laws or property boundaries, and are not suited to educational programs. This makes managing wildlife bacteria inputs quite difficult, and MDE acknowledges that the maximum possible reduction for wildlife bacteria inputs is actually 0.0%.

9.3 Implementation Actions

Table 9.1 below outlines the specific actions intended to be taken to reduce bacteria inputs to Gwynns Falls. These actions are organized by action type, as discussed above, and they indicate which source will be addressed by implementing each action. The table also includes a time frame to indicate a predicted time period by which the action should be fully implemented, and a performance standard to measure success. The column of responsible parties will indicate who will likely be tasked with implementing that specific action.

Table 9.4: Implementation Actions for the Reduction of Bacteria in Jones Falls

Action	Time Frame	Performance Standard	Responsible Party	Source Addressed[1]			
				H	D	W	L
Programmatic Actions							
Develop an agriculture workgroup to address livestock sources of bacteria	1-20 years	Workgroup established, # of agricultural actions taken to address livestock bacteria	EPS, Agricultural Community				X
Continue to meet the requirements of the consent decree for the elimination of sanitary sewer overflows	Ongoing	Status report	Baltimore County	X			
Implement a unified restoration tracking system to track progress toward meeting TMDL reduction requirements	2 years	None	Implementation Committee	X	X	X	X
Support State and County efforts to reduce and eliminate homelessness.	10 years	Actions taken	EPS	X			
Implement an awareness campaign to spread information regarding pet waste and streams.	3-20 years	Number of educational activities performed.	EPS, Blue Water Baltimore		X		
Measure behavioral change in pet waste management as a result of educational/outreach efforts. Check behavior against state/national averages if data is available.	3-5 years	Report on behavioral change that has resulted from educational/outreach efforts.	EPS		X		

PIA 23-172 Hazen - 00830

Action	Time Frame	Performance Standard	Responsible Party	Source Addressed[1]			
				H	D	W	L
Promote PAI's "Rat Attack" program to mitigate rat infestations.	20 years	Measurable reduction in number of rat complaints; measurable reduction in rat sourced bacteria if species tracking is available.	PAI			X	
Assess alternate implementation practices over time as they become known to Baltimore County.	On-going	Take advantage of future advancements in technology and accepted practices that we may not be aware of at the time of producing this document.	All	X	X	X	
Management Actions							
Street Sweeping Existing	On-going	Historic Data	Baltimore County EPS		X	X	X
Storm Drain Inlet Cleaning	On-going	Historic Data	Baltimore County EPS		X	X	X
Restoration Actions							
Implement Consent Decree and Eliminate Sewer Overflows	6 years (Consent decree is until 2020)	SSOs addressed each year	DPW	X			
Continue to assist land owners in addressing failing septic systems	On-going	Number of failing septic systems corrected	EPS, GWM	X			
Investigate and convert existing dry detention ponds identified for water quality treatment	10 years	Acres addressed	Baltimore County EPS		X	X	X
Design and implement stormwater retrofits at all feasible sites	4 years	Acres addressed	Baltimore County EPS, Blue Water Baltimore		X	X	X
Continue Stream restoration projects	10 years	Projects completed	Baltimore County EPS	X	X	X	X
Monitoring Actions							
Continue the Bacteria Trend Monitoring Program.	On-going	Annual monitoring at all sites	EPS	X	X	X	X
Implement the Bacteria Subwatershed Prioritization Program	2-years	Annual Reporting at all sites	EPS	X	X	X	X
Implement the bacteria source tracking monitoring program, in subwatersheds with high bacteria concentrations	2-20 years	Annual monitoring at all designated sites.	EPS	X	X	X	X

Action	Time Frame	Performance Standard	Responsible Party	Source Addressed[1]			
				H	D	W	L
Continue to implement Stream Watch, a citizen-based program, to increase the ability to identify sources of water quality and habitat degradation.	On-going	Number of stream miles adopted in the Baltimore County portion of Lower North Branch of the Patapsco River	Blue Water Baltimore	X	X		
Work with MDE to repeat the bacteria source contribution monitoring, in association with the MS4 Permit renewal for all sites that are not meeting bacteria water quality standards	5 year intervals	Results at 5-year intervals	EPS, MDE	X	X	X	X
Work with MDE to investigate feasibility of a method of source tracking that will provide more specific allocations among wildlife species (e.g. DNA testing or other).	2 years	Ability to track wildlife bacteria sources by species.	EPS, MDE			X	
Reporting Actions							
Implementation Committee to meet on a semi-annual basis to discuss implementation progress and assess any changes needed to meet the goals.	20 years	2 meetings per year	EPS and Implementation Committee partners	X	X	X	X
Continue to update status of restoration projects and BMPs in the Annual MS4 Report.	Annually	MS4 Report submitted to MDE and posted on county website	EPS	X	X	X	X

1. Sources H (Human); D (Domestic Pet); W (Wildlife); L (Livestock)

9.4 Timeframe and Responsible Parties

Baltimore County Department of Environmental Protection and Sustainability (EPS) will partner with other County agencies and with local citizen-based organizations to implement this plan. Dependant on the specific action, different parties may be responsible for implementation. Some actions involve implementing a program, such as tree planting or impervious surface removal, at an institutional site, and that institution will be one of the multiple groups responsible for implementation.

This TMDL Implementation Plan is built using an adaptive management approach. This approach requires periodic assessment of progress and an assessment of changes needed in the Implementation Plan. This periodic assessment will be coordinated with the Municipal Separate Storm Sewer System (MS4) 5-year permit cycle and will take place prior to the re-application process, and will be included as part of the re-application assessment of the success of the management programs.

9.5 Anticipated Pollutant Load Reductions

The available literature supports that the actions above will have a positive effect on bacteria load reduction, however, the exact reductions from implementing those actions is not yet known. There is no known loading rate of bacteria by land use for Baltimore County and therefore it is not possible to predict reductions from BMPs by drainage acre treated. For this reason, specific acreages and linear feet are not provided in the table above. Baltimore County acknowledges that the priority is to address human sources of bacteria due to greater health risk. The TMDL states that the reduction of human sources has a Maximum Extent Practicable of 95%; however, as previously discussed one subwatershed requires a 98% reduction to achieve water quality standards. The County feels that a goal of 100% efficiency from SSO elimination will be achievable. While Baltimore County expects a 100% reduction in SSO elimination, we cannot account for failures due to mechanical failure, natural disaster, or vandalism, which are issues that may be addressed by an adaptive management solution in the future. Additionally, through data received regarding a point in time survey for homeless people from Baltimore County Department of Planning, the County can determine outdoor public areas where there are no sanitary facilities and can conduct public outreach on the health concerns of bacteria which could prevent bacteria from entering waterways. It is important to note that due to the nature of this watershed, a significant portion of human inputs may be coming from failing septic systems, which are not controlled under the consent decree. BMPs to reduce runoff to water ways and homeowner education on septic system maintenance will be the main actions by which septic based sources are reduced.

9.6 Reductions Discussed

The timeline to implement all of the future actions with measurable reduction extends over the next 20 years. That means that all actions will be implemented by 2035. However, it is important to understand the role of lag times in watershed management and planning. Lag time is the delay from when a pollution control action is taken to when it actually results in water quality improvements. It is the sum of time required for practices to take desired effect, time required for effect to be delivered to the water source, and time required for the waterbody to respond to the effect (Meals, Dressing and Davenport 2010). Lag Times will vary depending on

PIA 23-172 Hazen - 00833

the watershed, the management action and the pollutant type. According to the Chesapeake Bay STAC Program Report from 2012, the lag time for sediment from source to stream in the Chesapeake Bay region is less than 1-5 years, but he lag time for sediment transport from stream to Bay is 5-100 years (Chesapeake Bay Program 2012). There is little data specifically for lag times of bacteria reduction. However, given this data, it is reasonable to assume that in-stream reduction will not necessarily be measurable by 2035 when all actions will be implemented. What this means is that Baltimore County may implement all of the necessary measures to meet the TMDL reductions by 2035, as TMDL is actually a limit on the amount of pollutant that is allowed to enter the stream from upland sources, but measureable in-stream effects on water quality may take a decade or more to fully reflect the load reductions. Expectations for water quality improvement should be reasonably based on the effects of lag time.

Additionally, the distribution of the stations spans Baltimore County and Baltimore City, with stations JON0184, JON0082, and UQQ0005 in the county and stations JON0039 and SRU0005 in the city. While Baltimore County has sole responsibility for achieving the bacteria water quality standards at stations JON0184, JON0082, and UQQ0005; achieving the bacteria water quality standards at the city monitoring stations is dependent on restoration actions implemented by Baltimore City. The modified Trend Monitoring Program will add stations at the city/county line to document the Baltimore County contribution to the downstream monitoring stations and meeting the interim targets and the ultimately all bacteria water quality standards at those sites is part of this implementation plan.

PIA 23-172 Hazen - 00834

The assessment of implementation progress is based on two aspects; progress in meeting programmatic, management, and restoration actions; and progress in meeting water quality standards and any interim water quality benchmarks. The assessment of progress in meeting the restoration actions; includes setting up methods of data tracking, validation of projects, and pollutant load reductions associated with the actions (10.1) and will be consistent across all TMDL Implementation Plans. The assessment of progress in meeting water quality standards and interim milestones (10.2) is the data analysis associated with the monitoring plan specific to each TMDL Implementation Plan.

10.1 Implementation Progress: Data Tracking, Validation, Load Reduction Calculation and Reporting

The Baltimore County Department of Environmental Protection and Sustainability – Watershed Management and Monitoring Section is currently preparing a document entitled *Baltimore County Method for Pollutant Load Calculations, Pollutant Load Reduction Calculations, and Impervious Area Treated*. This document will detail the data sources, data analysis (including pollutant load calculations, and pollutant load reductions calculations), validation of the practices, and reporting of progress made. It was determined that a document was needed to document how Baltimore County calculated pollutant loads and pollutant load reductions from the implementation of various best management practices, as guidance from the State continues to evolve. The document also needs modification based on the published literature and to include any additional findings that result from our monitoring programs. The document will be updated annually to account for any changes that may have occurred during the previous year. Due to the fact that implementation is being achieved through the actions of many county agencies, it was also determined that the means of data acquisition, any data manipulation, and the means of data analysis needs to be documented on an annual basis to provide consistency in the data acquisition and analysis and to document any changes in the process over time. The overall result is intended to provide transparency for the general public and users of reports on progress generated as a result of the analysis.

The Maryland Department of the Environment (MDE) has provided a guidance document for NPDES – MS4 permits entitled: *Accounting for Stormwater Wasteload Allocations and Impervious Acres Treated*. The draft document was released in June 2011, followed by a final release in August 2014. The document is intended to provide consistency among the MS4 jurisdictions in calculating baselines and reporting implementation progress. This document however, does not provide guidance on bacteria, chlordane, mercury, or PCB reduction efficiencies. MDE also provides guidance through its web site, with a webpage entitled *Maryland TMDL Data Center*. This site provides guidance on the development of the TMDL Implementation Plans and is updated on a regular basis.

The document *Baltimore County Method for Pollutant Load Calculations, Pollutant Load Reduction Calculations, and Impervious Area Treated* will be posted for review and comment in the spring of 2015. It will be modified on an annual basis to take into account any modifications to any guidance documents, monitoring results, and/or new literature; and future calculations will reference the edition on which the calculations were based.

PIA 23-172 Hazen - 00835

10.1.1 Reporting

Baltimore County will prepare two-year milestones for each local TMDL in conformance with the Chesapeake Bay TMDL two-year milestone process. Programmatic actions and monitoring data analysis will be based on the calendar year, while restoration actions will be based on the fiscal year (July 1 – June 30). The current two-year milestone period was developed in January 2014; for Programmatic actions covers January 2014 through December 2015, and for restoration actions cover July 1, 2013 through June 30, 2015. When the next two-year milestones are developed in 2016, they will be presented by watershed and will include each of the local TMDLs.

Reporting will be done through the annual NPDES – MS4 Permit Report. This is technically due on the anniversary date of the permit renewal, but will be completed for submittal to MDE in October each year. The report will detail progress made in meeting each of the local TMDLs and the Chesapeake Bay TMDL. The analysis will include progress in meeting the two-year milestone programmatic and restoration actions, along with the calculated load reduction. It will also present the results of the monitoring conducted the previous year. See below for TDML specific monitoring.

In January of each year, a progress report (mostly extracted from the MS4 report) will be prepared and posted on the web.

10.2 Implementation Progress: Water Quality Monitoring

The Jones Falls bacteria monitoring will initially focus on two of the three bacteria monitoring programs, trend monitoring and subwatershed prioritization monitoring. The bacteria source tracking monitoring program will be implemented based on the results of the subwatershed prioritization monitoring program. Table 10.1 presents the bacteria monitoring locations, by subwatershed and monitoring type and Figure 10.1 displays the locations.

Table 10.1: Existing and Future Jones Falls Bacteria Monitoring Site Locations and Type

Station Code	Subwatershed	Monitoring Type	Latitude	Longitude

10.2.1 Bacteria Trend Monitoring Program

The Bacteria Trend Monitoring has been implemented in conjunction with Baltimore City since June 2010 and consists of five monitoring sites within the Jones Falls watershed, which MDE used in developing the Jones Falls Bacteria TMDL. The program is designed to determine bacteria concentration trends over time and whether the sites are improving, degrading or meeting water quality standards. Monitoring at these four sites will continue until bacteria water quality standards are met at all sites. Two new trend sites will be added to this bacteria monitoring program both on Western Run – Jones Falls, one on the West Branch and one on the East Branch. These new trend sites are located on the city/county line and will be used to document bacteria concentrations as the streams discharge from the county into the city. They will also, along with three existing trend sites located in Baltimore County (JON-2, JON-3 and JON-4) serve to document improvement in bacteria concentrations as a result of restoration efforts by the county.

10.2.2 Subwatershed Prioritization Bacteria Monitoring Program

The subwatershed prioritization bacteria monitoring program is designed to provide more detailed information on bacteria on a subwatershed basis. The sites used by MDE to develop the Jones Falls TMDL do not provide sufficient information on the bacteria concentrations in the subwatersheds within the Jones Falls. In order to focus bacteria reduction efforts, 12 subwatersheds will be monitored on a fixed site, fixed interval basis over the seasonal monitoring period (May 1st through September 30th) for two successive years starting in 2015. Based on the data from the first year, subwatersheds with higher bacteria concentrations will be selected for bacteria source tracking monitoring. The second year of subwatershed prioritization will serve as confirmation of the subwatersheds with higher bacteria concentrations.

10.2.3 Bacteria Source Tracking

The bacteria source tracking program is designed to locate sources of bacterial contamination by monitoring stream reaches in tributaries identified as having high bacteria concentrations. This monitoring program has not been initiated within the Jones Falls. Bacteria source tracking monitoring sites will be added, based on the results of the subwatershed prioritization bacteria monitoring. Subwatersheds with high bacteria concentrations will be selected for bacteria source tracking monitoring.

10.2.4 Bacteria Source Relative Contribution Monitoring

In the development of the Jones Falls Bacteria TMDL, MDE used a methodology to identify bacteria sources in four categories, human, pet waste, livestock, and wildlife; and the relative contribution of each to the bacteria load. As progress is made in reducing the bacteria concentration, it is expected that the relative contribution from the various source categories will change. Since it is important to know the relative contribution from the various sources in order to target remediation actions correctly, Baltimore County will work with MDE to develop a program whereby at the beginning of each 5-year MS4 Permit cycle, the Bacteria Source Monitoring will be repeated for those Bacteria Trend Monitoring sites that are not meeting bacteria water quality standards.

For those sites that require a wildlife bacteria reduction to meet the bacteria water quality standards, Baltimore County will work with MDE to determine how to refine the wildlife source to species if possible. The results will determine if an existing program can be enhanced (rat

PIA 23-172 Hazen - 00837

control and deer control programs), if another program needs to be developed, or whether the wildlife sources are such that we will need a greater period of time to meet the bacteria standard, and if it is possible to meet the standard.

PIA 23-172 Hazen - 00838

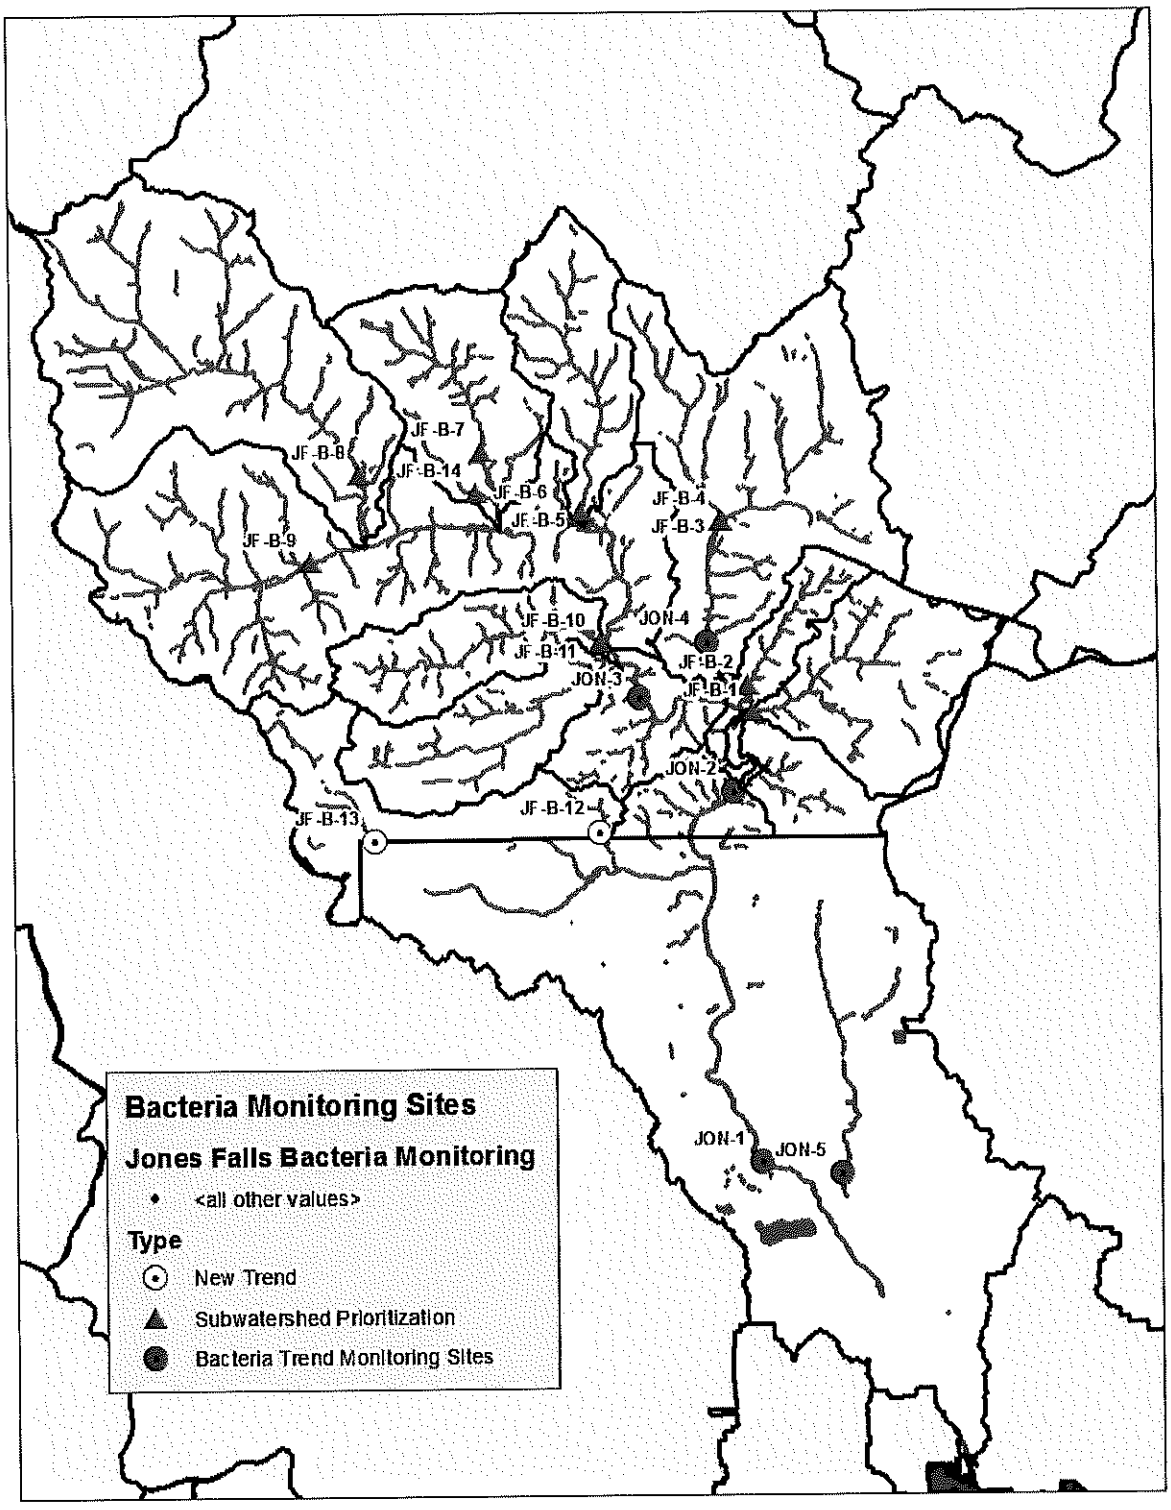

Figure 10.1: Map of Jones Falls Monitoring Locations by Monitoring Type

In order to engage the public in the TMDL implementation process this continuing public outreach plan will be implemented upon approval of this TMDL Implementation Plan. The continuing public outreach plan is applicable to all TMDL Implementation Plans that are currently being developed and those developed in the future, as well as the Trash and Litter Reduction Strategy. This continuing public outreach plan is meant to engage county agencies, environmental groups, the business community, and the general public.

11.1 County Agencies

County agencies will be engaged through two regularly scheduled NPDES Management Committee meetings per year and other agencies meetings as necessary to move implementation forward.

11.1.1 NPDES Management Committee

The NPDES Management Committee is composed of representative agencies that are involved in meeting the NPDES – MS4 Permit requirements. This committee has met irregularly in the past, generally to review information on permit requirements and other upcoming regulatory requirements, such as, the General Industrial Stormwater Discharge Permit. In the future this committee will meet twice per year and will discuss not only the NPDES – MS4 Permit requirements, but also the TMDL Implementation Plans and progress being made in meeting the implementation strategy. In order to address all components of the TMDL Implementation Plans the committee membership will be expanded to include any county agency that has some responsibility for TMDL implementation. Examples being, the County Police Department and the Department of Environmental Protection and Sustainability – Groundwater Management Section. Prior to the development of the TMDL Implementation Plans and the Trash and Litter Reduction Strategy, these agencies were not specifically engaged in NPDES – MS4 Permit activities.

The first yearly meeting will be held in January of each year. The focus of this meeting will be to review the implementation plan 2-year milestones for each plan; provide a forum for discussion of the ability to meet the implementation actions; and determine any revisions necessary to meet the interim implementation milestones set in the plan. This meeting is also the forum for discussion of data tracking and reporting to ensure that the implementation actions are properly credited.

The second yearly meeting will be held in July of each year and will provide the forum for determining data submittal for the yearly progress report on the implementation actions and the resulting load reductions. The monitoring data from the previous calendar year will be presented and contrasted with the interim water quality milestones that are detailed in each implementation plan.

11.1.2 Other Agency Meetings

In order to move forward with implementation, agency meetings regarding specific implementation actions are anticipated. These will be scheduled as needed, and tracked by meeting date, attendance, TMDL Implementation Plans discussed, and topic. Meeting minutes will be reported in the Annual NPDES – MS4 Report submitted to Maryland Department of the Environment. This report is also posted on the county website for public access.

11.2 Environmental Groups

Baltimore County is currently engaged with local watershed associations through its funding of *Watershed Association Restoration Planning and Implementation Grants*, and through inclusion of watershed association members on the Steering Committees of the Small Watershed Action Plans. Formerly, this engagement and support was coordinated through the *Baltimore Watershed Agreement*. As part of that engagement, periodic Watershed Advisory Group (WAG) meetings were held. As part of this continuing public outreach plan, WAG participation will be formalized with two meetings per year.

The first meeting will be held in March of each year and focus on the local and Chesapeake Bay TMDL implementation actions and implementation progress, including an analysis of the pollutant load reduction calculations from the previous fiscal year. The watershed associations are currently engaged in citizen-based restoration activities and report their implementation progress to the county for inclusion in the Annual NPDES – MS4 Report. This meeting will provide a forum for discussion of the progress being made, coordination between the watershed associations, and any changes to the *Watershed Association Restoration Planning and Implementation Grant* being considered for the next grant period.

The second meeting will be held in November of each year and will focus on the water quality monitoring results from the previous calendar year. The results presented will compare trends and measures against the TMDL Implementation Plans water quality benchmarks and water quality standards.

11.3 Business Community

The business community will be engaged through various business forums, targeted outreach and education efforts on specific topics, and hosting workshops on specific topics as necessary.

11.3.1 Business Forums

Business forums, such as the Hunt Valley Business Forum with greater than 200 business members, provide opportunities to present the TMDL Implementation Plans and the Trash and Litter Reduction Strategy, and discuss the role of business in helping improve water quality. These forums will be convened as the opportunities arise. Summaries of these meetings will be reported in the annual NPDES – MS4 Report and will include the name of the forum (or other business organization), approximate number in attendance, the topic presented, and audience responses.

11.3.2 Targeted Business Outreach and Education

The Small Watershed Action Plan (SWAP) process includes an upland assessment of potential pollution hotspots. Often, these potential hotspots are commercial or industrial sites. The information derived from this assessment will be used to target outreach and education to businesses specific to the issue(s) at the location identified in each SWAP. These actions will be tracked and reported in the annual NPDES – MS4 Report.

11.3.3 Business Workshops

There are certain issues that may be pervasive through a segment of the business community that can most effectively be addressed through hosting workshop education on the specific topic. These issues will be identified as SWAP implementation moves forward, but one potential topic for a business workshop is related to the recently renewed *General Discharge Permit for*

PIA 23-172 Hazen - 00841

Stormwater Associated with Industrial Activities. A workshop designed in conjunction with Maryland Department of the Environment would not only result in improved water quality, but it would also benefit the business community through increased understanding of the requirements of the permit.

11.4 General Public

The general public will be engaged through a number of mechanisms, including:

- Watershed Implementation Plan (WIP) team meetings
- Targeted outreach and education efforts on specific topics
- Steering committee meetings and stakeholder meetings in the development of Small Watershed Action Plans
- Meetings of the implementation committee for completed Small Watershed Action Plans
- Displays at various events
- Annual progress reports posted on the county website and placed in our libraries
- A biennial *State of Our Watersheds* conference.

11.4.1 WIP Team Meetings

Baltimore County has assembled a WIP team to serve as a sounding board for the development of the WIP to address the Chesapeake Bay TMDL. Members of the team include representatives from various county agencies, business community representatives (particularly the environmental engineering community), watershed associations, representatives from the agricultural community, and Baltimore County citizens.

The county will schedule at least one meeting annually to present implementation progress and to address specific topics related to the TMDL Implementation Plans and the Trash and Litter Reduction Strategy. Meetings will be scheduled as issues arise. It is anticipated that the WIP team will provide initial review of newly developed outreach and education materials, in order to provide feedback from a variety of perspectives.

11.4.2 Targeted Outreach and Education

The Small Watershed Action Plan development process includes upland assessments of neighborhoods to identify pollution sources and restoration opportunities. This information will be used to prioritize and target outreach and education efforts specific to the issue(s) in neighborhoods with the intent to affect behavioral change and/or increase citizen based restoration actions. These actions will be tracked and reported in the annual NPDES – MS4 Report.

11.4.3 SWAPS

Baltimore County has been developing SWAPs since 2008. There are 22 planning areas in the county, with 13 completed plans, 5 plans in development, and 4 areas pending. These planning areas cover the entire county. The planning process includes the development of a steering committee, the composition of which is determined by the issues, and land ownership within the planning area. At a minimum membership consists of agency representatives, watershed associations, and citizen representatives. The process also includes a number of stakeholder meetings, open to all planning area residents and businesses, which provide information on the plan and solicit input. Once the SWAP is complete, the steering committee becomes the

PIA 23-172 Hazen - 00842

implementation committee. As designed, the implementation committee is to meet twice per year, however, most implementation committees have not met this goal.

The plans have addressed to varying degrees the TMDLs that are applicable within the planning area. Some of the TMDLs have been developed subsequent to the specific SWAP development or did not address the full range of TMDLs that were applicable to the planning area. The TMDL Implementation Plans are built on incorporation of the actions from each SWAP within the applicable TMDL area. In some cases, additional actions have been identified in order to meet water quality standards.

11.4.3.1 Small Watershed Action Plans in Development and Future Plans

For SWAPs currently under development, and for plans developed in the future, the steering committee and stakeholder meetings will be used for outreach regarding the TMDL Implementation Plans and the progress being made in achieving water quality standards. The meeting participants will be informed on where they can access the TMDL Implementation Plans, the Trash and Litter Reduction Strategy and any Progress Reports that have been developed.

Applicable TMDL Implementation Plan actions will be incorporated into the SWAP based on the assessment of applicable restoration actions within the SWAP planning area. Since the SWAPs incorporate field assessments of streams and uplands, they provide more detailed information on applicable restoration actions, both on quantity and location. The accelerated schedule for developing TMDL Implementation Plans precluded conducting field work to build the plans.

11.4.3.2 Small Watershed Action Plans Already Developed

For those SWAPs already developed, the implementation committee meetings will be scheduled twice per year. The first meeting will be held in winter and will present the implementation progress not only of the SWAP, but also any applicable TMDL Implementation Plan progress. The progress analysis will be based on fiscal year. This meeting will also provide the opportunity to discuss any changes in the SWAP or the TMDL Implementation Plan based on an analysis of what actions have been successful and what actions have been more difficult to implement.

The second implementation committee meeting will be held in fall of each year and will present the monitoring data in relation to progress being made toward interim milestones and water quality standards.

11.4.4 Educational Displays at Events

Educational displays and handouts will continue to be used at applicable events as they occur. The particular display and handout materials will be determined by the location and focus of the event. The location, event type, number of citizens engaging staff at the display, and the number of handouts taken by citizens will be tracked for annual reporting in the NPDES – MS4 Report.

11.4.5 TMDL Implementation Plan, Trash and Litter Reduction Strategy, and Progress Report Availability

The TMDL Implementation Plans and the Trash and Litter Reduction Strategy will be posted on the Baltimore County website with hard copies placed in county libraries. The hard copies in the libraries will be specific to the watershed in which the library is located. Progress reports will be

posted on the county website and placed in libraries. A set of hard copy plans will be kept at the Baltimore County Department of Environmental Protection and Sustainability office in Towson, Maryland.

11.4.6 Biennial State of Our Watersheds Conference

Baltimore County, in conjunction with Baltimore City, has held *State of Our Watershed* conferences in the past to present information to county and city citizens on water quality issues applicable to the watersheds in these jurisdictions. Future conferences will be held in March of even numbered years. Information on implementation progress for local TMDLs and the Bay TMDL will be presented, along with other topics of interest. These conferences will be organized with the assistance of the WAG, and the surrounding local jurisdictions (Baltimore City, Howard County, Carroll County, Harford County, and York County, PA) will be invited to participate in the organization and presentation of the conference.

The timing of even years is related to the 2-year milestone process set up by the Maryland Chesapeake Bay TMDL WIP whereby in January of even calendar years, progress in meeting the previous 2-year milestone programmatic and restoration implementation is reported and the next 2-year programmatic and restoration implementation milestones are proposed by the local jurisdictions. The timing of the conference not only permits reporting on the progress made in meeting the previous 2-year milestones but also what is planned for the next two years.

11.5 Summary of Continuing Public Outreach Plan

A summary of the continuing public outreach plan, by component, element and frequency is presented in Table 11.1.

Table 11.1: Continuing Public Outreach Plan Summary

Plan Component	Plan Element	Frequency
Agencies	NPDES Management Committee	2x per year
	Other agency meetings	As needed
Environmental Groups	Watershed Advisory Group (WAG) meetings	2x per year
Business Community	Business forums	As identified
	Targeted business outreach and education	As identified
	Topical workshops	As identified
General Public	WIP team meetings	1x per year
	Targeted outreach and education	As identified
	SWAP – steering committee meetings	6x per year, each
	SWAP – stakeholder meetings	2x per year, each
	SWAP – implementation committee meetings	2x per year, each
	Educational displays at events	As identified
	Document availability (various)	As needed
	Biennial conference	Even # years

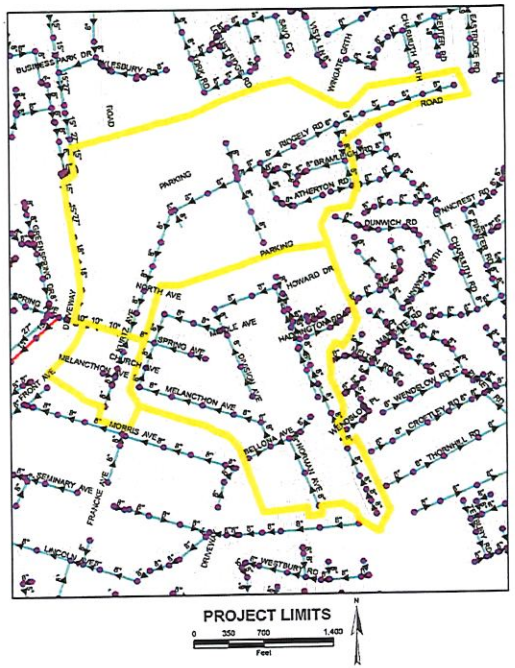
1.0 INTRODUCTION

1.1 BACKGROUND

In accordance with the recommendations included in the Jones Falls Sewershed Repair, Replacement, and Rehabilitation (SRRR) plan, the County has determined to move forward with the development of design documents for rehabilitating defective gravity collection system assets (pipelines and manholes) located within the public portion of meter basin BC04 in the Jones Falls Sewershed.

Meter basin BC04 is located along the northeast edge of the Jones Falls Sewershed and is comprised of sewer service areas (SSA's) 45-59-30-01, 45-59-30-02, and 45-59-30-03. The following **Figure 1** graphically presents the project limits.

Figure 1 – (Source of Data – Baltimore County GIS)



PIA 23-172 Remcoll - 02522

In total, the project consists of approximately 21,200 linear feet (LF) of gravity sewer and 108 manholes (per the County's GIS). Piping across the project area ranges in size from 8-inches to 15-inches in diameter (distributed as follows):

- 8-inches: 20,400 LF (approximate)
- 10-inches: 450 LF (approximate)
- 15-inches: 330 LF (approximate)

* *Note these quantities do not include a portion of a 27-inch diameter trunk sewer that is located within the project limits. Evaluation and subsequent rehabilitation of this trunk sewer is not included as part of this project.*

The County has tasked O'Brien & Gere to provide professional engineering services for the development of contract documents for the rehabilitation of defective gravity system assets within the aforementioned basins (work authorized under Job Order # 213-201-0077-7158 under the On-Call Sanitary Sewer Rehabilitation Design Service contract).

Services commenced with a detailed desktop data review (of existing system information), followed by the development of this Data Evaluation report. Field confirmation inspections, Final Design, and Construction Phase Services will be provided upon review and approval of this report by the County. (Bid Phase support services are not warranted as part of this project.)

1.2 PURPOSE

As part of the preliminary engineering efforts for the project, the County requested a detailed review/evaluation of available existing system data in order to identify/accomplish the following:

- Confirm the appropriateness of Cured-in-Place Pipe Lining (CIPP) as a viable rehabilitation technique based on inspection data reviewed.
- Confirm the appropriate manhole rehabilitation techniques based on inspection data reviewed.
- Confirm basin mapping connectivity and subsequently identify locations requiring follow up investigative efforts.
- Identify rehabilitation recommendations based on cursory review of existing system data and broadly categorize recommendations for assets requiring rehabilitation.

The conclusions and recommendations of this review (discussing the aforementioned purposes) are presented in this Data Evaluation Report.

PIA 23-172 Ramsoll - 02525

1.3 REPORT ORGANIZATION

This Data Evaluation Report has been prepared to summarize the results of the data evaluation efforts, provide recommendations for follow-up field investigation/evaluation efforts, and preliminarily identify rehabilitation recommendations across the project area. The report is organized as follows:

- ***Section 1:*** ***Introduction***
- ***Section 2:*** ***Data Review Activities***
- ***Section 3:*** ***Findings and Recommendations***
- ***Appendices:*** ***Support Documentation***

2.0 DATA REVIEW ACTIVITIES

2.1 GENERAL

This section introduces the data review activities that were performed as part of the Project's efforts.

2.2 DATA REVIEW ACTIVITIES

As part of the development of the SRRR plan for the Jones Falls Sewershed, the County performed a comprehensive sewer system evaluation survey (SSES) that included the mapping and inspection of gravity sewers and manholes across the sewershed. The data and documentation compiled as part of these efforts (including follow-up inspection and maintenance data) was made available by the County through web portal access to their online data library.

Data reviewed and analyzed as part of this review effort included:

- Geographic Information System (GIS)
- Closed-circuit television (CCTV) inspection videos and inspection logs
- Manhole inspection reports and photographs
- Access databases compiling characteristics, conditions, and ratings of inspected assets
- Maintenance records of assets (including repairs)
- Jones Falls Sewershed SRRR report

2.3 SYSTEM MAPPING AND CONNECTIVITY REVIEW

The County's GIS was reviewed in order to gain knowledge of the assets that comprise the collection system across the project area including infrastructure locations and flow pattern. In conjunction with reviewing the County's GIS, on-line aerial mapping and a site "drive-thru" of the project area was also performed in order to achieve familiarity with the locations of the assets and the overall environment that will support future rehabilitation construction activities. This assessment also served to identify locations across the system that may require field evaluation work to confirm system connectivity (i.e. mapped locations where the flow pattern appears irregular, confirm locations of assets classified as being "abandoned", etc.). Recommendations supporting future field work required to confirm system connectivity are provided in **Section 3** of this report.

2.4 PIPELINE DATA REVIEW

A cursory review of pipeline inspection data (CCTV inspection logs, videos, compiled access databases, and maintenance records) was performed to ascertain pipelines that will require inspection/re-inspection efforts and to

preliminarily identify the rehabilitation efforts required across the basin (based on available system information). Review efforts consisted of the following:

1: Performed a comparison of the access database file (supplemented by the individual pipeline inspection logs) against the existing GIS to identify pipelines that required inspection/re-inspection due to either missing report data or incomplete report data.

2: Review of all available CCTV inspection logs (cross-compared to the access database) to identify pipelines demonstrating moderate to significant defects/deterioration. In cases where multiple inspections are available, the most recently dated inspection report was reviewed.

3: Review of CCTV videos of pipelines observed in Step #1 that are demonstrating moderate to significant defects/deterioration in order to further assess and confirm severity of defect and subsequently identify type of rehabilitation required.

4: Review of available maintenance records/reports to confirm if defects identified in Steps #1 and #2 were repaired/rehabilitated by the County.

Upon completing the review, a preliminary rehabilitation summary assessment was developed that broadly categorized the following:

- Pipelines requiring cleaning and CCTV due to missing/incomplete inspection records.
- Pipelines suitable to accommodate cured-in-place pipe (CIPP) lining as rehabilitation alternative. *
- Pipelines requiring excavation repairs (either point repairs or complete relay) to accommodate system rehabilitation.

Conclusions and recommendations associated with the Pipeline Data Review are provided in **Section 3** of this report.

** Note: Pipelines deemed suitable for CIPP do not necessarily require rehabilitation. Pipelines categorized as such (per the cursory review of the inspection logs) possess minor structural and operational defects that can be addressed/rehabilitated without excavation efforts. During design development activities, the final determination of pipelines selected for rehabilitation via CIPP will be established by both the County and the Engineer.*

2.5 MANHOLE DATA REVIEW

Similar to the pipeline data review goals, available manhole inspection data (manhole inspection reports and the compiled access database) was reviewed in order to ascertain manholes that will require inspection/re-inspection efforts and to preliminarily identify manhole rehabilitation requirements across the project area. The manhole data review approach consisted of the following:

PIA 23-172 Ramboll - 02526

1: Performed a comparison of the access database file (supplemented by the individual manhole inspection reports) against the existing GIS to identify manholes that required inspection/re-inspection due to either missing report data or incomplete report data.

2: Review manhole conditions and defects (as documented in the access database file) in order to identify manholes with moderate to significant defects (including inflow/infiltration susceptibility). No attempt was made to identify and/or correct minor cosmetic problems.

3: Review individual manhole inspection reports of manholes noted with defects (per the access database file review) to visually observe (as available) noted defects. The manhole inspections were performed in 2009 & 2010 and therefore current manhole conditions may vary from those represented in the 2009/2010 manhole inspection reports.

Upon completing the review, a preliminary rehabilitation summary assessment was developed that broadly categorized the following:

- Manholes requiring inspection/re-inspection
- Manholes requiring Operational and Maintenance work
- Manholes with Frame and/or Cover defects
- Manholes with Chimney and/or Wall defects
- Manholes with Bench/Channel defects
- Manholes demonstrating susceptibility to Inflow and Infiltration

Conclusions and recommendations associated with the Manhole Data Review are provided in **Section 3** of this report.

3.0 FINDINGS AND OBSERVATIONS

3.1 GENERAL

This section serves to introduce and summarize the findings and conclusions of the data review activities discussed in **Section 2** (including a preliminary summary of pipeline and manhole rehabilitation requirements) and the recommendations for follow-up field inspection services.

3.2 SUMMARY OF FINDINGS

Based upon the review activities described in **Section 2**, the following summarizes our conclusions concerning the completeness of available system data (critical for design development activities) and a preliminary summary assessment of assets requiring rehabilitation.

System Mapping and Connectivity Review: Based upon our review it was determined that the County's GIS and mapping system appears to be relatively thorough (with no major connectivity concerns). In turn, no locations were identified that appear to require dye testing to confirm connectivity.

Pipeline Data Review: Based upon our cursory review of existing pipeline data, the following has been determined with respect to the completeness/availability of existing system data and the overall preliminary assessment of the pipelines within the project area:

- **8 sewer segments** Missing Inspection Data/Incomplete Inspection Data (require cleaning & CCTV)
- **49 sewer segments** Defects (minor) deemed suitable for rehabilitation via CIPP
- **26 sewer segments** Deemed candidates for lining to allow for continuity of CIPP
- **11 sewer segments** Defects require excavation (point repairs) prior to lining
- **23 sewer segments** No rehabilitation required

Manhole Data Review: Based upon our cursory review of existing manhole data, the following has been determined with respect to the completeness/availability of existing system data and the overall preliminary condition of the manholes within the project area:

- **13 manholes** Missing Inspection Data/Incomplete Inspection Data (require inspection).
- **9 manholes** Frame and/or Cover defects
- **10 manholes** Cone and/or Wall defects
- **2 manholes** Bench and/or Channel defects
- **22 manholes** Operational & Maintenance Rehabilitation (i.e. Cleaning)

PIA 23-172 Kimball - 02527

- **76 manholes** Manhole coating associated with pipeline CIPP
- **4 manholes** Excavation associated with the rehabilitation
- **4 manholes** No work required

Review tables listing the pipelines and manholes reviewed as part of this effort are provided in **Appendix A.** Tables include: asset identification numbers, identified defects (respective to each asset), and comments/descriptions (as necessary). A map presenting the locations of assets requiring further evaluation (i.e. inspect/re-inspect and CCTV/re-CCTV) is included in **Appendix B.** A map broadly categorizing (and visually locating) assets that can be rehabilitated via trenchless technologies versus excavation has been provided in **Appendix C.**

3.3 RECOMMENDED FOLLOW-UP FIELD EVALUATION/INVESTIGATION EFFORTS

Based upon the observations and findings of the data review efforts completed as part of this project, the following recommendations have been determined for the project:

Recommendations:

- Pipe segments noted as requiring excavation work (i.e. point repairs) should have the excavation limits field canvassed to confirm surface features that could impact construction methods.
- Pipe segments noted as requiring CCTV/re-CCTV should be inspected under this contract against the contingent CCTV allowance included as part of this project. Based on the review, 1,324 LF of pipe is recommended for CCTV inspection. Project budgeting has allowed for up to 2,000 LF of CCTV for the project. Since the recommended CCTV work can be completed under the designated allowance included as part of the project budget, it is recommended that the work be completed at this time as opposed to being performed as pre-rehab CCTV during construction.
- Manholes designated for inspection/re-inspection should be inspected. Inspection activities would consist of top-side manhole inspections utilizing a Quickview Camera to record identified defects.

PIA 23-172 Ramboll - 02528

Reference: On-Call Hydraulic Modeling – Task 2
Jones Falls Model Evaluation

Dear Mr. Pierstorff:

This is your formal notice to proceed with the subject project as presented in your proposal of June 19, 2013. Delivery Order #00022056 is being issued under separate cover.

Should you have any questions, please contact Lisa Eicholtz, of my staff, at 410-887-3781.

Very truly yours,

Task 002 – Jones Falls Model Evaluation

BACKGROUND

Hazen and Sawyer will review the development, calibration and verification of the Jones Falls sewershed model. This will also include a review of the Long Term Capacity/Peak Flow Management Evaluation report recommendations developed for the 10-year, 6-hour storm.

The Task Order includes the following tasks:

- Meetings, QA/QC, monthly reporting
- Collection and review of data
- Collection, pumping, and transmission system modeling

Deliverables are indentified under each Task.

GENERAL ASSUMPTIONS

For the purposes of this Task Order, the following assumptions are made as the basis for the study:

1. Community/Public Relations activities/notifications/meetings, if any, will be led by the County with assistance from the Consultant.
2. GIS, record drawing data, and existing County and City models (including any required boundary condition data for modeling purposes) will be provided by the County.
3. Rain gauge, radar rainfall, and flow monitoring (velocity, depth and flow) data will be provided by the County.
4. A contingent sub-task (3.2) has been included in the event that any adjustment to the County's model parameters and recalibration of the model is required.

PIA 23-172 Hazen - 00168

5. No model training is required.

Consultant will perform the following tasks and subtasks:

TASK 1 – PROJECT MANAGEMENT

Task 1.1 – Project Management, QA/QC

Due to the efficiency required for the On-Call work process, a detailed Work Plan will not be prepared for this Task Order. The tasks outlined herein will suffice as a Work Plan.

Prepare monthly Progress Reports presenting work activities completed during the reporting period, budget status (including MBE/WBE status), schedule status, and identification of any out of scope items. Prepare monthly invoices detailing project labor costs and other direct costs.

Quality Assurance / Quality Control (QA/QC)

QA/QC procedures shall be employed in order to maintain document quality (as well as quality of modeling and analysis). These procedures will address the use of quality control reviews, engineering and calculations checking, and other measures necessary to maintain a consistent, complete, high quality and compatible deliverable. A QA/QC review will be conducted on every submittal prior to delivery to the County. These reviews apply to all technical memoranda or reports generated for this Task Order. Members of in-house staff not associated with the Task Order will be selected to perform these reviews.

Deliverables:

- Four (4) copies of each Progress Report (electronic version also).
- Two (2) copies of each monthly invoice (1 copy that includes back-up material and 1 copy with invoice only).

Task 1.2 – Meetings

Conduct one (1) progress/technical meeting with representatives from the County's Department of Public Works (DPW) and others, as the County requires, to review results and to obtain direction on matters requiring decisions by the County.

Deliverables:

- Consultant will prepare an agenda for each meeting.
- Consultant will prepare and transmit one (1) copy of the recorded meeting minutes via email to all participants.

TASK 2 – DATA COLLECTION AND REVIEW

Task 2.1 – Data Collection

Consultant will collect and review existing InfoWorks model files and reports documenting same (including the modeling report, hydraulic capacity assessment report, and/or the Long-Term Capacity/Peak Flow Management Evaluation), for the purpose of evaluating the adequacy of model development, calibration and verification, as well as recommendations developed for the 10-year, 6-hour storm. Flow and rainfall monitoring data will be reviewed for adequacy in calibration/verification of the model. Monitoring locations with sufficient quantity and quality of data will be used as calibration points.

Consultant will also conduct interviews with DPW staff, as necessary, to ascertain their knowledge regarding the operation of the system.

Deliverables:

- Results of this task will be included in the monthly Progress Report and the Technical Memorandum (Task 4).

TASK 3 – HYDRAULIC MODELING

Task 3.1 – Model Simulations

Consultant will perform simulations using the County's existing InfoWorks model for the Jones Falls sewershed, for the purposes of reproducing a select number of calibration and verification storm events and comparing observed (measured) versus model-predicted flows. It is anticipated that up to twenty (20) storms (same data used in previous calibration/verification efforts for this model) will be investigated. Additional, more recent, flow monitoring and rainfall data may be used to perform the comparisons.

Modeled and measured flows and depths will be compared based on industry-standard guidelines, such as delineated in the *Wastewater Planning User's Group Code of Practice for the Hydraulic Modelling of Sewer Systems (Nov. 2002)*. The guidelines establish general acceptable ranges for model accuracy, as follows:

- Dry weather peak flows within +10% and -10%
- Dry weather flow volumes within +10% and -10%
- Wet weather peak flows within +25% and -15%
- Wet weather flow volumes within +20% and -10%
- Wet weather peak depths within +1.6 feet and -0.3 feet
- Timing and shape of hydrographs similar

Deliverables:

- Results of this task will be included in the monthly Progress Report and the Technical Memorandum (Task 4).

Task 3.2 – Model Re-Calibration / Verification (Optional)
This is a contingent item and may be required if calibration of current model is deemed insufficient based on the analysis performed in Task 3.1.

Consultant will utilize the flow and rainfall monitoring data received from the County to adjust the current model's dry and wet weather parameters, if determined necessary by the County. An adequate number of representative storm events of varying intensities, spatial variability, duration and depths will be selected from the rainfall data set to be used for simulating calibration and verification storm events. A minimum of six (6) storms, but no more than ten (10), will be used for calibration and two (2) for verification of the model.

The model will be re-calibrated by adjusting hydrologic and hydraulic parameters until reasonable agreement is reached between observed and predicted flows, volumes and depths. Model calibration accuracy and quality will be judged by County standards and industry-standard guidelines, such as delineated in the *Wastewater Planning User's Group Code of Practice for the Hydraulic Modelling of Sewer Systems (Nov. 2002)*, with error ranges as specified in Task 3.1.

Deliverables:

- Results of this task will be included in the monthly Progress Report and the Technical Memorandum (Task 4).

Task 3.3 – Recommendations (Optional)
This is a contingent item and may be required at the County's discretion.

Consultant will utilize the recalibrated collection system model, updated in Task 3.2, to re-simulate the 10-year, 6-hour design storm and update any recommendations developed in the Long-Term Capacity/Peak Flow Management Evaluation report. Updates to size of relief sewers or quantities of I/I reduction, or other recommendations will be revised and updated as necessary with the new model. A hydraulic capacity assessment will be performed by comparing model-predicted SSO volumes and locations to previous results, and summarizing via GIS data/maps.

Boundary conditions for the 10-year, 6-hour event simulated will be applied in the model. The boundary condition data will be provided by the County.

Deliverables:

- Results of this task will be included in the monthly Progress Report and the Technical Memorandum (Task 4).

TASK 4 – TECHNICAL MEMORANDUM

Task 4.1 – Draft Technical Memorandum

Consultant will develop and submit a Draft Technical Memorandum including sketches, technical narratives, methodologies, simulation/evaluation results, recommendations (e.g., size of relief sewer and other affected sewers as appropriate), and all pertinent information used to perform the analyses under this Task Order. The document will contain an assessment of the adequacy of the model to predict/simulate the collection system response to wet weather events. One (1) electronic copy of the Draft Technical Memorandum will be submitted to the County for review and comment.

Deliverables:

- One (1) electronic copy of the Draft Technical Memorandum.

Task 4.2 – Final Technical Memorandum

A meeting will be held to discuss the County's comments before finalizing the analysis and Technical Memorandum. The Final Technical Memorandum will build upon the Draft version and incorporate comments received from the County. Following the final changes to the Technical Memorandum, the Consultant shall submit one (1) electronic copy and five (5) hard copies of the Final Technical Memorandum to the County, no later than 60 days after comments are received from the County on the draft version. An electronic version of the revised InfoWorks model will also be provided.

Deliverables:

- One (1) electronic copy of the Final Technical Memorandum.
- Five (5) hard copies of the Final Technical Memorandum.
- InfoWorks model files.

Re: Jones Falls Model Evaluation

Summary

This memorandum summarizes the evaluation and improvement of the Jones Falls InfoWorks hydrologic/hydraulic model. The County's Jones Falls sewershed model is comprised of two separate networks/files: 1) "boundary" model and 2) primary model. The boundary model is composed of several small sewer systems near the County/City line that each discharge flow into the City's sewer system. The primary model comprises the majority of the sewer system within the Jones Falls sewershed, and eventually discharges flow into the City's sewer system at a single location. Each model was evaluated on the basis of calibration adequacy as outlined in further detail below. Generally, the models are calibrated within industry-standard error tolerances, with the exception of a few meter basins that are described further herein. The models were updated and improved by refining the locations where flow is input into the modeled sewer network. In addition, the models were validated to historical flow and rainfall data.

Methodology

The analysis was performed in a step-wise process as follows, and as described further below:

1. Review existing information, including modeling report (entitled "Model Development and Calibration Report for The Jones Falls Sewershed Hydraulic Model," dated November 2011 by RK&K); also review model files, meter site sheets, flow data and rainfall data.
2. Perform model simulations of the flow and rainfall monitoring period for the Boundary model (May 9, 2006 through May 18, 2007)
3. Perform model simulations of the flow and rainfall monitoring period for the Primary model (February 1, 2008 through November 30, 2008)
4. Prepare summary calibration statistical plots comparing observed and predicted storm volume, peak flow and peak depth
5. Review model connectivity and flow input locations
6. Update the model and validate to historical data

Summary of Previous Work (2011)

2011 Jones Falls Model Development

The County previously developed and calibrated the Jones Falls sewershed model, comprised of two separate networks/files: 1) "boundary" model and 2) primary model. Figure 1 depicts both model networks. The County model network files were entitled "Boundary Meter-Baseline_Final_AdditionalNetwork!" (for the boundary model) and "Existing-Network-revised-2012-FM" (for the primary model).

The primary data source for model development was the County's geographic information system (GIS). The model data was then improved with the collection and use of manhole survey data. Dry weather flows were developed in the model using water consumption data, population, tributary areas, and flow/rainfall monitoring data. Dry weather flows were divided into sanitary (base) flow and groundwater infiltration using Sliicer software. The SWMM RUNOFF routine in InfoWorks was employed to characterize wet weather responses to rainfall in the modeled sewer system.

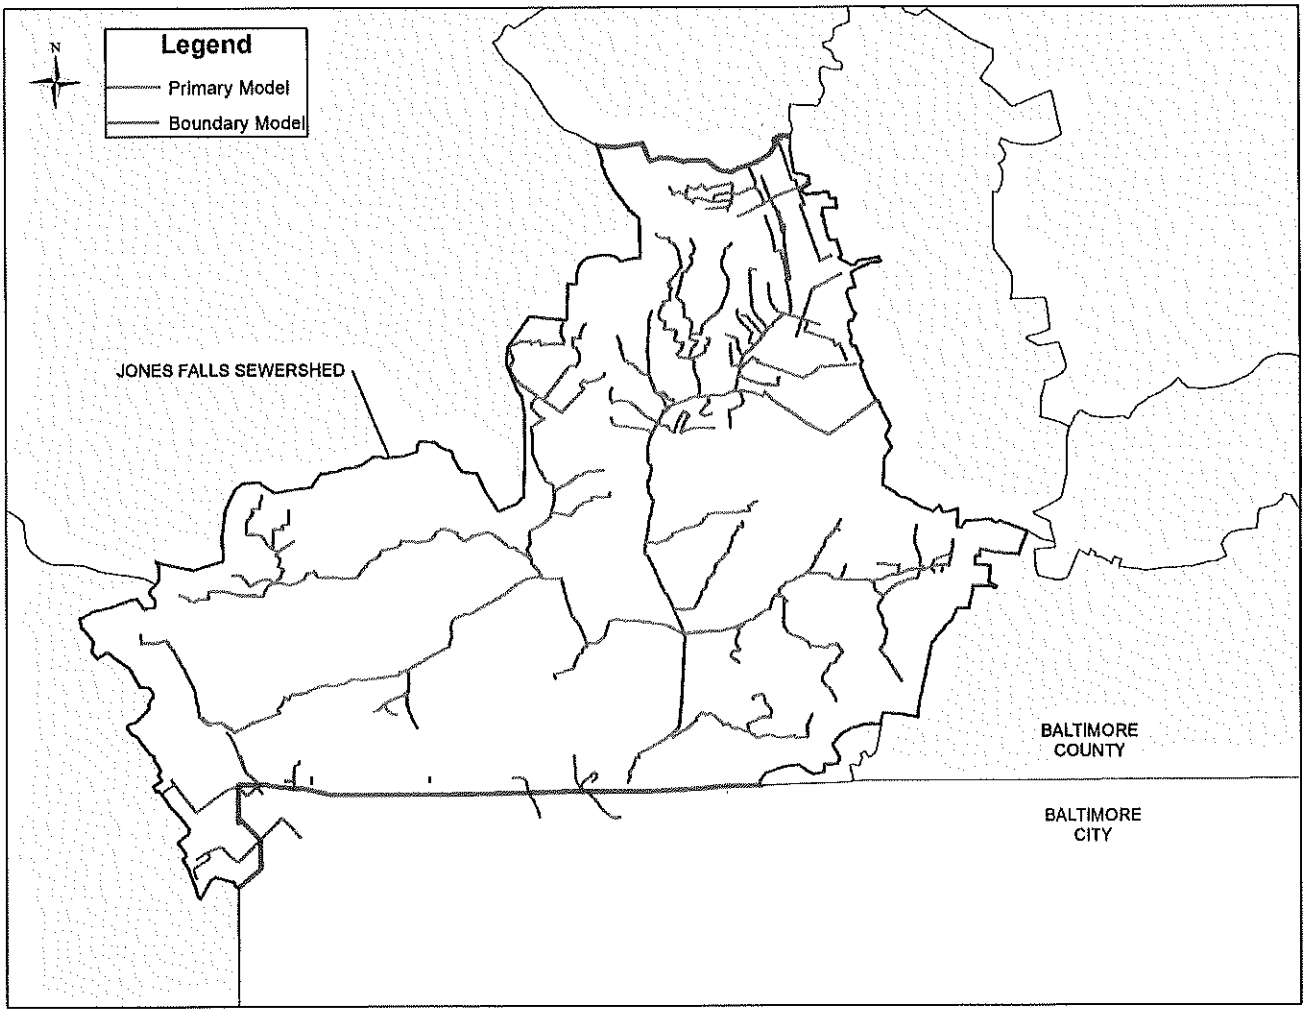

Figure 1: County's Boundary and Primary Model Networks

2011 Jones Falls Model Calibration

Calibration of the model was performed in two phases: dry weather calibration followed by wet weather calibration. A total of 26 meters in the primary model and 6 meters in the boundary model were utilized for calibration.

Dry weather calibration was completed by simulating at least 3 consecutive days of no rain in the monitoring period and comparing model output with observed data. Dry weather calibration statistics were prepared to evaluate percent differences between predicted and observed peak flow and volume. The calibration criteria used represents a larger range of error tolerance than the industry standard WaPUG guidelines. Error bounds of +20% and -20% were used in the 2011 report instead of the standard +10% and -10% ("Wastewater Planning Users Group (WaPUG) Code of Practice for the Hydraulic Modelling of Wastewater Systems, November 2002").

Wet weather calibration was completed by simulating 7 storms (Primary model) and 6 storms (Boundary model), and comparing model output with observed data, and making adjustments to model parameters until good agreement was reached between the two sets of data.

Model validation was not documented in the 2011 report or model files.

Model Evaluation and Updates (2014)

Continuous model simulations of each of the two separate monitoring periods for the Primary model (February 1, 2008 through November 30, 2008) and Boundary model (May 9, 2006 through May 18, 2007) were performed to independently evaluate the adequacy of model calibration. Model input files (networks, rainfall data, boundary conditions, wastewater data, etc.) were received and used directly in InfoWorks to re-simulate the monitoring periods. The closest rain gauge was associated to each model subcatchment to enable spatial variation of rainfall to be simulated.

In addition to simulating the six calibration events from the 2011 report, historical storm events were simulated in the model and compared with flow monitoring data to evaluate how well the model is validated. Tables 1 and 2 summarize the calibration and validation storm events simulated in the model (denoted as "C" for calibration events and "V" for validation events).

The loading points (locations where flow is input into the modeled sewer system) in the model were also evaluated relative to the latest GIS data for the sewer system. Appendix A contains the findings of this review, which include incorrect flow input locations and over-loading of certain locations. The model was corrected at these locations by revising the loading locations and/or dividing model subcatchments into smaller polygons and redistributing the flows according to the GIS data.

Finally, an evaluation was performed to identify large model subcatchments where flow is input at the upstream end of the model network that are also locations of model-predicted manhole SSOs. Table 3 summarizes this evaluation, indicating several model subcatchments (highlighted in yellow) with over 50 acres in size and predicted SSOs. At these locations, SSO volumes may be over-predicted.

Table 1: Storm Events Evaluated in Primary Model

#	Rain Start	Rain End	Duration (Hour)	Peak Intensity (Inch/Hour)	Total Depth (Inch)	Calibration or Validation

Industry standard WaPUG calibration criteria were used in the evaluation, as summarized below:

Dry Weather Flow Calibration:

- Modeled peak flows should be within 10 percent of the observed peak flows, and
- Modeled 24-hour volumes should be within 10 percent of the observed volumes

Wet Weather Flow Calibration:

- Modeled peak flows should be within +25 percent and -15 percent of the observed peak flows,
- Modeled storm event volumes should be within +20 percent and -10 percent of the observed volumes, and
- Modeled depths of flow in surcharged sewers should be within +1.6 feet and -0.33 feet

Boundary Model Evaluation

Figure 2 shows the percent differences between model-predicted peak flows and volumes relative to observed values for the dry weather periods, for the boundary model. One continuous simulation was performed, and then the specific dry weather periods listed in Table 4B of the 2011 modeling report were used to compare model predictions with observed data. Calibration criteria ranges (pink dashed lines) are also shown on this plot. Dry weather volumes matched well (all within the criteria ranges), while peak flows were generally outside, but in close proximity of, the criteria ranges (model under-predicts peak dry weather peak flows). Since volume is the primary parameter of importance, and due to the normal fluctuations in

dry weather flow (peaky trends are common), it is not recommended to attempt to improve the dry weather peak flow calibration.

Figures 3 through 8 show the percent differences between model-predicted peak flows and volumes relative to observed values, as well as absolute differences between peak depths, for the calibration storms. Calibration criteria ranges (pink dashed lines) are also shown on these plots. In general, the model is considered adequately calibrated, as most of the storm comparisons for volume, peak flow and depth were within the calibration criteria ranges, with the exception of a few outliers and some general scatter (some points above the 45-degree line and some below). The following meters were identified as being slightly biased with respect to the wet weather response in the sewer system:

- JF0320S (volume over-estimated)
- JFWR29 (volume over-estimated for calibration events but many validation events are within tolerances)

Table 4 summarizes the calibration/validation performance for the monitoring period.

Primary Model Evaluation

Figure 9 shows the percent differences between model-predicted peak flows and volumes relative to observed values for the dry weather periods, for the primary model. One continuous simulation was performed, and then the specific dry weather periods listed in Table 4A of the 2011 modeling report were used to compare model predictions with observed data. Calibration criteria ranges (pink dashed lines) are also shown on this plot. Dry weather volumes and peak flows matched well (almost all within the guideline ranges).

Figures 10 through 35 show the percent differences between model-predicted peak flows and volumes relative to observed values, as well as absolute differences between peak depths, for the calibration storms. Calibration criteria ranges (pink dashed lines) are also shown on these plots. In general, the model is considered adequately calibrated, as most of the storm comparisons for volume, peak flow and depth were within the calibration criteria ranges, with the exception of a few outliers and some general scatter (some points above the 45-degree line and some below). Meters BC03, BC09 and BC13 were initially identified as being slightly biased with respect to the wet weather response in the sewer system when evaluating only the calibration events; however, if the validation events are considered as well, the errors generally fall within or close to the tolerance ranges. When identifying the above meters, consideration was given to the quantity of storms outside of the calibration criteria ranges, the magnitude of the storms, and whether the bias was systematic (all points above or below the 45-degree line) or random (scattered about the 45-degree line).

Table 5 summarizes the calibration/validation performance for the monitoring period.

High = Low confidence that model predictions are accurate.

Conclusions

This memorandum summarizes the evaluation of the Jones Falls InfoWorks hydrologic/hydraulic model, which was previously developed and calibrated in 2011. The County's Jones Falls sewershed model is comprised of two separate networks/files: 1) "boundary" model and 2) primary model. The boundary model is composed of several small sewer systems near the County/City line that each discharge flow into the City's sewer system. The primary model comprises the majority of the sewer system within the Jones Falls sewershed, and eventually discharges flow into the City's sewer system at a single location.

Each model was evaluated on the basis of calibration adequacy by simulating storms used for calibration purposes in 2011. Then, additional simulations of other historical storm events were also performed to validate the model. Validation of the model had not previously been performed. During this effort, the loading points (locations where flow is input into the modeled sewer system) in the model were also evaluated relative to the latest GIS data for the sewer system. The model was corrected at these locations by revising the loading locations and/or dividing model subcatchments into smaller polygons and redistributing the flows according to the GIS data.

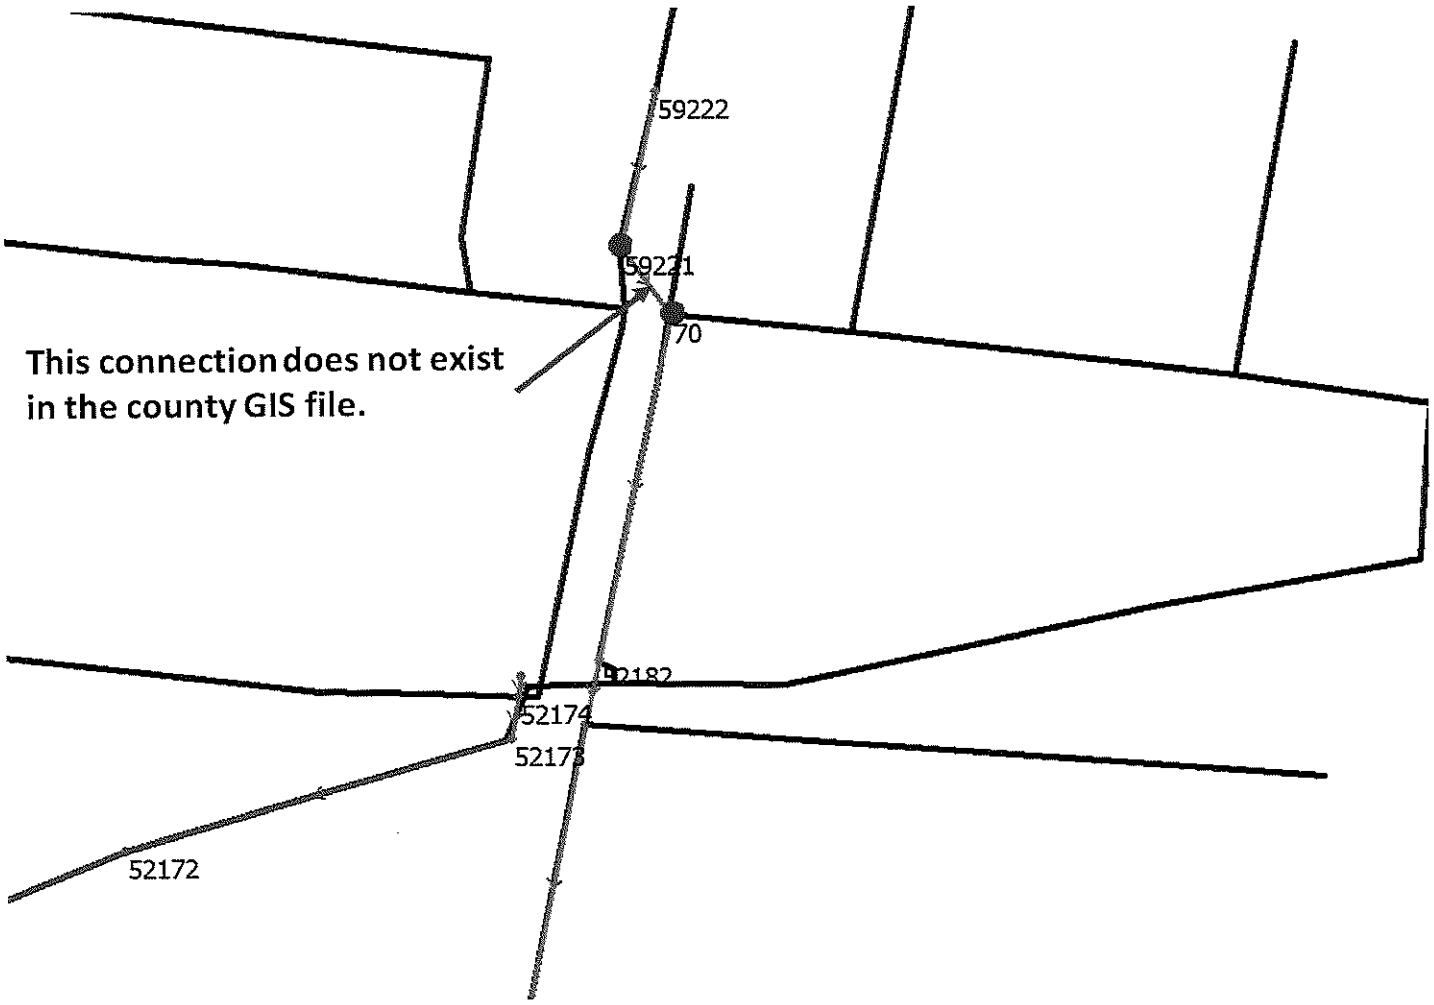
For the boundary model, meters JF0320S and JFWR29 were initially identified as being slightly biased with respect to the wet weather response in the sewer system, but upon evaluation of the totality of events (calibration and validation) meter JWR29 is considered adequately calibrated/validated. Meter JF0320S is still over-predicting volumes.

For the primary model, meters BC03, BC09 and BC13 were initially identified as being slightly biased with respect to the wet weather response in the sewer system when evaluating only the calibration events; however, if the validation events are considered as well, the errors generally fall within or close to the tolerance ranges.

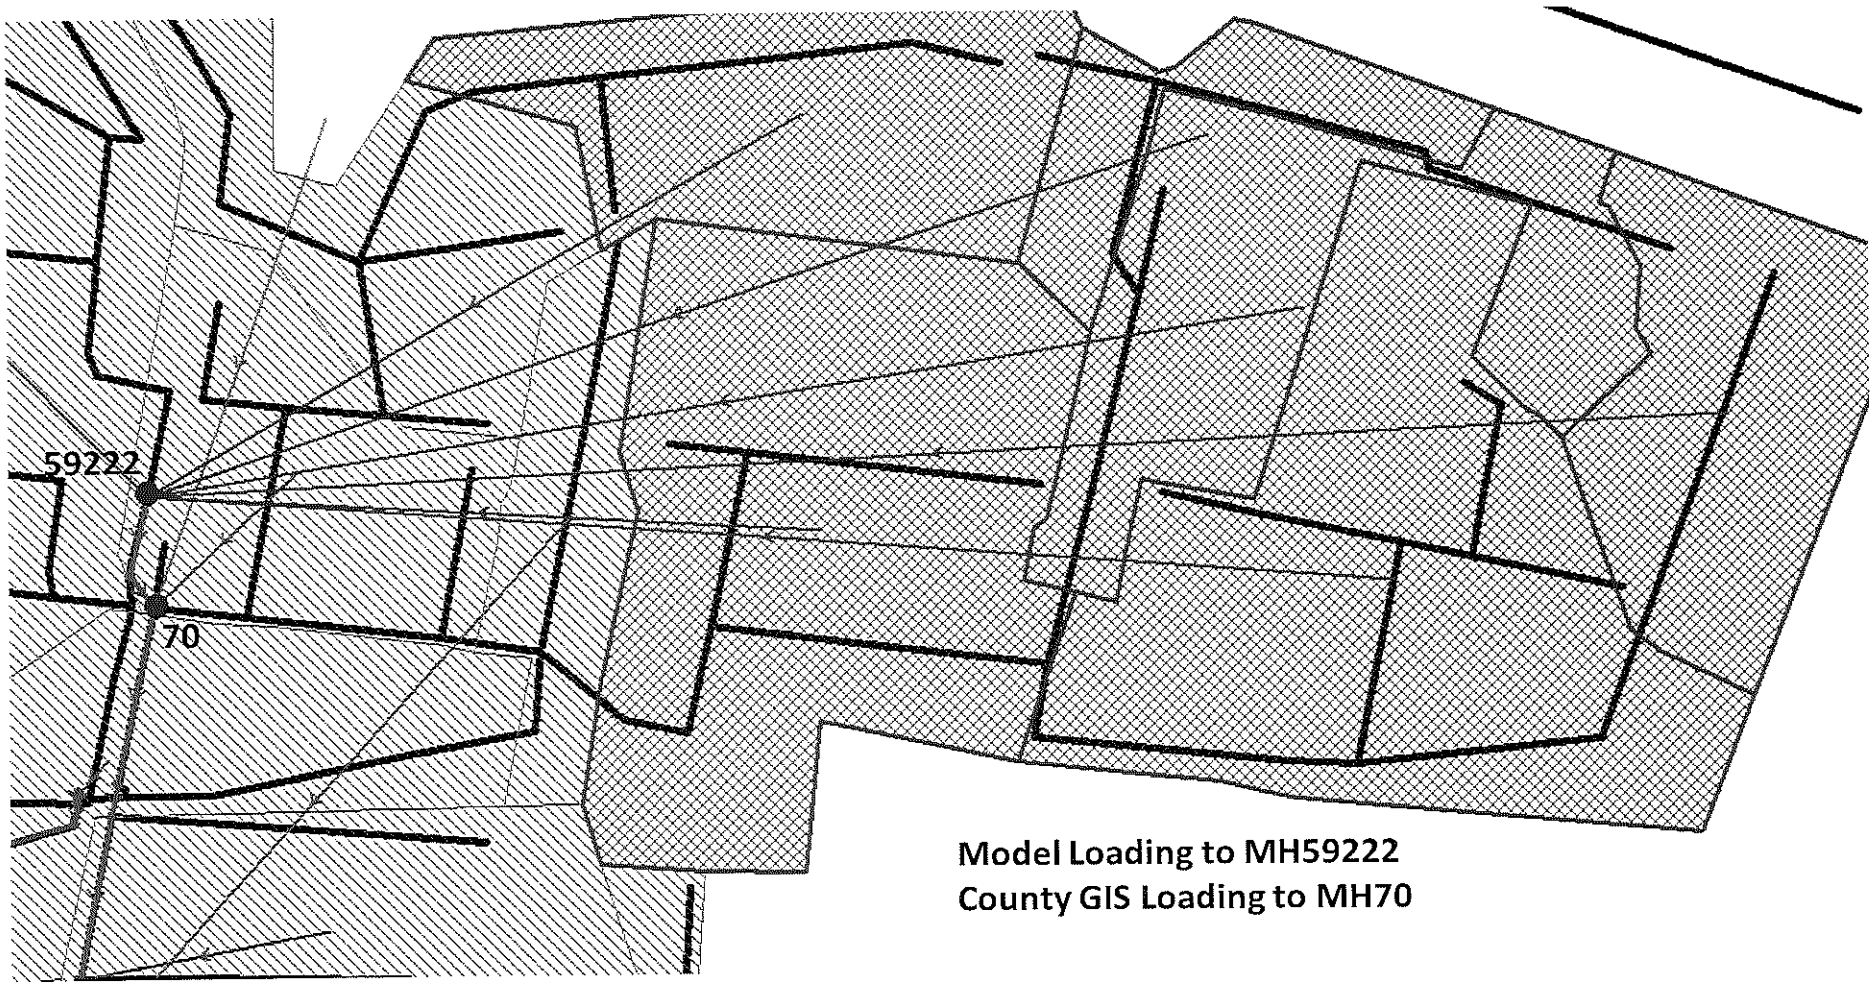
APPENDIX A

- The figures that follow and the findings they illustrate were incorporated into the Jones Falls model – the revised model results are presented in the memorandum accordingly

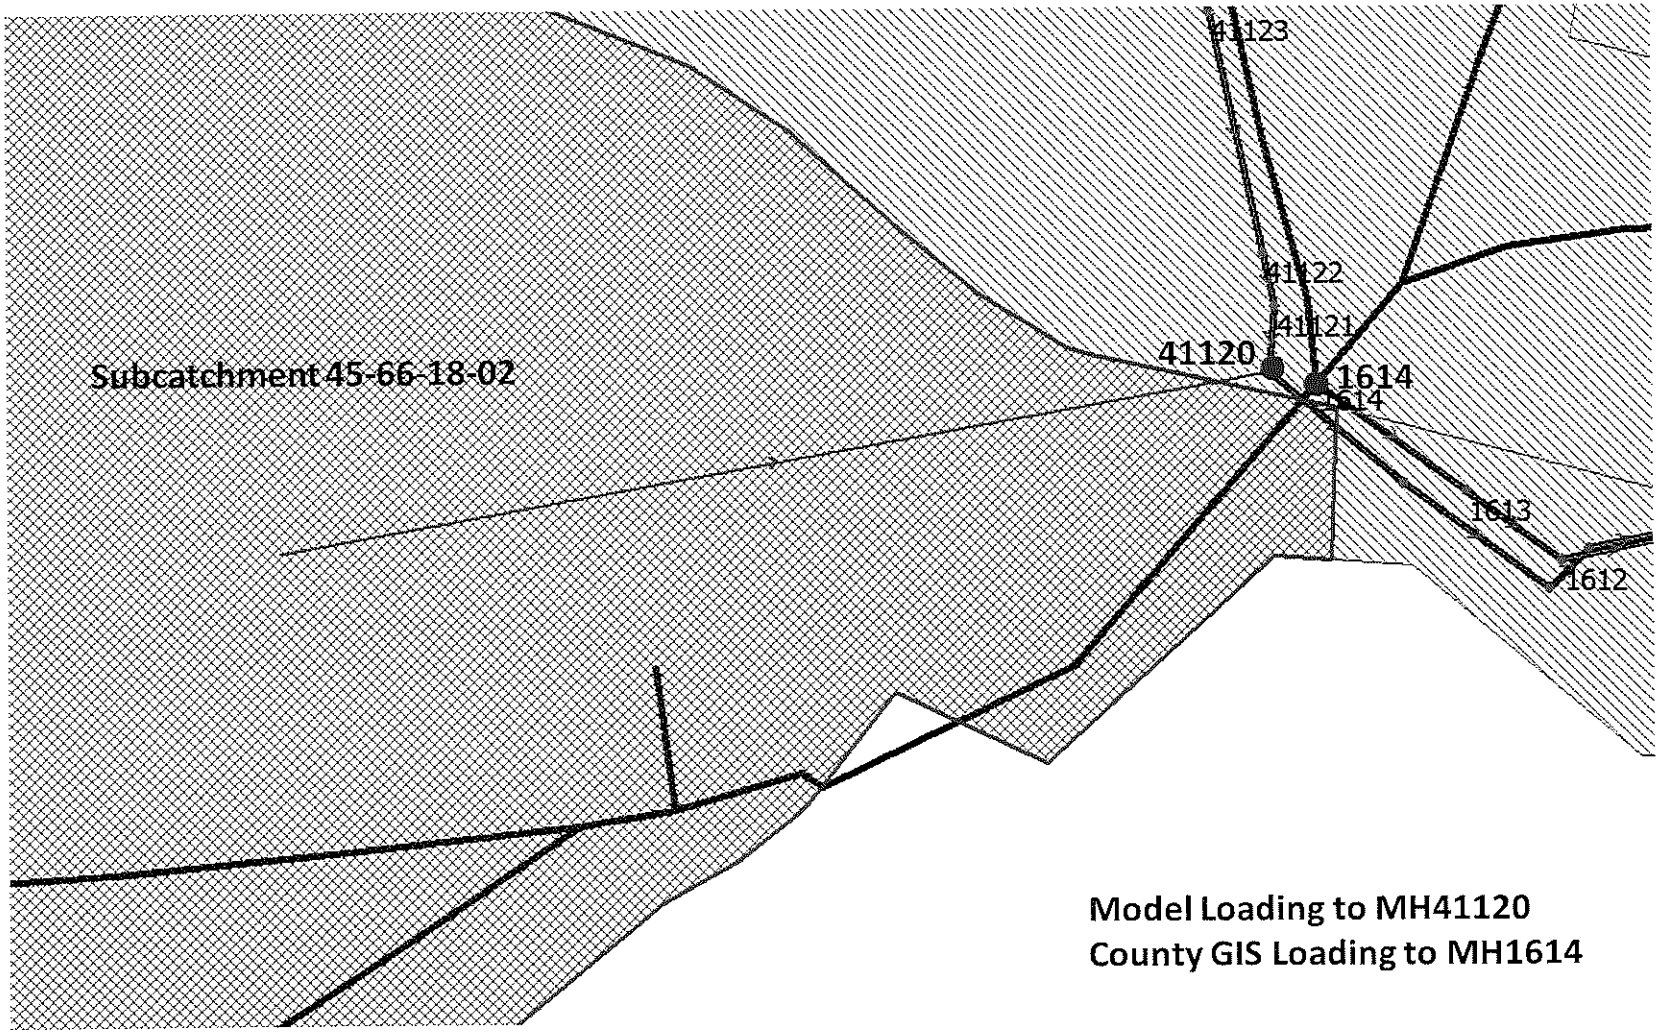
Wrong Connection from MH59221 to MH70



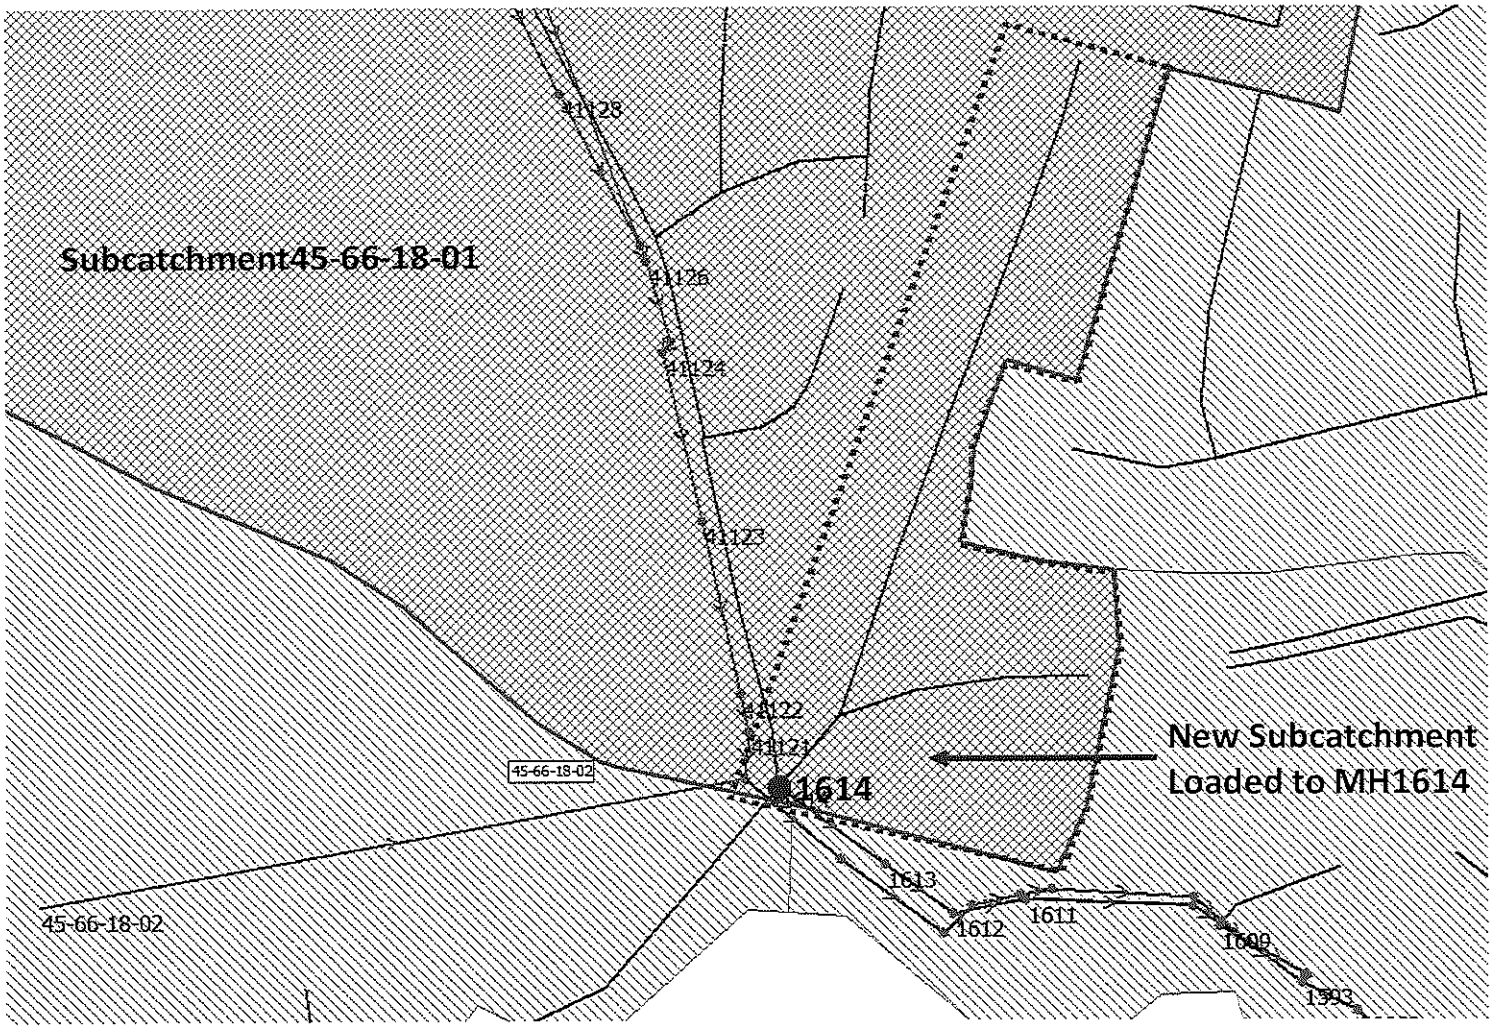
Wrong Loading Nodes for Subcatchments: 45-58-23-04,45-58-25-00, 45-58-26-01,45-58-26-02,45-58-27-00,45-58-28-00



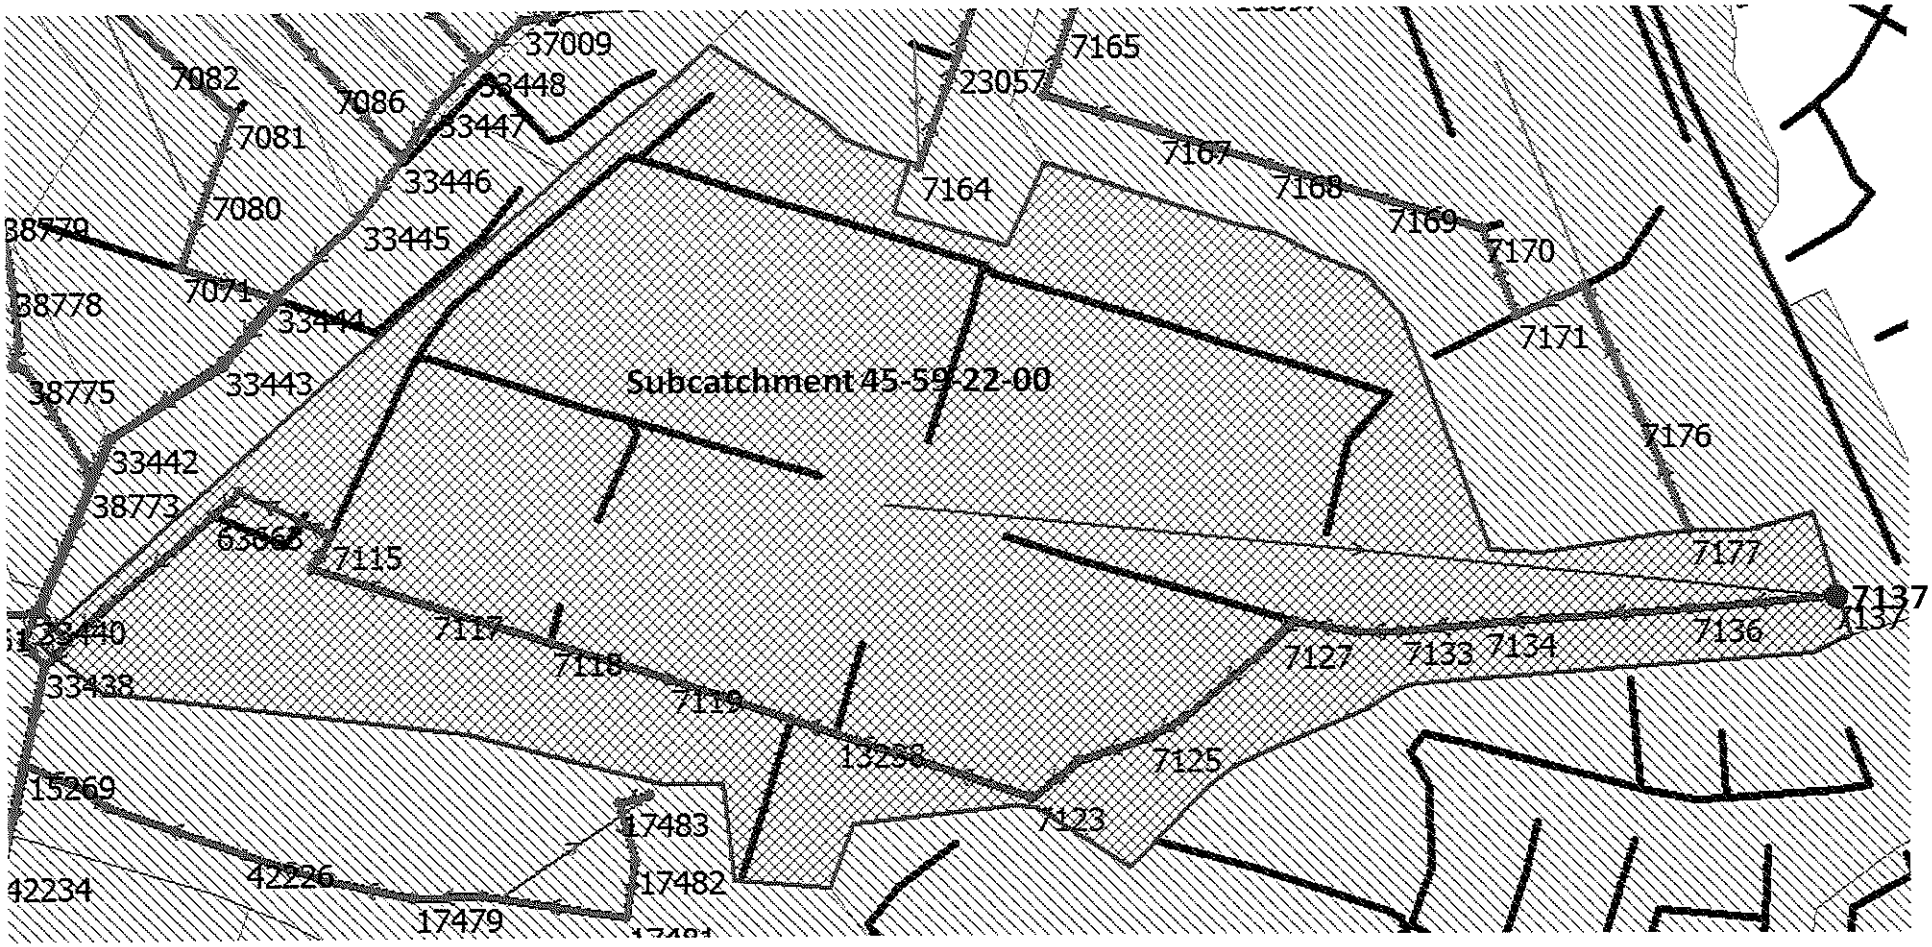
Wrong Loading Node for Subcatchment 45-66-18-02



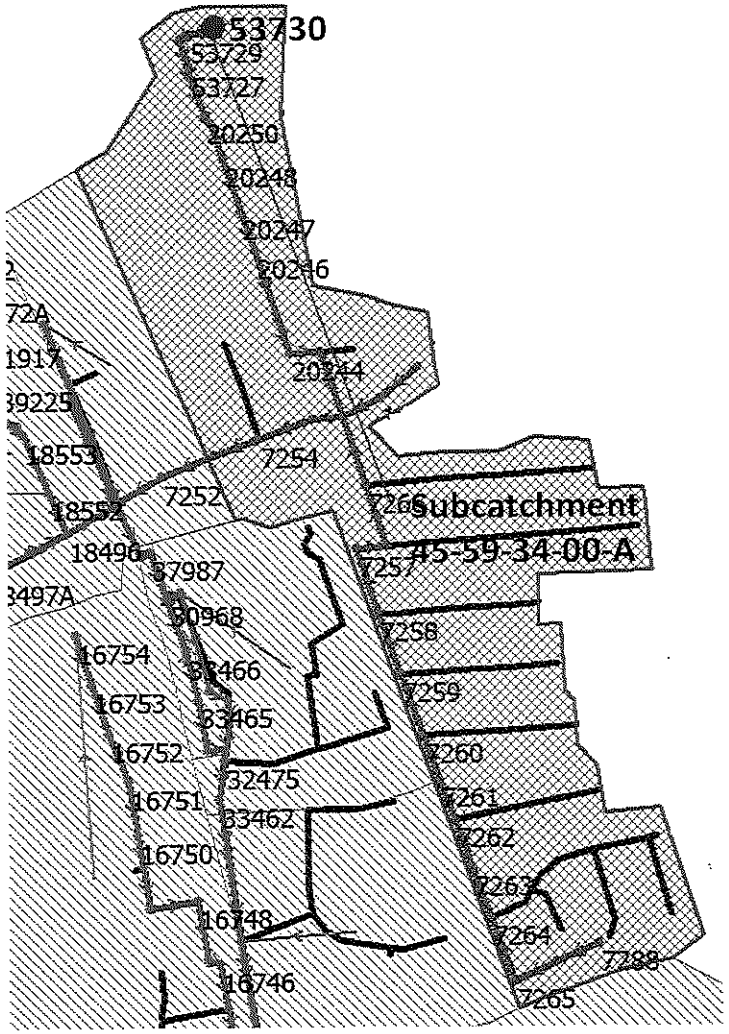
Subcatchment 45-66-18-01 Should be Split



Wrong Loading Node for Subcatchment 45-59-22-00, the subcatchment should be split



Subcatchment 45-59-34-00-A Should be Split



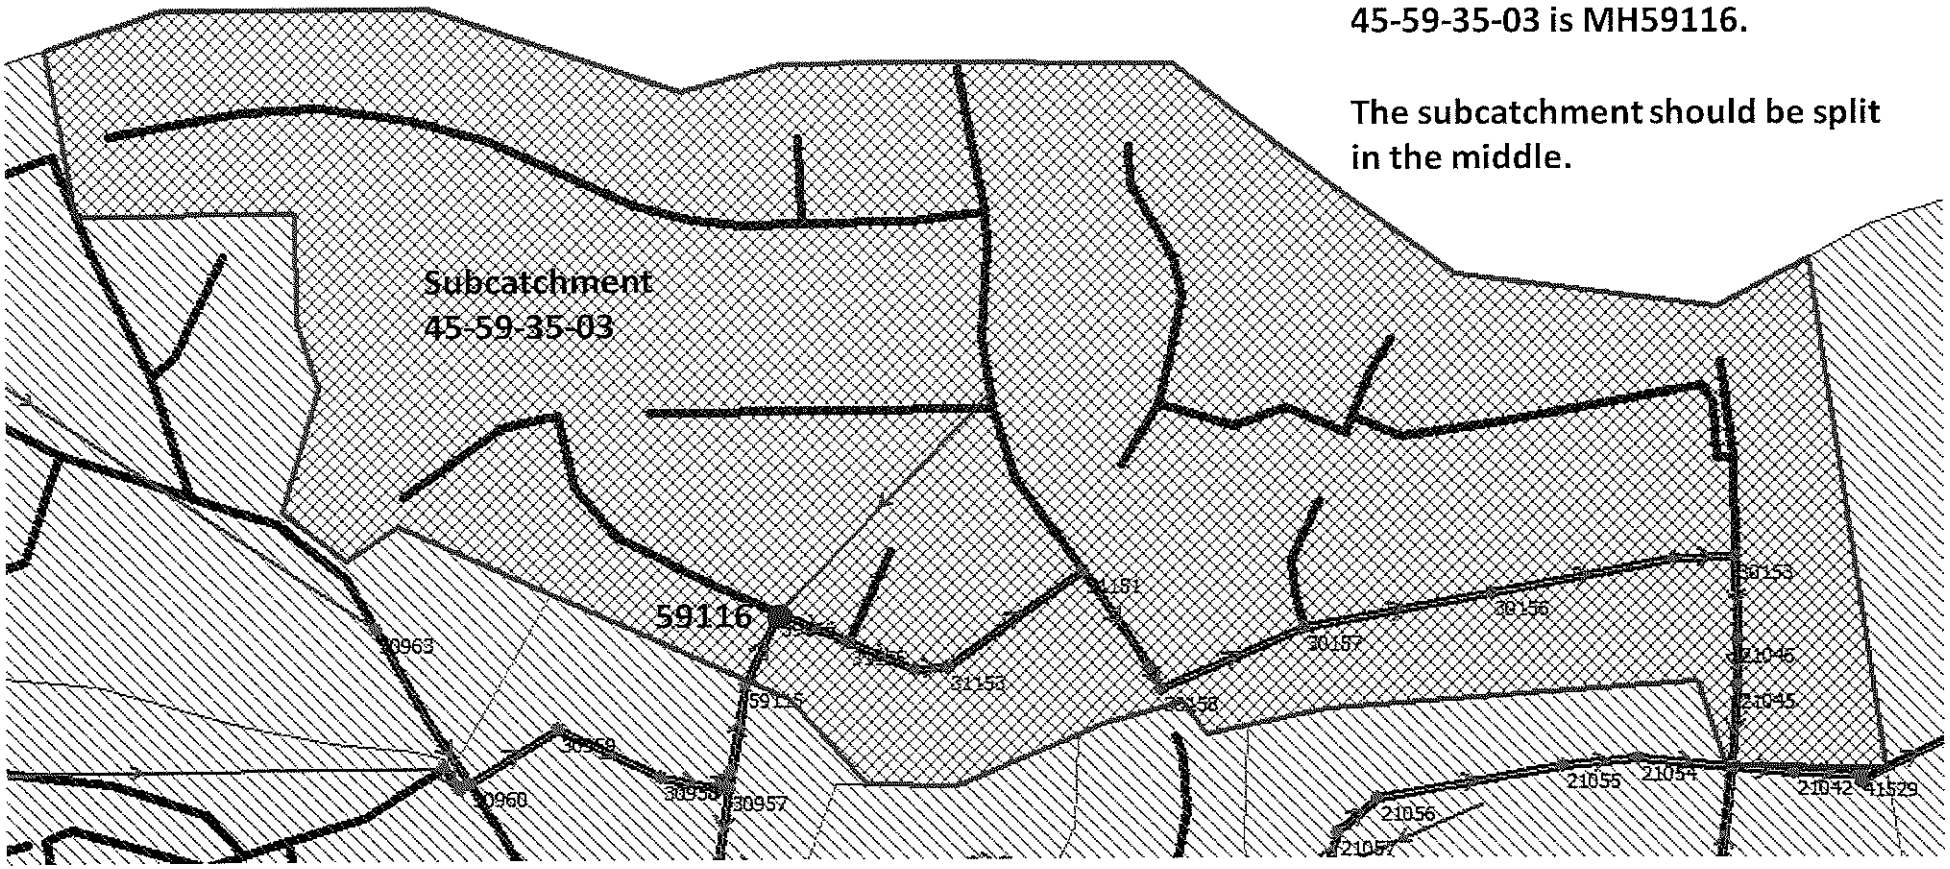
Loading node for subcatchment 45-59-34-00-A is MH53730.

The subcatchment should be split in the middle.

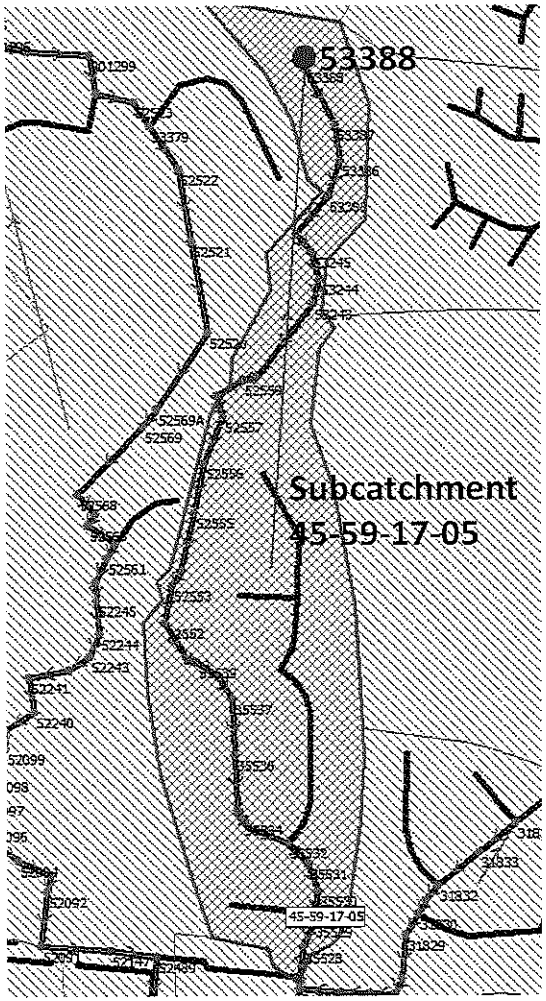
Subcatchment 45-59-35-03 Should be Split

Loading node for subcatchment 45-59-35-03 is MH59116.

The subcatchment should be split in the middle.



Subcatchment 45-59-17-05 Should be Split



Loading node for subcatchment 45-59-17-05 is MH53388.

The subcatchment should be split in the middle.

Subject: RE: On-Call Modeling Task 2 - Jones Falls Model Evaluation
Attachments: Model Output Summary - Existing Conditions.xlsx; Model Output Summary - Future Conditions.xlsx

Hi Bryan,

Please find attached two Excel files. One summarizes the results for existing conditions and one summarizes the results for the future (2025) condition, which was created based on the population/employment data you provided. The "total peak flow" column in the second tab of each file represents the peak flow at the timestep during the model simulation in which an SSO is just about to occur, regardless of where in the system. There was a predicted SSO at a "loading node", however, that was ignored for the purpose of this analysis. We have often explained those away as an artifact of model resolution in many cases, and have done so here as well. The "X"s show locations where a pipe is surcharged during the storm (HGL above crown).

Please let me know if you'd like any other information on this or any follow up questions/clarifications.

Thanks,
Chuck

Chuck,

I have included the employment and population projections for Jones Falls with this email. Please incorporate these numbers in the model to account for future growth and revise these tables accordingly.

Thank you,

Bryan Bokey, PE

Subject: RE: On-Call Modeling Task 2 - Jones Falls Model Evaluation

Hi Bryan,

Attached is what we have for option 1, but for existing conditions (no future growth included). We can certainly do the same tables for future growth, if you'd provide the future growth version of the Jones Falls InfoWorks model to us. When we worked on the on-call modeling task 002 back in 2014, the scope was an evaluation of the calibration only, so we only required the existing condition version of the model at that time – we don't currently have the future growth version in our possession. It's a quick turnaround now that we've dusted this off, however, so if you are able to obtain the future growth model we'll turn this around very quickly.

Thanks,
Chuck

Subject: RE: On-Call Modeling Task 2 - Jones Falls Model Evaluation

Chuck,

After discussing with the team, we are going to go with 'option 1' for now. This will give us a record of all the pipes that are under capacity, for the future conditions, using your revised model.

Thanks again,

Bryan Bokey, PE
Project Engineer
Baltimore County DPW

Subject: RE: On-Call Modeling Task 2 - Jones Falls Model Evaluation

Hi Lisa,

PIA 23-172 Hazen - 00140

We are finished with populating 90% of the Appendix tables for Jones Falls. However, the last few columns of the 2nd table ("Major Gravity Sewer that Cannot Convey..") are populated in part based upon pipe segments that needed improvement (upsizing) in each storm event. Since we don't currently have the InfoWorks files for improvement networks/models, we can't readily populate those columns.

Thus,

Option 1: submit what we have now, or
Option 2: ask for the final improvement models, and then finish populating the second table

Thanks,
Chuck

Subject: On-Call Modeling Task 2 - Jones Falls Model Evaluation

Chuck,

Good morning! We have a follow up request from the Jones Falls Model Evaluation Task (JO 201-0077-7126). For the Jones Falls Sewershed, please prepare tables like those I have attached from South Area reports.

Please let us know if you have any questions or need additional information.

Lisa

Notes:
1) Pipe Full Capacity (manning's equation)
2) Total peak flow was calculated by reviewing locations of model-predicted SSOs, and simulating an artifical condiditon in the model by gradually increasing the rainfall intensity until the HGL was predicted to be just below the manhole rim (~0.1 feet) - the peak flow at that moment was then reported.
3) Total Peak Flow - Pipe Design Capacity

ones Falls - Modeled Capacity Restrictions - Future Conditio

Notes:

1) Pipe Full Capacity (manning's equation)

2) Total peak flow was calculated by reviewing locations of model-predicted SSOs, and simulating an artifical condiditon in the model by gradually increasing the rainfall intensity until the HGL was predicted to be just below the manhole rim (~0.1 feet) - the peak flow at that moment was then reported.

3) Total Peak Flow - Pipe Design Capacity

4) This analysis was performed for the system with future (2025) flows, and no improvements.

Towson, Maryland 21204

Subject: Baltimore County Project 2012-01 On-Call Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan Services
Scope of Work and Fee Proposal – Task Order No. 14 Jones Falls Sewershed I/I Analysis and Post-Rehabilitation Performance Assessment Amendment 1
RJN Project No. 17-2658-14

Dear Mr. Keller:

Please find attached our scope of work and DPW Form 105 fee proposal for an amendment to Task Order 14 of the subject contract to continue monitoring at five flow monitoring sites in the Jones Falls Sewershed, that are currently being monitored by RJN under separate contract, for a 6-month duration. The additional flow monitoring period is proposed to allow for completion of on-going rehabilitation construction along the interceptor. The services to be performed under the amendment and the unit prices used to develop the DPW Form 105 are consistent with previous Task Orders prepared under our On-Call Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan Services Agreement dated March 18, 2013.

We look forward to continuing to work with you on this project.

Sincerely,

Jon van Soestbergen, P.E.
Senior Vice President

BALTIMORE COUNTY
BUREAU OF ENGINEERING & CONSTRUCTION
DEPARTMENT OF PUBLIC WORKS
Project 2012-01 On-Call Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan Services
TASK ORDER 14 – AMENDMENT 1
Jones Falls Sewershed I/I Analysis and Post-Rehabilitation Performance Assessment
March 4, 2020

DETAILED SCOPE OF WORK

Amendment 1 is to perform flow monitoring at five sites for 6 months starting February 1, 2020.

Flow monitoring and all services associated with this Amendment 1 will be performed in accordance with the Detailed Scope of Work provided herein, Baltimore County's Consent Decree, including Paragraph 9, Rainfall and Flow Monitoring, Baltimore County's Revised Flow Monitoring Plan, the County's SRRR Guidelines (Section 2.0), and any other guidelines provided by the County.

The additional services provided by RJN Group, Inc. to Baltimore County will be a continuation of flow monitoring at five sites currently being monitored by RJN for the County under Task Order 2 of Master Agreement 02668, On-Call Sanitary Sewer Flow Monitoring.

A. Scope of Services

7. Monitoring Program Start and Duration

1. Monitoring Program Start – The flow metering period for each meter will start on February 1, 2020 and extend the monitoring period at five existing sites for a period of 6 months. Extension of the flow monitoring period at these sites is desired to monitor post-rehabilitation flows after recently completed rehabilitation construction along the interceptor monitored by these five sites. The flow monitoring sites are:

Meter Site	Manhole ID	Metering Purpose	Tributary Length
BC03	33463	Flow Diversion Quantification and Modeling	-
BC09	NS1079	I/I Analysis, Modeling, and Performance Assessment	60,300
BC11	6944	I/I Analysis and Modeling	34,600
BC30	6930	I/I analysis and Modeling	18,300
BC31	14565	I/I analysis and Modeling	19,100

2. Monitoring Period - The monitoring period is estimated to be 6 months. The County may reduce this period or extend this period beyond 6 months in order to meet Consent Decree requirements, in response to site hydraulics, or for any other reason. RJN understands that the County may shorten or extend the flow-monitoring period at the sole discretion of the County. In the event the flow-monitoring period is extended beyond the anticipated 6-month duration, RJN agrees to continue working at the agreed unit prices. Furthermore, RJN understands and agrees that there is no compensation to RJN if the flow monitoring period is reduced from the anticipated 6-month duration.

PIA 23-172 RJN - 00015

8. *Monitor Maintenance and Data Collection*

1. Wireless Remote Data Collection - RJN will utilize a host software support application program for remote wireless flow meter data collection. The host software will be capable of individually, by group or globally changing the data collection interval including collection after each measurement. The host software will enforce clock synchronization with the host system's clock for all field RTUs, thus ensuring time interval integrity for all collected data. RJN will install, operate, maintain and remove the telemetry upon the completion of the monitoring period, and will repair any disturbed areas resulting from the wireless telemetry installations.

2. Web Server Data Availability – RJN will use a system employing client/server architecture. RJN will store all project deliverables including flow and rainfall data; equipment configurations; event logs; site parameters, etc. into a SQL database on a server. Transfer of data will be seamless into the project's Enterprise data platform. The software will allow any networked computer (with the appropriate access rights) access to the data stored in the SQL database using a common web browser (e.g. Microsoft Internet Explorer). The web module will be read only; the user will not have access to modify the database or any operational system configurations. A client access control utility will be included that permits the system administrator to control data content to authorized parties by username and password. Client access control will permit different access levels. The web module will have the ability to present near-real time data (i.e. data upload every 24-hours).

3. Data Transfer to Modeling Software – Monthly flow data submittals will be in .csv file format for importation into InfoWorks CS/ICM modeling software.

4. Data Review - RJN will utilize trained data analysts experienced in processing and analyzing flow and rainfall data from sanitary sewer systems. RJN will use various analytical tools, such as hydrographs, scattergraphs, and flow balancing methods to verify the accuracy of the flow data. RJN will work diligently with the County and the County's hydraulic modeling Consultants to resolve flow balancing issues. RJN will collect data remotely from every flow meter site at least twice a week. Furthermore, RJN will schedule the data collection activities in a manner to allow data review by a trained data analyst within 24-hours of the data collection or delivery from the field. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation. Such logs will be made available to the County upon request.

5. Equipment Operation and Maintenance (O&M) - The Consultant's qualified field crews will visit each monitor installation as appropriate to perform any necessary maintenance to the equipment. All measurements, adjustments, and efforts undertaken during site visits will be logged in a maintenance log specific to that site, which will be available to the County upon request.

6. Uptime Requirement - RJN will collect useable flow data a minimum of 90% of the time throughout the monitoring period. RJN will submit to the County an "Uptime" table each

month demonstrating compliance with the uptime requirement, including an explanation of the reasons for not meeting the up-time requirement at any site. Monitor uptime will be defined as the number of five (5) minute measurement intervals where a flow value can be calculated from a measured depth and a measured or inferred velocity for a common time interval divided by the total number of measurement intervals in the reporting period. It is understood and agreed between RJN and the County that the uptime requirement is to be generally satisfied with actual measured data. However, it is also recognized that there may be occurrences where a velocity measurement may not be required to develop accurate data. Accordingly, inferred data would not be considered downtime if RJN documents to the satisfaction of the County that accurate data can be obtained without the velocity measurement and that the loss of velocity data was not caused by maintenance neglect. In any case, however, no velocity data will be inferred for any measurement interval where (1) a corresponding depth measurement has not been obtained for that measurement interval or (2) independent calibration measurements have not been acquired for the site.

9. Monitor Confirmation/Calibration

1. Dry Weather - In accordance with RJN procedures, RJN will perform dry-weather, independent depth and velocity measurements during dry weather conditions periodically throughout the project duration. Furthermore, RJN will assess monitor performance relative to these measurements, and make any adjustments to the monitor or raw depth and velocity data as necessary to maximize the accuracy of the data with respect to actual conditions. Such confirmations will be evenly scheduled and performed a minimum of two (2) times during the 6-month flow monitoring period within approximately 3-month time intervals. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation. Such logs will be provided to the County upon request.

2. Wet Weather - The County and RJN mutually recognize the difficulties and potential hazards associated with obtaining wet weather calibration measurements. Accordingly, RJN will adhere to RJN safety policies as they relate to this topic. However, RJN will demonstrate a good-faith attempt at acquiring at least one (1) independent wet weather measurements. Further, RJN will demonstrate performance relative to this issue by reporting each month during the flow monitoring period the number of independent wet-weather calibration measurements obtained to date at each site. For the purpose of this contract, a wet weather confirmation is acceptable at any time the flows are higher than normal during or following a rain event.

10. Equipment Removal

1. Notification - RJN will notify the County prior to the end of the flow monitoring period. Flow monitoring equipment will not be removed without written County approval.

2. Confirmation – Prior to removing the equipment, RJN will take manual depth and velocity readings using independent instrumentation to confirm that the in-situ monitor yields data representative of actual field conditions. Field crew(s) will also take manual velocity readings of the cross-section (velocity profile) of flow in order to determine the pipe

PIA 23-172 RJN - 00017

hydraulic profile. All measurements, adjustments, and efforts undertaken will be logged in the maintenance log specific to that installation.

3. Site Restoration - RJN will remove all the flow meters at the completion of the flow-monitoring period and will repair any damage or disturbance from the installation and operation of the flow meters.

11. Data Analysis & Reporting

1. Flow Data Analysis - RJN will provide data analysis services for each flow-monitoring site for the entire duration of the flow-monitoring period. Data analysis will include a comprehensive review of collected data to identify data gaps, equipment service needs, as well as the conversion of raw flow data into final edited data. An experienced Data Analyst will review the flow data in order to verify diurnal patterns and reasonable depths and velocities using data diagnostic tools such as hydrographs and scattergraphs. In addition, the Analyst will check for data anomalies or unusual trends that are recognizable.

   Where applicable, metered flow data will be compared to County Pumping Station operation and flow records, as provided by the County, to correlate to the meter data.

2. Flow Data Reporting - RJN will report flow and rainfall data to the County as follows:

   a) Monthly – For each flow meter location, RJN will submit monthly reports of flow data and rainfall data. The data will be submitted electronically by the 30th day for the previous month. Each report will include (as relevant):

   - Five-minute flow, depth, and velocity data in a tabular (.csv) format.
   - Rainfall data for each metered area, correlated by meter basin either to one or more specific County rain gauges or radar-rainfall grids.
   - Five-minute flow, depth, and velocity data will be posted monthly to a web-based portal accessible to Baltimore County and other users as assigned by Baltimore County.
   - Scattergraphs of processed depth-velocity readings with discernable calibration measurements overlain.
   - Monthly hydrographs including depth, velocity, continuity-derived flow, and rainfall hyetographs.
   - An Uptime Report including each metered site, including the basis for failure in meeting uptime requirements and any data quality issues.
   - Meter Calibration Status Report indicating by site the number of calibrations for each month.

   b) Final Data Report – RJN will incorporate the data from the 6-month extension at these five sites into the final data reports for these five sites submitted under Task Order 2 of the On Call Sanitary Sewer Flow Monitoring Contract.

c) Deliverables

- Monthly Operation and Maintenance Reporting
  - Meter summary report documenting issues with the meters and uptimes
  - Meter operation and maintenance and site visit logs
  - Independent depth and velocity confirmations taken during the flow monitoring period (available upon request)
- Monthly Data Reporting
  - On-line internet data access.
  - Monthly finalized flow, depth, and velocity data submitted on CD, including:
    - Tabular finalized flow data in .csv format (Dfinal, Vfinal, Qfinal, Rain)
    - Hydrographs with rainfall hyetographs overlain,
    - Scattergraphs of depth vs velocity
    - Flow balance and summary, if applicable
    - Data and data quality review summary, including data loss summary
    - Data uptime report

B. Compensation

The current Task Order 4 authorized Delivery Order Amount is $160,373.87 (DO# 51730, November 12, 2019). The amount of this Amendment proposal is $76,854.54, which would increase the total delivery amount to $237,228.41.

C. Schedule

The additional services provided by RJN Group, Inc to Baltimore County will not require a change to the current schedule.

PIA 23-172 RJN - 00019

BALTIMORE COUNTY
BUREAU OF ENGINEERING & CONSTRUCTION
DEPARTMENT OF PUBLIC WORKS
Project 2012-01 On-Call Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan ServicesTASK ORDER 14 – AMENDMENT 2
Jones Falls Sewershed I/I Analysis and Post-Rehabilitation Performance Assessment
September 18, 2020

DETAILED SCOPE OF WORK

Under Task Order 14 of Baltimore County Project 2012-01 (MA2446), RJN Group is performing I/I analysis and post-rehabilitation performance assessment services for the Jones Falls sewershed. In support of this effort, flow monitoring was initiated in the Jones Falls sewershed under Baltimore County Master Agreement (MA) No. 00002668 for 18 months at 43 locations in the Jones Falls Sewershed, starting in 2018 and ending on January 31, 2020. It was decided to continue flow monitoring at five (5) locations under MA00002446 to capture additional data in support of the performance assessment effort and additional capacity evaluations for Jones Falls. In January 2020, Amendment 1 to this Task Order 14 extended the flow monitoring period at five (5) existing sites (BC03, BC09, BC11, BC30 and BC31) for six months, through July 31, 2020.

At the request of the County, this Amendment 2 is to extend the flow monitoring period at these existing five meters for an additional 18 months, starting on August 1, 2020. The County also requested that an additional 10 sites be added to allow for additional flow monitoring within Jones Falls in support of the performance assessment and additional capacity evaluations in the sewershed. The specific locations of the additional 10 flow meters has not yet been determined, but the monitoring period for each of the 10 additional sites is anticipated to be 18 months.

Flow monitoring and all services associated with this Amendment 2 will be performed in accordance with the Detailed Scope of Work provided herein, Baltimore County's Consent Decree, including Paragraph 9, Rainfall and Flow Monitoring, Baltimore County's Revised Flow Monitoring Plan, the County's SRRR Guidelines (Section 2.0), and any other guidelines provided by the County.

A. Scope of Services

1. Monitoring Program Start and Duration

1. Monitoring Program Start – The flow metering period for each of the existing five meters will start on August 1, 2020 and extend the monitoring period at those sites for a period of 18 months. The existing flow monitoring sites are:

Meter Site	Manhole ID	Metering Purpose	Tributary Length
BC03	33463	Flow Diversion Quantification and Modeling	-
BC09	NS1079	I/I Analysis, Modeling, and Performance Assessment	60,300
BC11	6944	I/I Analysis and Modeling	34,600
BC30	18452	I/I analysis and Modeling	18,300
BC31	6866	I/I analysis and Modeling	19,100

PIA 23-172 RJN - 00020

The locations of the 10 additional site locations will be determined by Baltimore County, and the monitoring period for each of those additional sites will begin upon installation of the flow meter.

2. Monitoring Period - The monitoring period for each meter is estimated to be 18 months. RJN understands that the County may shorten or extend the flow-monitoring period at the sole discretion of the County. In the event the flow-monitoring period is extended beyond the anticipated 18-month duration, RJN agrees to continue working at the agreed unit prices. Furthermore, RJN understands and agrees that there is no compensation to RJN if the flow monitoring period is reduced from the anticipated 18-month duration.

2. *Monitor Maintenance and Data Collection*

1. Wireless Remote Data Collection - RJN will utilize a host software support application program for remote wireless flow meter data collection. The host software will be capable of individually, by group or globally changing the data collection interval including collection after each measurement. The host software will enforce clock synchronization with the host system's clock for all field RTUs, thus ensuring time interval integrity for all collected data. The data will be collected in Eastern Standard Time (GMT-5). The host software has an alarming capability that can be set with County's authorization. The alarms include high and high high alarms. Each type of alarm is set at a certain trigger level, that is authorized by the County, that will trigger the alarm when the water level reaches the appropriate height. RJN will install, operate, maintain and remove the telemetry upon the completion of the monitoring period, and will repair any disturbed areas resulting from the wireless telemetry installations.

2. Web Server Data Availability – RJN will use a system employing client/server architecture. RJN will store all project deliverables including flow and rainfall data; equipment configurations; event logs; site parameters, etc. into a SQL database on a server. Transfer of data will be seamless into the project's Enterprise data platform. The software will allow any networked computer (with the appropriate access rights) access to the data stored in the SQL database using a common web browser (e.g. Microsoft Internet Explorer). The web module will be read only; the user will not have access to modify the database or any operational system configurations. A client access control utility will be included that permits the system administrator to control data content to authorized parties by username and password. Client access control will permit different access levels. The web module will have the ability to present near-real time data (i.e. data upload every 24-hours).

3. Monthly flow data submittals will be in .csv file format to be submitted to the County.

PIA 23-172 RJN - 00021

4. Data Review - RJN will utilize trained data analysts experienced in processing and analyzing flow and rainfall data from sanitary sewer systems. RJN will use various analytical tools, such as hydrographs, scattergraphs, and flow balancing methods to verify the accuracy of the flow data. RJN will work diligently with the County to resolve flow balancing issues. RJN will collect data remotely from every flow meter site at least twice a week. Furthermore, RJN will schedule the data collection activities in a manner to allow data review by a trained data analyst within 24-hours of the data collection or delivery from the field. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation. Such logs will be made available to the County upon request.

5. Equipment Operation and Maintenance (O&M) - The Consultant's qualified field crews will visit each monitor installation as appropriate to perform any necessary maintenance to the equipment. All measurements, adjustments, and efforts undertaken during site visits will be logged in a maintenance log specific to that site, which will be available and provided as a deliverable with the monthly data submittal.

6. Uptime Requirement - RJN will collect useable flow data a minimum of 90% of the time throughout the monitoring period. Monitor uptime will be defined as the number of five (5) minute measurement intervals where a flow value can be calculated from a measured depth and a measured or inferred velocity for a common time interval divided by the total number of measurement intervals in the reporting period. It is understood and agreed between RJN and the County that the uptime requirement is to be generally satisfied with actual measured data. However, it is also recognized that there may be occurrences where a velocity measurement may not be required to develop accurate data. Accordingly, inferred data would not be considered downtime if RJN documents to the satisfaction of the County that accurate data can be obtained without the velocity measurement and that the loss of velocity data was not caused by maintenance neglect. In any case, however, no velocity data will be inferred for any measurement interval where (1) a corresponding depth measurement has not been obtained for that measurement interval or (2) independent calibration measurements have not been acquired for the site. Uptime report will be provided as a deliverable with the monthly data submittal.

3. *Monitor Confirmation/Calibration*

   In accordance with RJN procedures, RJN will perform independent depth and velocity measurements periodically throughout the project duration. Furthermore, RJN will assess monitor performance relative to these measurements, and make any adjustments to the monitor or raw depth and velocity data as necessary to maximize the accuracy of the data with respect to actual conditions. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation and provided to the County with the monthly submittal.

4. *Equipment Removal*

PIA 23-172 RJN - 00022

1. Notification - RJN will notify the County prior to the end of the flow monitoring period. Flow monitoring equipment will not be removed without written County approval.

2. Confirmation – Prior to removing the equipment, RJN will take manual depth and velocity readings using independent instrumentation to confirm that the in-situ monitor yields data representative of actual field conditions. Field crew(s) will also take manual velocity readings of the cross-section (velocity profile) of flow in order to determine the pipe hydraulic profile. All measurements, adjustments, and efforts undertaken will be logged in the maintenance log specific to that installation.

3. Site Restoration - RJN will remove all the flow meters at the completion of the flow-monitoring period.

5. *Data Analysis & Reporting*

1. Flow Data Analysis - RJN will provide data analysis services for each flow-monitoring site for the entire duration of the flow-monitoring period. Data analysis will include a comprehensive review of collected data to identify data gaps, equipment service needs, as well as the conversion of raw flow data into final edited data. An experienced Data Analyst will review the flow data to verify diurnal patterns and reasonable depths and velocities using data diagnostic tools such as hydrographs and scattergraphs. In addition, the Analyst will check for data anomalies or unusual trends that are recognizable.

   Where applicable, metered flow data will be compared to County Pumping Station operation and flow records, as provided by the County, to correlate to the meter data.

2. Flow Data Reporting - RJN will report flow and rainfall data to the County as follows:

   a) Monthly – For each flow meter location, RJN will submit monthly reports of flow data and rainfall data. The data will be submitted electronically by the 30th day for the previous month. Each report will include (as relevant):

   - Five-minute flow, depth, and velocity data in a tabular (.csv) format.
   - Rainfall data for each metered area, correlated by meter basin either to one or more specific County rain gauges or radar-rainfall grids.
   - Five-minute flow, depth, and velocity data will be posted monthly to a web-based portal accessible to Baltimore County and other users as assigned by Baltimore County.
   - Scattergraphs of processed depth-velocity readings with discernable calibration measurements overlain.
   - Monthly hydrographs including depth, velocity, continuity-derived flow, and rainfall hyetographs.
   - An Uptime Report including each metered site, including the basis for failure in meeting uptime requirements and any data quality issues.
   - Meter Calibration Status Report indicating by site the number of calibrations for each month.
   - Operation & Maintenance log report.

b) Final Data Report – RJN will incorporate the data from the existing five sites into the final data reports for these five sites to be submitted. Final Data Reports for the 10 new flow meter locations will be submitted within 30 days of the end of the flow monitoring period for each meter.

c) Deliverables

- Monthly Operation and Maintenance Reporting
  - Meter summary report documenting issues with the meters and uptimes
  - Meter operation and maintenance and site visit logs
  - Independent depth and velocity confirmations taken during the flow monitoring period (available upon request)
- Monthly Data Reporting
  - On-line internet data access.
  - Monthly finalized flow, depth, and velocity data submitted on CD, including:
    - Tabular finalized flow data in .csv format (Dfinal, Vfinal, Qfinal, Rain)
    - Hydrographs with rainfall hyetographs overlain,
    - Scattergraphs of depth vs velocity
    - Flow balance and summary, if applicable
    - Data and data quality review summary, including data loss summary
    - Data uptime report

B. Compensation

The current Task Order 14 authorized Delivery Order Amount, including Amendment 1 is $237,228.41 (DO# 51730, May 12, 2020). The amount of this Amendment 2 proposal is $723,500.00, which would increase the total Task Order 14 amount to $960,728.41.

C. Schedule

This amendment will extend the flow monitoring period at five existing locations for a period of 18 months. The scheduled flow monitoring period for each of the additional 10 flow meters will be 18 months, starting upon installation of the flow meter. The amendment will not change the schedule for other deliverables as required under this Task Order.

DEPARTMENT OF PUBLIC WORKS
Project 2012-01 On-Call Sewershed Repair, Replacement and Rehabilitation (SRRR) Plan ServicesTASK ORDER 14 – AMENDMENT 3
Jones Falls Sewershed I/I Analysis and Post-Rehabilitation Performance Assessment
December 23, 2020

DETAILED SCOPE OF WORK

Under Task Order 14 of Baltimore County Project 2012-01 (MA2446), RJN Group is performing I/I analysis and post-rehabilitation performance assessment services for the Jones Falls sewershed. In support of this effort, flow monitoring was initiated in the Jones Falls sewershed under Baltimore County Master Agreement (MA) No. 00002668 for 18 months at 43 locations in the Jones Falls Sewershed, starting in 2018 and ending on January 31, 2020. It was decided to continue flow monitoring at five (5) locations under MA00002446 to capture additional data in support of the performance assessment effort and additional capacity evaluations for Jones Falls. In January 2020, Amendment 1 to this Task Order 14 extended the flow monitoring period at five (5) existing sites (BC03, BC09, BC11, BC30 and BC31) for six months, through July 31, 2020.

At the request of the County, Amendment 2 was submitted on September 18, 2020 to extend the flow monitoring period at these existing five meters for an additional 18 months, starting on August 1, 2020. The County also requested that an additional 10 sites be added to allow for additional flow monitoring within Jones Falls in support of the performance assessment and additional capacity evaluations in the sewershed. The specific locations of the additional 10 flow meters has not yet been determined, but the monitoring period for each of the 10 additional sites is anticipated to be 18 months.

At the request of the County, this Amendment 3 is to add additional 15 flow meters. Total number of meters, to include the existing 5 meters, additional 10 meters (amendment 2) and additional 15 meters (this amendment 3) will be 30 meters.

Flow monitoring and all services associated with this Amendment 3 will be performed in accordance with the Detailed Scope of Work provided herein, Baltimore County's Consent Decree, including Paragraph 9, Rainfall and Flow Monitoring, Baltimore County's Revised Flow Monitoring Plan, the County's SRRR Guidelines (Section 2.0), and any other guidelines provided by the County.

A. Scope of Services

1. Monitoring Program Start and Duration

1. Monitoring Program Start – The flow metering period for each of the existing five meters will start on August 1, 2020 and extend the monitoring period at those sites for a period of 18 months. The existing flow monitoring sites are:

Meter Site	Manhole ID	Metering Purpose	Tributary Length
BC03	33463	Flow Diversion Quantification and Modeling	-
BC09	NS1079	I/I Analysis, Modeling, and Performance Assessment	60,300

PIA 23-172 RJN - 00025

BC11	6944	I/I Analysis and Modeling	34,600
BC30	18452	I/I analysis and Modeling	18,300
BC31	6866	I/I analysis and Modeling	19,100

The locations of the 15 additional site locations will be determined by Baltimore County, and the monitoring period for each of those additional sites will begin upon installation of the flow meter.

2. Monitoring Period - The monitoring period for each meter is estimated to be 18 months. RJN understands that the County may shorten or extend the flow-monitoring period at the sole discretion of the County. In the event the flow-monitoring period is extended beyond the anticipated 18-month duration, RJN agrees to continue working at the agreed unit prices. Furthermore, RJN understands and agrees that there is no compensation to RJN if the flow monitoring period is reduced from the anticipated 18-month duration.

2. *Monitor Maintenance and Data Collection*

1. Wireless Remote Data Collection - RJN will utilize a host software support application program for remote wireless flow meter data collection. The host software will be capable of individually, by group or globally changing the data collection interval including collection after each measurement. The host software will enforce clock synchronization with the host system's clock for all field RTUs, thus ensuring time interval integrity for all collected data. The data will be collected in Eastern Standard Time (GMT-5). The host software has an alarming capability that can be set with County's authorization. The alarms include high and high high alarms. Each type of alarm is set at a certain trigger level, that is authorized by the County, that will trigger the alarm when the water level reaches the appropriate height. RJN will install, operate, maintain and remove the telemetry upon the completion of the monitoring period, and will repair any disturbed areas resulting from the wireless telemetry installations.

2. Web Server Data Availability – RJN will use a system employing client/server architecture. RJN will store all project deliverables including flow and rainfall data; equipment configurations; event logs; site parameters, etc. into a SQL database on a server. Transfer of data will be seamless into the project's Enterprise data platform. The software will allow any networked computer (with the appropriate access rights) access to the data stored in the SQL database using a common web browser (e.g. Microsoft Internet Explorer). The web module will be read only; the user will not have access to modify the database or any operational system configurations. A client access control utility will be included that permits the system administrator to control data content to authorized parties by username and password. Client access control will permit different access levels. The web module will have the ability to present near-real time data (i.e. data upload every 24-hours).

3. Monthly flow data submittals will be in .csv file format to be submitted to the County.

PIA 23-172 RJN - 00026

4. Data Review - RJN will utilize trained data analysts experienced in processing and analyzing flow and rainfall data from sanitary sewer systems. RJN will use various analytical tools, such as hydrographs, scattergraphs, and flow balancing methods to verify the accuracy of the flow data. RJN will work diligently with the County to resolve flow balancing issues. RJN will collect data remotely from every flow meter site at least twice a week. Furthermore, RJN will schedule the data collection activities in a manner to allow data review by a trained data analyst within 24-hours of the data collection or delivery from the field. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation. Such logs will be made available to the County upon request.

5. Equipment Operation and Maintenance (O&M) - The Consultant's qualified field crews will visit each monitor installation as appropriate to perform any necessary maintenance to the equipment. All measurements, adjustments, and efforts undertaken during site visits will be logged in a maintenance log specific to that site, which will be available and provided as a deliverable with the monthly data submittal.

6. Uptime Requirement - RJN will collect useable flow data a minimum of 90% of the time throughout the monitoring period. Monitor uptime will be defined as the number of five (5) minute measurement intervals where a flow value can be calculated from a measured depth and a measured or inferred velocity for a common time interval divided by the total number of measurement intervals in the reporting period. It is understood and agreed between RJN and the County that the uptime requirement is to be generally satisfied with actual measured data. However, it is also recognized that there may be occurrences where a velocity measurement may not be required to develop accurate data. Accordingly, inferred data would not be considered downtime if RJN documents to the satisfaction of the County that accurate data can be obtained without the velocity measurement and that the loss of velocity data was not caused by maintenance neglect. In any case, however, no velocity data will be inferred for any measurement interval where (1) a corresponding depth measurement has not been obtained for that measurement interval or (2) independent calibration measurements have not been acquired for the site. Uptime report will be provided as a deliverable with the monthly data submittal.

3. *Monitor Confirmation/Calibration*

   In accordance with RJN procedures, RJN will perform independent depth and velocity measurements periodically throughout the project duration. Furthermore, RJN will assess monitor performance relative to these measurements, and make any adjustments to the monitor or raw depth and velocity data as necessary to maximize the accuracy of the data with respect to actual conditions. All measurements, adjustments, and efforts undertaken during site visits will be logged in an installation/maintenance log specific to that installation and provided to the County with the monthly submittal.

4. *Equipment Removal*

1. Notification - RJN will notify the County prior to the end of the flow monitoring period. Flow monitoring equipment will not be removed without written County approval.

2. Confirmation – Prior to removing the equipment, RJN will take manual depth and velocity readings using independent instrumentation to confirm that the in-situ monitor yields data representative of actual field conditions. Field crew(s) will also take manual velocity readings of the cross-section (velocity profile) of flow in order to determine the pipe hydraulic profile. All measurements, adjustments, and efforts undertaken will be logged in the maintenance log specific to that installation.

3. Site Restoration - RJN will remove all the flow meters at the completion of the flow-monitoring period.

5. *Data Analysis & Reporting*

1. Flow Data Analysis - RJN will provide data analysis services for each flow-monitoring site for the entire duration of the flow-monitoring period. Data analysis will include a comprehensive review of collected data to identify data gaps, equipment service needs, as well as the conversion of raw flow data into final edited data. An experienced Data Analyst will review the flow data to verify diurnal patterns and reasonable depths and velocities using data diagnostic tools such as hydrographs and scattergraphs. In addition, the Analyst will check for data anomalies or unusual trends that are recognizable.

   Where applicable, metered flow data will be compared to County Pumping Station operation and flow records, as provided by the County, to correlate to the meter data.

2. Flow Data Reporting - RJN will report flow and rainfall data to the County as follows:

   a) Monthly – For each flow meter location, RJN will submit monthly reports of flow data and rainfall data. The data will be submitted electronically by the 30th day for the previous month. Each report will include (as relevant):

   - Five-minute flow, depth, and velocity data in a tabular (.csv) format.
   - Rainfall data for each metered area, correlated by meter basin either to one or more specific County rain gauges or radar-rainfall grids.
   - Five-minute flow, depth, and velocity data will be posted monthly to a web-based portal accessible to Baltimore County and other users as assigned by Baltimore County.
   - Scattergraphs of processed depth-velocity readings with discernable calibration measurements overlain.
   - Monthly hydrographs including depth, velocity, continuity-derived flow, and rainfall hyetographs.
   - An Uptime Report including each metered site, including the basis for failure in meeting uptime requirements and any data quality issues.
   - Meter Calibration Status Report indicating by site the number of calibrations for each month.
   - Operation & Maintenance log report.

PIA 23-172 RJN - 00028

b) Final Data Report – RJN will incorporate the data from the existing five sites into the final data reports for these five sites to be submitted. Final Data Reports for the 10 new flow meter locations will be submitted within 30 days of the end of the flow monitoring period for each meter.

c) Deliverables

- Monthly Operation and Maintenance Reporting
  - Meter summary report documenting issues with the meters and uptimes
  - Meter operation and maintenance and site visit logs
  - Independent depth and velocity confirmations taken during the flow monitoring period (available upon request)
- Monthly Data Reporting
  - On-line internet data access.
  - Monthly finalized flow, depth, and velocity data submitted on CD, including:
    - Tabular finalized flow data in .csv format (Dfinal, Vfinal, Qfinal, Rain)
    - Hydrographs with rainfall hyetographs overlain,
    - Scattergraphs of depth vs velocity
    - Flow balance and summary, if applicable
    - Data and data quality review summary, including data loss summary
    - Data uptime report

B. Compensation

The current Task Order 14 authorized Delivery Order Amount, including Amendment 1 is $237,228.41 (DO# 51730, May 12, 2020). The amount of Amendment 2 proposal is $723,500.00, The amount of this Amendment 3 proposal is $741,000.00 which would increase the total Task Order 14 amount to $1,701,728.41

C. Schedule

This amendment will add additional 15 flow meters for a period of 18 months. The scheduled flow monitoring period for each of the additional 15 flow meters will be 18 months, starting upon installation of the flow meter. The amendment will not change the schedule for other deliverables as required under this Task Order.

Re: January 2023 Progress Report for Project 2015-03, Task 003

Ms. Eicholtz and Mr. Bayer:

The following is the progress report through the month of January 2023 for Task 003, Jones Falls Sewershed Comprehensive Evaluation. Had a Progress Workshop on December 14th and a discussion on the Draft Report outline January.

I. Current Project Status

- **Task 1 – Project Administration – Ongoing**
    - Task 1 is ongoing and will continue throughout the project.
    - Invoices are up to date (through end of November 2022, December 2022 will be sent shortly) and have been submitted to the County for review/approval. The invoice submittal process has changed, as going forward invoices will be submitted electronically to the County.
    - Schedule is being updated as the project progresses with updates provided, if and when necessary. Work has progressed largely along with the Baseline Schedule to date. Flow monitoring and ensuring recent data is used for model calibration purposes has shifted the project completion date to Winter 2023/January 2024, which is past the original completion data. This will result in a more comprehensive evaluation of the sewer system in its current condition and future condition.
    - Implemented a GIS Network Drive and Virtual Desktop to allow for collaboration amongst our multi-region project team. This prevents data loss and corruption. GIS data stored in Microsoft Azure SQL storage and accessible by Database Connections. Hosted live in Hazen GIS Portal as referenced registered data and connected directly to PowerBI.
- **Task 2 – Gather and Review Existing Data – Complete (Provide additional services as required, if identified during project)**

PIA 23-172 Hazen - 00292

- Hazen completed review of past historical reports provided by the County.
- Reviewed SSO, basement backup, and work order info (cleaning, repairs, etc.) from the Bureau of Utilities.
- Reviewed latest sewerline and manhole inspection information, coupled with asset rehabilitation information, to identify assets where inspections would be warranted to assess current structural/O&M condition
- Reviewed as-built drawings and GIS data against the existing model framework to identify discrepancies and data gaps

- **Task 3 – System Characterization and Gap Analysis – Partially Complete (Provide additional services as required, if identified during project)**
  - Completed a gap analysis of the existing model.
  - Completed a QA/QC of the GIS data available to expand the hydraulic model.
  - Based on the GIS review and model gap analysis, completed survey of manholes to update the hydraulic model.
  - Completed a Hot Spot Analysis associated with all SSO, basement backup, and work order data. This Hot Spot Analysis allowed for field work areas to be identified for field reconnaissance and CCTV/manhole inspection.
  - Field Reconnaissance work has begun. An SOP was developed for data capture.
  - CCTV work has begun. An SOP was developed for data capture. Assets were identified based upon a review of RDII results, NASSCO database scores, etc. Priority 1 pipe assets are those without recent CCTV data, within high RDII basins, and without recent rehab history.
  - Phase II Field Reconnaissance (CCTV, Acoustic, and Sonar) work will follow model calibration/validation into Spring 2023.

- **Task 4 – Flow/Rainfall Monitoring Data Review and Interim I/I Analysis – Ongoing**
  - Using Hazen Q, completed a flow, level, and rainfall monitoring data review to assess current high RDII sewer service areas. These areas respond more dramatically to rainfall.
  - Using the results of the Hazen Q analysis, coupled with SSO, basement backup, work order, and rehabilitation data selected flow monitor locations in order to refine the hydraulic model calibration during model expansion.

PIA 23-172 Hazen - 00293

- County completed deployment of the additional flow monitors, based upon the recommendations, in late October 2021. Flow monitoring data has been received through September/October 2022.

- **Task 5 – Hydraulic Model Refinement and Calibration – Ongoing**

  - Completed existing model review and gap analysis.

  - Expanded the existing model to include all sewers in the sewershed (original model included 10" and larger). This expansion to include all sewers and manholes within the sewershed will allow for a more detailed sewershed wide analysis.

  - Completed subcatchment delineation updates within the model. This resulted in major improvements to metershed coverage, removal of unsewered areas that do not contribute to rainfall dependent inflow and infiltration (RDII), and increased flow distribution resolution.

  - Updated dry weather flow distribution based upon water meter billing data, which was georeferenced using GIS for accurate distribution of sewer flows. Also utilized TAZ information to help allocate flows within the hydraulic model.

  - Implemented improved wet weather simulation methodology: existing model used fixed runoff whereas the expanded model uses RTK plus a groundwater infiltration model to address antecedent moisture condition.

  - Developed initial population/employment projections. These projections were discussed with County Planning. Meetings were held with Stakeholders within the Jones Falls Sewershed to discuss wastewater flow projections, which are directly related to residential and employment projections.

  - Completed an initial climate change assessment, which aimed to assess potential rainfall impacts within the sewershed over the 50 year planning period. Climate change is believed to compress the hydrologic cycle, resulting in long periods of dry conditions punctuated with more frequent heavy rainfall. Extremes can increase at a higher rate than average annual rainfall. As a part of the Climate Action Plan, Hazen recommended a 15% increase in precipitation in the 2050's and a 30% increase in precipitation in the 2080's.

  - Completed initial septic system elimination evaluation. Next step in this evaluation will be to use the calibrated sewer model to assess the impact connecting septic systems to the public sewer system may have on capacity and needed improvements. This is anticipated to be completed in Summer/Fall 2022 when model calibration is complete.

  - Continued model validation efforts. Initial model validation of the expanded model was completed using some of the historical and ongoing flow monitoring

hazenandsawyer.com
PIA 23-172 Hazen - 00294

within the sewershed. This is being refined with new modeling data, as it becomes available in 2022 – have received data through September 2022.

- Completed Dry Weather Flow Calibration in December 2022. A total of 63 meters were used spanning from 2018 through 2022. Only 4 meters were deemed uncalibrated, but reasons were developed for the differences in flows:
  - FM26 - New meter with flow data mass balance issues. Model calibrated to the upstream meters at BC09 (permanent) and BC10 (historical), and immediate downstream meter at BCSSO01 (historical). This is the new meter we added, add more details to explain if we have.
  - BC03 - Permanent meter with flow data mass balance issues. Poor data quality observed per the historical data. Model calibrated to the immediate downstream new meter at FM03, which was added to verify/replace BC03.
  - BC06 - Historical meter with substitute new meter at FM22 (immediate upstream). Model calibrated to the new meter FM22.
  - 6882- New meter with flow data mass balance issues. Model calibrated to the immediate upstream permanent meter at BC31, which can balance the accumulated flow from the multiple upstream meters.
- Goal is to complete wet weather calibration by February, so current and future capacity analysis can take place. Wet weather calibration is underway.

- **Task 6 – Asset Management and Capital Improvement Program Development - Ongoing**
  - Hazen completed a socioeconomic analysis for the sewershed. This analysis was completed to determine if socioeconomic and demographic characteristics of Jones Falls and other Baltimore County Sewersheds should be used to prioritize planned sewer collection system projects. Analysis also helped to answer the question of whether there are proposed projects that could receive priority ranking for Federal or State Loan or Grant Programs based on Environmental Justice Issues. Based on the analysis completed, it appearr that socioeconomic factors will have minimal impact on project prioritization within the Jones Falls sewershed.
  - Hazen has completed the initial Asset Management component of the project. This work will be expanded following the hydraulic model capacity analysis. See Task 5 above.
  - Hazen completed a stream evaluation using a risk assessment approach that complements the asset management assessment. Focus is to reduce the risk of SSO's caused by exposure of and damage to sewer assets from erosion. Outcomes of this evaluation include: inspection prioritization by risk, field inspection

PIA 23-172 Hazen - 00295

methodology, pilot field inspections, rehabilitation decision trees. Field confirmations were completed. 36 potential exposures were identified from the analysis.

- Developed a risk-based framework that can be applied to the sewershed assets. Framework includes 4 failure modes and a Triple Bottom Line Evaluation (Socia, Economic, and Environmental).
- Consequence of Failure criteria were defined in accordance with the Triple Bottom Line Evaluation. Assets have been assigned preliminary Consequence of Failure ratings.
- Likelihood of Failure criteria was also defined.
- Workshops have been held to discuss goals and best industry practices.

- **Task 7 – Sewershed Evaluation Report – Future Work**
  - Hazen has begun development of text that will populate the future Sewershed Evaluation Report, including data analysis, model gap analysis, model expansion, flow monitor selection, future flow projections, septic system evaluation, stream asset prioritization, and asset management. A Draft Outline was presented on December 14th – County and Hazen discussed additions/changes in mid-January. The Report Outline was agreed upon. Targeting a July Draft Report Submittal.

- **Task 8 – Public Outreach – Ongoing**
  - Hazen has provided the County with information, as needed, based upon inquiries about the ongoing work within the sewershed.
  - Prepared preliminary PowerBI Dashboards for results presentation purposes. These could be shared with Stakeholders to provide project updates.
  - Future Public Outreach will be conducted as deemed necessary by the County with support from Hazen.
  - Quarterly Reports are being prepared for publication – they are posted on the County's website.

- **Other Items**
  - The following innovations have been implemented on this project:
    a) Hazen Q Analysis – Better RDII Analysis Tool
    b) Model Calibration – RTK + GWI Model – Better Tool to Assess Capacity Needs

hazenandsawyer.com
PIA 23-172 Hazen - 00296

c) Digital Field Work Approach – SOPs with Collector and Survey 1,2,3

d) Climate Sensitivity

e) Stream Assessment Approach – Utilize GIS to help characterize risk

f) Tie in Equity and Sustainability to Asset Management Framework

g) Triple Bottom Line – Social, Economic, and Environmental

h) Dashboard Visualizations

II. Upcoming Work

- Meetings to be held:
  - Meeting with the Groundwater Management Section to discuss Septic System Analysis completed.
- If required or identified by modeling efforts - Phase II CCTV Inspection, Acoustic Inspection, Sonar Inspection and manhole inspections beginning in early 2023 and continuing into Spring 2023. Hazen may rely upon data available in CityWorks, as this remains the most current information.
- Creek Walks/Exposed Asset Assessments have been completed. Additional work may be required at the 36 potential exposed assets. County and Hazen to discuss prior to any further field work.
- Dry weather model calibration is complete. Wet weather model calibration to be completed by February. New flow monitoring data was provided by the County through September/October.

III. Longer Term Work Items

- Capacity assessment using the calibrated model under future flow conditions.
- Acoustic Inspection, Sonar/CCTV Inspections, if required based upon modeling results. Otherwise, Hazen will rely upon CityWorks data.
- Review capacity assessment results and define level of service.
- Review recommended Capital Improvement Program (CIP).
- Recommended Asset Management Program features.
- Final PowerBI Dashboards (and/or ESRI Dashboards) to present results and findings.

hazenandsawyer.com
PIA 23-172 Hazen - 00297

- Document recommended Best Management Practices for future operations and maintenance of the system.
    - Meeting with Stakeholders within the Jones Falls Sewershed to discuss wastewater flow projections, which are directly related to residential and employment projections.

IV. County Action Items

- County to weigh in on whether any of the innovation ideas discussed would be of interest for piloting within the Jones Falls Sewershed. Ideas included:
    - Artificial Intelligence/Machine Learning – "Smart" Sewer
        a) Operational Enhancements
        b) Forecasting – Weather, Flow, Failure, and Predictive.
    - Smart Manhole Cover Technology/Level Monitoring
        a) Maintenance Prioritization
        b) Strategic Complete Sewer Rehabilitation
    - Markov Chain Probabilistic Modeling
    - Resiliency/Reliability and Conservation
        a) Energy Management/Optimization
        b) Operational Enhancements/Automatic Operation
    - Tools/Software (Cover Separately)
        a) CityWorks – Condition Data, Work Order Data, Risk Scores
        b) Dude Solutions Capital Predictor – Work with GIS, CityWorks, and PowerBI
        c) GIS and PowerBI
- County working to provide Hazen with CityWorks access. Data effort will focus on pipe and manhole repair work orders. Other factors that will be considered include customer service requests/complaints, potential for internal corrosion, and choke history.

hazenandsawyer.com
PIA 23-172 Hazen - 00298

- Continued coordination with On-Call Flow Monitoring Contractors to have flow monitoring data provided throughout the Jones Falls Sewershed. County is continuing to send this data as it becomes available – David Bayer has provided through May 2022.
- Investigate whether the County has any additional FOG data that Hazen could add to the data analysis.
- County to gather historical SL-RAT data for Hazen analysis purposes.

V. Task Budget Status

Project Costs	Total Fee	Prior Billings	This Invoice (January 1 – January 31, 2023)	Billed to Date	Percent Billed
Task 003	**2,313,083.12**	**$1,487,426.16**	**$26,161.53**	**$1,513,587.69**	**65.4%**

If you have any questions or require additional information, please don't hesitate to contact me.

Regards,

Jeremy Hise

Jeremy T. Hise, PE
Senior Associate/Project Manager

Subject: RE: Greenspring Manor SWM Report

Michael,

That is the latest we have as far as any kind of report. I did not actually receive the November 2021 report for review until August 2022 when they were trying to get approval of a redlined development plan. At that time we had some comments regarding the redline changes which were addressed by the revisions referenced in the email from Matt Bishop from the afternoon of 8/25/22. Please see the attached correspondence.

Thanks,

Ella

Subject: RE: Greenspring Manor SWM Report

Thanks Ella. Yes, we were looking for anything new since the Swm report itself, which is dated May 2021. Last time we asked, in fall 2022, we were told there was nothing new. So these November 2021 reports are new to us.

Michael

Re: *United States and State of Maryland v. Baltimore County*
Consent Decree Civil Action No. AMD 05-2028, AI# 31394
Stipulated Penalty Assessment for SSOs in CY 2018

Dear Ms. Buckler:

The Maryland Department of the Environment, Water and Science Administration, Compliance Program ("Department"), in consultation with the United States Environmental Protection Agency ("EPA") (collectively, the "Agencies"), has reviewed the additional information which the Baltimore County Department of Public Works and Transportation (the "County") provided to the Department and the EPA on November 18, 2022, regarding Sanitary Sewer Overflows from the County's collection system ("SSOs") occurring in calendar year 2018.

The County is liable for stipulated penalties to the United States and the State of Maryland for all SSOs, per Paragraph 39 of the Consent Decree, Civil Action No. AMD 05-2028 (Consent Decree). Following the review of twenty-four (24) hour and five (5) day SSO reports provided to the Agencies, and considering record corrections provided by the County during the review process, the Department has determined that the County is liable for stipulated penalties for 151 SSOs during calendar year 2018, and a total penalty of $641,750. Half of this amount, $320,875, is due to the State of Maryland.

The Agencies may, "in their own behalf and in their unreviewable exercise of discretion, reduce or waive stipulated penalties otherwise due," per Paragraph 45 of the Consent Decree. The Department, in consultation with EPA, has conducted a thorough review of all waiver requests, along with any additional data provided by the County to support these requests. While the Department declines to make *force majeure* determinations, it does agree to a waiver of certain SSO stipulated penalties at its discretion. The Department gives consideration to circumstances under the County's control and measures taken by the County to avoid or minimize delays. The Department has utilized metrics in certain categories of SSOs, such as the storm recurrence interval, in an effort to apply its discretion in a more consistent and replicable manner.

The Department, at its discretion, waives stipulated penalties for the 57 SSOs listed in Attachment I; $136,687.50 total waived penalties. These penalties would have otherwise been due to the State of Maryland. Please note that this waiver is for penalties due to the State of Maryland only. As such, the Department has determined that the County owes stipulated penalties for the remaining 94 SSOs.

Ms. Lauren Buckler, AI# 31394

Pursuant to Section XI of the Consent Decree, and as detailed in Attachment I, the County owes a total stipulated penalty of $184,187.50 to the State of Maryland, for SSOs occurring during calendar year 2018.

Please notify Mr. Arno Laud, Chief, Enforcement Division, Compliance Program at (410) 537-3510 or by email at arno.laud@maryland.gov within fourteen (14) days confirming your acceptance of this stipulated penalty assessment. Upon acceptance, an invoice payable to the Maryland Department of the Environment will be mailed to you under a separate cover.

Please note that this letter addresses the Department's request for payment of stipulated penalties only. The EPA will provide a separate letter regarding payment of penalties to the United States, and any waivers granted.

Sincerely,

D. Lee Currey, Director
Water and Science Administration

CHAPTER III - WATER SUPPLY PLAN

GENERAL BACKGROUND

Baltimore County has received virtually all its public water supply from the Metropolitan Water System which began in Baltimore City. As early as 1881, Baltimore built a stone dam across the Gunpowder River and a tunnel to bring water into the City. In 1915, a second dam was constructed across the river at Loch Raven which is being used today along with Prettyboy Dam, built in 1936.

Owing to the need for additional raw water, Baltimore erected Liberty Dam in 1954 to impound the Patapsco River. Twelve (12) years later the Susquehanna River was tapped as a third source of water by the City. Since all of the water sources in Maryland belong to the State, Baltimore secured the State's approval to use these rivers for water supply.

The Maryland State Legislature, in 1908, granted the City exclusive use of the entire Gunpowder River[1] watershed above Loch Raven. It also granted the City the right to use the entire Patapsco River[2] watershed in 1931; and in 1931 and in 1955, the City received the legislature's approval to withdraw water from the Susquehanna River[3] above the Conowingo Dam.

The present Baltimore County water system is actually an extension of the City system. This resulted from the 1918 annexation[4] of nearly 50 square miles of County land surrounding Baltimore and Acts of the Legislature previously mentioned. As development took place along primary County roads, the distribution system was extended to serve the people. Water was brought into the City filtration plants from the impoundment reservoirs in the County, treated, and returned to the County consumers. So both the City and County are physically and legally wedded to a common water system. In looking at the history of the marriage, one might say that it has been quite successful in view of the service rendered to the people.

[4] Acts of the Maryland General Assembly - 1918, Chapter 82, Sec. 1-18

DESCRIPTION OF EXISTING SYSTEM

Water served to consumers in Baltimore County is secured from three (3) surface supplies: the Gunpowder River, the North Branch of the Patapsco River and the Susquehanna River. Baltimore City developed these rivers as water supply sources as they were needed.

Gunpowder River

The Gunpowder River development consists of two (2) concrete gravity dams: one (1) at Loch Raven and the other near the mouth of Prettyboy Creek. Raw water is conveyed in a 12-foot-diameter tunnel from Loch Raven Dam to the Montebello Filtration Plant. These two dams impound 43-billion gallons of water collected as runoff from the 333 square mile watershed. Loch Raven is located about one-half (1/2) mile north of Cromwell Bridge Road, and Prettyboy Dam is located about three (3) miles southwest of Parkton.

North Branch of the Patapsco River

The Patapsco River development consists of the concrete, gravity Liberty Dam located near Falls Run on the North Branch of the river and a 10-foot diameter tunnel from the dam to the Ashburton Filtration Plant. Liberty Dam impounds 43-billion gallons of water. The reservoir collects runoff from the 164-square mile watershed.

See Impoundment and Safe Yield Data.

Susquehanna River

The Susquehanna River development consists of an intake structure at Conowingo, a 12-foot diameter tunnel and pipeline from the intake to the Deer Creek Pumping Station, a 9-foot diameter pipeline extending to Fullerton, and an 8-foot diameter pipeline from that point to the Montebello Filtration Plant. The intake structure and 12-foot line permit withdrawal of 500 million gallons per day (MGD) from the Susquehanna River which flows by gravity to the Deer Creek Pumping station and discharge line which are sized for an approximate flow of 200 MGD. At present, there are four (4) 62.5 MGD variable speed pumps in the station with one pump remaining on standby. The pipeline decreases in size to 8 feet at Fullerton in anticipation of the construction of a plant to filter the Susquehanna supply.

The Susquehanna River drains 27,000-square miles of land in New York, Pennsylvania and Maryland.

METHOD OF OPERATION

Under normal operating conditions, water flows by gravity from Loch Raven Reservoir to the Montebello Filtration Plant through the 12-foot diameter, concrete-lined tunnel which is 7 miles long.

When water in Loch Raven Reservoir recedes to about 9 feet below the crest of the dam, gates in Prettyboy Dam are opened and water flows down to Loch Raven to maintain the desired level in the reservoir. If the water level at Loch Raven continues to drop below certain elevations, low lift pumps must be started at Montebello to pump water into the filter plants and/or the Deer Creek Pumping Station must be brought into operation.

Water from the Liberty Reservoir flows by gravity through a 10-foot diameter concrete-lined tunnel to the Ashburton Filtration Plant. In low water situations, low lift pumps at Ashburton can be used to deliver water from Liberty Reservoir to the filtration plant.

All water from the Susquehanna River which enters the Baltimore System is presently pumped into the Montebello Filtration Plants. Currently, the Susquehanna supply is not used unless the water levels of the reservoirs on the Gunpowder and the Patapsco rivers drop below predetermined elevations. This method of operation is used so that water in the upland reservoirs can be drawn by gravity into the filter plants in quantities which approach what would be the total yield of the streams without the Susquehanna supply. This usually results in economical operation of the reservoirs. Some of the runoff which formerly flowed over the spillways and was lost during periods of heavy rainfall can be impounded behind the dams. This operation also diminishes pumping time and costs at Deer Creek.

FILTRATION

Water drawn from the three (3) rivers is filtered before it reaches the public. Gunpowder and Susquehanna water is treated at the Montebello Filtration Plant. There are two (2) complete filter plants at Montebello. The first plant was built in 1915, has 32 filter units and a capacity of 128 MGD. The second was constructed in 1928, has 28 filter units and a capacity of 112 MGD. The Ashburton Filtration Plant was erected in 1956, has 20 units and a capacity of 120 MGD.

The treatment process consists of chlorination, chemical treatment, coagulation, sedimentation, filtration and fluoridation. After the water leaves the filter plants, additional chlorine is added at each distribution reservoir and remote pumping station to keep it as sterile as possible.

Careful supervision is exercised in the treatment process with samples of water taken every two (2) hours at various points through the filter plant. Other samples are collected from many points in the distribution system by both the City Environmental Services Division and the State Health Department. These samples are analyzed for the chemical and bacteriological composition of the water.

FUTURE FULLTERTON FILTRATION PLANT

The proposed Fullerton Water Treatment Plant, will be the most significant addition to Baltimore's regional water supply system since the development of the Susquehanna River supply and the construction of the Susquehanna Transmission Main and the Deer Creek Pumping Station in the 1960s.

The Fullerton Plant will be located on a large tract of land in the Fullerton area of Baltimore County north of the intersection of the Baltimore Beltway and Interstate-95. The land was acquired by the City as part of the implementation of the Susquehanna River system.

The Fullerton Plant will be designed to meet the following objectives:

- Facilitate more use of the Susquehanna River supply to augment other water supplies especially during times of drought
- Increase the total water filtration capacity for the regional system to help reliably meet future needs
- Help in distributing finished water to the growing areas of Northeast Baltimore County
- Increase the overall dependability of the regional system by providing alternative means to obtain, treat, and supply water in the event that another major component of the water system is out of service, under maintenance, or experiencing emergency conditions.

The Fullerton Plant's ultimate filtration capacity will be 120 MGD.

Baltimore City and County have put a hold on moving forward with the plant at this time.

DISTRIBUTION

The Baltimore distribution system is one of the most complex systems in the United States. This is due not only to its size (although it is one of the ten (10) largest systems in the country), but also to the large number of zones of service which are established to serve areas with significantly different ground elevations. At present, there are thirteen (13) distinct zones of service. They are linked together by a series of pumping stations, transmission mains, storage reservoirs, and elevated tanks.

Water from Montebello flows by gravity into areas on the east side of the County adjacent to the harbor, and it is pumped into the north and northeast areas of Baltimore County through several pumping stations. Water leaving the Ashburton plant flows by gravity to the southwest area of the County and is pumped into the western and northwestern parts of the County.

SERVICE AREA

The service area contains about 120-square miles of land in Baltimore County in addition to the City and other adjacent counties. Elevations in the area vary from sea level at the harbor to 750 feet above sea level in Reisterstown. Most of the heavy industry is located near the harbor while

commercial development is scattered throughout the County with primary land use devoted to residential subdivisions.

Residents in the Metropolitan District[5] are eligible for water service although some people who live in the District have their own private systems. Water lines may be extended if property owners, who own 60% of the frontage, submit a petition to the County or if the Department of Environmental Protection and Sustainability deems there is a health problem.

WATER CONSUMPTION

In fiscal year 2022, Baltimore County used about 78 MGD from the Baltimore system. This amounts to about 42.4% of the average day water demand of 184.3 MGD. About 44% of the 78 MGD is used by commerce and industry (based on 1.5" and larger meters). Residential consumption accounts for the remaining 56%.

FIRE PROTECTION

The County system also supplies water for fire protection. Currently, all fire flow data is collected by Baltimore City and is distributed to Baltimore County for permanent record and future inquiries. Those areas found to be deficient are included in a yearly list (the Basic Services Map; see section 4A02 of the Baltimore County Zoning Regulations) that precipitates capital improvement programs to eliminate these deficient areas. All Basic Services deficient areas identified in the water system have been addressed as of the 2022 Basic Services map update.

The American Insurance Association conducted a study in 2008 of fire flow in Baltimore County. This study is available from the Baltimore County Fire Department.

FINANCES

The County finances the water system from a number of charges including water rates, service charges, front-foot assessments, system connection charges, and water distribution charges. Revenue from the water rates is used to reimburse the City for the County's share of the City's operation and maintenance expenses. The Metropolitan District Operations Special Revenue Fund receives any net surplus on the sale of water or water service charge.

RELATIONSHIP WITH CITY AND ADJACENT COUNTIES

Baltimore County has as its neighbors the City, the four (4) counties of Anne Arundel, Howard, Carroll and Harford, and the State of Pennsylvania. All of these political subdivisions with the exception of Anne Arundel County are interrelated by the use of water from the Baltimore System. Pennsylvania is involved only because of its location with respect to surface waters. The Gunpowder River has its origin in this state, and about 80% of the Susquehanna Basin lies in Pennsylvania.

---

[5] See Title 35, Baltimore County Code.

Howard County is supplied with water from Baltimore City which flows through the Baltimore County distribution system. Although present consumption in Howard County is relatively small at 25.1 MGD, they rely heavily on the Baltimore System for future water supply. Howard County recognized this fact in 1957 when it entered into an agreement with the City and Baltimore County for the joint financing of distribution facilities to supply them with 5 MGD from the Western Third Zone of service. The City and Baltimore, Howard and Anne Arundel counties also signed an agreement in 1969 for construction of pipelines in the western part of the Second Zone. Presently, Anne Arundel County does not accept water from the Baltimore System.

In 1968, Carroll County signed an agreement with the City to purchase a maximum of 3 MGD from the Liberty Reservoir to serve the Freedom District. Although Carroll County is not consuming filtered water, it is using part of the total raw water supply. Harford County is also a raw water customer. By legislative acts, they have the right to a maximum of 25 MGD from the Susquehanna pipeline. When the Deer Creek Pumping Station (Susquehanna water) is off, Harford County uses raw water from Loch Raven Reservoir.

The relationship between Baltimore County and the City includes legal, financial, and practical arrangements for the operation and maintenance of the County water system. Legally, the City must supply water to the County at cost.[6] The question of cost has been the source of debate between the two (2) jurisdictions since 1945. An agreement resolving many cost problems was executed by the City and County on September 20, 1972[7]. In 2023, Baltimore City and County introduced emergency legislation at the State to evaluate a new governance structure. The legislation passed as House Bill 843 and will create the Baltimore Regional Water Governance Task Force. The Task Force will report its findings and recommendations to the Mayor of Baltimore City, the County Executive of Baltimore County, the Governor, and the General Assembly on or before January 30, 2024. Under the present method of operation, Baltimore County builds and finances improvements to its distribution system; and the City operates and maintains it. The City reads the water meters and bills the County consumers. The water revenue is used to pay the City for its services. Any excess is returned to the County. Any deficit is paid to the City by the County.

[6] See Title 35, Baltimore County Code.

[7] See Water Agreement, Baltimore City and Baltimore County, dated September 20, 1972.

THE PRESENT SYSTEM – ITS STRENGTHS AND WEAKNESSES

The quality of water in the three reservoirs is usually excellent, but the Susquehanna River presents a serious quality problem during periods of low stream flow (less than 10,000 CFS) which occurs during drought years in the late summer and fall. During these periods, the sulfate hardness increases. When this water is used in the system, complaints can be expected from the consumers about the hardness and possible red-water conditions which may occur. In addition, when Susquehanna water is filtered at the Montebello Plant, complaints may occur from consumers regarding taste and odor conditions.

A problem of algae blooms has developed in Liberty Reservoir and Loch Raven Reservoir. This is primarily caused by nutrients in untreated waste effluents from industries which flow into the upper reaches of the reservoirs. The problem will intensify as the watersheds are urbanized and more wastes are discharged into the reservoirs. On June 29, 1979, Baltimore County entered into a reservoir Watershed Management Agreement[8] with Carroll County and the City to continuously review and evaluate existing problems and proposed actions potentially affecting the water supply watersheds. It is of the utmost importance that the State Water Quality Standards be adhered to in order to secure a pure and constant supply of water.

The following is a summary of the improvements needed in the County water system in each zone of service:

First Zone

The southeastern part of the County is served by gravity flow from the Montebello Filtration Plants. Both of the Montebello Filtration plants are in need of extensive rehabilitation. There is currently a large infrastructure improvement construction project ongoing at Montebello plant #2. (The Fullerton Transmission Main, connecting the major transmission system to facilities located on the Fullerton site, was completed at the end of 1999). The Fullerton reservoirs (60 MG) are currently in operation

Replacement covered reservoirs are scheduled to be built by 2023 to comply with the EPA LT2ESWTR mandate at Druid Lake.

A new 16" transmission main will be needed in Ebenezer Road, between Stumpfs Road and Harewood Road, to provide a redundant source of water (to enhance system reliability) to the Chase area of Baltimore County.

New 8" and 12" water mains are currently under construction in St. Helena to replace deteriorated cast iron pipes.

---

[8] See Reservoir Watershed Management Agreement, Baltimore City, Baltimore County & Carroll County dated June 29, 1979.

Water main projects to replace fifty year old, failure-prone cast iron pipe are planned for Millers Island (10,000 ft.) and along Back River Neck Road from East Homberg Avenue to Hyde Park Road (5,400 ft.).

Numerous rehabilitation and replacement projects need to be done on the existing piping network to ensure adequate pressure, fire protection, and water quality.

Second Zone

Replacement covered reservoirs is scheduled to be built by 2023 at Ashburton Reservoir to comply with the EPA LT2ESWTR mandate.

Water main projects to replace fifty year old, failure-prone cast iron pipe are planned along Hospital Drive and Lennings Lane in Rosedale (7,000 ft.)

Numerous rehabilitation and replacement projects will be needed on the existing piping network to ensure adequate pressure, fire protection and water quality.

Eastern Third Zone

New 12" water mains were recently installed in Perry Hall along Seven Courts Drive, Proctor Lane and Gunview Road to replace deteriorated cast iron pipes.

Water main projects to replace fifty year old, failure-prone cast iron pipe are planned along Ellenham Road and Ellenham Avenue in Towson (4,300 ft.) and in the Hillendale (6,000 ft.) and Fullerton (7,000 ft.) Communities in Parkville.

Numerous rehabilitation projects need to be done on the existing piping network to ensure adequate pressure, fire protection, and water quality.

Western Third Zone

New 12" water mains were recently installed along Maidens Choice Lane and Kenwood Avenue in the Catonsville area to replace deteriorated cast iron pipes.

Numerous rehabilitation and replacement projects need to be done on the existing piping network to ensure adequate pressure, fire protection, and water quality.

Catonsville Fourth Zone

New 12" water mains were recently installed along Johnnycake Road and various side streets in the Windsor Mill/Catonsville area to replace deteriorated cast iron pipes.

Numerous rehabilitation and replacement projects are needed on the existing piping network in order to ensure adequate pressure, fire protection and water quality.

Pikesville Fourth Zone

Improvements to the transmission system around the Owings Mills Area will need to be completed.

Water main projects to replace fifty year old, failure-prone cast iron pipe are planned along Reisterstown Road (I-695 to Irving Place) (6,200 lf.), Liberty Road (Washington Avenue to Rolling Road) (5,300 lf.) and the 42-inch and 30-inch Pikesville Discharge Mains (9,500 lf.).

Eventually, a 36" transmission main in Reisterstown Road, from Pikesville pumping Station to Pleasant Hill Road will be needed to support demand during the summer months and provide redundancy to ensure system reliability.

A new 1.0 MG Tank is needed and under design to replace the deteriorated and old Randallstown Tank.

Numerous rehabilitation and replacement projects are needed on the existing piping network in order to ensure adequate pressure, fire protection and water quality.

Towson Fourth Zone

A new 24" water line is needed in York Road, from Cockeysville Road to Shawan Road to replace existing problem-prone water mains.

A new 16" water main along Oakleigh Road from E. Joppa Road to Yakona Road is needed to replace deteriorating 12" cast iron pipe.

Water main projects to replace fifty year old, failure-prone cast iron pipe are planned along Seminary Avenue (Hillspring Drive I-83) (5,000 lf.) and in the Fox Chapel Community (9,400 lf.) in Timonium.

Numerous rehabilitation projects need to be done on the existing piping network to ensure adequate pressure, fire protection and water quality.

Sparks Fifth Zone

Improvements are underway at the Sparks Pumping Station and the Sparks Tank to improve safety and to maintain reliability.

A new water main to provide a redundant supply to the zone is currently being modeled due to a recent 20-inch water main break along York Road at Thornton Mill Road.

Reisterstown Fifth Zone

Increasing demands in the Reisterstown/Glyndon areas of Baltimore County will require the construction of a 2.0 million gallon elevated water storage tank in the near future. Community objections continue to delay this project.

Zones not needing Planned Improvements

- Colgate Second Zone
- Pot Springs Fifth Zone
- Sherwood Fifth Zone
- Falls Fifth Zone

IMPOUNDMENT AND SAFE YIELD DATA

Parameter	Loch Raven	Prettyboy	Liberty
Elevation at Crest of Dam	240 feet	520 feet	420 feet
Spillway Length	288 feet	274 feet	480 feet
Total Length of Dam	650 feet	845 feet	740 feet
Height of Crest Above Stream Bed	82 feet	130 feet	160 feet
Capacity of Reservoir (in billions)	23 gallons	20 gallons	43 gallons
Length of Shore Line at Crest Elevation	50 miles	46 miles	82 miles
Area of Land Owned	8,000 acres	7,380 acres	9,200 acres

Safe Yield

- Loch Raven - Prettyboy 148 MGD
- Liberty 92 MGD
- Susquehanna
  - 108-inch line 250 MGD
  - Future Additional Allowance 250 MGD
  - *Total Available Water:* 740 MGD*

*Total available water is subject to the following:

1. Liberty yield is limited to 82 MGD without the use of Ashburton pumps.
2. Present agreements would allow up to 69 MGD average day for Howard and Anne Arundel Counties.
3. Harford County has State authority for 25 MGD from the Susquehanna.
4. Baltimore City has been approved by the Susquehanna River Basin Commission (SRBC) to withdraw a maximum of 250 mgd from the Conowingo pond depending on system hydraulics, but withdraw is currently limited by its aggregate pumping capacity with three pumps operating to a withdrawal of approximately 137 mgd,. During low flow periods on the Susquehanna River (i.e., when Federal Energy Regulatory Commission Flows (Q-FERC) or lower flows occur), withdraw is limited to 64 mgd measured as a maximum 30-day average and 107 mgd (equivalent to two pumps at Deer Creek Pumping Station) any one day.

WATER DEMANDS

Round 10 Population Forecasts by the Baltimore Metropolitan Council (see Chapter II) indicate over 830,000 persons in the urban area of Baltimore County by the year 2050. The provision of public water services to this many people will require capital expenditures in nearly every zone of water service.

DOMESTIC, COMMERCIAL AND INDUSTRIAL USES

The expected domestic and commercial uses were obtained from the population figures and per-capita consumption for each zone of service. The results indicate an increase of use in some zones by the year 2050.

Industrial use is not expected to increase. It is anticipated that industrial and commercial use will replace the industrial water that was subtracted with the loss of the steel operation at Sparrows Point. After reviewing reports and available data on existing industrial use, zoning, transportation, water requirements and other parameters, it is estimated that industrial and commercial usage should increase slightly from the current rate of 24.5 MGD to 26.15 MGD through the year 2050.

About 48.6% of the industrial use is expected to be concentrated in the First Zone where most of it is now located. The other 51.4% will probably be located in existing industrial parks. Substantial water-using industries are not expected to settle in the northern part of the County.

Baltimore County's economic health depends to a significant degree on industry, and water is a prerequisite. Ensuring new industry and an ample water supply will permit some growth and will encourage industrialization where consistent with the County's *Master Plan 2020.*

ESTIMATED DAILY USE IN THE YEAR 2050

The estimated Baltimore County 2050 average-day demand is 112.66 MGD. This quantity can be obtained from the existing sources of supply. The maximum-day demand of 201.42 MGD can be obtained from existing, raw water, reservoir storage and the Susquehanna River. Future distribution storage and pumping capacity must be designed to meet the maximum day demands. With the addition of the Fullerton Filtration Plant the water system will be able to handle anticipated future filtration water demands.

WATER DEMANDS – PRESENT TO 2050

Attempts to forecast long-range water use are only estimates based on the best available information and various engineering judgments. Fortunately, Baltimore County has some very valuable historical data which has been used to help predict the water demands through 2050. The present thinking of planners is that the water service area in the year 2050 will be virtually the same as the present one. The pressure zones (which also serve as the planning areas for public water service) are located generally within the URDL, with exceptions only for public health projects (such as in the eastern peninsula areas) and where mains are extended for redundancy

("looping") to meet system reliability and water quality requirements. The outline of the service area is shown on the following page.

PER-CAPITA CONSUMPTION

The per-capita consumption is expected to be highest in the First and Second Zones of service where industrial and commercial uses will probably be most extensive. Per-capita use in the upper zones is expected to increase gradually.

For engineering purposes, "per capita" usage figures are derived by dividing the actual observed flow by the population located within the pressure zone in question. This leads to confusion in that it does not accurately reflect actual domestic usage, since it assigns industrial and commercial usage as well as losses due to fire fighting operations, system leakage and water main breaks on a "per-capita" basis. It does, however, provide the information necessary to properly size and maintain the water system. These "per capita" figures were used historically in Table No. 3.

Domestic usage for design purposes is based on 90 gpcd (gallons per capita per day) (See Design Manual adopted August 2, 2010, Chapter 6, Section IV (B)3(c)2 (a) & (b) for complete details. This is the section on sewer design. Water systems are always designed for adequate fire flow and are not usually governed by domestic usage.) This is a conservative figure for system hydraulic design purposes. Actual residential domestic usage is closer to 80 gpcd.

Domestic usage is further refined in the Central System Report, varying from a low of 63 gpcd to a high of 111 gpcd in different pressure zones. The variation is the result of the consultant's usage estimates based on lot size and type of dwelling typical in those service areas, with larger residences assumed to have a greater number of plumbing fixtures, more lawn watering and other outdoor usage. For all of these reasons, Table No. 3 has been modified to provide a better explanation of water demand.

OTHER SOURCES OF WATER

The rural areas of Baltimore County use ground water, predominantly in the northern part of the County. For more details about the use of ground water supplies, see the section on Rural Baltimore County.

THE FUTURE WATER SYSTEM

Water consumption in Baltimore County is expected to increase slowly through the year 2050.

The Water Analyzer Office has conducted extensive distribution studies of each zone of service. These studies were reviewed in detail to determine the distribution improvements which will be required to meet demands for the next twenty-five years. The improvements include additional pumping capacity, storage capacity, and transmission mains.

WATER CONSERVATION

COMPLIANCE WITH STATE REQUIREMENTS

The County Building Engineer, Building Code Official for the County in the Department of Permits, Approvals and Inspections, advised on January 24, 2011 that Baltimore County complies with the Maryland Water Conservation Plumbing Fixtures Act (see COMAR 26.03.01.07).

BALTIMORE COUNTY WATER CONSERVATION PLAN

The present Baltimore County water system is actually an extension of the City system. Raw water is brought into the City filtration plants from the City-owned impoundment reservoirs in the County, treated and returned to the County consumers through a complex system of transmission mains, distribution mains, storage facilities and pumping stations. Therefore the City and County are physically and legally bound to a common water system.

In fiscal 2022 Baltimore County used about 78 MGD from the Baltimore system. This amounts to about 42.4% of the average day water demand of 184.3 MGD. In fiscal 2022 there was 25.62% unaccountable water in the Baltimore Metropolitan Water System.

In recent years the County has financially participated at a rate of approximately 40% in the following City-managed contracts to reduce the amount of unaccountable water:

- SCADA (Supervisory Control and Data Acquisition) contract to replace or renew all of the telemetry in the system to gain more accurate readings.
- Water audit contracts to calibrate all large meters above 4" in size and to search for other unaccountable water causes.
- Valve and fire hydrant exercising and repair contract to limit leakage from these appurtenances.
- Leak detection contracts to survey large areas of the system to repair water leaks that do not reach the surface.
- Replacement of water tank altitude valves to stop unnecessary water overflows.
- Replacement of old water meters with new smart meters

In addition, Baltimore City and Baltimore County have made a comprehensive effort to find all buried meters in Baltimore County to gain a more accurate overall reading of metered water.

It is estimated that approximately 10% of the unaccountable water system wide is being lost through main breaks. Baltimore City and Baltimore County, like many large municipalities around the country, have a very old infrastructure with large inventories of old cast iron pipes that are prone to breakage, especially during the winter months. Each jurisdiction is allotting more money to replacing mains that have frequent breaks. In the fiscal year 2024 alone, Baltimore County will be replacing over 40,000 linear feet of old cast iron piping which have a history of main breaks. Baltimore City, through its emergency response network, is responding to breaks in a more timely manner to limit the amount of wasted water.

Also, over the last several years, both the City and the County public works officials, police and fire departments have put forth a lot of cooperative effort to stop illegal usage from the system's fire hydrants. Baltimore County has applied updated State standards in regard to plumbing fixtures in new construction to conform to the State's conservation requirements. Baltimore City also mails a water quality report annually to all metered accounts which gives guidance on how consumers can limit and conserve their daily water usage.

It is the objective of both Baltimore County and Baltimore City to reduce the system's unaccountable water to 15% within the next 5 years.

NEIGHBORHOOD EXTENSIONS

A petition process for facilities extensions in existing neighborhoods has been established to determine priorities for facilities planning, design, and construction as directed by Section 35-142 of the Baltimore County Code. In addition, priorities for facilities planning, design and construction are established by the Department of Environmental Protection and Sustainability and the Director of Public Works under procedures established pursuant to Section 35-144.

SUBDIVISION PROJECTS

Priorities for the extension of Metropolitan facilities for new developments (residential, commercial or industrial) are established by negotiation of Public Works Agreements pursuant to the authority of Section 32-4-304 of the Baltimore County Code.

CONSTRUCTION AT HIGHWAY SITES

Facilities are constructed at strategic locations crossing major highway projects to preclude future expenses involved in tunneling under the highways. The priority for this work is established by highway construction schedules.

RURAL BALTIMORE COUNTY

The areas outside of the Urban-Rural Demarcation Line (URDL) are predominantly served by individual "private" well water supplies. Ground water in Baltimore County may be obtained from two (2) geological and physiographical provinces that are separated by the "Fall Line" (which lies approximately along I-95 in Baltimore County). The Piedmont subarea is north of the Fall Line and the Coastal Plain subarea is south of the Fall Line.

Piedmont Subarea

Groundwater supplies in the Piedmont Subarea are generally sufficient to supply only domestic and moderate commercial demands because the yields from individual wells are relatively low, rarely exceeding 50 GPM. Crystalline rocks, including schist, gneiss, gabbro, granite, and marble are the chief aquifers. Groundwater generally occurs under water table conditions in the uppermost 250 feet of the rocks, and most wells and springs yield water from local recharge. The aquifers store groundwater in the more permeable zone of decomposed rock nearest to the land surface.

Well yields vary by geologic formation and within each formation. The following information is generalized yield data in Baltimore County:

Geologic Formation	Well Yield
Marble	Varies from 1- 500 GPM and averages 12 GPM
Pleasant Grove Schist & Prettyboy Schist	Varies from 1- 100 GPM and averages 8.5 GPM
Gneiss & Granite	Varies from 1 - 100 GPM and averages 8.5 GPM
Mafic and Ultramafic	Varies from 1 - 75 GPM and averages 8.0 GPM
Loch Raven Schist	Varies from 1 - 100 GPM and averages 6.5 GPM

Wells in the Loch Ravens Schist, particularly the area known as Chestnut Ridge, are generally the lowest yielding wells in Baltimore County. For this reason the Loch Raven Schist (and Jones Falls Schist) are known as Critical Water Areas (see map in Chapter II) as defined in the Baltimore County Code 34-2-103(f).

Coastal Plain Subarea

The Coastal Plain Subarea contains relatively large quantities of groundwater in artesian or semi-artesian and water-table conditions. Well yields vary from a few gallons per minute to as much as 1,000 GPM. The average yield is 200 GPM. Sand and gravel are the major aquifers that are separated by relatively impervious confining layers of clay.

Groundwater in the Coastal Plain Subarea is susceptible to salt water contamination. Groundwater contaminated by salt water is generally high in mineral content, high on the pH scale, and very hard. Detailed analyses can be obtained from the Geological Survey Water Supply Paper, 1499-F.

WATER QUALITY AND RELIABILITY

In general, residents of rural Baltimore County have little difficulty attaining an adequate and safe water supply from domestic wells use. The results of a County-wide 1998 study completed by the Maryland Geologic Survey entitled "Ground Water Quality in the Piedmont Region of Baltimore County" and a 2002 Supplemental Report indicate that there were no regional water quality concerns. However, subsequent water quality sampling has revealed a number of wells located in the Baltimore Gneiss Formation with elevated levels of naturally occurring radium in the ground water (see discussion below). The droughts of 1999 and 2002 raised concerns from many residents who rely on well water. Other localized ground water quality problems exist sporadically as a result of anthropogenic activities. Typically, areas of dense development and/or wells in close proximity to sources of contamination are more susceptible to groundwater quality problems. The discussion below details some of the more prevalent water quality issues that face rural Baltimore County property owners.

Radium

In 2005, a water quality survey of wells in the Baltimore Gneiss and Setters Gneiss formation revealed elevated levels of gross alpha particle emissions and radium (a human carcinogen) were present in roughly 10% of the wells. The areas of concern include Monkton, northern Phoenix, Sparks, Glencoe, Butler, and Woodstock. Radioactive elements such as uranium and radium are naturally occurring in the rock. Evaluation of the well construction data indicates no particular pattern in well depth, yield or age to wells with high gross alpha or radium concentrations. The occurrence of elevated concentrations of gross alpha and radium in ground water appears to be random within the gneiss formations and localized in various "hot spots." The County recommends (and may require) that all potentially affected wells be tested for gross alpha and/or radium to minimize exposure. Water softeners have proven to be an effective removal technique for radium. In 2005, Baltimore County sent a mailing with information regarding radium to all Baltimore County residents located in areas of concern. Baltimore County Department of Environmental Protection and Sustainability continues to work with individual residents, and realtors to educate and assist in identifying those wells where treatment may be needed.

Drought

The drought of 2002 was marked by the lowest ground water levels on record in Baltimore County and an unprecedented number of replacement wells being drilled. Approximately 500 replacement wells were drilled which equates to nearly 1.5% of the total number of domestic wells estimated to be in service. Particularly hard hit were properties underlain by Loch Raven Schist and the Bradshaw Layered Amphibolite. These formations have long been known for their relatively low yielding wells and an increased likelihood of drilling "dry holes." It was also noted that a large percentage of yield problems were experienced from hand dug wells or older shallow drilled wells that did not meet current construction and yield test standards.

Petroleum Constituents

Petroleum contamination of ground water, primarily from leaking underground storage tanks (UST) has been a known threat to drinking water supplies for many decades. The primary constituents of concern include volatile and semi-volatile compounds that the USEPA has designated as potential human carcinogens. The Baltimore County Department of Environmental Protection and Sustainability works in cooperation with Maryland Department of the Environment to monitor known cases of groundwater contamination related to petroleum fuel spills and advise residents when corrective action is necessary. The historical and current status of the major MDE remedial investigations in Baltimore County may be reviewed by accessing the Maryland Department of the Environment's web page:

http://www.mde.state.md.us/programs/Land/OilControl/Pages/remediationsites.aspx

Road Salt

Once applied, road salt or sodium chloride (the predominant form of salt used in Baltimore County) is easily dissolved with precipitation and may enter the ground water system through the nearby surface soils or discharge directly into streams through storm water run-off. Studies have shown that the sodium typically becomes bound in subsurface soils, and gradually displaces calcium, magnesium and potassium from the soil into the ground water system (Kaushal *et. al.*)[9]. However, chlorides move through the subsurface and into groundwater relatively unaffected by chemical or biological interaction. The US EPA has set a secondary maximum contaminant level (SMCL) for chlorides at 250 mg/l (parts per million (ppm)) in drinking water. An SMCL is a non-enforceable water quality standard that is recommended for aesthetic qualities such as taste and odor. While chlorides are not considered a concern for human health, they can impart a bitter taste in drinking water and increase corrosion of metal pipes and fixtures. Chlorides can also inhibit plant growth and in high concentrations cause damage to root systems. The US EPA has set a Health Advisory for sodium of 20 mg/l.

In a study by the Maryland Geological Survey, "Ground Water Quality in the Piedmont Region of Baltimore County" (Bolton 1998), it was found that approximately 5% of the 106 wells sampled throughout rural Baltimore County had chloride levels above 100 ppm, but only one well was above the SMCL of 250 ppm. In addition, it was found that chloride concentrations were significantly higher in wells located within 200 feet of a paved roadway. Impacts to wells from chlorides are generally localized and dependent on where storm water run-off is directed. No wells in the 1998 study were found to have elevated levels of sodium in the water. However, over the last twenty years, there has been a marked increase in the number of complaints and many documents cases (dozens) of chloride and sodium levels exceeding SMCLs and Health Advisory levels.

Baltimore County and the City of Baltimore have monitored salt concentrations from the drinking water reservoirs and streams leading to the reservoirs during base flow conditions (i.e.

---

[9]Kaushal, S.S., Groffman, P.M., Likens, G.E., Belt, K.T., Stack, W.P., Kelly, V.R., Band,L.E., & Fisher, G.T. (2005) *Proc. Natl. Acad. Sci. USA* 102, 13517 – 13520.

during dry weather). The data show a trend of increasing chloride levels that has more than doubled over the last 30 years. Sodium levels have increased 3 fold. Of most concern is that while chloride (and sodium) levels in streams are observed to peak during the winter months (as expected), the streams are not returning to baseline levels during the summer. The sodium and chlorides levels appear to be slowly building up in the groundwater system. Even if salt application were ceased today, it would take decades to the salt to be flushed out of the freshwater system.

While sodium chloride is not found naturally in this region, there are a number of anthropogenic sources of chlorides that are contributing to the observed trends. These include road salt, sanitary wastewater, fertilizers, and industrial discharges. The largest contribution of chlorides into Baltimore County watersheds by far is road salt. However, the other contributions should also be considered for proper management of this growing problem. For example, thousands of homeowners in Baltimore County use water softeners to treat their private water supplies. The spent brine from these systems solutions is usually discharged into the ground through their septic systems. While we are not seeing direct impacts to domestic wells from the use of water softeners (wells are intentionally sited to be upgradient and at least 100 feet from septic systems), chlorides from the brine are likely loading the ground water system and contributing to elevated chloride levels in downgradient streams. For further information related to chlorides and their environmental and health impacts, please see the Maryland Department of the Environment webpage:

http://www.mde.state.md.us/programs/Marylander/Pages/roadSalt.aspx

Regarding private water treatment systems, it is recommended that homeowners maintain an on-going service contract with a qualified professional to regularly monitor their well water quality and have their system upgraded or adjusted as needed to optimize the system efficiency.

Manor Shopping Center

In recent years, Manor Shopping Center, located in Jacksonville, has been unable to fully meet onsite water demand with its existing wells. Since at least 2005, the shopping center has been purchasing water trucked in from Baltimore City. In addition, the shopping center has sporadically been in violation of the lead and nitrate standards. The shopping center's wells are also high in total dissolved solids and chlorides, exceeding national secondary standards. While Baltimore County EPS and MDE were working with the system to install treatment to address the lead and nitrate concerns, it was discovered that the onsite sewage disposal system is either at capacity or at the point of failure. Due to the limited land owned by this system, it may be difficult or impossible to pump enough water to meet potable demand and have enough space to adequately dispose of wastewater. A long term solution to this shopping center's water and wastewater needs are needed.

SMALL COMMUNITY WATER SUPPLIES

There are currently nine small community water supply systems located in Baltimore County, together serving approximately 2,149 people. With the exception of Phoenix and Sunnybrook, these systems are privately owned and operated.

Small Community Public Water Supply Systems in Baltimore County

Name	Location	Population Served
Glen Meadows Retirement Community	11630 Glen Arm Rd., Glen Arm	468[2]
The Gramercy Mansion Bed & Breakfast	1400 Greenspring Valley Rd., Stevenson	40
Granite Trailer Court	10600 Davis Ave Woodstock	100
Oldfields School	1500 Glencoe Rd. Glencoe	200
Manor Community Water Supply[1]	15626 Old York Rd Monkton	25
Phoenix Community Water Supply[1]	Sweet Air Rd. Phoenix	50
Chapel Hill Nursing Center	4511 Robosson Rd. Randallstown	125[2]
Sunnybrook Community Water Supply[1]	Club View La. Phoenix	416[2]
Woodstock Job Corp	10900 Old Court Rd., Woodstock	675
Villa Julie Infirmary	1531 Greenspring Valley Rd., Stevenson	50
Total Population Served		**2,149**

WATER PROGRAM COST SUMMARY

ESTIMATED 5-YEAR (2025-2029)
(Source: Capital Budget FY 2024, Capital Improvement Program FY 2025 – FY 2029)

Neighborhood Water Extensions (Petitions)	$1,500,000
Miscellaneous Distribution System Improvements	$55,000,000
Construction at Highway Sites	$38,000,000
Rehabilitation & Replacement of Water Mains	$140,000,000
TOTAL NEIGHBORHOOD FACILITIES	**$234,500,000**
Major County Projects	$84,160,000
Joint City-County Projects (Baltimore County's Share Only)	$252,382,000
GRAND TOTAL ALL WATER FACILITIES	**$571,042,000**

* Baltimore County employs a Biennial Capital Budget.

CHAPTER IV - SEWERAGE PLAN

GENERAL BACKGROUND

Baltimore County constructs, operates and maintains all sewage collection and pumping facilities within the County. There are twenty-three (23) sewersheds which contain 2,060 miles of gravity sewer and 163 miles of pressure sewer. Baltimore County operates one hundred twenty (120) pumping stations and one (1) 90-thousand gallon per day treatment plant at Richlyn Manor, east of Belair Road, adjacent to the Gunpowder River.

County generated sewage is treated and disposed of at the City-owned and operated treatment plants, Back River and Patapsco. The City and County agree to pay for new capital projects and for the repair to, and enlargement of, additions or improvements to sewerage facilities. The total flow conveyed from the County to the treatment plants determines the County's portion of capital improvement and/or operation and maintenance cost.

Baltimore County receives flow from Anne Arundel and Howard Counties. By agreement, these counties pay their portion of operating and capital costs. Copies of the sewer agreements with Baltimore City, Anne Arundel County and Howard County are included in the Appendices.

On September 20, 2005, Baltimore County entered into a Consent Decree with the U.S. Department of Justice, the U.S. Environmental Protection Agency and the Maryland Department of the Environment. This document requires Baltimore County to completely evaluate its sewer system and make corrections in order to eliminate sanitary overflows in the collection system. This massive effort will involve field investigations, studies, reports, designs and construction projects. As of September 29, 2016 MDE and the EPA approved all Sewershed Repair, Replacement and Rehabilitation (SRRR) Plans. The County is in the process of implementing the corrective actions from these plans.

System Overview

The following is a description of each of the twenty-three (23) sewersheds with a discussion of their location, major system components, pumped flow, existing conditions and proposed projects:

Location

This area includes Parkville, Fullerton, Rossville, and Victory Villa and is located between Parkville and Essex in Eastern Baltimore County. The area encompassed by the drainage basin is approximately 3,950 acres serving a population of 32,916 people.

System Components

Major Sewers	Length (Miles)	Pipe Size

Montross Farms	0.45	10" to 16"
Northeast Creek	1.40	12" to 24"
Stemmers Run	4.90	18" to 27"
Parkville	0.77	10" to 18"
Carney Heights	0.85	15" to 18"
Orems Road	1.05	30" to 36"

Pumped Flow

Stemmers Run receives flow from the Orems Road and White Marsh Pumping Stations via the Brien Run Interceptor. Flow is then split between the 42.0 MGD Stemmers Run and the 71.7 MGD New Stemmers Run Pumping Stations. The sewage is then transported through 48" and 54" force mains discharging into the outfall sewer at Back River Treatment Plant, located approximately three (3) miles south of the Stemmers Run Pumping Station.

Existing Conditions

The Stemmers Run SRRR Plan was accepted by the EPA on September 9, 2013, and is scheduled to be constructed by June 2026.

Proposed Projects

There are multiple projects under design in Stemmers Run. The list of the proposed projects is shown below.

Project	Description	Estimated Cost
SR02B & 03 Rehabilitation	32,527 LF of sewer rehabilitation	$3,412,514
SR05 & 06 Rehabilitation	77,476 LF of sewer rehabilitation	$6,516,414
	Total	$9,928,928

BIRD RIVER

Location

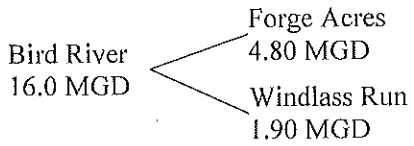
This area is in eastern Baltimore County includes Perry Hall and White Marsh and is boarded on the east by the Big Gunpowder Falls. The area encompassed by the drainage basin is approximately 5,710 acres serving a population of 14,222 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Honeygo Run Interceptor	3.34	24" to 27"
Bird River Interceptor	4.58	16" to 42"

Pumped Flow

The 16.0 MGD Bird River Pumping Station receives flow from two (2) pumping stations, Forge Acres and Windless Run.



Existing Conditions

The Bird River SRRR Plan was accepted by the EPA on September 29, 2016. Implementation of the SRRR plan recommendations is constructed.

Proposed Projects

There one project under design in Bird River, which is listed below.

Project	Description	Estimated Cost
Chapel Road Sewer Extension	2200 LF of sewer (health project)	$878,000
	Total	$878,000

OREMS

Location

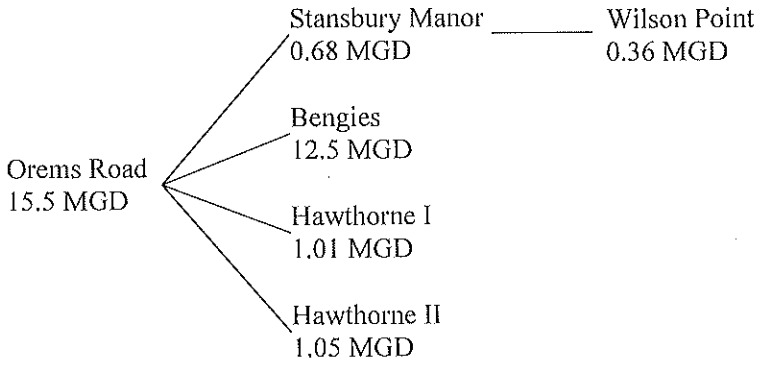
This area is in eastern Baltimore County, between Essex and Bengies, and encompasses the areas around Aero Acres, Martin Plaza, Ballard Gardens, Hawthorn, and Wilson Point including the Chesapeake Industrial Park and the Glen L. Martin State Airport. It serves approximately 1,600 acres with a population of 17,379 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Middle River Diversion	1.27	15" to 36"
Middlesex Outfall	0.62	12" to 30"
Leland Avenue Interceptor	2.34	42" to 48"
Aero Acres Outfall	0.45	12" to 18"

Pumped Flow

The 15.5 MGD Orems Road Pumping station receives flows from five (5) pumping stations as shown below:



The sewage is then transported from Orems Road Pumping Station through a 30" force main to the Brien Run Interceptor in the Stemmers Run System

Existing Conditions

The Orems Sewershed SRRR Plan was accepted by the EPA on September 29, 2016. Implementation of the Orems SRRR plan recommendations have been delayed by real estate acquisition issues and will occur after the original September 29, 2020 deadline. The expected complete construction is August 2025.

Proposed Projects

There is one project under design in Orems, which is listed below.

Project	Description	Estimated Cost
Stansbury Manor Force Main Replacement	Replace force main	$3,508,477
	Total	$3,508,477

BENGIES

Location

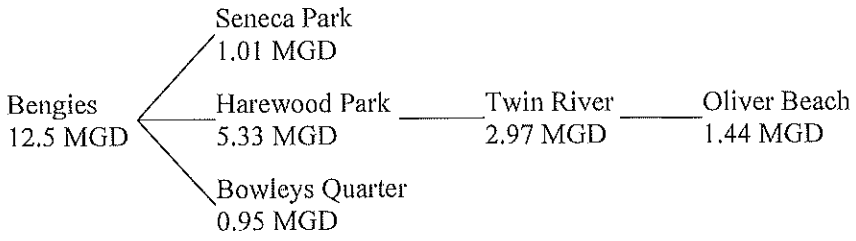
The Bengies Sewershed is in eastern Baltimore County and includes the Bowleys Quarters Peninsula and the area along Eastern Avenue northeast of Carroll Island Road. The area serves approximately 1,450 acres with a population of 13,758 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Eastern Avenue Int. West	0.93	18" to 42"
Bowleys Quarters Interceptor	1.19	18" to 24"
Eastern Avenue Int. East	3.31	24" to 48"
Olivia Road Outfall Sewer	0.29	12" to 15"
Oliver Beach PS Outfall Sewer	0.63	15" to 18"
Middle River Neck Interceptor	1.44	20"

Pumped Flow

The 12.5 MGD Bengies Pumping Station receives flow from five (5) pumping stations.



Existing Conditions

The Bengies SRRR Plan was accepted by the EPA on September 29, 2016. Implementation of the Bengies SRRR plan recommendations have been delayed by real estate acquisition issues

and will occur after the original September 29, 2020 deadline. The expected date of complete construction is May 2026.

Proposed Projects

There are no planned projects in design in the Bengies sewershed..

WHITE MARSH

Location

This area includes Perry Hall, Carney and the White Marsh Town Center and is located in eastern Baltimore County. The area encompassed by the drainage basin is approximately 4,025 acres serving a population of 52,581 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
North Branch White Marsh	4.75	30" to 54"
White Marsh South Interceptor	0.82	12" to 18"
South Branch White Marsh	2.29	12" to 24"
Barrington Outfall	0.59	10" to 20"
West Branch White Marsh	4.41	10" to 27"
Belmont Outfall Sewer	0.58	12" to 18"
Bird River Interceptor	2.50	24" to 48"

Pumped Flow

The 72.8 MGD White Marsh Pumping Station receives flows from the Gunpowder and Bird River Pumping stations. The sewage is then transported through dual 42" force mains extending southerly to Compass Road and the Brien Run Interceptors.

Existing Conditions

The White Marsh sewershed SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be completely constructed by August 2027.

Proposed Projects

There are multiple projects under design in White Marsh, below is a list of the proposed projects.

Project	Description	Estimated Cost
White Marsh Run PS Electrical Upgrades	Pump station electrical upgrades	$2,694,000
Richlyn Manor Interceptor Rehabilitation	4,600 LF of force main rehabilitation	$2,380,000
White Marsh Sewer Structural Rehabilitation - West	41,341 LF of sewer rehabilitation	$3,635,000
White Marsh Sewer Structural Rehabilitation - East	36,906 LF of sewer rehabilitation	$4,730,000
Richlyn Manor WWTP Decommissioning	Removal of the Richlyn Manor wastewater treatment plant and construction of a sewage pumping station	$7,500,000
Richlyn Manor Force Main	4,350 LF of sewer force main	$2,500,000
	Total	$23,439,000

GUNPOWDER

Location

The Gunpowder Sewershed is located in northeast Baltimore County, generally north of Joppa Road and south of the Gunpowder River. The area served by this Sewershed is approximately 4,100 acres with a population of 36,509 people.

System Components

Main Sewers	Length (Miles)	Pipe Size
Gunpowder Interceptor	6.60	27" to 42"
Perry Hall Interceptor	1.94	12" to 24"
Jenifer Run Interceptor	1.85	12" to 18"
Satyr Hill Interceptor	1.84	12" to 16"

Pumped Flow

There are two (2) pumping stations tributary to Gunpowder Pumping Station, the Campus Hills and Longquarter Pumping Stations. The 37.0 MGD Gunpowder Pumping Station pumps flow through a 36" force main to the northern end of the Whitemarsh Sewershed.

Existing Conditions

The Gunpowder SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be completely constructed by July 2026.

Proposed Projects

There are multiple projects under design in Gunpowder, below is a list of the proposed projects.

Project	Description	Estimated Cost
Gunpowder PS to White Marsh PS System Improvement	32,446 LF of gravity and force main relief sewer	$206,000,000
Gunpowder Relief Sewer	35,815 LF of relief sewer	$175,000,000
Gunpowder Sewer Structural Repairs – Off Road	65,795 LF of sewer rehabilitation	$17,511,000
Jennifer Branch Relief Sewer	6,273 LF of relief sewer	$5,765,000
Perry Hall Manor Sewer Extension	Extension of the sewer system to serve all of the Perry Hall Manor community with failing septic systems	$10,800,000
Schroeder Avenue Sewer Extension	1,600 LF of low pressure sewer	$1,220,000
	Total	$416,296,000

LONGQUARTER

Location

The Longquarter Sewershed is located in north-central Baltimore County, between Towson and the Loch Raven Reservoir. The area served by this Sewershed is approximately 4,150 acres with a population of 20,177 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Greenridge (Fairmount Avenue)	2.30	10" to 24"
Spring Branch Outfall	1.12	16" to 66"
Timonium Interceptor	1.54	33" to 42"
Spring Branch Interceptor	1.02	10" to 15"

Pumped Flow

The Longquarter System receives flows from the Texas Pumping Station. The present capacity at Longquarter Pumping Station is 36.0 MGD. The sewage from Longquarter Pumping Station is pumped through dual force mains to the top of the Gunpowder System.

Existing Conditions

The Longquarter SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be completely constructed by December 2026.

Proposed Projects

There are multiple projects under design in Longquarter, below is a list of the proposed projects.

Project	Description	Estimated Cost
Long Quarter Structural Repair On road	48,052 LF of sewer rehabilitation	$5,518,290
Long Quarter Structural Repair Off Road	51,534 LF of sewer rehabilitation	$8,112,915
Long Quarter Force Main Replacement	Force main replacement	$15,500,000
Long Quarter South Interceptor Rehabilitation	14,241 LF of sewer rehabilitation	$16,000,000
	Total	$45,131,205

TEXAS

Location

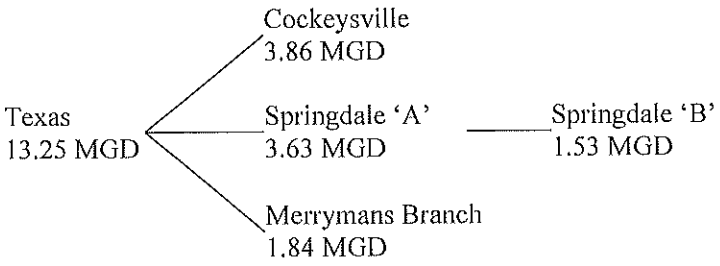
The Texas Sewershed is located between Cockeysville and Timonium in north-central Baltimore County. The Texas System serves approximately 2,100 acres with a population of 25,794 people.

System Components

Major Sewers	Length (Miles)	Pipe Sizes
Texas East Interceptor	1.86	12" to 24"
Texas South Interceptor	1.77	15" to 24"
Padonia Road West	1.38	10" to 16"

Pumped Flow

There are four (4) pumping stations tributary to the Texas Pump Station as shown below:



The Texas Pumping Station pumps through a 30" force main to the Longquarter Sewershed.

Existing Conditions

The Texas SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by January 2024.

Proposed Projects

There no planned projects in design in the Texas sewershed.

COCKEYSVILLE

Location

The Cockeysville Sewershed is located in north-central Baltimore County. The area served by this system is approximately 1,400 acres with a population of 5,931 persons.

System Components

Major Sewers	Length (Miles)	Pipe Size
Oregon Branch Interceptor	1.14	21" to 36"
Beaver Dam Run Interceptor	1.02	27" to 30"
Western Run Interceptor	3.67	12" to 36"

Pumped Flow

There is one (1) pumping station tributary to the Cockeysville Pump Station, Loveton Estates. The sewage is pumped from the 3.86 MGD Cockeysville Pumping Station through a 24-inch force main southerly along the Pennsylvania Railroad to the Texas Pumping Station.

Existing Conditions

The Cockeysville SRRR Plan was accepted by the EPA on September 29, 2016. Implementation of the Cockeysville SRRR plan recommendations have been delayed by real estate acquisition issues and will occur after the original September 29, 2020 deadline. Projects in this sewershed are expected to be constructed by October 2023.

Proposed Projects

There no planned projects in design in the Cockeysville sewershed.

ESSEX

Location

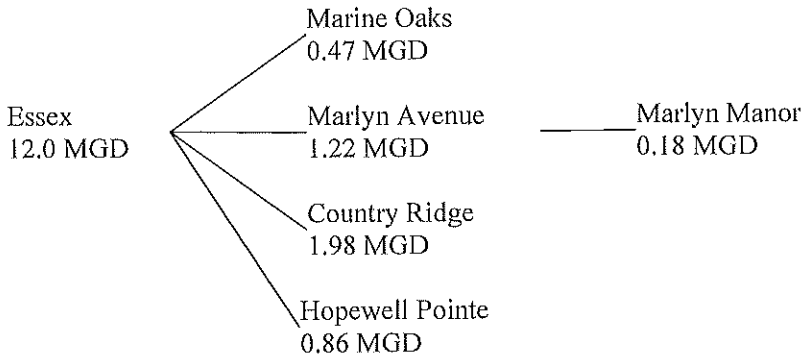
The Essex Sewershed consists of the Essex area in eastern Baltimore County. The area served is approximately 1,900 acres with a population of 17,193 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Essex Outfall Sewer	1.94	12" to 18"
Cedar-Taylor Avenue Outfall	1.33	12" to 30"
Cedar Avenue Outfall	2.77	18" to 30"

Pumped Flow

The 12.0 MGD Essex Pumping Station receives flows from five (5) pumping stations as shown below:



The sewage is then pumped through one of two 20" force mains, either under the Back River or along Eastern Avenue, and outfalls to the Back River Wastewater Treatment Plant.

Existing Conditions

The Essex SRRR Plan was accepted by the EPA on April 18, 2016.

Proposed Projects

There are currently no planned nor active projects in the Essex sewershed.

DUCK CREEK

Location

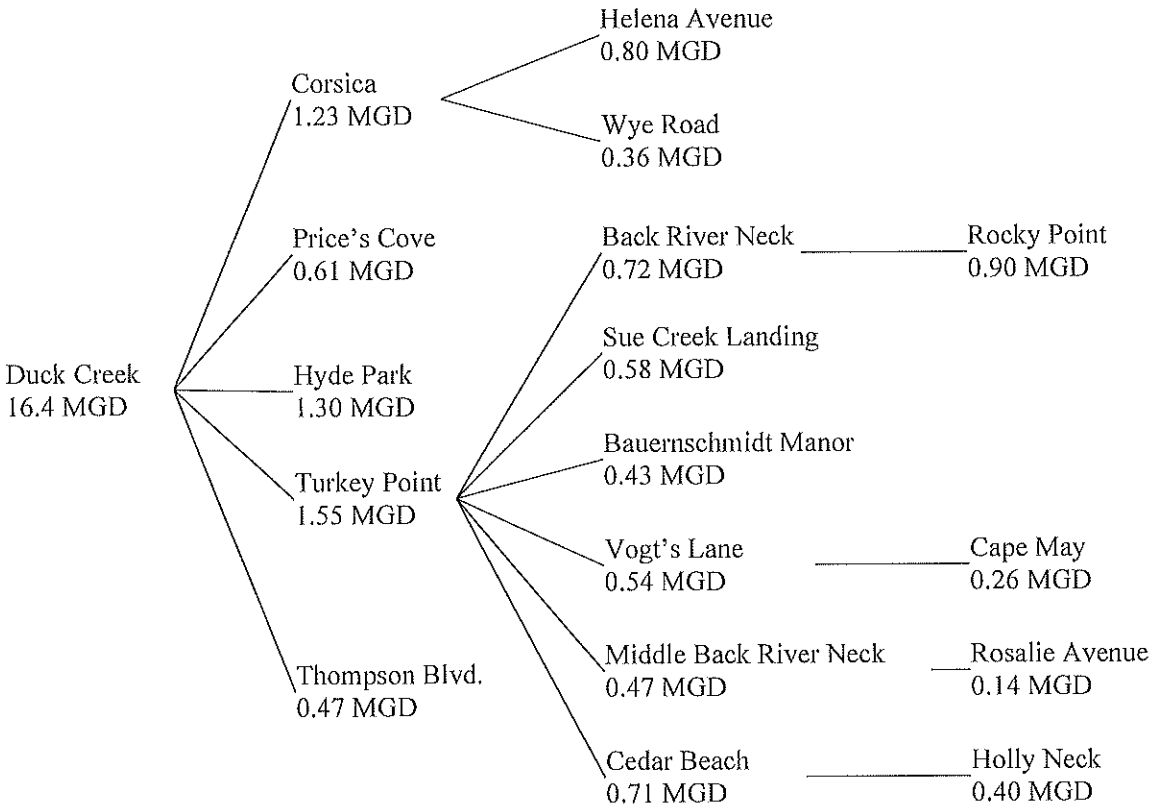
The Duck Creek Sewershed is located south of Essex in eastern Baltimore County and includes Cape May, Turkey Point and the Back River Neck Peninsula. The area encompassed by the drainage basin is approximately 1,475 acres serving a population of 18,544 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Marlyn Avenue Hyde Park	1.41	12" to 42"
Middleborough Interceptor	1.54	12" to 24"
Turkey Point Interceptor	0.99	8" to 24"

Pumped Flow

The existing capacity of the Duck Creek Pumping Station is 16.4 MGD. The pumping station receives flows from seventeen (17) pumping stations as shown below:



The sewage is then transported through a 30" force main along Eastern Avenue and outfalls to the Back River Treatment Plant.

Existing Conditions

The Duck Creek SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by July 2026.

Proposed Projects

There are multiple projects under design in Duck Creek, below is a list of the proposed projects.

Project	Description	Estimated Cost
Browns Road & Annetta Road Sewer Extension	Low pressure sewer to serve failing septic systems	$300,000
Duck Creek structural rehabilitation	4,184 LF of sewer rehabilitation	$2,736,217
	Total	$3,036,217

BREAD & CHEESE

Location

The Bread and Cheese Sewershed is located in the south eastern portion of Baltimore County, generally southeast of Eastern Avenue, along the south side of North Point Boulevard to a point where it intersects Bread and Cheese Creek and then both sides of North Point Boulevard to Coves Road. The area encompassed by the drainage basin is approximately 700 acres serving a population of 5,925 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
North Point Blvd. Interceptor	1.02	18" to 24"
Bread and Cheese Creek Interceptor	1.13	12" to 24"
Gray Manor FM Outfall	0.64	30" to 36"

Pumped Flow

The 16.7 MGD Bread and Cheese Pumping Station normally has no other pump stations tributary to it. However, the Gray Manor Pumping Station has the option of pumping a small percentage of its flow to Bread and Cheese. The Bread and Cheese Pumping Station transports sewage through a force main that outfalls to the Back River Treatment Plant.

Existing Conditions

The Bread & Cheese SRRR Plan was accepted by the EPA on September 29, 2016, and was completed September 29, 2020.

Proposed Projects

There are currently no active nor planned projects in the Bread & Cheese sewershed.

GRAY MANOR

Location

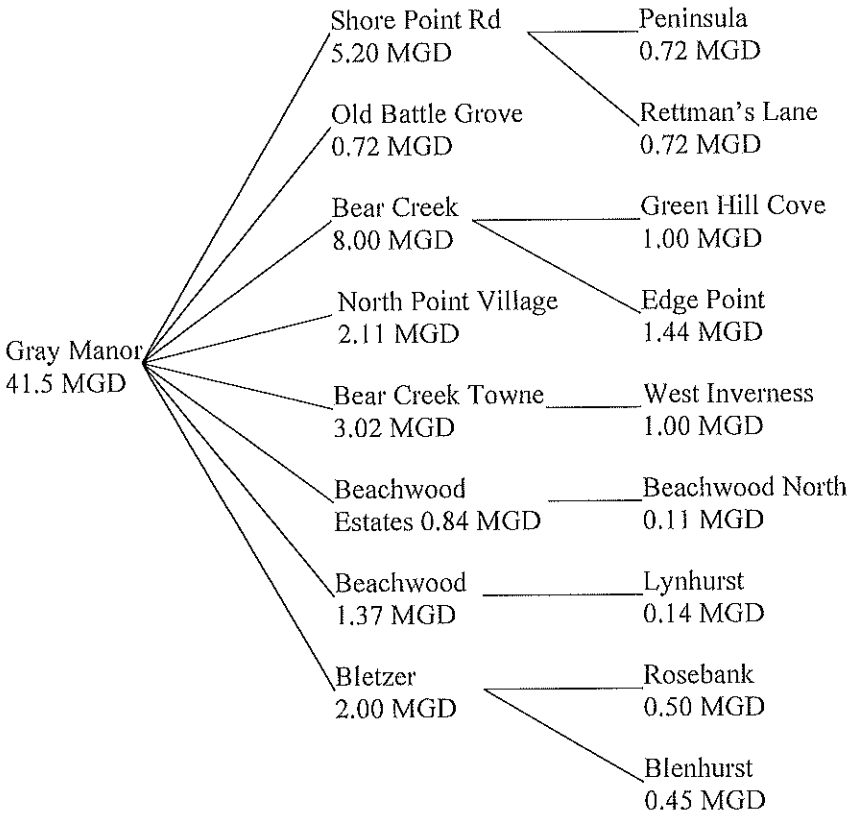
The Gray Manor Sewershed is in the southeastern portion of Baltimore County, generally bounded by Back River on the east, German Hill Road and North Point Road on the north, Sollers Point Road and Merrit Boulevard on the west, and Patapsco Freeway and North Point Boulevard on the south. The area encompassed by the drainage basin is approximately 2,225 acres serving a population of 30,219 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Lynch Road - Wise Avenue Sewer	0.78	30" to 48"
Patapsco Neck Outfall	2.03	33" to 48"
Shore Road PS Collector Sewer	0.94	12" to 18"
Wise Avenue (Bear Creek PS Outfall)	1.20	24" to 30"

Pumped Flow

There is a total of seventeen (17) pumping stations that are tributary to the Gray Manor Pump Station as shown below:



The 41.5 MGD Gray Manor Pumping Station has the option of pumping a small percentage of its flow to the Bread and Cheese Sewershed but normally pumps directly to the main outfall sewer at Back River Wastewater Treatment Plant.

Existing Conditions

The Gray Manor SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by April 2026.

Proposed Projects

There are multiple projects under design in Gray Manor, below is a list of the proposed projects.

Project	Description	Estimated Cost
Gray Manor Interceptor Rehabilitation	16,665 LF of sewer rehabilitation	$7,354,104
Fischer Road Relief and Replacement Sewer	3,580 LF of relief sewer	$6,521,713
	Total	$13,875,817

DELMAR

Location

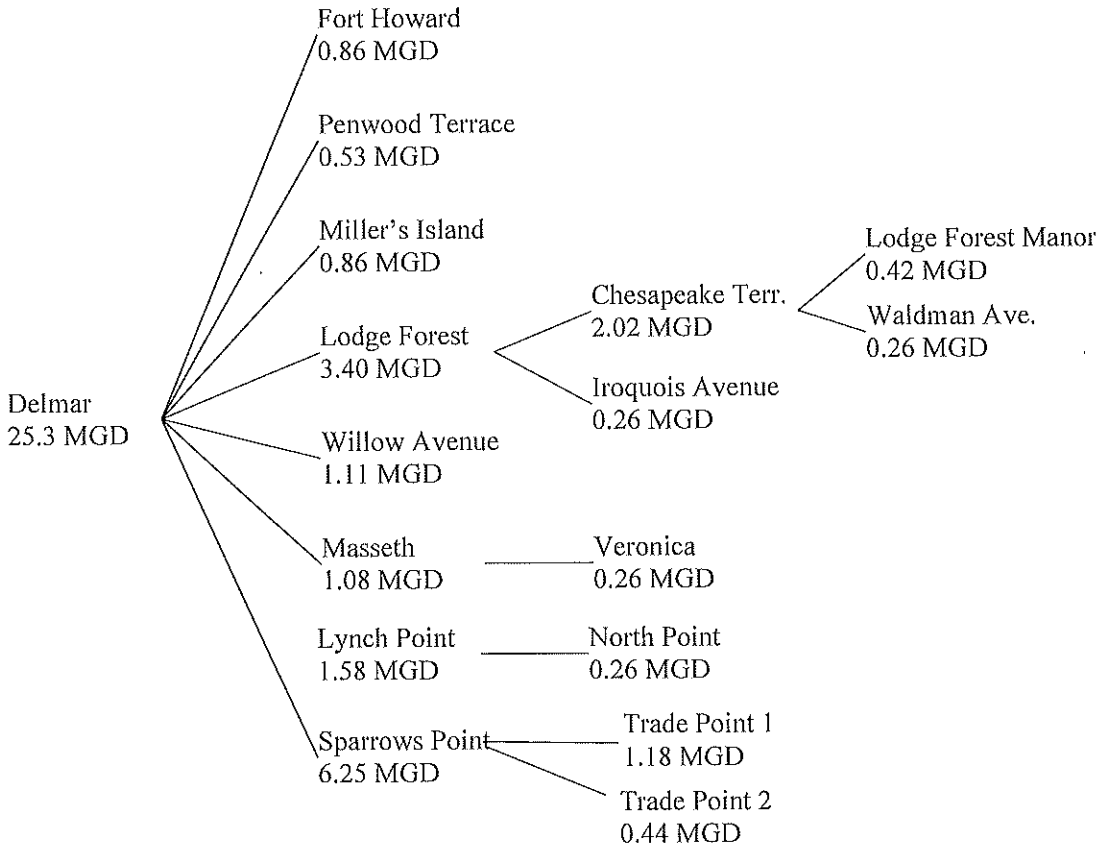
The Delmar Sewershed is located in the extreme southeastern end of Baltimore County, south and east of North Point Boulevard and Patapsco Freeway. The area encompassed by the drainage basin is approximately 1,600 acres serving a population of 8,210 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Glen Echo Interceptor	1.38	15" to 36"
Sparrows Point Force Main Outfall	0.47	24"
Chesapeake Terrace Collector Sewer	0.89	10" to 24"

Pumped Flows

The 25.3 MGD Delmar Pumping Station receives flows from sixteen (16) pumping stations as shown below:



The sewage is then pumped through a 30" force main to the Patapsco Neck Outfall Sewer at the upper end of the Gray Manor Sewershed.

Existing Conditions

The Delmar SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by March 2028.

Proposed Projects

There is one project under design in Delmar, which is listed below.

Project	Description	Estimated Cost
Delmar Force Main Replacement	Replacement of existing 30-inch force main	$4,415,324
	Total	$4,415,324

EASTPOINT

Location

The Eastpoint Sewershed is a small area in eastern Baltimore County. The system is along Eastern Boulevard in the area of North Point Boulevard. The system has one (1) pumping station and a small gravity system all tributary to the Back River Treatment Plant. The system serves 226 acres with a population of 5,578 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Eastpoint Outfall Sewer	0.58	8" to 12"

Pumped Flow

The Eastpoint Pumping Station has a capacity of 2.7 MGD and pumps to outfall to the Back River Wastewater Treatment Plant.

Existing Conditions

The Eastpoint SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by October 2025.

Proposed Projects

There is one project under design in Eastpoint, which is listed below.

Project	Description	Estimated Cost
Eastpoint Force Main Improvements	Force main relocation	$4,000,000
	Total	$4,000,000

REDHOUSE RUN

Location

The Redhouse Run Sewershed is on the east side of Baltimore County along the eastern boundary of Baltimore City, north of the Back River Treatment Plant. The system serves 2,500 acres and 17,508 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Redhouse Run Interceptor	4.35	18" to 30"
Chesaco Park Outfall	0.64	15" to 24"

Pumped Flow

There are two (2) pumping stations tributary to the Redhouse Run Pumping Station. The 3.44 MGD Chesaco Park Pumping Station pumps to the Chesaco Park Outfall Sewer and 1.15 MGD Quad Avenue Pumping Station pumps directly to Redhouse Run Pumping Station. The 15.0 MGD Redhouse Run Pumping Station pumps directly to outfall line to the Back River Wastewater Treatment Plant.

Existing Conditions

The Redhouse Run SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by March 2025.

Proposed Projects

There are multiple projects under design or in evaluation in Redhouse Run, below is a list of the proposed projects.

Project	Description	Estimated Cost
Redhouse Run Structural Repairs Phase 3	40,000 LF of sewer rehabilitation	$7,000,000
Redhouse Run Relief Sewer	7,716 LF of relief sewer and upsizing	$14,500,000
	Total	$21,500,000

DUNDALK

Location

The Dundalk Sewershed is located in southeastern Baltimore County west of Baltimore City. The area served is approximately 1,500 acres with a population of 23,663 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Woodland Avenue	0.31	20" to 24"
Cameron Drive Outfall	0.76	10" to 24"
Liberty Parkway (Dundalk)	0.70	12" to 24"

Pumped Flow

The 7.5 MGD Dundalk Pumping Station receives flows from the Day Village and Lyons Homes Pumping Stations. The sewage is then transported through a force main into Baltimore City before eventually being pumped to outfall to the Back River Wastewater Treatment Plant.

Existing Conditions

The Dundalk SRRR Plan was accepted by the EPA on April 18, 2016, and is scheduled to be constructed by July 2026.

Proposed Projects

There is one project under design in Dundalk, which is listed below.

Project	Description	Estimated Cost
Dundalk Force Main Replacement	Force main replacement	$4,000,000
	Total	$4,000,000

HERRING RUN

Location

The Herring Run Sewershed is located at the north boundary of Baltimore City south of the Baltimore Beltway, between Harford Road and York Road. The system serves an area of approximately 3,200 acres with a population of 44,493 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
East Branch Herring Run	2.32	12" to 24"
West Branch Herring Run	2.17	12" to 24"
E. Fork W. Branch Herring Run	1.30	12" to 18"
W. Fork E. Branch Herring Run	1.55	12" to 15"

Pumped Flow

There are no pumping stations located in the Herring Run Sewershed.

Existing Conditions

The Herring Run SRRR Plan was accepted by the EPA on September 9, 2013 and is scheduled to be constructed by May 2026.

Proposed Projects

There is one project under design in Herring Run, which is listed below.

Project	Description	Estimated Cost
Herring Run Structural Repairs Phase 2	13,381 LF of sewer rehabilitation	$3,185,786
	Total	$3,185,786

JONES FALLS

System Components Location

The Jones Falls Sewershed is located in central Baltimore County from the north boundary of Baltimore City to Green Spring Valley and from York Road on the east to Reisterstown on the west. The system serves approximately 7,100 acres and 64,217 people.

Major Sewers	Length (Miles)	Pipe Size
Jones Falls Interceptor	5.23	8" to 42"
Towson Run Interceptor	3.83	8" to 24"
Roland Run Interceptor	5.60	15" to 42"
Moores Branch	3.11	12" to 18"

Pumped Flow

There are four (4) pumping stations in the Jones Falls System, Stevenson at Anton, Templegate, Stanton Woods and Buchanan Road. The sewage from these stations flow to the Jones Falls Interceptor and then to the Mt. Washington Flume at the Baltimore City Line.

Existing Conditions

The Jones Falls SRRR Plan was accepted by the EPA on December 9, 2013 and is anticipated to be substantially constructed in May 2026.

Proposed Projects

There are multiple projects under design or in evaluation in Jones Falls, below is a list of the proposed projects.

Project	Description	Estimated Cost
Towson Run Relief Sewer	4,899 LF of 24"-27" relief sewer	$4,003,461
Lake Roland	Rehabilitation of 19,550 LF of sewer	$10,000,000
	Total	$14,003,461

WEST LOW LEVEL

Location

The West Low Level Sewershed is located in the southwest part of Baltimore County. The area is south of Baltimore National Pike to south of Frederick Road and from an area west of the Baltimore Beltway (I-695) easterly to the boundary of Baltimore City. The area served by this system is approximately 880 acres with a population of 10,870 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
West Low Level Interceptor	1.51	10" to 21"

Pumped Flow

There are no pump stations within the West Low Level Sewershed.

Existing Conditions

The West Low Level SRRR Plan was accepted by the EPA on December 9, 2013 and certified by the County as substantially complete on September 6, 2017.

Proposed Projects

There are currently no planned projects in the West Low Level Sewershed.

DEAD RUN

Location

The Dead Run Sewershed is located on the west side of Baltimore County from an area south of Windsor Mill Road southerly to Baltimore National Pike and from west of Rolling Road easterly to the west boundary of Baltimore City. The area served is approximately 3,250 acres with a population of 32,175 people.

System Components

Major Sewer	Length (Miles)	Pipe Size
Dead Run Interceptor	3.25	15" to 30"
Ingleside Avenue Outfall	1.63	12" to 16"
Catonsville Manor Outfall	0.65	12" to 15"
Dead Run Branch	1.85	16" to 24"

Pumped Flow

There is one (1) County maintained pump station in Dead Run, Putnam Green Pumping Station.

Existing Conditions

The Dead Run SRRR Plan was accepted by the EPA on December 9, 2013 and was certified by the County as substantially complete on September 6, 2017.

Proposed Projects

There are currently no planned projects in the Dead Run Sewershed.

GWYNNS FALLS

Location

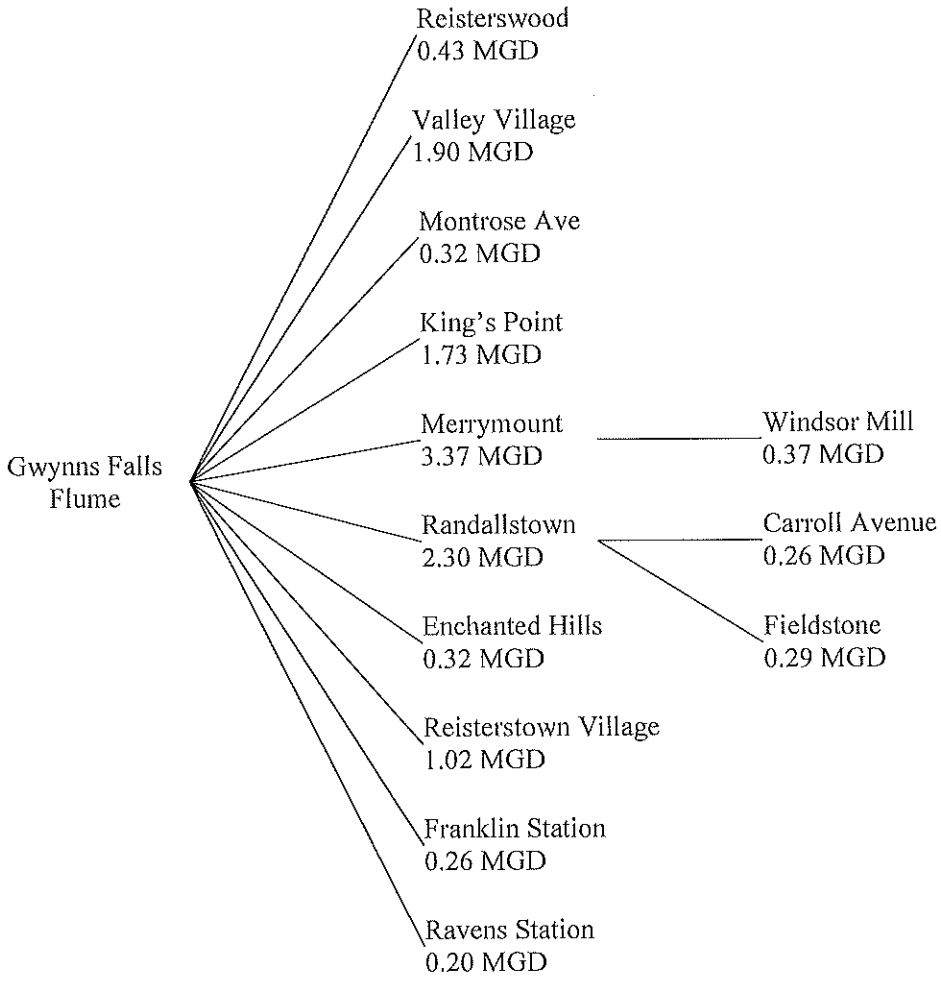
The Gwynns Falls sewershed covers a large portion of the northwest part of Baltimore County, from the northwest corner of Baltimore City, generally northwest along Garrison Forest Road, and out to the area of Hanover Pike north of Butler Road then southerly along Berrymans Lane and Deer Park Road to the area of Lyons Mill and Liberty Roads then southeasterly along Windsor Mill Road to the Baltimore City Line. The area served is approximately 13,600 acres with a population of 168,867 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Gwynns Falls Interceptor	30.39	10" to 60"
Powder Mill Interceptor	3.17	12" to 31"
Scotts Level Interceptor	9.81	10" to 24"
Horse Head Branch Interceptor	1.14	18" to 21"
Red Run Interceptor	4.71	16" to 36"
Lyons Mill Road North Interceptor	1.32	12" to 16"
Roaches Run Interceptor	2.62	10" to 18"

Pumped Flow

There are thirteen (13) pump stations in the Gwynns Falls area as shown below. Flow from the Gwynns Falls Flume has the option of a diverting a portion of flow to the Back River Treatment Plant but normal operation directs flow to the Patapsco Treatment Plant.



Existing Conditions

The Gwynns Falls SRRR Plan was accepted by the EPA on December 9, 2013 and is anticipated to be substantially constructed in May 2024.

Proposed Projects

There are multiple projects under design in Gwynns Falls, below is a list of the proposed projects.

Project	Description	Estimated Cost
Powder Mill Relief Sewer Ph 3	1,800 LF relief sewer	$5,273,000
	Total	$5,273,000

PATAPSCO

Location

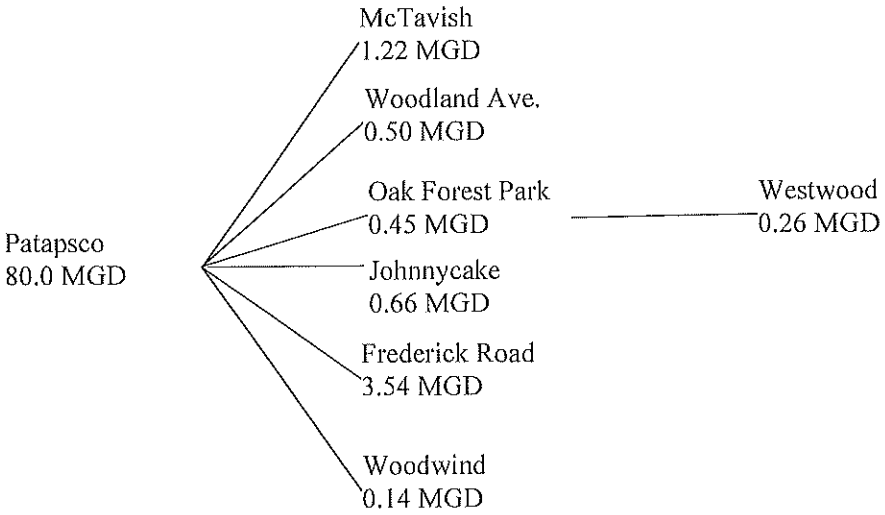
The Patapsco River Basin is located in the southwest end of Baltimore County. The area covers everything south and west of the southwest corner of Baltimore City, along Frederick Road to the Baltimore Beltway, and then Baltimore National Pike west to Rolling Road north to Route 70 then west to the Patapsco River and then along the River south and east back to the Baltimore City Line. The area served is approximately 8,775 acres with a population of 80,221 people.

System Components

Major Sewers	Length (Miles)	Pipe Size
Patapsco (Top to MH34848)	9.40	42" to 54"
Old Patapsco, 85-15 to 85-10	0.84	54"
Old Patapsco, 85-10 to 85-01	2.72	42" to 54"
Patapsco Supplemental Interceptor	3.64	48" to 72"
Baltimore Highlands	2.08	12" to 24"
Herbert Run	4.10	12" to 30"
Herbert Run West	2.88	12" to 30"
UMBC Outfall Sewer	0.84	12" to 18"
Maiden Choice Outfall	0.57	10" to 12"
Bull Branch Interceptor	3.53	18" to 24"
Mellor Avenue Diversion	1.05	12" to 15"
Thistle Branch Interceptor	1.84	10" to 12"
Coopers Branch Interceptor	1.33	10" to 15"

Pumped Flow

The 80.0 MGD Patapsco Pump Station receives flow from six (6) pumping stations as shown below.



Existing Conditions

The Patapsco SRRR Plan was accepted by the EPA on December 9, 2013 and is anticipated to be substantially constructed in June 2026.

Proposed Projects

There is one project under design in Patapsco, which is listed below.

Project	Description	Estimated Cost
Patapsco Force Main Replacement	Replacement of force main	$45,000,000
	Total	$45,000,000

RURAL BALTIMORE COUNTY

The use of private onsite sewage disposal systems (OSDS), commonly known as septic systems are predominantly in the areas outside of the Urban-Rural Demarcation Line (URDL). However, there are also clusters and isolated occurrences of developed properties within the URDL that are served by OSDS due to the proximity of existing public sewer to the properties and the relative cost/complication of extending the sewer to serve them. Currently it is estimated that there are approximately 36,000 septic systems in Baltimore County, of which approximately 5,000 are located inside the URDL and within the existing sewer service area.

Generally speaking, soils in Baltimore County are conducive to the installation of reliable septic systems that meet state and county regulations. However, there are also certain areas where there are generally poor soils for onsite sewage disposal and as a result, these areas have a higher incidence of septic system failures and complicated repairs.

In northern Baltimore County, several older communities continue to experience septic system failures due to limited areas for repair (small lot sizes), poor soils, and high water tables. These areas were developed prior to zoning and environmental protection regulations (i.e., prior to 1970) that were designed to protect against building on poor soils and on undersized lots. These areas include the following: the old town of Phoenix, Hereford, Monkton, Butler, Baldwin, Freeland, Trenton and Kingsville. Because these problems involve a relatively small number of privately owned properties that are far removed from the metropolitan district, there is no straightforward mechanism or procedure to accomplish community-wide septic system corrections. Efforts to organize a Rural Sanitary District to resolve these types of problems were initiated in the early 1990s, but were ultimately put on hold due to complexity of establishing such a district, and the concerns for increased development as a result.

Dating as far back as the late 1960's, the County recognized that existing well and septic systems in many of the waterfront areas in the Bowleys Quarters and Back River Neck Peninsulas (both designated as "No Planned Service Areas) posed public health and environmental concerns due to shallow water tables and soils with low permeability. In the 1980's, the county approved extension of public water and sewer service to serve most of the existing properties in those areas as a health project. Over the subsequent 20 years, hundreds of developed properties were connected to public water and sewer. To address the questions of serving undeveloped existing lots of record in these areas, the County passed Bill 65-99.

Due to the historic development pattern, certain developed properties in the Bowleys Quarters and Back River Neck areas were deemed too remote to be served by public water and/or sewer economically. Similarly, there are also several other areas along the Chesapeake Bay waterfront in Baltimore County where existing septic systems may be considered to be "failing" due shallow water tables. These areas include properties along the southern shores of Saltpeter Creek, and Bird River. In these cases, the Department of Environmental Protection and Sustainability works with each property owner to determine the best method of providing safe and adequate water supplies and sewage disposal and may conduct sanitary surveys to evaluate if extension of public water and/or sewer is recommended.

Since 2015, Baltimore County has been focusing on efforts to identify where septic systems are located within the metropolitan district and assess the feasibility of getting these facilities connected to public sewerage through the Bay Restoration Fund Grant Program. The grant program assists residents as well as businesses and non-profit organizations with the dual purpose of resolving septic system problems and reducing nitrogen loading to the Chesapeake Bay and its tributaries.

* Baltimore County employs a Biennial Capital Budget. No money is funded for FY29

RURAL BALTIMORE COUNTY

The use of private onsite sewage disposal systems (OSDS), commonly known as septic systems are predominantly in the areas outside of the Urban-Rural Demarcation Line (URDL). However, there are also clusters and isolated occurrences of developed properties within the URDL that are served by OSDS due to the proximity of existing public sewer to the properties and the relative cost/complication of extending the sewer to serve them. Currently it is estimated that there are approximately 36,000 septic systems in Baltimore County, of which approximately 5,000 are located inside the URDL and within the existing sewer service area.

Generally speaking, soils in Baltimore County are conducive to the installation of reliable septic systems that meet state and county regulations. However, there are also certain areas where there are generally poor soils for onsite sewage disposal and as a result, these areas have a higher incidence of septic system failures and complicated repairs.

In northern Baltimore County, several older communities continue to experience septic system failures due to limited areas for repair (small lot sizes), poor soils, and high water tables. These areas were developed prior to zoning and environmental protection regulations (i.e., prior to 1970) that were designed to protect against building on poor soils and on undersized lots. These areas include the following: the old town of Phoenix, Hereford, Monkton, Butler, Baldwin, Freeland, Trenton and Kingsville. Because these problems involve a relatively small number of privately owned properties that are far removed from the metropolitan district, there is no straightforward mechanism or procedure to accomplish community-wide septic system corrections. Efforts to organize a Rural Sanitary District to resolve these types of problems were initiated in the early 1990s, but were ultimately put on hold due to complexity of establishing such a district, and the concerns for increased development as a result.

Dating as far back as the late 1960's, the County recognized that existing well and septic systems in many of the waterfront areas in the Bowleys Quarters and Back River Neck Peninsulas (both designated as "No Planned Service Areas) posed public health and environmental concerns due to shallow water tables and soils with low permeability. In the 1980's, the county approved extension of public water and sewer service to serve most of the existing properties in those areas as a health project. Over the subsequent 20 years, hundreds of developed properties were connected to public water and sewer. To address the questions of serving undeveloped existing lots of record in these areas, the County passed Bill 65-99.

Due to the historic development pattern, certain developed properties in the Bowleys Quarters and Back River Neck areas were deemed too remote to be served by public water and/or sewer economically. Similarly, there are also several other areas along the Chesapeake Bay waterfront in Baltimore County where existing septic systems may be considered to be "failing" due shallow water tables. These areas include properties along the southern shores of Saltpeter Creek, and Bird River. In these cases, the Department of Environmental Protection and Sustainability works with each property owner to determine the best method of providing safe and adequate water supplies and sewage disposal and may conduct sanitary surveys to evaluate if extension of public water and/or sewer is recommended.

Since 2015, Baltimore County has been focusing on efforts to identify where septic systems are located within the metropolitan district and assess the feasibility of getting these facilities connected to public sewerage through the Bay Restoration Fund Grant Program. The grant program assists residents as well as businesses and non-profit organizations with the dual purpose of resolving septic system problems and reducing nitrogen loading to the Chesapeake Bay and its tributaries.

NOTES:

1. GPCD (gallons per capita per day) includes residential commercial industrial and infiltration/inflow.
2. Population and flows from the Gwynns Falls sewershed have been allocated to the Patapsco Wastewater Treatment Plant reflecting the typical system operations. Flows can be diverted from the Gwynns Falls sewershed through the Southwest Diversion pressure sewer to the Back River Wastewater Treatment Plant if required.
3. Howard County data based on "Howard County Maryland Master Plan for Water and Sewerage, 2015 Amendment" and correspondence with Howard County DPW staff.
4. Anne Arundel County data based on "Master Plan for Water Supply & Sewerage Systems, 2022".

MAPS

MAP MAINTENANCE POLICY (From 1993 Triennial Review)

WHEREAS, it is a benefit to the general public, the Baltimore County Council, the Baltimore County Executive, and appropriate agencies of both local and state government to have access to the WATER SUPPLY AND SEWERAGE PLAN which is as current as possible; and

WHEREAS, each capital improvement program adopted by the County Council may introduce water or sewer facilities, 12 inch in diameter or larger, which may not appear on the plan; and

WHEREAS, each capital improvement contract which is completed in the field automatically changes the map designation of a project from a proposed to an existing facility; and

WHEREAS, any capital facilities area (W-3 or S-3) in which a capital, development, or neighborhood improvement project has been completed and put in service becomes legally and automatically an existing service area (W-1 or S-1);

NOW THEREFORE, the Department of Public Works is directed by the County Council of Baltimore County to maintain the original water and sewer maps in as current a condition as possible with regard to the capital improvement program, as adopted by the County Council, and with regard to construction completed in the field, and to any changes from a W-3 or S-3 designation to a W-1 or S-1 designation, without recourse to further public hearings or Council action; and

Further, it is directed that copies of such maps which are as current as possible be available to members of the County Council, the Baltimore County Executive, agencies of local and state government, and the general public through the Engineering Records Section, Bureau of Engineering, Room 206 Baltimore County Office Building, 111 West Chesapeake Avenue, Towson, Maryland, and that they be available under the same conditions as apply to the production of any other record from that unit.

February, 1993

WATER SUPPLY& SEWERAGE PLAN DESIGNATIONS

Areal designations noted on each page of analysis and on the petition exhibits:

W-1 or S-1 EXISTING SERVICE AREAS Areas in which Metropolitan water and sewerage facilities are presently available to 90 % of the properties.

W-3 or S-3 CAPITAL FACILITIES AREAS Areas in which water and sewerage facilities are required, and are possible, within the framework of the six-year capital program, subject to annual budgeting, neighborhood petitions, determination of health hazards and the negotiation of Public Works Agreements.

W-4 or S-4 STUDY AREAS Areas, rural centers, outside the Metropolitan District which shall be studied to determine the feasibility of future community water supply and sewer service.

W-5 or S-5 MASTER PLAN AREAS Areas in which water and sewerage facilities are required and are intended within the framework of the Baltimore County Master Plan.

W-5 X or S-5 X MASTER PLAN AREAS Areas to become CAPITAL FACILITIES AREAS upon annexation into the Baltimore County Metropolitan District.

W-6 or S-6 AREAS OF FUTURE CONSIDERATION Areas which are to be considered in the design of major facilities for growth and development beyond the Land Use Master Plan.

W-7 or S-7 NO PLANNED COMMUNITY OR MULTI-USE SERVICE (NPS) Areas of planned, low-density growth (also known as "Resource Conservation Zoning") for which Metropolitan water and sewerage facilities are neither planned nor intended.

The following definitions have been derived from Maryland State Law and the Baltimore County Code and are set forth here as they relate specifically to Water Supply and Sewerage Planning in Baltimore County:

INDIVIDUAL WATER SUPPLY A water supply well and plumbing system within a single property, intended for domestic use of less than 5,000 gallons of ground water per day.

INDIVIDUAL SEWERAGE SYSTEM A sewerage system, within a single property, comprising a treatment system (septic tank) which receives waste water from a plumbing system and has a ground water recharge system of less than 5,000 gallons per day.

MULTI-USE SYSTEM A water supply or sewerage system which is identical to an individual system, as defined above, except that use and recharge of ground water is equal to or greater than 5,000 gallons per day.

COMMUNITY SYSTEM (Public or Private)
A system of water supply or sewerage disposal involving two or more property owners, regardless of the quantity or point of disposal.

Note: Any of the above may be a community system under the Clean Water Act of the Federal Government relative to the required water quality and frequency of testing.

Disclaimer

Information shown on the maps in this document **does not guarantee** that public water or sewerage service is available in any given area.

INTRODUCTION

The Environmental Article of the Annotated Code of Maryland (Section 9-503) requires Baltimore County to adopt a Plan for the provision of adequate water supply and sewerage throughout the County that is consistent with the County comprehensive land use plan. This Plan is to be reviewed by the County governing body at least once every three years.

The 10-year Baltimore County Water Supply and Sewerage Plan 2020 Triennial Review was adopted on August 2, 2021 by County Council Resolution No. 99-21.

Baltimore County *Master Plan 2020* was adopted by County Council Resolution 94-10 on November 15, 2010.

The 2020 Triennial Review was approved by Maryland Department of the Environment (MDE) in the letter from MDE's Director of the Water Management Administration dated November 30, 2021.

The next Triennial Review is due for submission to MDE in 2023.

STATEMENTS AND CERTIFICATIONS

Upon approval of the *Water Supply and Sewerage Plan 2023 Triennial Review*, COMAR 26.03.01.04 requires the following statements to be provided in this Introduction:

1. Statement certifying that the county governing board has officially adopted the plan. This will be the County Council Resolution, endorsed by the County Executive, adopting the *Triennial Review*.

2. Statement certifying that the plan incorporates subsidiary plans. This is not applicable to Baltimore County in that there are no subsidiary jurisdictions within the County.

3. Statement certifying that the sections covering the engineering aspects of water and sewerage projects have been prepared and reviewed for adequacy by a registered engineer licensed in the State. This statement is usually made in the letter from the Director of Public Works and Transportation submitting the *Triennial Review* to the Maryland Department of the Environment.

4. The letter of approval from the Maryland Department of the Environment.

Statements and certifications will be attached when the Plan is adopted and approved.

CHAPTER I: GOALS AND ORGANIZATION

GOALS OF THE COUNTY CONSISTENT WITH COMPREHENSIVE PLANNING

MASTER PLAN 2020

To promote policies and actions resulting in a safe, sustainable environment for future generations, the County Council in partnership with the Citizens of Baltimore County, Maryland, adopted *Master Plan 2020* on November 15, 2010 (Resolution 94-10). The Master Plan 2030 is in progress and has not been approved or finalized at this time. The goals of the Mater Plan 2020 are as follows:

Goal One: Continue the Success of Growth Management

- Direct the future growth within the Urban-Rural Demarcation Line (URDL)
- Protect and enhance Community Conservation Areas
- Promote redevelopment with an emphasis on ailing commercial or industrial properties
- Develop compact, mixed-use, transit-oriented and walkable neighborhoods
- Advance economic wellbeing by promoting a high quality labor force
- Provide a mixture of housing types for an emerging diversity of residents
- Support quality public schools to enhance communities
- Prioritize infrastructure improvements via the Capital Improvement Program to endorse sustainable development
- Protect the character and economic vitality of the rural communities

Goal Two: Improve the Built Environment

- Provide adequate open space and recreational opportunities and increase connections to nature by linking open spaces and parks
- Invest in public grounds by tree planting, buffer conservation and habitat restoration
- Expand and deliver multi-modal transportation services
- Reduce pollutant loadings of runoff with enhanced stormwater management
- Meet desire for green communities by providing regulatory incentives
- Ensure integration between regulations and sustainability programs such as LEED

Goal Three: Strengthen Resource Conservation and Protection

- Protect health of the natural environment and maintain a valuable biodiversity
- Restore ecosystems and encourage fair, efficient use of natural resources
- Preserve cultural assets to establish a tangible sense of community
- Nurture farming activities and importance of the agricultural industry
- Conserve rural characteristics and scenic vistas

WATER AND SEWER PLAN

Sustainable development has been defined as that which "meets the needs of the present in a responsible manner without compromising the ability of current and future generations to meet their own needs" (United Nations General Assembly (1987)). To help ensure a sustainable community, Baltimore County will continue the following actions to protect the public water supplies and sewer systems:

- Work with Baltimore City and adjacent jurisdictions to protect and enhance the water supply reservoirs;
- Maintain and upgrade all capital facilities as required;
- Implement the water resource conservation practices established in the Baltimore county plumbing code;
- Where technically and economically feasible, require property owners with developed properties that utilize septic systems that are located within areas designated as S-1, to connect to public sewer and abandon their septic systems.
- As determined by the Department of Environmental Protection and Sustainability (EPS), individual properties, communities, and subdivisions with failing, inadequate, and substandard private onsite water or septic systems or other public health concerns that exist inside of the Metropolitan District and outside of the URDL in W-7 and/or S-7 (no planned service) designated areas, public water and/or sewer may be extended to existing lots of record if evaluated and required by DPW&T as an economically feasible solution. Such extensions are permitted through the County's existing Water Supply and Sewerage Master Plan Amendment process.
- Actively participate in the Metropolitan District;
- Also actively participate in the Susquehanna River Basin Commission.

Master Plan 2020 was prepared in accordance with Article 66B of the Annotated Code of Maryland, Section 523 of the Baltimore County Charter, and pertinent sections in the Baltimore County Code. Development of the master plan involved all "stakeholders", such as citizens and community associations, county and state agencies, government officials, and businesspersons. Similarly, in preparing this Water and Sewer Plan, the appropriate comprehensive planning agencies were consulted: the Maryland Department of Planning, the Baltimore County Department of Planning, and the regional planning group, the Baltimore Metropolitan Council (BMC). This unified effort helped to ensure the Water and Sewer Plan is indeed consistent with, and in fact supportive of the County's goals of comprehensive planning.

The Water and Sewer Plan shall remain in effect concurrently with the Master Plan. Any revision to one plan that has substantive impact on the other will require commensurate modification of the other plan.

ADDITIONAL PLANS

Additional plans and studies are amendments to the *Master Plan 2020*, which further define land use and growth management strategies countywide, and for specific areas of the County. The County's Master Planning web page lists all adopted community and other plans:
https://www.baltimorecountymd.gov/departments/planning/masterplanning/adoptedcommunityplans/index.html

Furthermore, "The Baltimore County, Maryland Land Preservation, Parks and Recreation Plan," was adopted by the Baltimore County Council as a *Master Plan 2020* Amendment on June 5, 2017. The full document is posted at:
https://www.baltimorecountymd.gov/departments/planning/masterplanning/parkrecplan

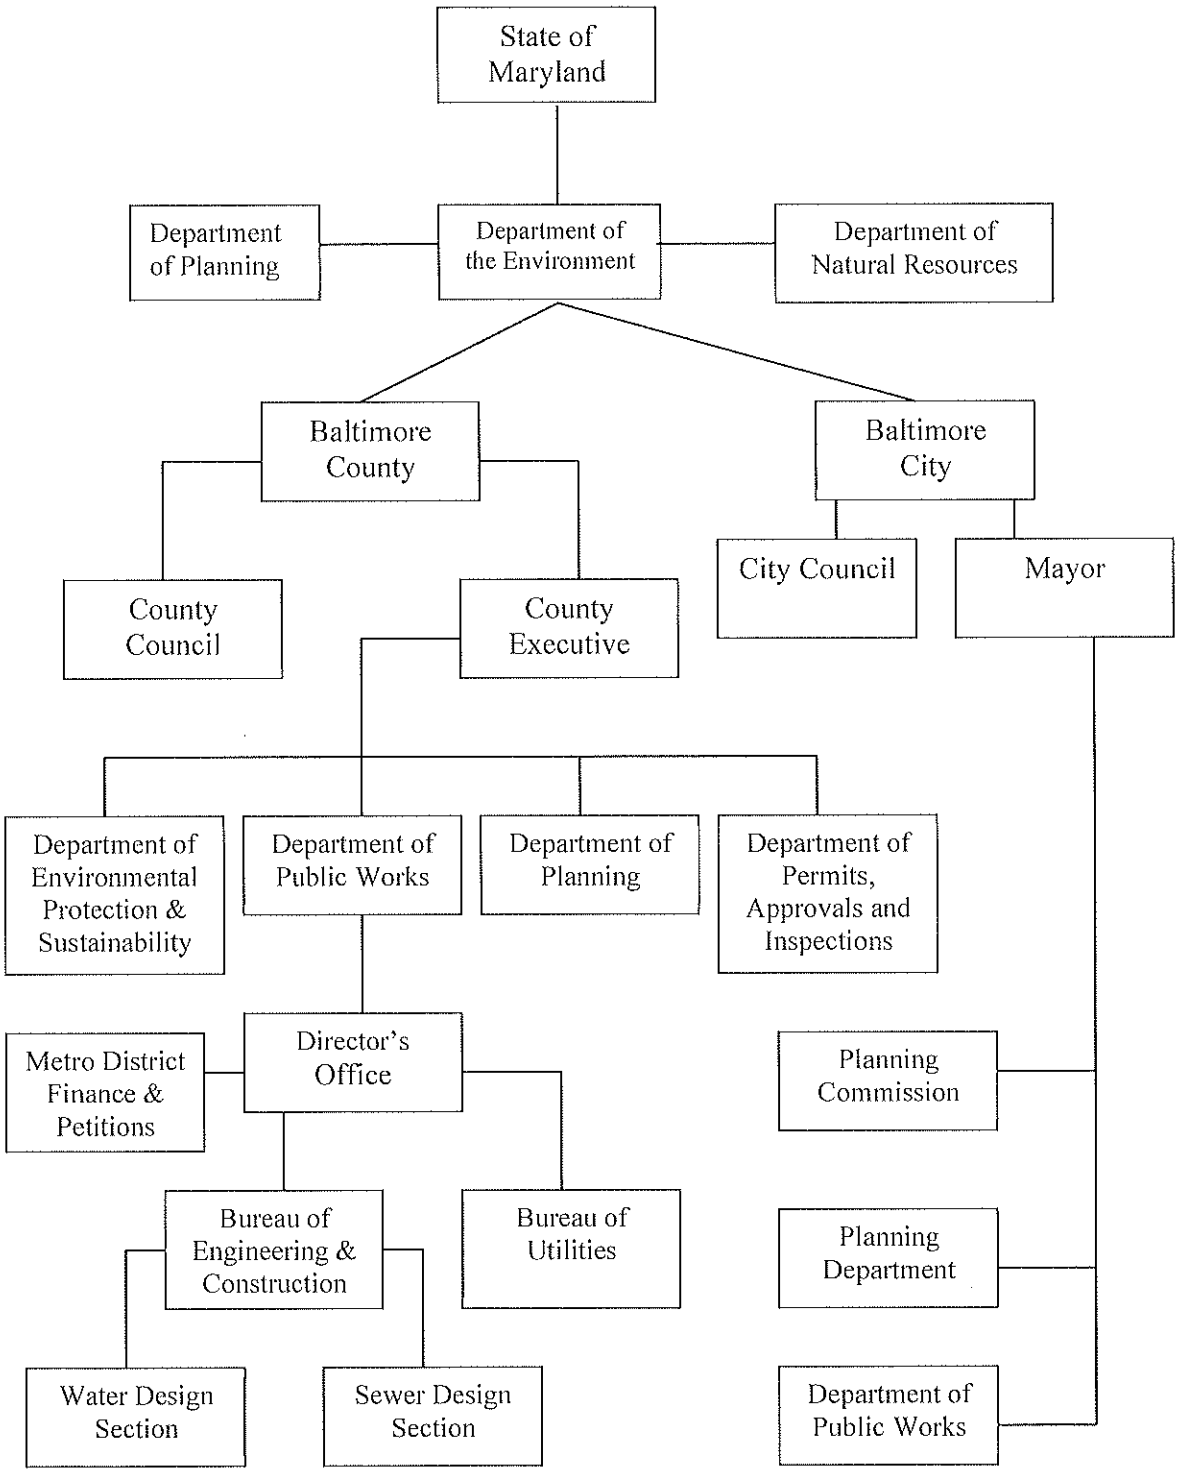
ARTICLE 66B, ANNOTATED CODE OF MARYLAND

In response to directives from the United States Environmental Protection Agency (EPA), the General Assembly of Maryland passed legislation amending Article 66B of the Annotated Code of Maryland. In 2012, the Maryland General Assembly repealed Article 66B and Article 28 and replaced them with the Land Use Article.

Specifically House Bill 1141 (HB 1141, 2006) required, among other items, a thorough examination of the safety and adequacy of all drinking water supplies and sewerage disposal systems for existing and future populations. The analysis contained in the master plan, called a Water Resources element (WRE), revealed that, with continued maintenance and protection, the public water supply and sewerage systems serving Baltimore County will be safe and adequate for the projected population until at least 2035. The WRE had a major influence on the policies and actions developed in *Master Plan 2020*, especially concerning protection of surface waters and the Chesapeake Bay. One of the primary goals is to direct virtually all new land development (or *redevelopment*) inside the Priority Funding Area (PFA), which is essentially the urban area closest to Baltimore City. Even with this anticipated population growth, there will be enough potable water in the public supply system, and adequate capacity in the public sewer system.

ORGANIZATIONAL CHART

State & Local Government as Related to Water & Sewer Management



COUNTY GOVERNMENT AS IT RELATES TO WATER AND SEWERAGE MANAGEMENT

In order for property to be served by public water and sewer in Baltimore County, it must meet two geographic conditions:

1. Located within the Baltimore County Metropolitan District, and
2. Located within an area designated as Capital Facilities or Existing Service on the Water and Sewerage Plan Maps.

METROPOLITAN DISTRICT

Under the Metropolitan District Act (established by the Acts of the General Assembly of Maryland of 1924, Chapter 539) the Baltimore County Metropolitan Sewer and Water Operating District (the "Metro District") was created as a separate and financially self-supporting entity under the jurisdiction of the County to supply water and to provide sewer and wastewater systems to residents of the County living within certain prescribed areas primarily in the most densely populated areas. The extension of these boundaries is subject to the approval of the County Council with the consent and approval of the Mayor and City Council of Baltimore. The Department of Public Works under the direction of the County Administrative Office carries out the administration of the Metropolitan District. The Metro District has its own revenue and bond issuance powers, subject to authorization by the County Council. The Metropolitan District Act requires the City of Baltimore (the "City") to provide water to the Metro District at cost. Although the Metro District constructs water facilities within its boundaries, under an agreement between the City and the County, the City maintains and operates the facilities at cost, including billing and collecting water usage. Under said agreements, the City and the County have also agreed to pay for certain new capital projects and the repair and enlargement of additions or improvements to certain existing water facilities on a specified pro-rata basis. In addition, the County, from time to time, has entered into agreement with adjacent Anne Arundel and Howard counties under which, certain of the County's water facilities are made available to each of said counties. For such use, these other jurisdictions have agreed to pay for a pro-rate share of capital and operating costs.

The Metro District is operated like a regulated utility company. However, instead of using a quasi-public commission or appointed authority, the system is managed, financed and operated directly by Baltimore County. The County Charter states that all funds expended by the County must be appropriated and be contained in an operating or capital budget that has been approved by County Council. Therefore, the Metro District's Capital Improvement Program (CIP) is part of the overall County CIP.

WATER AND SEWERAGE PLAN MAPS, ANNUAL AMENDMENT CYCLE

Owners of properties for which public water and sewer utility service is desired but are not within Capital Facilities or Existing Service areas must petition the County for a map amendment. The executive order of April 11, 1990, established an **annual amendment cycle** for this purpose. Petitions for map amendments must be submitted by May 1 of each year. After being reviewed by Planning, DEPS and DPW&T, staff recommendations are forwarded to the Planning Board for public hearing and report to the County Executive. The County Executive may then forward any favorable recommendations to the County Council for approval. The County Council resolution approving any map amendments is then forwarded to the State Department of the Environment (MDE) for final approval. MDE uses this information during review of permits under its jurisdiction.

Properties having designations W-4 or S-4, W-5 or S-5, W-6 or S-6 must petition for amendment to receive any service. The special designation W-5X or S-5X automatically becomes W-3 or S-3 when the property is included in the Metro district. When capital facilities are completed in W-3 or S-3 areas, those areas become W-1 or S-1 areas automatically (see map maintenance policy). Properties designated as W-7 or S-7 (No Planned Service) are served by private well water and sewage disposal systems, with the exception of those areas where public water and sewer has been extended for public health and environmental protection. Properties using in excess of 5,000 gallons per day must be added to the list of "multi-use facilities" and so designated on the maps. Two or more properties served by the same well water supply or sewage disposal system must be listed as a "community system" and so designated on the maps. Although the Water and Sewerage Plan is primarily intended as a tool for ensuring public health and safety, there are land uses permitted by right under certain RC zones for which density may be controlled only through the Water and Sewerage Plan cycle amendment process.

WATER AND SEWERAGE PLAN VARIANCES

Variances to the Water and Sewerage Plan Maps are given consideration under certain circumstances. A property designated W/S-1, 2, 3 or 4 where it is contested that extension of or connection to public utility mains is not feasible, a property owner may apply for a variance to allow the use of private well(s) and/or septic system(s). Such variance requests must be submitted to DPW&T in the specified format, and subject to review by both DEPS and DPW&T. In such cases where the variance is approved by DPW&T, the petitioner must execute and record an "interim agreement" which requires the owner of such property to connect to any future public utility main extension, including participation in all costs and assessments as required. Properties designated W/S-5 or 6 may be served by private water supply and/or sewage disposal systems not of an interim nature. See COMAR 26.03.01.05 for authority to allow interim systems.

CHAPTER II: BACKGROUND INFORMATION: PHYSICAL, POPULATION PROJECTION, LAND USE

COMPREHENSIVE PLAN

Master Plan 2020 is the guiding document for County's future development. The *Master Plan* embodies the broad goals, formulating policies for sustaining livable communities and achieving balanced development in Baltimore County. The County has begun the process of updating the *Master Plan*, *Master Plan 2030*, per the County Charter.

The County's water and sewer planning is based on the County's landmark Urban Rural Demarcation Line (URDL), which also corresponds to the state's Priority Funding Area (PFA) boundaries delineated for the state permitting and financing purposes. The ideal areas for redevelopment include adequate public water and sewer as well as other public facilities and services. Items to be analyzed in determining suitability of an area to accommodate population growth are the adequacy of existing and proposed infrastructure (*Master Plan 2020*, page 34).

Since the establishment of URDL in 1967, the residential construction and redevelopment within the URDL has continued to prove that the County excels in conserving its urban and rural communities by revitalizing existing communities and directing new development into the County's community conservation and designated growth areas. Water and sewer planning to allow those public utilities only in urban areas ensures development is concentrated inside the URDL, thus reducing sprawl (*Master Plan 2020*, page 2).

Public facilities such as water and sewer built in the urban area have been consistent with the County's pattern and timing of growth. Public infrastructure is important in determining the timing, location, and intensity of development, serving as a valuable tool for master plan implementation. Basic infrastructure provides the foundation for the location where private and public sector redevelopment and reinvestment take place (*Master Plan 2020*, page 46).

The County's *Master Plan* has language with regard to water or sewer extensions outside the URDL as public health projects. *Master Plan 2020* stipulates that the County must, "Ensure that sewer extensions to correct failing septic areas outside the URDL only address existing problems and do not stimulate growth and development" (p. 49).

For public health projects to proceed, the Executive Order [for the] Baltimore County Water & Sewerage Plan Amendment Process indicates that the Planning Board must find that there has been "a danger to public health" and water and sewerage facilities are necessary to resolve the health concerns. In practice, the extension of water and/or sewer services to areas outside the URDL, is initiated when it has been determined by the County Department of Environmental Protection and Sustainability (DEPS) that there is public health concern related to existing on-site water supplies and septic systems and where the County Department of Public Works and Transportation (DPW&T) has determined that the extension is an economically feasible

solution. The process for making such extensions would be through the aforementioned Amendment process, which allows the Maryland Departments of Planning and the Environment as well as the County Planning Board, County Council, and the County Administration to weigh in, ensuring that the extension is appropriate and would not intensify development in areas outside the URDL.

The referenced *Master Plan* also stipulates that, "the proper siting, design, and construction of on-site sewerage disposal systems (OSDS) [in rural areas or places outside the URDL] is critical to protecting ground water supplies and public health. Should community health threats be documented in areas that are accessible to the Metropolitan District, extension of public water or sewerage is provided on a long-term financing basis" (p. 159).

The referenced *Master Plan* further states that the County must "continue to manage and protect groundwater supplies, particularly in areas where citizens, businesses, industry and agriculture rely solely on wells; review development proposals and permits to assure the proper siting, design, and construction of drinking water wells and OSDS in accordance with the Code of Maryland Regulations and Code of Baltimore County Regulations. The current regulations and standards for drinking water wells and OSDS are considered effective in protecting public health while ensuring that there is adequate supply for current and future demands." (p. 160)

The growth tiers, as amended in *Master Plan 2020*, identify where major and minor residential subdivisions may develop and what type of sewage disposal system will serve them. The County's Growth Tiers were developed in response to Maryland's Sustainable Growth and Agricultural Preservation Act of 2012 (SB 236). A parcel divided into four or more lots is considered a major subdivision in Baltimore County. Existing geographic data such as existing and planned sewer areas, zoning, URDL and a variety of conservation or preservation layers (PDF) were analyzed and used to classify County land into one of four Growth Tiers:

- Tier I: Major or minor subdivisions served by public sewers are allowed.
- Tier II: Major or minor subdivisions served by public sewers are allowed. Minor Subdivisions on individual on-site disposal systems shall be viewed as interim.
- Tier III: Major subdivisions on individual on-site disposal systems are allowed, with the recommendation of approval by an approving authority. Minor subdivisions on individual on-site disposal systems are allowed.
- Tier IV: Only minor subdivisions on individual on-site disposal systems are allowed.

In addition to amendments to *Master Plan 2020* as reported in the 2017 Triennial Review, Chapter II, there are two new amendments to the *Master Plan* to ensure sustainable development, environmental protection, and resource conservation: *The 2017 Land Preservation, Parks and Recreation Plan* and renewal of sustainable communities.

The Land Preservation, Parks and Recreation Plan (LPPRP) serves as the advisory master plan for the Baltimore County Department of Recreation and Parks. The LPPRP outlines the County's recreation, parks and open space policies, goals, objectives and priorities, particularly those associated with parklands and recreational facilities. The *Land Preservation, Parks and*

Recreation Plan, was adopted by the Baltimore County Council as a *Master Plan 2020* Addendum on June 5, 2017.

From 2019 to 2022, the Maryland Department of Housing and Community Development approved renewals for the following sustainable community designations. Those eight sustainable community designations are eligible to apply for the resources in order to strengthen reinvestment and revitalization in those communities within the URDL.

- Arbutus approved in September 2021
- Pulaski Highway Redevelopment Area approved in March 2019.
- Greater Dundalk-Sparrows Point Area approved in March 2019.
- Catonsville Patapsco Area approved in March 2019.
- Towson Area approved in November 2019.
- Hillendale-Parkville-Overlea Area approved in November 2019.
- Reisterstown Main Street approved in November 2019.
- Northwest Gateway, approved in 2020.

POPULATION TRENDS

Information in Table 1 is computed on the basis of the Baltimore County's Round 10 population forecasts, most recently adopted in August 2022. The population forecast dataset is prepared by transportation analysis zone (TAZ) for the regional transportation planning purposes. The results of this analysis confirm that approximately 90% of the County's population resides within the URDL, which takes up one-third of the County's land area (640 square miles).

Table 1: Population Forecasts

Forecast Year	Population Forecasts				
	Urban (Inside URDL)		Rural (Outside URDL)		Total
	Total Urban	% County Total	Total Rural	% County Total	
2020	761,579	89.12%	92,944	10.88%	854,523
2025	773,922	89.15%	94,190	10.85%	868,112
2030	781,651	89.16%	95,075	10.84%	876,726
2035	797,576	89.16%	96,965	10.84%	894,541
2040	810,512	89.17%	98,488	10.83%	909,000
2045	820,611	89.17%	99,664	10.83%	920,275
2050	833,357	89.17%	101,164	10.83%	934,521

Source: Baltimore County Department of Planning, Round 10 Forecasts, August 2022

The following maps (1 through 8) by TAZ provide a general overview of population distribution patterns and trends throughout the County (2020 - 2050) based on Round 10 forecasts. Maps 1 to 4 show total population distribution by TAZ, while Maps 5 to 8 display population density by TAZ. The maps indicate that while population growth is projected to remain consistent with past trends – the majority occurring within the URDL, and some spilling over into neighboring rural TAZ's – major increases in population density will only occur within the URDL, with over 40% in the eastern portions of the County.

LAND USE AND ZONING

The existing land use data (Table 2a) show that among all the land use types, the largest amount and percent share of the County's total land area is Land Preservation followed by Rural Residential and Open Space. Those types of land use account for 53.51% of the total land acreage of the County. Map 9 on page II-15 depicts existing land use patterns.

Table 2a: Existing Land Use

Land Use Type	Acreage	Percent Total
Agricultural	38,008	9.79%
Commercial	7,721	1.99%
Environmentally Constrained	1,094	0.28%
Industrial	11,619	2.99%
Institutions	17,472	4.50%
Land Preservation	83,124	21.40%
Landfill	1,086	0.28%
Mixed Use	1,212	0.31%
Multi-family	5,272	1.36%
Office	1,424	0.37%
Open Space	62,235	16.02%
Rural Residential	62,486	16.09%
Single-Family Semi-Detached and Attached	5,670	1.46%
Single-Family Detached	40,345	10.39%
Transportation	27,742	7.14%
Utility	6,094	1.57%
Vacant	15,794	4.07%
Total	388,397	100%

Land use date updated summer of 2021 by Baltimore County Department of Planning.

The land use data demonstrate the County's commitment and endeavor on sensible development and resource preservation, which has been consistent with the County's Master Plan goals and in concert with the *Annual Report on Growth* series mandated by the Sections 1-207 and 1-208 of the Land Use Article in the *Annotated Code of Maryland*, aiming to monitor the growth patterns and trends in a charter county and denoting implementation of the County's Master Plan.

This land use pattern is determined by the zoning classifications, one of the most effective tools to implement *Master Plan 2020.* The zoning classification table (Table 2b) summarizes that the majority of the land acres is set aside for agricultural preservation and resource conservation (36.79% and 30.41% correspondingly). The zoning for residential uses ranks third, representing 24.32% of the County's land area, which includes low, medium, and high density residential. Land zoned for business, manufacturing, and office combined amount to 8.49% of the County's total acreage. Map 10 on page II-16 presents current zoning patterns throughout the County.

Table 2b: Zoning Classifications

Zoning Classification	Acreage	Percent Total	Zones in Each Category
Agricultural Preservation	143,251	36.79%	RC 2, RC 50
Resource Conservation	118,409	30.41%	RC 20, RC 3, RC 4, RC 5, RC 6, RC 7, RC 8, RCC
Residential:	94,716	24.32%	As listed below:
Low Density Residential	50,050	12.85%	DR 1, DR 2, DR 3.5
Medium Density Residential	32,900	8.45%	DR 5.5
High Density Residential	11,766	3.02%	DR 10.5, DR 16, RAE 1, RAE 2
Manufacturing	20,204	5.19%	MH, ML, MLR, MR
Business	9,993	2.57%	BL, BLR, BM, BMB, BMM, BMYC, BR, CB
Office	2,847	0.73%	O 3, OR 1, OR 2, OT, RO, ROA, SE
Total	**389,420**	**100.00%**	

Data compiled by Baltimore County Department of Planning, June 2023.

The proposed land use in *Master Plan 2020* applies the transect zone concept. As indicated in *Master Plan 2020* (pages 27 to 31), the transect "T-zones" are a framework that identifies a range of habitats from the most natural to the most urban. Its continuum, when subdivided, lends itself to the creation of zoning categories (Table 2c). The standards overlap, reflecting the sequential pattern of development and ecosystems. The concept provides general direction for the County's future land use decisions that are subject to amendments to *the Master Plan 2020* and new update to the Plan.

Table 2c: Proposed Land Use

Smart Code	Land Use Type	Acreage	Percent Total
T1	Natural	53,054	13.62%
T2	Rural	172,483	44.29%
T2 R	Rural Residential	35,057	9.00%
T2 V	Rural Village	175	0.04%
T3	Suburban	46,183	11.86%
T4	General Urban	67,730	17.39%
T5	Urban Center	14,420	3.70%
T6	Urban Core	320	0.08%
TOTAL		**389,421**	**100.00%**

Data compiled by Baltimore County Department of Planning, June 2023.

The proposed land use map (Map 11 on page II-17) illustrates the transect "T-zones" designed for the intent to support compact mixed-use communities within the URDL and protect natural resources outside the URDL. In addition, Map 12 shows major public institutions throughout the County.

Description	**Page**
Direct exam of Dave Bayer by Mr. Rosenblatt	18
Cross exam of Mr. Bayer by Mr. McCann	61
Cross exam of Mr. Bayer by Mr. Wyatt	116

(ON RECORD)

ALJ: Good morning, everyone. Calling case number 08-0922 and 2021-250-SPH. This is the property address at 2310 West Joppa Road. And you're attending the Motion for Reconsideration hearing for the Order on the combined development plan and zoning case known as Greenspring Manor. And we're going to have counsel introduce themselves for the record, beginning with the Developer.

MR. ROSENBLATT: Good morning, Judge Murphy. Adam Rosenblatt and Chris Mudd of Venable, LLP on behalf of the Developer and Petitioner.

ALJ: All right. Mr. McCann?

MR. MCCANN: Good morning, Judge. Michael McCann on behalf of the Protestants.

ALJ: Mr. Wyatt? You're muted.

MR. WYATT: Yeah. Good morning, Your Honor. Michael Wyatt, I'm an adjoining property owner.

ALJ: All right. And Ms. Demillio, you're here for Mr. Zimmerman? Yep, you're muted. I just unmuted you. Can you hear me?

MS. DEMILLIO: Yes, I can. Good morning, Judge Murphy. Good to see you.

ALJ: Good to see you. All right. And you're here for People's Counsel.

MS. DEMILLIO: Yes.

ALJ: All right. I think that's everyone. All right. So, let's see. We are here on the Motion for Reconsideration hearing in that it's a limited hearing as outlined in the Order that was dated September 25th, 2023. And so, I know that Mr., I guess Mr. Mudd or Mr. Rosenblatt, have a witness to present or two.

Before we get to that, let me do this. I believe everyone on, it looks like on Friday afternoon, we all received an e-mail from the County Attorney, I believe. And so, I just wanted to start with that. Sorry. I'm just having a minute to open it and see if this works. For some reason it's putting up, try again. There we go, okay. All right.

So, just to, just so we can get, I guess, just the beginning here. We all got this e-mail. It looks like it was, it was dated Friday, and this was at 1:16. And it looks like everyone received it. I guess counsel of record received it. And it, attached to this e-mail was a letter from the County Attorney, which I'm now pulling up, is also on the screen and hopefully you all can see that. Can you all see that?

MR. ROSENBLATT: Yes.

ALJ: All right, great. And so here, this is the letter and I, I wasn't going to read it, but I think maybe everyone hopefully has had a chance to read it. It has to do with the, it looks like the, the sewer line and really the MOU that really formed a basis for a lot of the comments that came

in from the County on this case.

And so, this, this document, obviously, it shows, you know, it indicates that the, the MOU has expired. It expired in, looks like in, it was a September 27, 2017 MOU.

It expired and it looks like the County is in the middle of trying to negotiate a new MOU for the sewer segments that were, you know, there was, I guess, just express information from the County, from DPR, from DPW&T, I should say, that indicated that, you know, this was a, that these were, Hopkins was supposed to fix it and whatever, I'm not going to go through it and read it.

But it looks like they're going through there and they're, they're negotiating now a new MOU. And so, I, you know, I appreciate this letter that, that we received, that actually highlights some of the information and really kind of, in contrast, to some of the information that we had.

Here's the Memorandum of Understanding. I'm just showing it on the screen. This was referenced in the letter. In 2017, it has attachments to it. It shows what the land was, the pavilion that Hopkins was building at the time. And it also shows, you know, that there were sewer improvements. And so, there was an agreement here, under this MOU, who was supposed to do what.

But in summary, it was really, it looks like and, and everyone can read it in their time. But a coordinated effort

between the County and Hopkins to actually make these improvements, which are listed, referenced in Exhibit C, which is attached again. And so, there were specific things that each one was supposed to do.

But basically, it was a coordinated effort between the two. And, and, but I guess, what the County Attorney highlighted in his letter here for all of us, just to make clear, that what, that the use and occupancy permit, I guess, was one of the issues and the suggestion was that, you know, that, that the use and occupancy permit shouldn't have been issued, the, if the sewer improvements weren't completed.

But, in fact, what this MOU indicates, and what the County Attorney's letter indicates, that, in fact, the occ, use and occupancy permit could have been issued and should have been issued and was issued regardless of whether the improvements were done.

So, this, this document and, and this MOU in this letter, with the attachments, you can see it was signed, this was the prior administration, because Mr. Homan signed it and it looks like Steve Weber was the, was the Director of the Department of Public Works at the time.

And, and here are the attachments. And so, these are, I mean, you don't really need these, but you can see them, they're hard to read. But essentially, these are the ones that are referenced in the letter that he sent all of us.

So, in any event, I was going to make this, because this kind of, you know, gives us a, a bigger scope of just an understanding of the sewer system, I'm going to make this County Exhibit, I think we left off on, this should be fourteen. Make this an exhibit in our, in our case. So, this will be County exhibit number fourteen. And so, I just wanted to kind of put that out there before we got started today. And with that, let's see.

The next thing would be, on my list would be that Mr. Rosenblatt or Mr. Mudd, you all were going to provide a blue lined development plan and you did that, I see, back in January. And that is, you said marked as Exhibit 1-C. And so, I just wanted to note for the record we received that blue lined plan, it has to do with the emergency gate. And so, we actually are admitting that. And the Order indicates that we're not taking testimony on that, we're just admitting that in evidence.

MR. MCCANN: Your Honor, Your Honor, --

ALJ: So, --

MR. MCCANN: -- may I be heard on both of those issues?

ALJ: Okay, sure.

MR. MCCANN: Yeah, there's a lot here. It looks like you've already, with respect to the letter from Mr. Benjamin, it looks like you've already looked at it. But, and I do have

a lot of respect for Mr. Benjamin. I, I work with him often. But I, I think the admission of this letter at this time, after the hearing has closed, is, is really highly inappropriate. This, the County, if it wanted to chime in on any of this, it had plenty of opportunity to do so.

In fact, I think the record would reflect that someone from Mr. Benjamin's office has attended I don't know every day in this hearing, but has certainly been attending the hearings in this matter. So, this could have been submitted months ago. It could have been raised on the very first day of the hearing when the issue of this, Johns Hopkins segments first came up. So, I think for that reason alone it shouldn't come in.

It's new evidence and, you know, I've had conversations with counsel for Johns Hopkins, so I can surmise what's behind all this. But I don't think we need to get into that. But what I would say is I, I think it's absolutely irrelevant anyway. I think as Your, Your Honor's opinion makes clear, it doesn't matter, he, he addresses a number of things.

He addresses who is responsible for submitting plans, who is responsible for the permitting. You know, you described it as a coordinated effort. That may all be well and good, but it doesn't matter at all. The bottom line is that these sewer segments, as we sit here today, as we sat here on the first, very first day of this hearing, have not been replaced. And

they haven't been. So, it doesn't matter, at all frankly, whose responsibility it is or, or was to undertake the repairs.

And, in fact, Your Honor, you addressed this at the very end of your opinion. You said, because I guess there was some suggestion, maybe there wasn't, I don't recall specifically, whether the plan could be approved upon condition that these, what I'm calling this Johns Hopkins sewer segments, I'm calling them those, them that, Your Honor, because, just for ease of reference, there's eight of them. But what we know from the evidence that is in the record, that only six of them, of those eight were required to have been completed in connection with the Hopkins improvements.

But in any event, getting back to your opinion, you explicitly addressed this, and you said that I'm not willing, quote, I'm not willing to condition approval here on the possibility that Johns, Johns Hopkins may or may not complete that work.

And you cited the Bluestem decision, which is, as you know, I was involved in, and there was a similar condition proposed in connection with that case and you, essentially, took the position in your opinion that you didn't need to impose such a condition.

That it didn't matter whether Hopkins did or did not complete the work. You weren't going to impose that condition. And that's consistent, frankly, with the entirety of your

opinion, which you found, Your Honor, capacity problems, not just with these sewer segments, but beyond. So, I don't see any relevance, even if this was submitted on the first day as it should have been or some time thereafter, I don't see any relevance to this at all. It just simply doesn't matter.

ALJ: And you said that the law office was here in the, in the, in the hearing, who, who --

MR. MCCANN: Ms. Frankovich, Jennifer Frankovich, she was from Mr. Benjamin's office. I've noted, I, I can't say specifically, Your Honor, which day she was here, but she has definitely been here throughout the course of this hearing. And I've had conversations with her and Mr. Benjamin in connection with my multiple PIA requests. So, I think that's in part may have been why she's participating.

But, you know, again, I have a lot of respect for Mr. Benjamin. But I, I, I just think this cannot come in at this late hour.

ALJ: All right, understood. I, and I don't know Ms. Frankovich and so, I don't know whether she was in the hearing, or she wasn't in the hearing. I don't, I'm not privy to any of the conversations either, obviously, between you and Mr. Benjamin or with you and Hopkins.

I'm just reading this letter that I got that, that actually, you know, provides some background information in regard to, to the sewer segment --

MR. MCCANN: Let me say, let me just add. I'm not even sure to the extent it matters, I'm not even sure what this, you know, put aside relevance just for a moment, what, what corrections, he talks about factual inaccuracies Mr. Benjamin is seeking to advance. I mean, the state of the record right now, I think it's fair to say, is that the County has deemed that there's insufficient capacity to allow this development to go through because of these eight sewer segments.

I think, if I recall correctly, there have been random statements to the, to the effect that Johns Hopkins is to have, or was to or is to have replaced the segments. But beyond that, I'm not so sure what, what, what is inaccurate about the record.

I think, frankly, to be honest with Your Honor, and just to, you know, I'm basing this on my conversations, that this is an, is an attempt to sort of correct the record. Not our record, but some other record, as to who or who is not obligated under this now outdated or rather expired MOU. I think Hopkins is trying to protect itself, which I understand it wants to do. But this isn't the forum for that.

ALJ: Okay, understood. Understood your position --

MR. MCCANN: And I can speak to the, to the, the new development plan as well, because I think it's very much a similar issue. And that is, the evidence in this case has

closed, it was closed a long time ago. I know you ruled on the, the issue of the pass through. But you also indicated in your opinion, Your Honor, explicitly that you would not consider an amended plan showing, showing a pass through.

You said on page 109, I got the blue, blue lined plan this morning, though I didn't know it was submitted in January. But you say at the bottom of page 109, I find the green lined development plan must be denied because the proposed emergency access only gate violates DPR policy manual, etcetera. Given, moreover, given that the development proposal for May's Chapel was emergency access only and not a full access road, that proposal can only be approved or denied. The (inaudible) not rectify this policy, this policy non-compliance by changing the May's Chapel gate to a full access road in order to approve the green lined plan.

So, I think for very similar reasons, the now blue lined plan, which I got this morning, is both too little too late and is irrelevant anyway because you've already indicated in your ruling that you wouldn't consider it and wouldn't change, well, I guess your ruling or your approval or denial of the plan based on it.

ALJ: So, you read the Order on the Motion for Reconsideration though, right? Because the last part of it says that they can submit the, a, a revised version of the development plan as a separately numbered exhibit, right? And

that there would be no testimony? It's the last paragraph on the Order.

MR. MCCANN: Yeah. I do recall that.

ALJ: I just wanted to say it for the record that we had received it and that it's going to be marked as 1-C.

MR. MCCANN: Still, I, you know, I'd like to, you know, at least on that issue, that is, the, the issue of its belatedness, and its, and its relevance, frankly, I would like to preserve that objection. So, --

ALJ: Okay. Understand.

MR. MCCANN: I, I do recall now that you say it, and I apologize, I didn't recall that offhand. That you did say that.

ALJ: Yeah, right. So, yeah, that's 1-C.

MR. MCCANN: Okay.

ALJ: All right. Okay. I, and, I, you know, I don't want to open anything else up to a dialogue but I, I hesitate now, Mr. Rosenblatt, Mr. Mudd, is there anything you want to say? See, Mr. Benjamin is also here. I just, I, you know, obviously, you know, we don't want to give you all an opportunity to respond to Mr. McCann if you, if you need to.

MR. ROSENBLATT: Sure, I, I can, I'm happy to address both issues. I'm going to share my screen just for a moment, Judge Murphy. This is first, the last paragraph of your Order on Motion for Reconsideration, which you just explained allowed

the submittal of a blue lined plan and just because there's people watching, I wanted to just share that plan.

It's marked as Exhibit 1-C. And this is identical to the green lined plan in all respects except for crossing out with blue lines the note regarding the request that emergency access gate and access through the actual gate itself, is the only change to the plan. So, that is all we would say on that topic.

On the other topic, Judge, throughout, throughout this case the Developer has not taken any position on the Johns Hopkins sewer segment requirements, whether they're responsible, Baltimore County is responsible.

It's been our position throughout that we understand that those segments have to be upsize, have to be improved before any homes from this project connect to Baltimore County sewer system.

To the extent that the letter from the County attorney paints an updated and more accurate interpretation of, of where things stand, the development process is ongoing. There's case law we cite in every memo, in every opinion, the Monkton Preserve case that speaks to that.

It's an ongoing process. Months have gone by. To the extent it's helpful to have an up-to-date interpretation of where things stand, we obviously have no objection to that. The point today is to, is to provide information from Baltimore

County because you've heard only from experts on one side and another side about sewer issues. So, that's, we think that if the letter helps in any way, it's, it should be admitted for, into the record and considered as, as you see fit.

MR. MCCANN: Your Honor, may, quickly, I'm sorry. The standard isn't whether it helps you or not. This is an evidentiary proceeding, and the record is the record. It closed. This is not an ongoing development process that allows up until the day you make your decision to add additional, and believe me, believe me, I could add additional sewer evidence today as we speak. So, by that, by that argument, all that could happen today.

But the other thing I wanted to mention is, is the, the, the plan in any event, the blue line plan now, is moot. It doesn't matter. Your Honor has already denied the plan on the independent ground that the intersection is failing, and the Developer did not meet its burden of proving a Petition for Special Variance.

The development plan is denied, period. And this plan does not change that. And frankly, nor do the proceedings today. So, the, the plan is moot. And shouldn't be admitted for that additional reason.

ALJ: Okay, all right. Thank you. Mr. Benjamin, you didn't want to say anything, did you? I wasn't sure if you were just observing.

MR. BENJAMIN: I am observing but I did want to clarify a couple of things, if I may, Your Honor.

ALJ: Sure, absolutely.

MR. BENJAMIN: One, with regard to the, and by the way, I appreciate Mr. McCann's kind words. We do hold each other in very high regard, so I do appreciate that. But with regard to the representations as to Ms. Frankovich, she was merely observing, she wasn't participating in the prior hearing. She was observing the hearing.

And then also too, again, the reason why the letter was written was just to provide clarifications that we thought were necessary for purposes of the record that were developed earlier. Whether or not it's to be used as evidence, that's certainly Your Honor's call. But we were just simply trying to clarify the record for Your Honor, as well as counsel of record. That's all I wanted to say. And then I will go back to observing.

ALJ: Okay, thank you.

MR. BENJAMIN: Thank you.

ALJ: All right, great. Well, I mean, this is an administrative hearing and, and I do think that the, the information provided by Mr. Benjamin in his letter, as I said, is going to be County exhibit number fourteen.

And, and I do think it does add to clarify some of the inaccuracies, namely, there are references in the concept

plan comments, or the development plan comments, different documents that were submitted by both Protestants, I think, actually just the Protestants, that indicated that, you know, for example, an UNO should never have been given by the County for, to Hopkins.

And that, you know, essentially, the project was (inaudible). This actually adds light to that. It actually gives more clarification to, to that, that issue. And so, again, that will be County fourteen. And so, this, we are now going to proceed with, there is a witness, I think, Mr. Rosenblatt or Mr. Mudd, you're going to call today?

MR. ROSENBLATT: Yes, that's correct.

ALJ: All right.

MR. ROSENBLATT: We have Dave Bayer is here.

ALJ: All right. Mr. Bayer, I see you. All right. You unmuted yourself. Good morning.

MR. BAYER: Good morning.

ALJ: All right. I've never, I've never met you before. I've seen your name on things. Looks like you're in your office.

MR. BAYER: I am.

ALJ: Surrounded by paper, piles of paper.

MR. BAYER: I am.

ALJ: All right.

MR. BAYER: That's not mine. That paper belongs to

Baltimore County.

ALJ: Oh, it belongs to Baltimore County, okay. All right. Well, listen, I need to swear you in, so if you could raise your right hand, please? Do you swear and affirm under penalties of perjury, the testimony you're about to give is true and correct to the best of your knowledge and belief?

MR. BAYER: I do.

ALJ: All right. Mr. Rosenblatt or Mr. Mudd?

MR. ROSENBLATT: Yes, Mr. Rosenblatt. Thank you.

ALJ: All right, sure.

MR. ROSENBLATT: Good morning, Mr. Bayer.

MR. BAYER: Good morning.

MR. ROSENBLATT: Can you explain, what is your position with Baltimore County?

MR. BAYER: I'm a project engineer in the Sewer Design Section (inaudible) Construction and Department of Public Works and Transportation.

MR. ROSENBLATT: Okay. How long have you had that job?

MR. BAYER: About twenty-two years.

MR. ROSENBLATT: Were you with the Sewer Design Section for all twenty-two years?

MR. BAYER: Yes, yep.

MR. ROSENBLATT: And before that, did you have any other job with Baltimore County?

MR. BAYER: I did. I was in the Development Plan Review Section for about ten years.

MR. ROSENBLATT: Can you just describe your general duties and responsibilities, a couple sentences about what you do?

MR. BAYER: Actually, reviewing and designing capital improvement projects for Sewer Design Section.

MR. ROSENBLATT: Do you have, in terms of education, do you have a Bachelor's degree in Engineering?

MR. BAYER: I do, yes.

MR. ROSENBLATT: Do you have any other type of degree in engineering?

MR. BAYER: A Master's, a Master's degree in Environmental Pollution Control.

MR. ROSENBLATT: And have you, you've worked for Baltimore County for over thirty years?

MR. BAYER: Yes.

MR. ROSENBLATT: How often on a day to day basis in your job are you dealing with issues relating to Baltimore County sewer system?

MR. BAYER: Every day.

MR. ROSENBLATT: Were you subpoenaed to testify at this hearing?

MR. BAYER: Yes.

MR. ROSENBLATT: Have you ever testified at a

development plan hearing before?

MR. BAYER: No.

MR. ROSENBLATT: What did you do to prepare for this hearing?

MR. BAYER: Gathered my information and read, and read the testimony.

MR. ROSENBLATT: Okay. Did you, did you meet with me?

MR. BAYER: Yes, I did.

MR. ROSENBLATT: Was your attorney present?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Mr. McCann or Mr. Zimmerman or any other lawyers in the case ask to meet with you?

MR. BAYER: No.

MR. ROSENBLATT: Okay. I'm going to go through some of the exhibits that were presented in this case and just ask you some questions about them. So, starting with Protestant's Exhibit 65, the Consent Decree. And I want to ask you, Mr. Bayer, what was your involvement with the, with the Consent Decree from 2005?

MR. MCCANN: Objection, Your Honor. Your ruling was very specific. It says, quote, a hearing will be conducted to consider testimony and/or documents from DPW representatives or representative regarding the sewer path from the subject property.

ALJ: Um hm.

MR. MCCANN: So, I suspect what we're getting into now is what Mr. Bayer does or does not believe the County's obligations are under the Consent Decree. And I think that's, number one, it's beyond the scope of your ruling, which was very limited. I think purposely so.

And number two, this gentleman is a project engineer. He's, he's, he does not hold a leadership position, so the extent, to the extent he's going, he's purporting to speak on behalf of the County, I think that's problematic as well. But more importantly, I think this is beyond the scope of your ruling.

ALJ: Well, we don't --

MR. MCCANN: In fact, in fact, I don't even think, just to --

ALJ: We're not going to know until he asks the question. I mean, the, this Consent Decree was put in by you all and it has to do with, with the sewer line. I mean, I don't, I don't know where, where the question is going, so let's see where it goes.

MR. MCCANN: Fair enough. I thought I heard a question about, about the substance of the Consent Decree. So, before, I did, I thought I did hear a question, maybe I --

ALJ: It could be, it could just be background information but over, overruled. We're, we're going to let

him, go ahead and ask the question, Mr. Rosenblatt.

MR. ROSENBLATT: Judge, to, to prevent what may be constant disruption of flow, there are a number of exhibits submitted by Mr. McCann in this case all talking about the Jones Falls sewer shed, all relating to the path of sewage from this property down to Baltimore City. And Mr. Bayer, as you'll hear, is going to testify to his understanding of what a lot of these documents mean with respect to the sewage that is proposed from this project.

MR. MCCANN: The fact --

MR. ROSENBLATT: And it's all directly related to your Order and sheds light on the issue from the County's perspective.

MR. MCCANN: The, the fact that these exhibits are in evidence doesn't mean he gets to speak about them.

ALJ: Okay. I, I, I appreciate both of your positions. Overruled. Go ahead. Ask your question.

MR. ROSENBLATT: Okay. Mr. Bayer, what was your involvement with the Consent Decree, Pet, or Protestant's Exhibit 65?

MR. BAYER: From day one, we began negotiating with the Department of Justice, EPA and, and MDE.

MR. ROSENBLATT: Are you generally familiar with the Consent Decree and its requirements?

MR. BAYER: Yes.

MR. ROSENBLATT: Is this --

MR. MCCANN: Your Honor, may I have, again, I don't want to interrupt Mr. Rosenblatt, but I have to preserve my objection. May I have a continuing objection about, at least about this document, and I'll try not to interrupt again, all right?

ALJ: Yes, continuing objection.

MR. MCCANN: And any questions regarding his involvement in it.

ALJ: Yes, you can have a continuing objection.

MR. MCCANN: Or understanding of it.

ALJ: Okay, continuing objection. Thank you. Understood. I understand you want to preserve your objection for the record. I understand, Mr. McCann.

MR. MCCANN: Thank you.

ALJ: Thank you.

MR. ROSENBLATT: So, I'll ask you again, Mr. Bayer. Are you generally familiar with the Consent Decree and its requirements?

MR. BAYER: Yes.

MR. ROSENBLATT: Do you interpret and look to this document throughout your regular course of work?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay. Does the Consent Decree require Baltimore County to fix the sewer system to meet any

specific level of storm?

MR. BAYER: No.

MR. ROSENBLATT: Does it specifically exclude such a requirement?

MR. BAYER: Yes.

MR. ROSENBLATT: Did the Consent Decree require Baltimore County to prepare an SRRR plan?

MR. BAYER: It did, yes.

MR. ROSENBLATT: And did the Consent Decree require Baltimore County to prepare an LTC, long term capacity, report?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Baltimore County hire RK&K as a consultant to prepare these reports for the Jones Falls sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: Show you what's been marked as Protestant's Exhibit 68. The LTC report by RK&K. Are you familiar with this document?

MR. BAYER: Yes.

MR. ROSENBLATT: What is the purpose of this document?

MR. MCCANN: Same objection, Your Honor. And also, that question in particular, what's the purpose of the document, I, I have a problem with that for, I guess, additional reasons --

ALJ: All right, overruled. You can cross examine him on those points.

MR. MCCANN: Okay, thank you.

MR. ROSENBLATT: Go ahead, Mr. Bayer. What is, what was the purpose of developing this long-term capacity report?

MR. BAYER: To evaluate the impacts of dry and wet weather on the sewer system.

MR. ROSENBLATT: Does this report require any specific improvements?

MR. WYATT: Objection, Your Honor. The report would speak for itself.

ALJ: Okay. Mr. Wyatt?

MR. MCCANN: And these questions are also leading, Your Honor. And this is, this is classic, the classic hearsay objection that I get. Does this document say X? I get that all the time from Mr. Rosenblatt.

ALJ: That is true. You do get that objection a lot.

MR. MCCANN: Mr. Rosenblatt and Mr. Mudd. So, and I, listen, I understand while we want to cut to the chase here, but I think that is a loaded and hearsay question.

MR. ROSENBLATT: And again, this, these are issues that, if there's going to be constant objections, it's just to disrupt flow here, Your Honor. This is --

MR. MCCANN: It is not. Jesus.

ALJ: Okay, all right. All right, all right. So,

what we're going to do is we're going to let him ask his questions. It's overruled. But, Mr. Rosenblatt, please, you know, don't lead him through the questions. Again, he's a County witness so if you could please just ask him the questions.

MR. ROSENBLATT: And, and he is, Judge, to that point though, he is a County witness, just like the witnesses that--

ALJ: Right.

MR. ROSENBLATT: -- (inaudible) at the beginning of the case.

ALJ: Correct, right. And Mr. Wyatt and Mr. McCann will both have the opportunity to cross.

MR. ROSENBLATT: Right, okay. So, did RK&K model Baltimore County sewer system under five separate storm events, Mr. Bayer?

MR. BAYER: Yes.

MR. ROSENBLATT: And are there maps at the conclusion of this report that show the results under each of the modeled storms?

MR. BAYER: Yes.

MR. ROSENBLATT: Are you familiar with what was marked as Protestant's Exhibit 67, the SRRR plan, prepared by RK&K?

MR. BAYER: Yes.

MR. ROSENBLATT: What is, what is the purpose of, of

the SRRR plan?

MR. MCCANN: Objection. Standing, please.

ALJ: Yeah, you have a continuing objection.

MR. MCCANN: Thank you, Judge.

MR. BAYER: To evaluate the, the sewer system and prepare any corrective actions necessary.

MR. ROSENBLATT: Did RK&K adopt all of the improvements for all of the storms that were modeled and identified in the LTC report?

MR. BAYER: Did they adopt? I don't know, could you ask me that question again?

MR. ROSENBLATT: Sure. So, we, we showed the five different maps contained in the LTC report. Does this SRRR plan require all of the improvements to address all of the issues that were modeled under the five different storms?

MR. BAYER: No, --

MR. MCCANN: Objection, leading.

ALJ: Overruled.

MR. BAYER: No.

MR. ROSENBLATT: What storms did Baltimore County select for the purpose of determining what improvements to make to its sewer system?

MR. BAYER: We evaluated all five and, and we wanted to normalize across all sewer sheds, so we looked at the ten-year six-hour event.

MR. ROSENBLATT: And why did you choose that level storm?

MR. BAYER: Because the Maryland Department of Environment has suggested that that rainfall pattern from that design storm closely matched what's in the area. And we were cur, and we were curious to see how our system would respond during that particular rainfall event.

MR. ROSENBLATT: Did the Consent Decree allow Baltimore County to choose a level storm like the one you chose?

MR. BAYER: Yes.

MR. ROSENBLATT: Did the SRRR plan focus on measures that would reduce inflow and infiltration?

MR. BAYER: Yes.

MR. ROSENBLATT: Does the SRR plan outline repairs that are deemed necessary to eliminate SSOs in the Jones Falls sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: And were those repairs outlined in a corrective action recommended plan?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay. I'm going to show you a few maps from within this SRRR plan. Start with, pardon my scrolling, okay. Starting with map 4-2 and ask you, does the, does the SRR plan contain a map identifying areas of high

infiltration and SSOs throughout the Balt, throughout the Jones Falls sewer shed?

MR. BAYER: Yes, the SRR plan includes a map, this map that shows areas that exhibit high I&I.

MR. ROSENBLATT: Are you familiar with the path of sewage from the Greenspring Manor project down, from Joppa Road down to Baltimore City?

MR. BAYER: Yes.

MR. ROSENBLATT: And downstream from the project, were there any areas identified on this map as exhibiting high I&I?

MR. BAYER: No.

MR. ROSENBLATT: Does this map show any SSOs downstream from the path of sewage from this project?

MR. BAYER: No.

MR. ROSENBLATT: Show you another map. Okay. Map 6-1 and ask you, is this a map of the corrective action recommendations plan?

MR. BAYER: Yes.

MR. ROSENBLATT: And how would you characterize the recommended actions downstream from the Baltimore, I'm sorry, from the Greenspring Manor project, down to Baltimore City?

MR. BAYER: Hard, hard to see at this scale of the map, but I'm, I believe there were structural repairs, corrective actions that were needed to the sewer system

downstream.

MR. ROSENBLATT: Looking at the overall map, was the area downstream from the Greenspring Manor project a primary area of concern for Baltimore County?

MR. BAYER: The corrective actions were, were a concern. We wanted to get those repaired. The structure, structural defects downstream, they were a concern, yes. As well as the, the I, I&I areas that are shown in the upper righthand corner of that map.

MR. ROSENBLATT: So, is the area in the upper righthand corner, is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: And are, what type of fixes were required in that area?

MR. BAYER: In the upper righthand corner area?

MR. ROSENBLATT: Yes.

MR. BAYER: We opted to do what we call comprehensive lining effort, which is lining as much of the public portion of the sewer system as we possibly could in the hopes that that would reduce the I&I. And also correct the, the structural defects and ultimately extend the service life of the existing sewer system.

MR. ROSENBLATT: Were there any projects as significant as that downstream from the Greenspring Manor

project?

MR. BAYER: No.

MR. MCCANN: (inaudible) on this exhibit or, I'm sorry. Your Honor, the questions are so leading, I mean, Mr. Rosenblatt is not following your instruction, I mean, he just keeps asking the same questions he has on his paper, which, and essentially, testifying.

I think a witness as important as this on a Motion for Reconsideration after the hearing is concluded and he could have called this gentleman before, I think it's imperative that we stick to non-leading questions. This gentleman has something to say on the issue that you said he could talk about, then he should say it.

MR. ROSENBLATT: And he is saying it.

MR. MCCANN: No, he's not.

MR. ROSENBLATT: (inaudible) his own words.

ALJ: So, I, I (inaudible) --

MR. MCCANN: Your own words.

ALJ: -- I didn't find those questions to be particularly leading, let me say that, number one. Number two, the, you know, the Protestants could also have called Mr. Bayer. I just highlight that, I mean, a lot of the documents that were put in had to do with Mr. Bayer.

So, you could also have called him. So, that's for either party to call him and we're here on a Motion for

Reconsideration, it was granted. He's testifying in regard to the sewer path. I don't find that particular question to be leading. So, overruled. Go ahead, Mr. Rosenblatt.

MR. ROSENBLATT: Okay. Mr. Bayer, I'm now showing you what was marked as Developer's Exhibit 43, two-page document, first from Maryland Department of the Environment and second page, from United States Environmental Protection Agency. And ask you, did MDE and EPA confirm in writing that the SRRR plan developed by RK&K meets the requirements of the Consent Decree?

MR. BAYER: Yes, that letter on, on the screen right now is MDE's letter that says the SRR plans meet the requirements of the Consent Decree.

MR. ROSENBLATT: And page two, is that a similar letter from EPA?

MR. BAYER: Yeah, that's United States Environmental Protection Agency letter acknowledging that the plans, SR plans, meet the requirements of the Consent Decree.

MR. ROSENBLATT: Okay. I want to ask you some questions about the various consultants that Baltimore County hired in this case, so. Starting with RJN and ask you, did the Consent Decree require Baltimore County to conduct performance assessments for each sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Baltimore County hire RJN to prepare a report for the Jones Falls sewer shed?

MR. BAYER: Prepare, prepare the performance assessment report? Yes.

MR. ROSENBLATT: Yes, and did RJN identify improvements made under the SRR plan between 2010 and 2019?

MR. BAYER: Yes.

MR. ROSENBLATT: Show you a few maps attached to this report. So, map one, is this the same corrective action recommendations map that was contained in the, in the RK&K report?

MR. BAYER: Yes.

MR. ROSENBLATT: And then map two is entitled, sorry. (inaudible). I can't get that bottom to go away, sorry.

ALJ: Oh, it, we can't see it, we just see the map.

MR. ROSENBLATT: Oh, okay. Good. All right. Map two entitled rehabilitation completed, what does this map show?

MR. BAYER: A lining that we did and, and corrective actions, including frame seals and replacing framing covers, inflow inserts, other structural repairs.

MR. ROSENBLATT: Has Baltimore County made the improvements shown on this map?

MR. BAYER: Yes.

MR. ROSENBLATT: So, if we compare the corrective actions recommendations map, map one to the report, with the rehabilitation completed, do you know if there are any projects in the Jones Falls sewer shed that have not been completed to

date?

MR. BAYER: There are maybe four or five segments and two manholes that have not yet been, the corrective actions have not been completed yet.

MR. ROSENBLATT: Okay. Can you, can you talk to where those are located?

MR. BAYER: The Towson Run interceptor at this scale, it's very difficult for me to --

MR. ROSENBLATT: Sure.

MR. BAYER: -- say exactly where it is but. They're located on the Towson Run interceptor.

MR. ROSENBLATT: Is, and why hasn't that been completed?

MR. BAYER: We were going to try to build a relief sewer that we thought was necessary and at the time when we build the relief sewer we will use that as the bypass and then we'll be able to only impact regulated resources. And when I say regulated resources, I mean flood plain, wetlands, will only impact that one time and then we'll save money by using a relief sewer as the bypass.

MR. ROSENBLATT: Okay and is that Towson area improvement, is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: And is there another area beyond the

Towson improvements that, that have not been, an area of repair that has not been completed yet?

MR. BAYER: Not that I'm aware of.

MR. ROSENBLATT: We've, we've heard testimony in this case about Marnat Avenue. Can you explain what the situation is with Marnat Avenue?

MR. BAYER: That's an existing SSO and a sanitary sewer overflow structure that's over in the Pikesville area. Over there, if you look at JF 03206, it's over in that area, I think. And that's an existing structure that we can't eliminate because the downstream restriction and capacity is on the City property. The City hasn't completed their improvements yet.

MR. ROSENBLATT: Okay and is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: RJN's report contains an executive summary at the outset. Have you reviewed this document in its, in total?

MR. BAYER: A while ago, yes.

MR. ROSENBLATT: Okay. Did RJN find the rehabilitation performed and relief sewers constructed to be effective?

MR. BAYER: Yes.

MR. MCCANN: Objection, leading. Particularly since

he read it so long ago. Did it find X?

ALJ: Okay. Overruled. Go ahead.

MR. ROSENBLATT: Okay. Mr. Bayer, I want to ask you about the Hazen report. So, did Baltimore County hire Hazen as a consultant in 2022?

MR. BAYER: Yes.

MR. ROSENBLATT: And what was the purpose of Baltimore Count hiring Hazen in 2022?

MR. BAYER: They wanted them to do a comprehensive evaluation or a needs analysis.

MR. ROSENBLATT: Was it to identify short term or immediate improvements that were required to the system?

MR. BAYER: Mostly long, medium and long term.

MR. ROSENBLATT: What, what type of long term, what, what level outlook? How many years out in the future?

MR. BAYER: I think we had a fifty-year planning horizon.

MR. ROSENBLATT: The, is Hazen to make maintenance recommendations to Baltimore County?

MR. BAYER: I don’t know about recommendations. They may offer strategies or options or alternatives.

MR. ROSENBLATT: Well, will the Hazen report help with future allocation of funding to specific sewer projects?

MR. BAYER: It, it might be a benefit, yes.

MR. ROSENBLATT: Will this report identify actions

that will require immediate fix before any connections are made to the Jones Falls sewer shed?

MR. BAYER: No.

MR. ROSENBLATT: And is there a final report from Hazen at this time?

MR. BAYER: For the comprehensive evaluation or the needs analysis? No.

MR. ROSENBLATT: Okay. I want to talk to you about the Ramboll report from June 2022. Did Baltimore County hire, hire Ramboll for a Lake Roland sewer rehabilitation project?

MR. BAYER: Yes.

MR. ROSENBLATT: And what was the purpose of hiring Ram, Ramboll?

MR. BAYER: We wanted a consultant on board that could help us with some design for some rehabilitation, (inaudible) the sewers in that Lake Roland area.

MR. ROSENBLATT: Did Baltimore County pursue this report because of concerns about capacity in the Jones Falls sewer shed?

MR. BAYER: No, we had seen, we finally got a good look at the interior, the inside the, the interceptor underneath the lake and we saw some corrosion which concerned us, and we felt we should be pro-active and try to initiate a rehabilitation project to take care of that corrosion.

MR. ROSENBLATT: So, was, was the purpose of

obtaining this, of, of retaining this consultant and this report related to the capacity of sewage in the Jones Falls sewer shed?

MR. BAYER: No. The benefit would be from the lining could be as increased capacity.

MR. ROSENBLATT: And does this Ramboll report, does it identify issues that must be corr, corrected before any new homes or fixtures are connected in the Jones Falls sewer shed?

MR. BAYER: No.

MR. ROSENBLATT: So, why did Baltimore County, why did you seek this analysis?

MR. BAYER: Like I said, we wanted to correct the, the corrosion that we saw on the interior of that Lake Roland sewer.

MR. ROSENBLATT: Would adding sixty homes to the Jones Falls sewer shed have any effect on this project?

MR. BAYER: No.

MR. MCCANN: Objection. That's an expert question that I don't think this gentleman is qualified to answer or has been qualified to answer.

ALJ: Sure, it is. He's, that's in the scope of his employment, what he does every day.

MR. MCCANN: It is --

ALJ: Sure, it is.

MR. MCCANN: I didn't, I didn't catch that, that he

does --

ALJ: Sure, it's in the scope of what he does every day. He's in the Sewer Design Section, he's a project manager and so the question, no, the question is within his scope of expertise. Overruled.

MR. ROSENBLATT: Take a break from documents for a minute. Mr. Bayer, are you aware, since the Consent Decree was entered into, how much money has Baltimore County spent on Consent Decree and non-Consent Decree projects to make repairs to the Jones Falls sewer system?

MR. BAYER: That's, the construction costs that we've got since the Consent Order, probably would be a little bit more than $25 million. And that's just the construction, that doesn't include design costs or anything else like that.

MR. ROSENBLATT: Okay and how many SSOs were there County wide when the Consent Decree was first entered into?

MR. BAYER: Forty-four structures, I believe.

MR. ROSENBLATT: How many have been eliminated since?

MR. BAYER: Thirty-four structures have been eliminated.

MR. ROSENBLATT: And so, ten remaining. How many of the ten remaining require Baltimore City improvements to fix?

MR. BAYER: Four require Baltimore City's assistance.

MR. ROSENBLATT: And of the ten remaining, how many are in the Jones Falls sewer shed?

MR. BAYER: One, that's the Marnat.

MR. ROSENBLATT: Just Marnat Avenue?

MR. BAYER: Yeah.

MR. ROSENBLATT: I want to talk about your bureau's involvement with development projects. So, when, when a project is first proposed, is your bureau often asked to analyze a proposed development to see if the sewer system is sufficient to handle a proposed project?

MR. BAYER: Yes, we evaluate all proposed subdivisions.

MR. ROSENBLATT: And I'm going to show you what was marked as Developer's, or sorry, Protestant's Exhibit 55 in this case. And ask you did, did Matt Bishop reach out to Lisa Eicholtz asking that question?

MR. BAYER: That's what that e-mail appears to do, is ask Lisa for some information on the capacity.

MR. ROSENBLATT: Okay and if we scroll up to the first page of this Exhibit 55, did Ms. Eicholtz copy you in responding to Mr. Bishop?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay and did Ms. Eicholtz identify the eight sewer segments that we have spoken about, six referring to Johns Hopkins and two additional sewer segments as needing repair?

MR. BAYER: Yes.

MR. ROSENBLATT: Does Baltimore County use a model to conduct this analysis when people ask the question can the sewer system handle my additional project?

MR. BAYER: Yes.

MR. ROSENBLATT: Let me show you what was marked as Protestant's Exhibit 4, sorry, Protestant's Exhibit 64. And ask you is this the model that was used in this case?

MR. BAYER: Yes, that's our old, what we call the SS Cap model, yes.

MR. ROSENBLATT: Okay. I just want to ask you, does this, does this model only account for dry weather?

MR. BAYER: No.

MR. ROSENBLATT: What, I'm looking at all these columns. Where would you point to show that it, that it does not just account for dry weather?

MR. BAYER: It's been my understanding that in, that infiltration column, that infill column that you see there, includes extraneous flow, which would be infill, and infiltration.

MR. ROSENBLATT: Okay. So, the inflow column has all zeroes?

MR. BAYER: Yeah, it's my understanding that we combined the extraneous flow and filtration and inflow together and it's placed in that inflow column.

MR. ROSENBLATT: And would you, would you say that

that infill column accounts for wet weather?

MR. BAYER: Yeah, it was, yes, it was our best guess at what we thought the wet weather impacts would be.

MR. ROSENBLATT: Is Baltimore County working on a new model to evaluate projects?

MR. BAYER: Yes.

MR. ROSENBLATT: Is the model finished yet?

MR. BAYER: Not yet.

MR. ROSENBLATT: Were you able to use the model to, to evaluate this project?

MR. BAYER: This project?

MR. ROSENBLATT: Yes.

MR. BAYER: The Greenspring Manor project?

MR. ROSENBLATT: Yes.

MR. BAYER: Yeah, I was curious to see --

MR. MCCANN: Objection. Objection, Your Honor.

ALJ: What's your objection?

MR. MCCANN: Now we're getting way afield. We have a model that was used to, for the County's comments on this particular project. Apparently the County has a new model that hasn't been finalized but he's going to now tell us what this new model has to say.

This is, this is new evidence. This isn't, this isn't clarification, which is what the subject of your Order is, as to the County's position as, on the sewer path. This is

new evidence that Mr. Rosenblatt is seeking to introduce.

ALJ: Okay. I didn't hear it that way, so overruled. Go ahead.

MR. ROSENBLATT: Mr. Bayer, did you run your new model with respect to the Greenspring Manor project?

MR. BAYER: Yes.

MR. ROSENBLATT: And did you run the model --

MR. MCCANN: I would, again, interrupt. I'm going to ask for a continuing objection on this.

ALJ: Okay.

MR. MCCANN: This is absolutely new evidence --

ALJ: You have a continuing, you have a continuing objection. It is a Motion for Reconsideration hearing. He is here, he's never testified in the case before. So, he's going to have new information by just, you know, as, as (inaudible)--

MR. MCCANN: I, I hope that works both ways, Your Honor. I hope it does.

ALJ: Well, I'm just saying, he's going to have, he's going to have, he can't not have new information because he's, he hasn't been in the hearing before, you know, but again, either party could have called him and probably would have been helpful to everybody if Mr. Bayer had come earlier maybe to go through some of this stuff. So, overruled. Go ahead.

MR. ROSENBLATT: Okay. Mr. Bayer, did, were you able to run the new model considering that the eight segments Ms.

Eicholtz identified in Exhibit 55 were repaired?

MR. BAYER: Yes.

MR. ROSENBLATT: And did the system show any downstream problems from the project when these eight segments were repaired?

MR. BAYER: No, once the eight segments were improved there weren't any issues.

MR. ROSENBLATT: What was Jeff Peluso's role with Baltimore County before he retired?

MR. BAYER: He was the Bureau Chief of the Bureau of Engineering Construction.

MR. ROSENBLATT: I'm going to show you what was marked as Protestant's Exhibit 90. It's an e-mail from Jeff Peluso to you and Lisa Eicholtz dated March 22nd, 2021. Do you see this e-mail? Can you see it, Mr. Bayer?

MR. BAYER: I can, yes.

MR. ROSENBLATT: Okay and I want to turn your attention to, in particular, to number four. So, Mr. Peluso asks four questions, the fourth being, if Greenspring Manor were to continue through development, is there another way to provide capacity? Is there a breaking point for Greenspring Manor and number of units?

And then, at the top of this document is an e-mail back from you, from Dave Bayer to Jeff Peluso and Lisa Eicholtz, and you respond to number four. In particular you

say, zero is the breaking point of number of, number of units that could be built without causing an SSO. I want to ask you, did your response assume that the eight identified segments from Ms. Eicholtz are not improved before the new homes are connected?

MR. BAYER: Yes.

MR. ROSENBLATT: If the eight identified --

ALJ: Hold on, hold on. Can you say that question one more time? You're, you're going kind of fast.

MR. ROSENBLATT: Sure.

ALJ: One more time with the question, thanks.

MR. ROSENBLATT: No problem, Judge. Let me try and make this easy. So, Mr. Bayer, just to go back real quick to Exhibit 55, there were eight segments, six that say part of John, part of Hopkins project and two additional segments.

And then moving forward to Protestant's Exhibit 90, my question is, when you said that zero is the breaking point of number of units that could be built without causing an SSO, does your response assume that the eight segments identified by Ms. Eicholtz in Exhibit 55, were not improved prior to the connection of the sewer system to the new homes?

MR. BAYER: Yeah, those eight segments needed to be improved before, because there was a high possibility of overflow. So, those eight segments needed to be improved.

MR. ROSENBLATT: Okay. So, if you were asked if

those eight segments are repaired, then what is the breaking point for number of units that can connect, what would your answer be?

MR. BAYER: They could, they could connect once the, once the capacity has been improved, they could connect all the units.

MR. ROSENBLATT: I want to talk to you about modeled results versus real results that you see in the field. And I'll start with, this is map three, so Protestant's Exhibit 78 was the RJN report. We've talked about maps one and two. This is map three and entitled model predicted SSO and flow restriction locations. And my question is, does this map show issues downstream from the eight segments that Ms. Eicholtz identified as needing repair?

MR. BAYER: Yes.

MR. ROSENBLATT: And when you wrote your e-mail to Jeff Peluso saying zero is the breaking point without causing an SSO, did that e-mail have anything to do with the modeled issues shown in this map downstream from the eight segments that Ms. Eicholtz identified?

MR. BAYER: No.

MR. ROSENBLATT: When a model like this shows potential problems, do you immediately go and make those changes in the, in the field?

MR. BAYER: No.

MR. ROSENBLATT: Do you try to verify the issues such as those shown on this map three that are actually happening in the field before you allocate funding to repair or replacement project?

MR. MCCANN: Goodness that's leading, Your Honor. Come on, geez.

ALJ: It's getting a little long, Mr. Rosenblatt. So, could, could you, could you rephrase that question, please?

MR. ROSENBLATT: Sure. Do you try to verify issues in the field prior to allocating funding to a re, rehab or rehabilitation project?

MR. BAYER: Try to, yes.

MR. ROSENBLATT: And how do you do that? What do you do to, to verify in the field?

MR. BAYER: We install flow monitors, for example.

MR. ROSENBLATT: I'll turn your attention to, this is Developer's Exhibit 47-B. And were you asked to identify flow monitors in the vicinity of the Greenspring Manor property?

MR. BAYER: Yes.

MR. ROSENBLATT: And this e-mail, which is, again, Developer's Exhibit 47-B, does this identify the flow monitors that are in the vicinity of Greenspring Manor?

MR. BAYER: They were as of last, last March, yes.

MR. ROSENBLATT: Okay and how many were there?

MR. BAYER: Five.

MR. ROSENBLATT: In addition to flow monitoring, are there any other tools that you used to, to evaluate the state of the system?

MR. BAYER: Yeah, the, the models, simulations that are run.

MR. ROSENBLATT: Okay. Do you use tools such as SSES?

MR. BAYER: That's one tool we do use, yes.

MR. ROSENBLATT: Can you explain what that means?

MR. BAYER: That's sanitary sewer evaluation surveys. So, what essentially we do is we might go out and do night flow isolations to try to find out how much flow is in the pipes in the middle of the night. And then we would also do smoke testing so we could try to find if there are illegal connections.

MR. ROSENBLATT: And is there any kind of chart or, or map that shows a comparison of what has, what you've seen, observed in the field versus what is modeled under various models that you used to evaluate the system?

MR. BAYER: Yes, every one of the SRR plans that we had we required our consultants to compare model calibrations summary table, those are included in the SRR plans and that particular one in the Jones Falls is table 5-3.1, which was prepared by RK&K.

MR. ROSENBLATT: Bear with me. So, in the RK&K

report, share my screen. Which again was Protestant's Exhibit 67. You mentioned table 5-3.1. And can you explain what this table shows? It's entitled model calibration summary table.

MR. BAYER: Yeah, I'll do my best to, to try to explain so we can all understand it. This is kind of a self-assessment that we ask our consultants to do when they prepare their model simulations so we can have a quick look at if there are any issues we should be concerned about related to, that's under predicting or over predicting. And this table provides that information for each meter basin location.

MR. ROSENBLATT: Okay and how, how did this, how did this information impact Baltimore County's use of, of modeled outcomes like the map three that we just went over?

MR. BAYER: Map three?

MR. ROSENBLATT: So, map three being the --

MR. BAYER: Oh, okay. So, RJN, I'm sorry.

MR. ROSENBLATT: Map three of, sorry, let me just, just so the record is clear, how did that chart that we just went over, how does that impact Baltimore County's interpretation of map three from the RJN report, which is the model predicted SSO and flow restriction locations?

MR. BAYER: Okay. I'll, I'll start with RJN used the same model that RK&K did. So, if you could go back to the RK&K table, I should try to better explain.

MR. ROSENBLATT: Okay.

MR. BAYER: So, again, this is a, a calibration summary table that we had every consultant prepare. If you look at, go to the next page because I want to look at BC-22, which you'll see on the RJN map. So, we were quite concerned at BC-22 of the over predicting that we were seeing at that location.

So, an over prediction means, if it's significant, which you'll see in the far-right column, there was at this location, BC-22, a significant, we have low confidence in the, in the predictions that are, accuracy of the predictions that were being provided. So, that was a big concern to us.

MR. ROSENBLATT: Okay and which, where is that particular area located on, on map three?

MR. BAYER: You see BC-22, it's right at the, out of the middle of your map.

MR. ROSENBLATT: Okay.

MR. BAYER: That's downstream of the beltway.

MR. ROSENBLATT: Okay.

MR. BAYER: Where you see a lot of the red.

MR. ROSENBLATT: Got it.

MR. BAYER: So, the insight we were getting from that, those simulations we had low confidence in that, in those.

MR. ROSENBLATT: Okay. I want to ask you some questions about the timing of comments in this case. Let's go

to, sorry, I have so many things open. All right. Let's start with RJN report. So, this was sent directly to you. This is Protestant's Exhibit 78 again, the first page of it. And this was sent to you on May 27th, 2021, okay?

Okay and then, bear with me. Okay. Then in August, a few months later, there's correspondence from Ms. Eicholtz that we've gone over listing the eight segments, the six Hopkins, six part of Hopkins project, two additional segments as required for this project. You see that?

MR. BAYER: Yes.

MR. ROSENBLATT: So, my question is, after the RJN report and map three came out, did Ms. Eicholtz add any additional downstream improvements to these eight segments as being requirements for the Greenspring Manor project?

MR. BAYER: She did not.

MR. ROSENBLATT: And on August 10th, 2021, so the memo is dated August 2nd, then August 10th, the development plan conference comments come out for this case. And again, we go to number twenty, I'm at number twenty, provides the eight segments. Were any other additional downstream requirements listed in the development plan conference comments for this case?

MR. BAYER: Not, not that I'm aware of.

MR. ROSENBLATT: Okay. Now, both the Lisa Eicholtz memo and the development plan conference comments say that

issuance of use and occupancy permits for the residential units from Greenspring Manor should be subject to completion. And that's Eicholtz memo. And then, again, in the development plan conference comments, it says issuance of use and occupancy permits should be subject to the completion of the system improvements.

Any my question for you is, did your Department ever oppose approval of the development plan? Not use and occupancy permits, but the development plan for Greenspring Manor, prior to the eight segments being replaced?

MR. BAYER: Can you ask that question again?

MR. ROSENBLATT: Sure. Did your Department ever oppose approval of the development plan, not, not the issuance of use and occupancy permits, but the approval of the development plan for Greenspring Manor prior to the eight segments being replaced?

MR. BAYER: Not that I'm aware of.

MR. ROSENBLATT: All right. I just want to ask you a couple more questions about, about pipe design in general. So, some models show that pipes in the Jones Falls sewer shed will operate at or over a hundred percent capacity under certain storm events. In your opinion, when models show that, when pipes are shown at a hundred percent or higher, does that mean that the pipes are unsafe?

MR. BAYER: Not necessarily, no.

MR. ROSENBLATT: Do you look at other factors to determine whether the pipes are safe?

MR. BAYER: Other factors, we would try to find out what, what the frame and cover elevation would be at the ground surface where this surcharging might be.

MR. ROSENBLATT: Okay and in the design manual, which I'll share one more time. So, Protestant's Exhibit 70, the DPW sewer design manual, under hydraulic design of sewers, it speaks to sewers shall be designed to flow at depths not exceeding ninety percent and then for laterals and mains eighty percent and building connections seventy percent. And my question to you is, is this the standard you use when evaluating whether a project can connect to an existing sewer system?

MR. BAYER: This is guidance that we provided for design of new sewers.

MR. ROSENBLATT: If it's for new sewers, is this the standard you use when you're evaluating a proposed project and whether the project can connect to the existing sewer system?

MR. BAYER: Yeah, we would make, try to make sure that any new design would not exceed this guidance providing, provided in the design manual.

MR. ROSENBLATT: All right. Would you try and ensure that the entire system downstream meets these percentage requirements?

MR. MCCANN: Objection. Asked and answered and speculation. Would he, would he --

ALJ: (inaudible), I'm sorry, go ahead, Mr. McCann.

MR. MCCANN: Yeah, I mean, the question is would he do X. I, I, we have no circumstances under which or context to that question. Aside from the fact it's, it's, it's leading, and he's already answered and hasn't, twice hasn't answered the question, said what Mr. Rosenblatt wants him to say.

ALJ: Mr. Rosenblatt, could you rephrase your question, please?

MR. ROSENBLATT: Sure. So, Mr. Bayer, when you're evaluating a project, a new project, hooking up to Baltimore County sewer system, are these percentages the, that you see on the screen in the design manual, the ninety, eighty, seventy, are you evaluating a new project and ensuring that the entire existing sewer system meets these percentage requirements?

MR. BAYER: Someone is constructing a new sewer, they're supposed to follow these guidelines.

MR. ROSENBLATT: Okay. For the, for new constructed pipes or existing pipes?

MR. BAYER: New, new sewer construction.

MR. ROSENBLATT: All right. Were there improvements downstream of this project identified in the SRRR plan?

MR. BAYER: Improvements?

MR. ROSENBLATT: Yes.

MR. BAYER: Downstream there were structural repairs that were required to be, that we, we're going to complete.

MR. ROSENBLATT: Okay and were you asked to see if those improvements have been completed?

MR. BAYER: Yeah, I was asked to do some research to see if those, those structural repairs were completed, yes.

MR. ROSENBLATT: Okay. I'm going to show you what is marked as Developer's Exhibit 45-A. And ask you, is this an e-mail that you sent on May 30th, 2023 answering that question?

MR. BAYER: Yes.

MR. ROSENBLATT: And there's both an e-mail and then 45-B, a spreadsheet, and my question to you is, are the improvements that were identified in the SS, in the SRRR plan downstream from Greenspring Manor, were those improvements all completed?

MR. BAYER: To the best of my knowledge, they were. Or it could have been eliminated like for one instance you'll see on the top there, two things were not needed.

MR. ROSENBLATT: Okay. What else is left to complete downstream from this project under the SS, under the SRRR plan?

MR. BAYER: Downstream from this along that flow path, not, nothing that I'm aware of.

MR. ROSENBLATT: Okay. One final topic. I want to talk about areas of special concern. Can you explain what is an area of special concern?

MR. BAYER: On the basic services maps, the areas of special concerns were areas where we had those sanitary sewer overflow structures.

MR. ROSENBLATT: And is the area including and surrounding the Greenspring Manor property, is that in an area of special concern?

MR. BAYER: That was, that was another area we didn't have a sanitary sewer overflow structure at that location, but we did have information that one of the staff members had gathered that we were very concerned about the possibility of overflow. So, that, we added that to the area of special concern.

MR. ROSENBLATT: Okay and if the eight segments that we've gone over, that Ms. Eicholtz identified, if those eight segments are improved would that resolve DPWT's concern for this being an area of special concern?

MR. BAYER: If there's, if capacity is added, then, then that concern would go away.

MR. ROSENBLATT: So, if, if those eight segments are improved, does DPWT believe the County's sewer system can function safely?

MR. BAYER: Yes.

MR. ROSENBLATT: And can it function without detrimental impact to public health or environment?

MR. BAYER: Yes.

MR. ROSENBLATT: Thank you. That's all the questions I have.

ALJ: Mr. McCann, cross?

MR. MCCANN: Yes. Two things, Your Honor. First of all, because I did not object to every single question and I think that would have been too disruptive, I want to move to, to strike, just for the record, Mr. Bayer's entire testimony on the grounds I've already stated, as well as those set forth in the Motion. This is all new evidence that could have been submitted long ago and this is just a, yet another bite of, at the apple that has been afforded the Developer.

Number two, I would like a short break to look at my notes, since this is, this is a lot of new stuff. And number three, just to, I would ask certainly, if not only out of fairness, but for a host of other reasons, that we be allowed the opportunity at, at a future date to call witnesses to rebut, to respond to Mr. Bayer's testimony, since again, this all could have been submitted during the course of the hearing, certainly in, in the Developer's case.

So, I'm just asking those, those things now, but I would immediately anyway, I would ask that his testimony be stricken and that I be given a little bit of an opportunity, ten-minute break of so, just to collect my notes here.

ALJ: Okay. The motion to strike is denied. Obviously, Mr. Bayer was coming in today, the motion, the Order

has been in place set for today's hearing. And again, I've said it, and this is probably the third time now, Protestants had every opportunity as well to call Mr. Bayer as a witness.

And you can see in this kind of case, it actually is, you know, something that maybe some party should have done, have Mr. Bayer come in and testify. So, the motion to strike is denied. (inaudible) --

MR. MCCANN: But, Your Honor, it wasn't our burden, it wasn't --

ALJ: There is, there is no additional day for, for more testimony here. This is a County witness so if this County witness had shown up on, when all the other County witnesses came on day one, then you would have had the opportunity just like you, you would today to have, to cross examine. And, and Mr. Wyatt does, and Ms. Demillio does and, and we give that opportunity to, to cross examine, you know, the, the County witnesses.

Even more so as probably what, than what is contemplated in the Code, which is really for the County witnesses to come in and say whether or not there are unresolved comments or open conditions or something like that. I actually go beyond that and let everybody cross examine. So, so there would be no difference.

So, if he came in day one, you would have had the same opportunity to do that and, and again, or in your own

case, either one of you, Protestants or Developers, could have called Mr. Bayer. There's nothing to prevent somebody from issuing a subpoena, either to him or, or the other people.

And, and all this evidence, you know, the reason he's testifying, he's responding now to, that these are all things that the Protestants put in evidence. So, it's not new and surprising, it's, it's in response to those things. So, I hear you but a Motion for Reconsideration by, by its nature is going to have new information. It's going to have new testimony. We can't, we're not going to, so it, you know, he's explaining things as, as within his, you know, expertise.

So, there's no additional days. We're not going about it like that. The, the Motion and the Order was limited to one, the County witness coming in and explaining their position. That's what it was limited to, not back and forth and so, all right?

MR. MCCANN: I'm not going to argue with you (inaudible) --

ALJ: Okay, good.

MR. MCCANN: -- although it may appear that I am.

ALJ: No, you won't. I know, I know, you're stating your position and you're zealously advocating for your client, and I always appreciate that. I --

MR. MCCANN: (inaudible) what's missing from, what's missing from it you just said, and what's missing from your

comment that we could have called him is, first and foremost, it is the Developer's burden in this case. And you've already ruled in your opinion, by the way, that a presumption didn't rise on this issue and therefore, the burden at no time has shifted to us.

But today it apparently has and now I'm being denied the opportunity to respond to new evidence asserted for the first time on behalf of the Developer to meet its burden that it had on the very first day of this hearing. So, this is the first time anything like this has ever happened to me in twenty years. It's unprecedented --

ALJ: Actually, if you note in the Order for the Motion for Reconsideration, actually Judge Beverungen had actually --

MR. MCCANN: Nothing to do with this case. That, there's no similarity at all.

ALJ: No, no, but I'm saying, he, but he issued, but he allowed a, an additional evidentiary hearings in two different cases.

MR. MCCANN: That's not what happened at all.

ALJ: I think you were in those, weren't you?

MR. MCCANN: That's not what happened at all, Your Honor. I was in that case.

ALJ: Okay.

MR. MCCANN: So, in any event, --

ALJ: Yeah, I thought you were in those cases.

MR. MCCANN: I got your ruling, I got your ruling. If I could have fifteen minutes to go through my notes, I think that's fair,

ALJ: Yes, absolutely.

MR. MCCANN: And I'll be, I'll be ready for cross.

ALJ: Okay. Fifteen minutes, we'll come back. I'll pause the record.

MR. MCCANN: Great, thank you.

ALJ: Thank you.

MR. ROSENBLATT: Thank you.

(PAUSE)

ALJ: All right. We're back on the record. Mr. McCann, you had cross?

MR. MCCANN: Okay, thank you. Mr. Bayer, I don't see you. Are you there?

MR. BAYER: I am.

MR. MCCANN: Okay. How you doing?

MR. BAYER: Great, thanks.

MR. MCCANN: Good. So, I want to jump around here a little bit, as you might suspect. You are a project engineer for the Sewer Design Section, correct?

MR. BAYER: Correct.

MR. MCCANN: You are not chief of that section, correct?

MR. BAYER: Correct.

MR. MCCANN: Do you hold, other than project engineer, do you hold any other titles with DPW?

MR. BAYER: No.

MR. MCCANN: And you mentioned your experience in the Sewer Design Section, and I think you also mentioned some other experience with the County. Prior to that, did you ever have a job in the private industry?

MR. BAYER: I did, yes.

MR. MCCANN: And where were you and what'd you do?

MR. BAYER: Whitman Requardt and Associates.

MR. MCCANN: I'm sorry?

MR. BAYER: Whitman Requardt and Associates.

MR. MCCANN: Okay.

MR. BAYER: And I was civil engineering.

MR. MCCANN: And what type of work did you do there?

MR. BAYER: Civil engineering.

MR. MCCANN: (inaudible)?

MR. BAYER: Water, water, sewer, storm drains, dams, landfills.

MR. MCCANN: Okay. What, what, describe the work that that firm does in general? What, are they just a general --

MR. BAYER: They're a multi-disciplinary engineering company.

MR. MCCANN: Okay.

MR. BAYER: Structural, mechanical, electrical, civil, water resources.

MR. MCCANN: And where are they based?

MR. BAYER: I think they're in Canton now.

MR. MCCANN: Okay. Yeah, I think I've heard of them. And when was that? When were you there?

MR. BAYER: Nineteen eighty to 1989.

MR. MCCANN: So, just one year?

MR. BAYER: Nineteen eighty to 1989.

MR. MCCANN: Okay, I'm sorry. And then you went to the County after that?

MR. BAYER: Correct.

MR. MCCANN: Okay and during those nine years, it sounds like your work was more in the general area of civil engineering as opposed to limited to or specializing in sewer design or sewer evaluation, is that fair?

MR. BAYER: Yeah, I did, yes, landfill, yep, etcetera.

MR. MCCANN: Okay.

MR. BAYER: (inaudible) kind of engineering, yep.

MR. MCCANN: And any other --

MR. BAYER: (inaudible).

MR. MCCANN: -- I'm sorry?

MR. BAYER: Along with water and sewer, storm drain.

MR. MCCANN: Okay.

MR. BAYER: Sorry.

MR. MCCANN: Any other work in the private industry, other than that experience with that firm from 1980 to 1989?

MR. BAYER: No.

MR. MCCANN: Okay and where, where'd you go to school?

MR. BAYER: Penn State (inaudible).

MR. MCCANN: Okay and when did you graduate?

MR. BAYER: Let's see, 1980 for my Bachelor's and I, I don't recollect the year on my Master's degree.

MR. MCCANN: Okay. Who is the, the Chief of the Sewer Design Section?

MR. BAYER: Amy Bley.

MR. MCCANN: B-L-E-Y?

MR. BAYER: Yes.

MR. MCCANN: Okay and then in terms of the hierarchy, if, if there is one, above her in, in terms of sewer anyways, there, is there such a person?

MR. BAYER: No, she's Chief of the Sewer Design Section.

MR. MCCANN: Okay and that falls under DPW?

MR. BAYER: DPWT.

MR. MCCANN: DPWT, okay. All right. Let's talk quickly, as you might expect, about the meeting that you had,

it sounds like, with Mr. Rosenblatt. Do you recall that meeting?

MR. BAYER: Yes.

MR. MCCANN: What, when was that meeting?

MR. BAYER: Friday.

MR. MCCANN: This past Friday?

MR. BAYER: Yes, and then we had another meeting, I don't recollect the date, prior to that.

MR. MCCANN: Okay. When, when approximately was that prior meeting?

MR. BAYER: It would have been a week or so before this was canceled because of snow.

MR. MCCANN: Right, so sometime in the end of January of 2024?

MR. BAYER: I, I don't recollect the date.

MR. MCCANN: But it, a couple days before that last hearing, is that fair?

MR. BAYER: Plus or minus, I guess, yeah.

MR. MCCANN: Okay, very well. And who else attended that meeting other than it sounds like Mr. Benjamin or someone from his staff?

MR. BAYER: Mr. Benjamin.

MR. MCCANN: Okay. He attended both meetings, that is?

MR. BAYER: Yes.

MR. MCCANN: Okay. Did Mr. Rosenblatt tell you the questions he was going to ask you today?

MR. BAYER: Yes.

MR. MCCANN: Did you provide any documents to Mr. Rosenblatt during that meeting or at any other time since the last hearing in this case?

MR. BAYER: Did I provide any documents since the last, not that I'm aware of.

MR. MCCANN: Okay. Did you have any e-mail correspondence with Mr. Rosenblatt or anybody from his firm about the meetings or the hearing in this case?

MR. BAYER: Yes, I did e-mail Adam because I couldn't get into the, into the Webex when the meeting was canceled.

MR. MCCANN: Okay.

MR. BAYER: So, I e-mailed Adam telling him I could not get into the Webex.

MR. MCCANN: Other than that, --

MR. BAYER: I didn't know the, I didn't know the meeting was canceled, so.

MR. MCCANN: Got it.

MR. BAYER: Or the hearing, I'm sorry, the hearing was canceled. So, yes, I e-mailed Adam.

MR. MCCANN: Any other e-mail communications with Mr. Rosenblatt, his firm, about this hearing or the meetings that you had?

MR. BAYER: I don't believe so.

MR. MCCANN: Okay. Okay. I'm going to show you a couple documents, which we've already seen or talked about. Bear with me one second, Mr. Bayer. There we go. This is Protestant's Exhibit 13 for the record. It's a March 3rd, 2021 e-mail from you to Mr. Desai. I think Mr. Rosenblatt asked you about this. Do you, you see that?

MR. BAYER: I do see it, yes.

MR. MCCANN: Okay and do you recall it?

MR. BAYER: Yeah, because I've seen it before, yes, um hm.

MR. MCCANN: Okay. At the time you wrote this, drafted this memo in March of 2021, was it, was it accurate?

MR. BAYER: Actually, I think Lisa drafted it, since she signed it on my behalf, that's where you see LKE for, so as far as I know, at the time it was accurate.

MR. MCCANN: Okay. But you authorized her to sign and/or send it to Mr. Desai?

MR. BAYER: Yes, she could sign and send on my behalf.

MR. MCCANN: Okay and likewise, I want to show you Protestant's Exhibit 90, which Mr. Rosenblatt did ask you about. And that is your e-mail exchange with Mr. Peluso, do you see that?

MR. BAYER: I do.

MR. MCCANN: Okay. So, your response, specifically, your response is at the top of this exhibit on March 20th, 2021, where you mention, as we've discussed, a zero breaking point comment. Was, at the time this e-mail was sent from you to Mr. Peluso and Ms. Eicholtz, was it accurate?

MR. BAYER: As far as I know.

MR. MCCANN: Okay and then, more specifically, the other comment that you make in here, in response to Mr. Peluso's questions about what are the ramifications of a new connection, your answer about, your answer was sanitary sewer overflows. Was that response to Mr. Bayer's question accurate at the time you wrote this e-mail in March of 2021?

MR. BAYER: Was that an accurate response to Mr. Peluso's question? Yeah, we were concerned that, that if the added units, there was high probability of an SSO.

MR. MCCANN: You say a high probability?

MR. BAYER: Yes.

MR. MCCANN: Okay. So, as I understand your testimony today, there is some new model that Baltimore County is working on that you applied, correct?

MR. BAYER: Yes.

MR. MCCANN: Tell me about that new model.

MR. BAYER: It's a (inaudible) model that Hazen is developing on our behalf. So, I thought it was important to know that if the, the proper size of the improvement, so those

eight segments, if they were sized properly so I, I asked to have a simulation run.

MR. MCCANN: You asked Hazen for that?

MR. BAYER: I did, yes.

MR. MCCANN: And when you say simulation run, what do, what do you, be a little more specific about that. What does that entail?

MR. BAYER: To analyze what would happen if capacity was improved, how the sewer system would react.

MR. MCCANN: Okay and before I get, I guess, into the substance of that, you said Hazens, Hazen has prepared this model, correct?

MR. BAYER: In, in response to my request, they, they ran that simulation, yes.

MR. MCCANN: Yeah, I'm not asking about the simulation, about the, I'm asking about the model itself. The, the model is Hazen's?

MR. BAYER: They, they were develop, developing it on our behalf, yes, um hm.

MR. MCCANN: Okay and it sounds like, based on your testimony just now and before that they are still in the process of developing that model?

MR. BAYER: They are, yes.

MR. MCCANN: Okay and I, at least according to their newsletters, which I've, we don't need to get into. But let me

know if you need to see them. That was one of the things Hazen was tasked to do, that is, recalibrate or update the model that the County is using, correct?

MR. BAYER: There are quite a few things that they were tasked to do on our behalf.

MR. MCCANN: Okay. Was that one of them?

MR. BAYER: That was one of them.

MR. MCCANN: Okay. So, again, not the simulation, but the model, has, has that model, the one that the County has asked Hazen to, to prepare, has that model been, I guess, completed, for lack of a better word? Are you suggest --

MR. BAYER: Not that I'm, not that I'm aware of, no.

MR. MCCANN: Okay. Even though it hadn't been completed, you nevertheless asked Hazen to, to run a simulation, correct?

MR. BAYER: I did, yes.

MR. MCCANN: Okay. Did, is there any, did you pick up the phone and call someone at Hazen or did you send them an e-mail? How did that connection happen with Hazen?

MR. BAYER: Yeah, I think they sent them an e-mail asking them to run a simulation in that area where the eight segments were.

MR. MCCANN: Okay and when you say the area where the eight segments were, what specific, what specifically did you ask?

MR. BAYER: I wanted to make sure that, that the proposed size of the sewers were adequate.

MR. MCCANN: So, was the, was your request of Hazen limited to those eight segments?

MR. BAYER: Yeah.

MR. MCCANN: And you said that was an e-mail correspondence, your request anyway?

MR. BAYER: Yeah, I think so.

MR. MCCANN: Any, and was, did Hazen respond by e-mail and/or provide in writing or by e-mail the results of that simulation?

MR. BAYER: Yes.

MR. MCCANN: And what, when did that take place? Number one, when did your request take place and when did Hazen's response take place?

MR. BAYER: I think it was November, late November maybe of, of 2023.

MR. MCCANN: That is both your request and the response?

MR. BAYER: Yeah, I believe so.

MR. MCCANN: And remind me, maybe you've already said it but what, what prompted you to do that? That is, to ask Hazen to run a simulation regarding these eight segments?

MR. BAYER: I thought it was very important to know that the fix was going to correct the situation.

MR. MCCANN: And why did you think it was very important to know?

MR. BAYER: Well, that's what we should always be doing is making sure that what's going to be constructed will correct the deficiency.

MR. MCCANN: Well, did you, did you ask Hazen to run a simulation on a model that hadn't been completed yet for any other projects?

MR. BAYER: I'm sorry, can you ask that question again? What was it, I'm sorry?

MR. MCCANN: Did you ask Hazen to run a simulation or a model that had, hasn't yet been completed on any other projects?

MR. BAYER: On other projects? Yes. We, we, they are, they are modeling on our behalf, yes.

MR. MCCANN: Well, my question was, on other projects, you've asked them to do that?

MR. BAYER: Other, other subdivisions, yes. That's not my role, but yes, as far as I know that they are doing modeling when we have a (inaudible) subdivision.

MR. MCCANN: And when, when did they start doing that, do you know?

MR. BAYER: I don't know.

MR. MCCANN: Okay. Again, my question was, you said you thought it important to ask Hazen for that information,

which you said is something you don't normally do. Why did you, why specifically did you ask Hazen to do that in November of 2023?

MR. BAYER: I wanted to make sure that the design that was being done by both consultants would, would work, would, would correct the deficiency, the capacity deficiency.

MR. MCCANN: Well, why didn't you do it a year or so earlier, or back in 2021 when you first issued your comments in this case?

MR. BAYER: Well, I think that the, the issue back then was we could only improve the size to a twelve inch, I believe, because there are twelve inch downstream. So, you can't, we are opposed to building a fifteen-inch sewer, for example, that would discharge into a twelve-inch sewer.

That's not something that we find is the best way to operate our system. So, that the design was kind of fixed, that they could only improve it to a twelve because there's a twelve immediately downstream.

MR. MCCANN: Yeah, I --

MR. BAYER: So, I, I just wanted to make sure that would work.

MR. MCCANN: I understand why, I think you've answered why it is you made this request in November of 2023. I'm asking you why you didn't make it earlier in connection with this project, when this project has been going on for two

years.

MR. BAYER: Be, because that, that twelve inch was the largest that could possibly be done. There was, you couldn't make it any larger.

MR. MCCANN: I'm not sure what that has to do with the timing of your request, that's what I'm asking about --

MR. BAYER: (inaudible), there was no reason to, to run a simulation because that was the largest that could be done.

MR. MCCANN: Okay. I'm not sure you're answering my question, but I'll move on. Were you involved in any way, Mr. Bayer, in collecting documents responsive to my Public Information Act request, including the most recent one just about a month and a half ago or so?

MR. BAYER: Oh, yeah. I think we were all asked to search our documents, yep.

MR. MCCANN: Is there a reason why you did not produce to me, why the County did not produce to me, either your e-mail exchange with Hazen, or the simulations that were run, that were sent back to you from Hazen in response to your request?

MR. BAYER: I, I can't answer that question. I don't know when the dates were when you had your PIA request.

MR. MCCANN: Well, I'll, I'll tell you my PIA request was, was, was much later than November 2023.

MR. BAYER: Okay.

MR. MCCANN: But my question now is, do you know of any reason why you'd, why those documents that you already described, were not produced to me?

MR. BAYER: I, sorry, I can't answer that question, I don't know why.

MR. MCCANN: Were you told not to produce them?

MR. BAYER: No.

MR. MCCANN: Were you told not to produce any, any other documents?

MR. BAYER: No.

MR. MCCANN: Let me finish the question.

MR. BAYER: I'm sorry.

MR. MCCANN: Were you told not to produce any other documents to me in response to my PIA request, either the most recent one or any of the ones in the past?

MR. BAYER: No, not that I'm aware of, nope.

MR. MCCANN: So, there is a document either in your e-mail folder or printed somewhere in your office that shows the results of the simulation run by Hazen?

MR. BAYER: Yes.

MR. MCCANN: Did you tell Mr. Rosenblatt about that?

MR. BAYER: I don't think so.

MR. MCCANN: Well, you, you, did you tell him that you reran a model, a different model?

MR. BAYER: We, we run simulations all the time, I don't, I don't know if I recollect if I told Mr. Rosenblatt that.

MR. MCCANN: Okay. Let me show you Exhibit 45-A, which Mr. Rosenblatt asked you about and this is Developer's Exhibit 45-A, I'm sorry, which was produced and discussed previously in this case. Do you see that?

MR. BAYER: Yes.

MR. MCCANN: Okay and this is dated, your response, I guess, to internal request, well, your response is May 30th, 2023, right?

MR. BAYER: Yes.

MR. MCCANN: Okay and I think you've indicated --

MR. BAYER: Wait, no, it says May 23rd, doesn't it? The date is May 23rd, not May 30th?

MR. MCCANN: Well, the --

MR. BAYER: There it is, I'm sorry. My bad.

MR. MCCANN: Yeah, May 30th, 2023.

MR. BAYER: Yep, sorry.

MR. MCCANN: It's okay. And I think those under, the repairs that and, and, well, let me back up a little bit. This e-mail, if I recall, or that rather this information in this e-mail was produced by you in response to a request from Venable asking for the repairs that have been made by the County downstream of the subject property, correct?

MR. BAYER: Yes.

MR. MCCANN: Okay and those repairs are identified here un, in red where it says corrective actions status?

MR. BAYER: Yes.

MR. MCCANN: Okay and then, there's also an Exhibit 45-B I think that has the same ones. But a lot of these, without going through them in detail, would you agree with me that several of these corrective actions were, in fact, not done, it says deleted, for instance, correct?

MR. BAYER: Yeah, my research, these were not my projects, so I did a little research and yes, in that instance, right there at the bottom in accordance with the contractor RFI that lining was deleted from that manhole.

MR. MCCANN: Okay. So, for instance, we know that with, with respect to manhole at 43819, manhole lining was not needed so that work was eliminated, right?

MR. BAYER: That's what that says, I think.

MR. MCCANN: Yep. So, the work that was installed, I think, is, is, is in here. It's, we've got a rain pan installation, a brick collar installation and a watertight frame and cover. These were all, these are the dates as well when, when those things were done, 2017, 2019, correct?

MR. BAYER: That's what my research showed, I think, yeah.

MR. MCCANN: Okay. So, and again, since this was

produced in response to Mr. Rosenblatt's or, I'm sorry, Venable's question about repairs downstream of the subject property, is there a reason why in May of 2023 you didn't, well, strike that. Other, let me ask you this. Other than the repairs reflected in this e-mail, which is Developer's Exhibit 45-A, in May of 2023, have any other repairs been undertaken downstream from the subject property?

MR. BAYER: Yeah, I believe that this, these corrective actions were, was done by the Bureau of Utilities. So, and, and some contractors, so, --

MR. MCCANN: Right.

MR. BAYER: -- yep.

MR. MCCANN: Well, I'm asking you whether there's been anything else since.

MR. BAYER: Not, not that I'm aware of.

MR. MCCANN: Okay and then let's look at, I think you, you spoke with Mr. Rosenblatt about map two in RJN's report. This is Protestant's Exhibit 78. I'll blow it up. Do you see that?

MR. BAYER: I do.

MR. MCCANN: Oops, sorry about that. Would you agree with me that, well, this map, which is part of RJN's report, is intended, as its title indicates, to show the rehabilitation completed, at least as of the date of RJN's report in 2021, correct?

MR. BAYER: Yes.

MR. MCCANN: Okay and would you agree with me that, if I blow this up, that this map shows, and I know you, and I think you indicated you're familiar with the sewer path, so I won't ask you about that. But that this map shows only two repairs, right here where my cursor is, in the sewer path from the subject property, correct?

MR. BAYER: It shows two, looks like above the Green, yeah, above the, above that. I can't see what's down below, but it looks like there's only two.

MR. MCCANN: When you say above, what do you mean by above?

MR. BAYER: Well, where you had your cursor there, that's right there, yeah.

MR. MCCANN: Okay. Do you know where the subject property is?

MR. BAYER: Yeah, right there.

MR. MCCANN: Is it right here where my cursor is?

MR. BAYER: Close by, yeah.

MR. MCCANN: Well, where exactly is it, do you know?

MR. BAYER: I think it's right across Joppa, Joppa Road there.

MR. MCCANN: Okay. Is it where my cursor is right now, below, in other words, below or to the right of the green, the green square?

MR. BAYER: No.

MR. MCCANN: Is it, is it up here?

MR. BAYER: Yes, I believe so.

MR. MCCANN: Okay.

MR. BAYER: So, I was looking at the path. If you could scroll down.

MR. MCCANN: Oh, I'm sorry.

MR. BAYER: Yeah.

MR. MCCANN: So, no repairs along the sewer path other than those two before this, this, the sewer system (inaudible) reaches Lake Roland, correct?

MR. BAYER: I'm trying to think, there was two segments in pink up there.

MR. MCCANN: Yeah.

MR. BAYER: It could be.

MR. MCCANN: Well, could be or --

MR. BAYER: Well, like my research showed what, what was in that e-mail.

MR. MCCANN: Okay. Okay and in terms of what has not been done, we know from the long-term capacity report, which you've talked about, this is Protestant's Exhibit 68. I'm going to show you map 5.1, bear with me one sec. Okay. So, first map in Protestant's Exhibit 68 is hydraulic improvements for the two-year twenty-four storm, correct? Map 5.1?

MR. BAYER: Uh huh, yes.

MR. MCCANN: Which is a lesser storm than a ten six, correct?

MR. BAYER: It's more frequent, so, I guess you could describe it as less.

MR. MCCANN: Okay. For the two-year twenty-four-hour storm, RKK, RK&K recommended, did it not, in the sewer path a, replacement of a ten-inch sewer with an eighteen-inch sewer in this area, correct?

MR. BAYER: That's what it looks like is shown there.

MR. MCCANN: Okay and we know that was not done, correct?

MR. BAYER: Correct.

MR. MCCANN: And then for the ten-year six storm, which I'll scroll down to, which is the next map, map 6.1, do you see that in Protestant's Exhibit 68. We know, according to RK&K that the same replacement or upsizing rather, was recommended along with additional manhole repairs, correct? Right here?

MR. BAYER: Yeah, but I don't know, you said manhole corrections.

MR. MCCANN: Well, the, the dots, the brown dots and the yellow dots reflect, and I can go to the legend if you want, --

MR. BAYER: Yeah, that would be helpful, thank you.

MR. MCCANN: Well, the, the brown dots indicate a

manhole to be sealed, correct?

MR. BAYER: Yeah.

MR. MCCANN: Okay. So, for the ten year six an upsizing was proposed along with sealing of manholes, correct?

MR. BAYER: Yeah.

MR. MCCANN: Okay and I think there's a, in the legend, there's a description of, upper lefthand corner, this same map, the description of the upsize. So, thirteen hundred and seventy-seven linear feet, correct?

MR. BAYER: Yes, looks that, looks that way.

MR. MCCANN: All right. And that's just for those two storms. Would you agree with me that the, the other storms reflect considerable more upsizing, repairs, relief sewers, correct?

MR. BAYER: It could be.

MR. MCCANN: Okay. I want to talk about the Randoll report, which are you familiar with that?

MR. BAYER: Yes.

MR. MCCANN: Okay and how is it that you're familiar? Were you involved in any way personally --

MR. BAYER: Discussions before we opted to request a proposal from Ramboll.

MR. MCCANN: You were involved in those discussions?

MR. BAYER: We had some discussions about, yeah, what we saw on the internal inspection, yes.

MR. MCCANN: Okay. I'm looking through my notes to exactly what you said about the Ramboll report. But what, what I thought you said, correct me if I'm wrong, is that, let me find it. Bear with me one second, Mr. Bayer, I'm sorry. In your words, I think as you put it, you saw some corrosion in the pipe underneath Lake Roland, is that, did I say that, did I write that down correctly?

MR. BAYER: Yes, that's correct. We were concerned by the corrosion that, internal corrosion that we saw on the video, yes.

MR. MCCANN: And in that, that concern is that what prompted the Ramboll report? Is that what you were suggesting?

MR. BAYER: Yeah, we had, had discussions and we thought that it would probably be a good idea to, to be proactive and try to get started on the project to address that corrosion.

MR. MCCANN: Well, isn't it true the, the Ramboll report, and I'll pull it up as I'm asking you this question, that the Ramboll report is directed to, or covers not just the, the long sewer segment under Lake Roland, but all of the segments and interconnectors in and around Lake Roland, correct?

MR. BAYER: Yeah, that's correct.

MR. MCCANN: In fact, bear with me one second. I don't know why I'm having problems finding it. Okay. Let me

show you the report. Okay. This is, for the record, is Protestant's Exhibit 87. Do you see that? I'll go to the first page.

MR. BAYER: I do.

MR. MCCANN: You do see that?

MR. BAYER: Yes.

MR. MCCANN: Okay. In terms of what was asked of Ramboll, as I understand it, and by the way, figure 1.1, do you see that?

MR. BAYER: I do.

MR. MCCANN: So, in red, and I'm sure the Judge is familiar with it, but this is the sewer segment under Lake Roland that you were speaking to, correct?

MR. BAYER: Yes.

MR. MCCANN: Okay. But this map actually figure 1.1, it says project map, this in red identifies all of the sewer segments that are the, within the scope of this report, not just the sewer line under Lake Roland, correct?

MR. BAYER: Correct.

MR. MCCANN: Okay and I, am I correct, I'm sorry I'm scrolling around so much, I'm sure it's annoying on your end. I highlighted this sentence. Quote, the primary focus of this project is to minimize the inflow and infiltration, I&I, into the interceptors to reduce the likelihood of sanitary sewer overflows, and correct, end, end quote. Did, did I read that

correctly?

MR. BAYER: Yes.

MR. MCCANN: And do you agree with that, that is, what Ramboll has indicated in it, in its own report what it is, what is the focus of its report, for the project, that is?

MR. BAYER: That's their, their language.

MR. MCCANN: But do you agree with that?

MR. BAYER: Well, I, I said the initial inferences for the project was we saw some corrosion which was concerning. And then we decided that, well, rather than impact those resources with flood plain, wetlands and environmentally sensitive areas, that we would expand the scope and then just line everything in that area at the same time.

MR. MCCANN: So, are you, are you, are you telling me that the, the sewer segments that we, that I just showed you in that figure 1.1, other than the one under Lake Roland, don't need any work? Is that what you're suggesting?

MR. BAYER: I said, we, we expanded the scope to include all that work (inaudible) --

MR. MCCANN: (inaudible).

MR. BAYER: -- while we were doing the interceptor. We expanded the scope.

MR. MCCANN: But, so you're not suggesting that those segments don't need the repairs that are called for?

MR. BAYER: I, I didn't look at the video on all

those segments, so I can't say if they are in need of structural repairs or not.

MR. MCCANN: Okay. Well, isn't it true and I can, we can go through the, the, the report, but isn't it true that Ramboll, number one, takes a look at all of the CCTV inspection videos that the County has, County had, correct?

MR. BAYER: Oh, yeah, they were tasked with reviewing that, yes.

MR. MCCANN: Okay. In fact, this 2.3 is a helpful section. It says, quote, a review of pipeline inspection data was performed, correct? Ramboll did that, right?

MR. BAYER: As far as I know. Again, this was not my project, but as far as I know they did.

MR. MCCANN: Okay and then, in addition, they reviewed available red zone sonar reports to confirm condition of existing pipeline for rehabilitation, correct?

MR. BAYER: That's what that report says, yep.

MR. MCCANN: And then number three under 2.3 it says, provided, provided, past tense, a corrective action recommendation for each pipeline reviewed, right?

MR. BAYER: Um hm.

MR. MCCANN: And then the very next paragraph it says, quote, upon completing the review, it was determined that all pipe segments within the system can be rehabilitated using lining. Since the goal of the rehabilitation project is to

minimize the amount of I&I and prevent overflows, all lines have been identified for rehabilitation, correct?

MR. BAYER: That's what the report says.

MR. MCCANN: Even if structural damage was not identified, I just continued reading, sorry about that. But, in fact, doesn't, does not this report specifically say that, identify anyway, the amount of structural defects or active infiltration that was discovered by Ramboll in its review of the data, correct?

MR. BAYER: I'm sorry, could you repeat that question (inaudible) --

MR. MCCANN: I'm just referring to this highlighted section. It talks about --

MR. BAYER: Yeah, --

MR. MCCANN: -- twenty-four segments with active I, infiltration, correct?

MR. BAYER: That's what it says.

MR. MCCANN: Fourteen of which included some level of structural defects, correct?

MR. BAYER: That's what it says.

MR. MCCANN: Okay. Well, and you did agree, I think, as my notes reflect, Mr. Bayer, that these, this rehabilitation of all these segments will help, as you put it, benefit capacity, correct?

MR. BAYER: If, if there is I&I and we line it and

that's reduced, then it should be an improve in capacity. As well as lining provides, makes the interior pipe more slippery. So, in theory, the pipe can carry more flow as well --

MR. MCCANN: That's a good point. That's a good point. And so, a lining of pipe doesn't --

MR. BAYER: And, and it, I'm sorry, and last but not least is what's really important is we extend the, the service life of this, of the pipes in the area. The other fifty, sixty, seventy, eighty years old so.

MR. MCCANN: Okay.

MR. BAYER: Another benefit is we extend the service life, sorry.

MR. MCCANN: Okay. So, I understand that shovel has not been put to ground, put to the ground yet, correct, (inaudible)?

MR. BAYER: Yeah, this is not my project so I, I don't know, but as far as I know, no, they have not (inaudible) design and we have not started construction.

MR. MCCANN: Having, but having looked at the Ramboll report, you would agree with me that Ramboll has reviewed all the data and based on that data made recommendations for where the rehabilitation needs to take place, correct?

MR. BAYER: Yeah, that, that's apparently what this report says.

MR. MCCANN: Okay and, in fact, is it not true that

this project will cost the County $10 million? Does that sound familiar to you?

MR. BAYER: I did, I never saw the budgetary estimate, I don't think, so I don't know if $10 million is accurate or not.

MR. MCCANN: But there is a, there is, this, the amount of work to make these repairs in and around Lake Roland has, in fact, been budgeted for, correct?

MR. BAYER: As far as I know, we have the funds available to complete the project.

MR. MCCANN: Well, let me show you, and Your Honor, I believe we're on Exhibit 109. I'm going to show Mr. Bayer this document. Do you see that, Mr. Bayer?

MR. BAYER: Triennial Review?

MR. MCCANN: Yep. Are you familiar with the Triennial Review?

MR. BAYER: Draft report? That's not my role and responsibility.

MR. MCCANN: But what is, what is the Tri, Triennial Review, if you know?

MR. BAYER: I, I, I don't. Like I say, it's not my role and not my responsibility to --

MR. MCCANN: You don't, you don't know what it is?

MR. BAYER: It's not my responsibility to draft that report.

MR. MCCANN: Well, it's not your responsibility to say a lot of things but, well. Let me show you, and maybe this will help you. Bear with me one second, it's page twenty-two. Bear with me one second. I'm having problems finding it. Well, I don't think he recognizes it anyway, Your Honor. Or won't recognize it. But I would offer this as Protestant's Exhibit 109 as I said.

MR. ROSENBLATT: I do object, Judge. It's a draft report. It's only been presented to a witness that says he doesn't know what this is or have any role in it. I don't know how that gets into evidence.

ALJ: I'm not, I'm not sure either, Mr. McCann. I mean, I, I don't know how it comes in if he can't say what it is and he doesn't work on it, he's not familiar with it. It's not --

MR. MCCANN: He doesn't, he doesn't need to say what it is. It's a County document. We introduce County documents all the time. I simply went to the County website. This is, this is what the County has on its website for its --

ALJ: I, I know but what if, if he can't add to it, if he can't, he's here to talk about the (inaudible), I don't know what, I don't even know what this document is.

MR. MCCANN: Okay. Well, I'll wait till he's off the stand then I'll move it into evidence. But it, it, I don't need this witness to get this document into evidence. It's a

County record. It is --

ALJ: Mr., Mr. Rosenblatt, do you recognize this as a County record?

MR. ROSENBLATT: I, I've never seen it before, I, I don't know where it comes from and I don't think it is relevant to the reason we're here, which is not, as Mr. McCann said, a complete reopening of the case, but limited to a specific issue and the witness that's here to testify about that issue doesn't know anything about this.

ALJ: Yeah, I, I just, yeah. And so, yeah, I mean, I'm, this, this document just can't come in at this time. Again, we're here for a limited purpose, for, for Mr. Bayer to discuss the sewage path from this property. The documents that were discussed were already in evidence and this is some other new thing that he says he doesn't even --

MR. MCCANN: Your Honor, do, you don't recognize the irony of that?

ALJ: I, I, no, I don't. I, I, I think it's trying to put this document in when you can say that this is something that maybe you wanted to put in in the past and he doesn't know what it is. I mean, I thought you, he was going to be able to discuss it or --

MR. MCCANN: I'll represent to you, as an officer of this court, of this office, that I, this is a County document that was received from the County --

ALJ: Okay, I --

MR. MCCANN: -- it says Baltimore County, everybody knows what the water supply and sewerage plan is. Mr. Bayer apparently does not. But everybody knows what it is. Everybody, it's self-authenticating, it's obviously --

ALJ: But we're not, but we're not reopening the case for, for some information that could have been presented in the, in the, you know, bef, previously. This is, this hearing is just for the Motion for Reconsideration in regard to his testimony about the sewage path from this project. And not, not reopening it to put other documents in evidence. So --

MR. MCCANN: It's the doc, it's the document you have a problem with, it's the document --

ALJ: -- even, even if you could say that you, you got it by a PIA request at this point, I, you know, unless it has to do with his testimony today about this sewage path, it doesn't come in. He says he doesn't know what it is. I can't let the document in, okay?

MR. MCCANN: Your Honor, he just testified, downplayed, in fact, I will suggest, the significance of the Ramboll report, suggesting that it was something that was prospective, planning, whatever, something that was, that was not something, something that was, in fact, limited to the Lake Roland interceptor itself.

And the fact, the fact that I introduced a document

that wasn't previously produced doesn't automatically mean that it's beyond the scope of cross. It, the irony, the irony, the irony of your ruling that this does not limit it to the sewer path is thick. Everything that was discussed already this morning had nothing, or very little, or tangentially to do with the sewer, with the sewer --

ALJ: If that, if that, that's the case, then why did you, if it didn't have anything to do with the sewer path, all the documents introduced, then why did you introduce them in the case in the first place? Because you, all the documents that were pulled up other than one were all your documents that you produced.

MR. MCCANN: I think --

ALJ: So, if they didn't have anything to do with the case, then why do we have a hundred exhibits?

MR. MCCANN: I didn't say it didn't have anything to do with the case. What I'm, what I'm directing you to, Your Honor, is your ruling, which limited to the sewer path, which to me --

ALJ: Right.

MR. MCCANN: If you didn't, if you didn't say sewer path and you instead said sewer capacity issue or yes, sewer capacity issue whether the County, you know, what, you could have used a lot of different language that would have, you know, addressed my objection. But you didn't. You said sewer

path and that, to me, that's very specific.

And that's why, and I don't agree it shouldn't even be limited, there, we shouldn't be discussing the sewer path, frankly. I hope that's clear by now. But, in any event, if, if, if I'm, if my cross examination is limited to the sewer path and Mr. Rosenblatt's is not, --

ALJ: Well, your, your, okay, its sewer path, sewer capacity, deficiencies, structural improvements, to me that's all the same thing. I'm trying to find out whether the, whether the, the sewage can flow from, from this development down to where it goes. That, you know, so, so it's not the, you know, the specific, it includes all those things --

MR. MCCANN: Well, that's news to me.

ALJ: -- and Mr. Rosenblatt went through those documents, if you want to cross examine on the documents and things that he asked, then that's fine.

MR. MCCANN: Okay. I just can't use any new documents in my cross examination.

ALJ: Well, I, it, it's not that you, you couldn't, but he doesn't recognize that document.

MR. MCCANN: That's a different issue. That's a different issue. I'm not talking about the, I'm not talking about authenticity. I'll deal with that. I'll get an e, I'll get an e-mail for, like I always do when you ask me whether something's authentic, --

ALJ: But, but then, this isn't the, your case was already presented. This, this is just one County witness who's talking about the limited issue of the sewer flow from this project. Not, not opening it up again to add in all these new documents and PIA requests.

MR. MCCANN: Your Honor, I'll say one more thing and then I'll --

ALJ: Okay.

MR. MCCANN: -- stop arguing with you --

ALJ: Okay, okay --

MR. MCCANN: -- because I don't mean to argue with you. But it, it's just shocking to me so I can't refrain myself. It's absolutely shocking.

ALJ: It's shocking?

MR. BAYER: It is absolutely shocking to me, and I think if Mr. Zimmerman were here or Mr. Wyatt or Mrs. Demillio chimed in, I think they would agree. They're nodding their heads. It is shocking what's going on in this, in this proceeding today.

ALJ: Okay. I don't, I don't understand why you're even saying it's shocking when, when the Order was issued that we were going to have one more County witness, there's nothing shocking about it. I, I don't, it just doesn't even, I don't, doesn't ring true. I mean, we spent thirteen days on this case, putting in hundreds of documents. And there was only

maybe one excluded, I think, from either side, I excluded one from either side. I, as I recall.

So, I mean, but we're not here to reopen the case. We're here to discuss this one County witness' testimony. If he can identify it and he can, he, you know, that's part of what he needs to talk about and the sewer capacities, sewer paths, improvements, you know, whatever you want to talk about in terms of whether the sewage can flow or not from Greenspring Manor property down to where it needs to go. That, that's all I need to know, right? Okay. So, I mean, I'm, I'm not sure where you're going with it but I, okay? So, --

MR. MCCANN: Then, then, then why did you not grant my motion to strike this new testimony about a new model being run recently and a new, a completely new opinion that obviously could have been introduced long ago in this case, either by the County or by Mr. Rosenblatt and his clients?

ALJ: Because it, it pertains to the Order, it pertains to the, the Motion for Reconsideration, the Order that was issued that he's going to come in and talk and he's going to testify like any other County witness does.

MR. MCCANN: Okay. I'll stop arguing with you. I will.

ALJ: All right, thank you.

MR. MCCANN: I promise, I promise. Okay. Re, regarding Hazen, Mr. Bayer. Were you involved in that in any

way? That is either the solicitation of that work or the, the, its ongoing nature in any way?

MR. BAYER: When you reference that work, are you talking about the needs analysis of the comprehensive evaluation that Hazen is doing right now?

MR. MCCANN: Yeah, you, well, yeah, let's start with those two things because you were very careful to say those two things, yes.

MR. BAYER: Well, you said that work, I, I, it's hard for me to answer your question --

MR. MCCANN: I appreciate that.

MR. BAYER: -- unless you're more specific. So, what was your question then? Am I involved in that needs analysis and comprehensive evaluation? Yes, a little bit, yes. Correct.

MR. MCCANN: And how are you involved in that?

MR. BAYER: We've been discussing with them what we, what we expect from them, which was outlined in the proposal that we sent them and, and asked them to provide.

MR. MCCANN: So, those two, those two aspects of it and, and again, I think you were careful to say that, comprehensive evaluation --

MR. BAYER: Evaluation.

MR. MCCANN: -- evaluation and needs analysis, those have not been accomplished by Hazen as we sit here today,

correct?

MR. BAYER: No, they're still working on it, correct.

MR. MCCANN: Okay. Is there some other aspect of Hazen's work that has been completed and has been provided to the County?

MR. BAYER: Of the needs analysis or that --

MR. MCCANN: No, other than those, other than those two things.

MR. BAYER: Are there other things that Hazen is doing on our behalf? Yes, they are.

MR. MCCANN: Okay, that have not been completed as we sit here today?

MR. BAYER: That have not been completed? Yeah, I have, I have passed them with some work to actually add in the (inaudible) sewers and some of the other sewer shed models.

MR. MCCANN: Okay.

MR. BAYER: So, the task is ongoing. There's lots of tasks that Hazen has, working on on our behalf.

MR. MCCANN: Okay. Do we know when the report, the comprehensive evaluation, I guess, is what you're referring to and needs analysis will be completed?

MR. BAYER: I don't have the latest schedule in front of me so I don't answer, I can't answer that. I don't know.

MR. MCCANN: Okay and did, did you really say, did I hear it correctly, that you didn't, that County didn't hire

Ramboll to determine sewer capacity?

MR. BAYER: Well, like I said, we, we hired them to do a design for the rehabilitation as the sewers that were in that, within that Lake Roland area.

MR. MCCANN: I'm sorry, you're talking about Ramboll now, right?

MR. BAYER: That's exactly, that's what I thought you said, Ramboll.

MR. MCCANN: Right and I, and I switched gears, I'm sorry. Hazen. Was, was Hazen hired to, to evaluate capacity?

MR. BAYER: That will be part of the needs analysis, I suspect.

MR. MCCANN: Okay. Okay. Let me show you, this is Protestant's Exhibit 64. Mr. Rosenblatt was asking about that. Do you recall that testimony?

MR. BAYER: Yes.

MR. MCCANN: Okay. This is our exhibit and our exhibit as introduced have these manholes highlighted in yellow. Do you see that?

MR. BAYER: Yes.

MR. MCCANN: Okay. Am I correct, do you recognize these manholes, maybe you have the manhole numbers memorized by heart by now, but do you recognize that these highlighted manholes are the eight segments, so called Johns Hopkins segments, that are across the street from this property?

MR. BAYER: Yeah, it looks like those are the eight segments that were in that memo that you showed me a little while ago.

MR. MCCANN: Okay and this chart, as I think you've already described, well, strike that. Does, does this chart in the column percent full, does it not reflect what the, the percent, capacity percentages are for those segments, correct? This column --

MR. BAYER: Scroll back up the top and see what that says at the top of that column, please.

MR. MCCANN: Percent full.

MR. BAYER: Yeah, there you go.

MR. MCCANN: Okay. So, putting aside this new model that you apparently ran or you asked for, a simulation for, is it, it, is it a safe assumption on my part, Mr. Bayer, that if I were to look at RK&K's work product and RJN's work product, for capacity numbers, if I were to see capacity numbers that were either 94.32 or greater for any sewer segments, that those are probably sewer segments that should cause us con, some concern, correct? Would you agree with that?

MR. BAYER: If you're talking about a simulation, prediction that the model was run and it showed something like this it could be a cause of concern, yes.

MR. MCCANN: Okay.

MR. BAYER: We use, we use a model as a tool to kind

of direct us to areas that might be a concern, like we do with other tools, like the I&I analysis that you, that Mr. Rosenblatt showed me with, there was areas exhibiting high I&I. Those are all tools that we use to try to point us in the direction (inaudible) be concerned about.

MR. MCCANN: Well, those may be tools that you use day to day, but that's not what the Consent Decree requires, is it?

MR. BAYER: The Consent Decree required us to do a long-term capacity peak flow and management evaluation.

MR. MCCANN: Specifically, the Consent Decree, let me ask you about that, you, you agree with me, that the Consent Decree requires the County to conduct a long-term evaluation to identify corrective actions necessary to ensure long term capacity, do you agree with that?

MR. BAYER: I believe that's what be what the language is in the Consent Decree.

MR. MCCANN: And then the Consent Decree also then requires the County to prepare an SRR plan to iden, to identify the deficiencies in the system and then perform all corrective actions necessary to address those deficiencies, correct?

MR. BAYER: I believe that's what the language in the CD says.

MR. MCCANN: Okay. Your Honor, this is, this is probably a good time to stop. I think the benefit of a, of a

lunch break would be, would be great. So, if it's okay with you, that's what I would like to do.

ALJ: How long do you all need?

MR. MCCANN: I mean, a half hour, forty-five minutes would be great, would be fine.

ALJ: All right. Mr. Rosenblatt, a half hour, forty-five minutes? You must be muted, I don't know.

MR. ROSENBLATT: I did it, sorry. A half hour is fine by me.

ALJ: And Ms. Demillio, any longer that you needed?

MS. DEMILLIO: No, half hour is fine.

ALJ: Okay. Mr. Wyatt?

MR. WYATT: Half hour is perfect.

ALJ: Okay, sounds good. All right. We'll come back, you know, one-ish or so. I'll pause the record.

MR. MCCANN: This, is this the last witness for the day, Mr. Rosenblatt?

MR. ROSENBLATT: It's the last witness, yes, that we have.

MR. MCCANN: Okay, all right. Thank you, Judge.

(PAUSE)

ALJ: All right, we're back on the record. Mr. McCann, you were still in cross.

MR. MCCANN: Okay, thank you. Mr. Bayer, can you hear me?

MR. BAYER: Yes.

MR. MCCANN: Okay. One of the things I didn't ask you about your work with the County is, as I understand it, at least my interactions, that there are one or more folks within the County that are charged with ensuring compliance with the Consent Decree. I don't know what you call those people, compliance, CD compliance folks, or something like that. Is, is that correct?

MR. BAYER: There's staff that, that are involved and we also have a program manager, if that's what you mean.

MR. MCCANN: Yeah, who's the program manager?

MR. BAYER: WSP.

MR. MCCANN: Okay. But you're not involved in that is, as I understand it, correct?

MR. BAYER: Not involved in what? No, I don't work for the program manager now. We work together on, on a lot of things relating to the CD, as do the other staff.

MR. MCCANN: You're not, but you're not part of the staff that's charged with determining whether or not compliance with the Consent Decree is being accomplished?

MR. BAYER: I don't know if that's the County's decision to make. The compliance is probably related to MDE, EPA and DOJ.

MR. MCCANN: Okay. So, there's no one in, no one in the County that is charged with determining whether or not what

it's doing complies with the Consent Decree?

MR. BAYER: I, I think we submit everything that we are obligated to do and then we wait for comments back from EPA, MDE, EPA and MDE.

MR. MCCANN: Okay. Let's talk about map three. I think, and I've got it up on the board here, it is Protestant's, part of it, Protestant's Exhibit 78. I'm sorry, let me make sure of that. Yeah, Exhibit 78. I think you acknowledged during examination by Mr. Rosenblatt, can you see that, by the way, Mr. Bayer?

MR. BAYER: Yes.

MR. MCCANN: That, in your words, map three does show some, quote, issues of concern downstream, is that, from the subject site, is that fair?

MR. BAYER: Well, I think if you go to the legend in the upper right, it describes what is shown on the map. So, it looks like model predicted hydraulic restrictions.

MR. MCCANN: I'm just asking you about your testimony. Your, I think you said, did you not, that, at least agreed, that map three shows issues of concern downstream from the subject property?

MR. BAYER: Yes, it was predictions of surcharging, yep.

MR. MCCANN: Okay. But then you said, well, excuse me. Then you said in response to Mr. Rosenblatt's leading

question, that you don't, that that doesn't mean --

MR. ROSENBLATT: Objection, objection.

MR. MCCANN: -- that doesn't mean you --

MR. ROSENBLATT: Is this --

MR. MCCANN: (inaudible) --

ALJ: Hold on, hold on. You guys are both talking at the, hold on. You're both talking over each other. Mr. McCann, yeah, you don't need to say his leading question, but. I know that's what he's, Mr. Rosenblatt is getting at, right, Mr. Rosenblatt?

MR. ROSENBLATT: Yes, Judge.

ALJ: All right. Let's play nice, as I always say to you two.

MR. MCCANN: Okay. I think what you said during that discussion as well, Mr. Bayer, is that that does not mean, in your opinion, that you do repairs right away, is that, I think you put it like that, right?

MR. BAYER: Yeah, we like to evaluate and try to confirm, validate what is predicted by those models.

MR. MCCANN: Yeah. Well, and what, and I think you put it in terms of verifier, right? That's what you said. It's called, you verified it somehow?

MR. BAYER: Yeah, we tried to, to see if we can't verify what the predictions are.

MR. MCCANN: Yeah. And let me, in that regard, let

me pull up another document, which is Developer's Exhibit 47. And one, and I think when you were asked how do you verify, you said flow monitoring, correct?

MR. BAYER: Yes, that's one, one way, yep.

MR. MCCANN: Okay. So, here's, during the last hearing, and then again, you were referred to it today, this is 47-A and 47-B, which is, bear with me one second, sorry. It's the e-mail associated with that. Mr. Rosenblatt asked you about this e-mail, do you correct, do you recall?

MR. BAYER: Yes.

MR. MCCANN: Okay. So, these are five level sensors downstream of this subdivision, right? You have them right here listed, correct?

MR. BAYER: Yes.

MR. MCCANN: And so, and a, a level sensor is, essentially, a flow monitor, correct? Is, are they one and the same thing?

MR. BAYER: A level sensor only gives a limited information compared to the flow monitor, which gives us more information.

MR. MCCANN: Okay. But this was introduced last time, and it was spoken about again today and where's all the data from these sensors? Is that available to you?

MR. BAYER: Oh, yeah, um hm.

MR. MCCANN: Okay. If you wanted to look at it?

MR. BAYER: Yes.

MR. MCCANN: Okay. But you haven't brought it with you today, I take it, right?

MR. BAYER: No, I do not. It's actually hosted by our consultant that provides that service to us.

MR. MCCANN: All right. Well, in the past, the County has done flow monitoring, correct?

MR. BAYER: We have run staff that does our own flow monitoring sometimes, yes.

MR. MCCANN: Yeah, in fact, RJN did flow monitoring, did it not, in two thousand and, when it submitted its report in 2021?

MR. BAYER: Yes, they've done some flow monitoring for us.

MR. MCCANN: Bear with me one second, I'm trying to pull that report up. So, flow monitoring, flow monitoring, I'm sorry, is a way to verify model predicted SSOs, for instance, of the type shown in map three, correct?

MR. BAYER: That's one way.

MR. MCCANN: Okay. So, but RJN did it, in its actual report, the same report that map three is attached to, it did flow monitoring, correct?

MR. BAYER: They were doing some flow monitoring in Jones Falls, yes.

MR. MCCANN: Okay. So, I'm showing you, again, this

is the report, May 27, 2021, RJN performance assessment report. And at page thirty-two, I'll direct you to it, bear with me. It says this paragraph, and I'll highlight it just to focus us in on it.

Can you read it? I'll blow it up a little bit. It says, and I'm going to paraphrase, but correct me if I get anything wrong. It says, flow monitoring was performed in twenty-six locations back in 2008 apparently in connection with the SRR plan.

And then the second sentence says, or at the bottom here it says, post-rehabilitation flow monitoring, I'm sorry, post-rehabilitation flow meter locations were selected on the previously 2008 monitored locations, supplemented by additional locations selected to address the County's intent. So, and then the next paragraph, it goes on about the post-rehabilitation flow monitoring that was performed. Do you see that and does that ring a bell with you?

MR. BAYER: I see that.

MR. MCCANN: Does do, are you familiar with that, the fact that RJN did post-rehabilitation flow monitoring?

MR. BAYER: Yeah, that's in order for us to assess how effective we were in the rehabilitation side, we have to do post-rehab flow monitoring (inaudible).

MR. MCCANN: And, in fact, it refers to figure 1.2, which I think is on this page, I'll scroll down to the next

page in this exhibit. And it shows in table 1-1, pre- and post-rehabilitation flow monitoring. And it looks like, correct me if I'm wrong, but it looks like post-rehab flow monitoring was done for, between 2018 and 2020, for all of the, the water meter basins, correct?

MR. BAYER: For the basins, looks like, yep.

MR. MCCANN: Okay. So, when RJN prepared its map three, it had conducted post-rehabilitation flow monitoring, correct?

MR. BAYER: Yes.

MR. MCCANN: One other point about this report is I think you, you know, you were talking about the rehabilitation that was performed up in the, the water meter basins up here in the northeast corner, 03, 02, 04, I think. Do you recall that testimony?

MR. BAYER: Yes.

MR. MCCANN: Okay. I want to, I want to focus in on these two sentences here. This is again on page four of the RJN report, which is Exhibit 78. And I'll just read it. Quote, flow monitoring in basins 02, 03, 04 and 09, I'm sorry, I keep on doing this, was performed to evaluate the effectiveness of comprehensive I&I rehabilitation performed in these four-meter basins. Did I read that correctly?

MR. BAYER: I think so.

MR. MCCANN: And then the remaining meters listed in

table 1.1, which we just discussed, were installed to evaluate flows at model predicted SSO locations, as identified in support of the 2013 Jones Falls SRRR plan or to calibrate and verify the model. Did I read that correctly?

MR. BAYER: I think so.

MR. ROSENBLATT: Objection. Judge, I'm trying to let this go, but we, we're having repeat questions of just reading a document and asking if it's read correctly. And the document says what it says.

ALJ: And the same objection, I think, came when you were asking questions as well. I, I'm thinking Mr. McCann is going to get to his next question. Maybe this is the --

MR. MCCANN: Yeah.

ALJ: -- background question for the next question. So, I'll overrule it. Go ahead, Mr. McCann.

MR. MCCANN: So, it sounds to me, and correct me if I'm wrong, Mr. Bayer, that the flow monitoring that was performed elsewhere, other than in these four meter basins up in the northeast corner, was not used by RJN to evaluate the effectiveness of the rehabilitation, but rather for the purposes I just indicated in the second sentence, correct?

MR. BAYER: I believe that's what it says.

MR. MCCANN: Okay and that flow monitoring data for all these water meter basins, including the ones that would receive sewage from the subject property, you have that data

available to you, correct?

MR. BAYER: It should have been provided to us.

MR. MCCANN: Okay. Okay. Let's switch subjects. You, actually one more thing about the RJN map three. So, the, the map three, which indicates modeled capacity issues, the, the data that on the, that underlies those or the, the capacity numbers specifically, can be found in other data that was supp, was supplied by RJN in connection with that port, report, correct?

MR. BAYER: Can you ask that question again --

MR. MCCANN: Yeah, that was a, that was a terrible question. Let me, let me show you the exhibit first and see if you recognize it. So, this is Protestant's Exhibit 82. You see that?

MR. BAYER: I do.

MR. MCCANN: Okay. Are you familiar with this document?

MR. BAYER: Yeah, I believe this came from the performance assessment.

MR. MCCANN: Right. So, and it's a long document, and I won't go through all of it obviously, but what it basically is, it tells us what RJN found for each of the storm events post-rehabilitation as part of a wet weather capacity analysis, correct?

MR. BAYER: It appears to be.

MR. MCCANN: Okay. So, I could go down to the ten six storm, for instance, and see what capacities RJN found post-rehabilitation for the sewer segments that are the sub, that would receive flow from the subject property, correct?

MR. BAYER: I guess you could scroll down to the ten-year six hour.

MR. MCCANN: And RJ, RK&K had that same information, did it not?

MR. BAYER: Yes. Well, they didn't do a post-rehab, but they did a capacity analysis, yeah.

MR. MCCANN: Yes, so, this is Protestant's Exhibit 72. And this is entitled future pipe capacity and manhole surcharge summary. Again, a long document beginning with the two-year six-hour storm. This, this document, which was attached to the RK&K work product, likewise, would tell us what percentages of capacity RK&K found for all the pipe segments downstream of the subject property, correct?

MR. BAYER: It looks like it shows a column of capacity use and percent and capacity remaining and the gallons a day.

MR. MCCANN: Okay. Okay. I'll switch gears. You, you mentioned, you said that the County found and looks like fixed with exception of one, thirty-four structural SSOs. Do you recall talking about that?

MR. BAYER: We eliminated, I think, that many.

MR. MCCANN: Yeah, Mr., Mr., I think, Rosenblatt was asking you about what you had done as far, had accomplished under the Consent Decree in terms of eliminating structural SSOs, do you recall that?

MR. BAYER: Yes.

MR. MCCANN: And let me show you, there is a very distinct and significant difference between structural SSOs and just SSOs, is there not?

MR. BAYER: Yeah, the structural SSOs are structures that constructed.

MR. MCCANN: Yeah, so here's the Consent Decree. I can go to the top, but you probably recognize it. This is, I just lost it, I'm sorry. This is at the bottom of page eleven. It has the definition, under Z, it has the definition of sanitary sewer overflow or SSO, quote, shall mean any spill, release or discharge from the collection system, including all building backups, end quote. Do you see that?

MR. BAYER: I do.

MR. MCCANN: And then next page, double A, it talks about SSO structures. Is that what you were, or sanitary sewer overflow structures. Is that what you were refer, referring to in your testimony with Mr. Rosenblatt?

MR. BAYER: Yes, it's a structure that was constructed.

MR. MCCANN: Right. So, these structural SSOs, I

think as this definition reflects, are structures that are actually constructed by the County for the purpose of allowing discharge, correct?

MR. BAYER: I don't know the purpose of why they were constructed. That's way before my time. But they were constructed by the County as far as I know.

MR. MCCANN: Well, the definition is here, that's why I'm, I'm paraphrasing the language. It says, shall mean any structure in Baltimore County constructed for the purpose of allowing discharge, end quote. Do you see that?

MR. BAYER: I do.

MR. MCCANN: Okay. As you were suggesting, and maybe I didn't catch you, but you're not suggesting that there haven't been any SSOs in the Jones Falls recently have, are you?

MR. BAYER: No, they're not, no, there's been SSOs, as far as I know.

MR. MCCANN: In fact, there was one right in Lake Roland just about a month ago in January, correct?

MR. BAYER: I was sent an e-mail that showed that the lid was off the top of one of our manholes and it appeared that there could have been evidence of an overflow.

MR. MCCANN: Were you shown photographs?

MR. BAYER: Yes.

MR. MCCANN: Okay. Let me show you, I'll mark this

as Protestant's Exhibit 110. Do you see that? I'm going to scroll down, it's just a couple pages. Do you see that, Mr. Bayer?

MR. BAYER: Yes.

MR. MCCANN: Is that, are those the photographs or is that the same manhole that you were sent photographs?

MR. BAYER: Yeah, I believe those are the same photographs and that's the same, yeah, same manhole, I believe.

MR. MCCANN: And then, aside from that, it occurred in January, correct, of this year?

MR. BAYER: I believe it did.

MR. MCCANN: Do you know, do you know what manhole that was by, by chance?

MR. BAYER: I, I don't.

MR. MCCANN: And there was a, an SSO in a, in a, nearby, very nearby manhole a couple years ago as well, correct?

MR. BAYER: The same situation, yeah. I was sent photographs of what appeared to be evidence of an overflow a couple years ago, yes.

MR. MCCANN: Okay. Your Honor, I would move this, these photographs in as Protestant's Exhibit 110.

ALJ: Mr. Rosenblatt?

MR. ROSENBLATT: No objection.

ALJ: You object?

MR. ROSENBLATT: No objection.

ALJ: Oh, no objection. Thank you. So, one ten, Mr. McCann, that's the number? I don't know --

MR. MCCANN: That's what I have, yes.

ALJ: Okay, accepted.

MR. MCCANN: Thank you. And, Your Honor, if I could just have a minute, I think I may be done, quicker than I thought. So, can I have a minute or two?

ALJ: Sure.

MR. MCCANN: I may just go on mute while I do that.

(PAUSE)

MR. MCCANN: That is all I have. Thank you, Judge. Thank you, Mr. Bayer.

ALJ: All right. We have Mr. Wyatt. Mr. Wyatt, do you have any cross?

MR. WYATT: Yes, Your Honor. I just have a, a few questions for Mr. Bayer.

ALJ: Sure.

MR. WYATT: Good afternoon, Mr. Bayer. How are you?

MR. BAYER: Fine, thanks.

MR. WYATT: I reached out, you and I actually spoke a couple of weeks ago about this case, did we not?

MR. BAYER: Yes.

MR. WYATT: And you and I know one another socially, I don't think we've ever interacted professionally, is that

accurate?

MR. BAYER: Correct.

MR. WYATT: All right. And by the way, is that your desk behind you? Is that your, are those files you're working on behind you?

MR. BAYER: Paperwork.

MR. WYATT: I've never been to your office, that's why I ask. Anyway. Fair to say at the time we spoke, you were a little bit reticent in speaking to me about this project?

MR. BAYER: Yes.

MR. WYATT: I think your words to me were, you're, you're a little uneasy about talking about it with me?

MR. BAYER: Yes.

MR. WYATT: And I was respectful of that, correct? I didn't push you in any uncomfortable position in terms of trying to get you to answer questions that I may have had about the project, right?

MR. BAYER: Correct.

MR. WYATT: All right. But I did ask you one question and the question was, we were talking about, I think it's Exhibit 90, but it's your e-mail, it's the, it's the zero breaking point e-mail. I asked you just one question and you did answer it, looking at my notes. Has anything changed since your e-mail? And your response was, nothing has changed. Is that, is that a fair description of our conversation?

MR. BAYER: Yeah, as far as I know nothing has changed, yep.

MR. WYATT: Okay, all right. Thank you, Mr. Bayer. I have no further questions.

ALJ: All right. Mr. Sachse, do you have any cross?

MR. SACHSE: No, thank you, though.

ALJ: Thank you, Mr., Mr. Sachse. And then, Ms. Demillio, do you have any cross?

MS. DEMILLIO: No, I don't, Your Honor.

ALJ: Okay, thank you. All right. And so, I guess, I mean, it's an odd situation to come back to Mr. Rosenblatt. Let, let me do, let me do this. Maybe this first. Mr. Bayer, you've been so good with us and patient with us. So, I am just a visual person and I apologize if you've already answered all these questions. But just, just humor me, okay?

MR. BAYER: Certainly.

ALJ: You see, you see what's on the screen?

MR. BAYER: I do, yes.

ALJ: All right. So, the last number for the, what we keep calling the Hopkins segments, but we see from Mr. Benjamin's letter that perhaps, you know, this was more of a joint effort. But in any event, what I'm looking at is the number, 43, 4, 43786.

And this My Neighborhood map was produced by the Protestants. And it shows, it is, oh, it says it on there

actually. Let me hit the number just for the, sixty-three was Protestant's exhibit. All right. So, so this is the, the, the, the property, right? You recognize that?

MR. BAYER: Yes.

ALJ: So, this is the My Neighborhood map, everybody can pull this up. And this was submitted by the Protestants, but in reality, everybody agrees that this is the sewer path, right? Okay, so, so the last, so the last number is 43, 43786 and that's like right in here where my cursor is. And that's the last part. The, the rest, all this up to the property is either the Developer or it's the Hopkins segments, right?

MR. BAYER: Correct.

ALJ: All right. So, then we had this other document that the Protestants produced, which was seventy-seven, and this thing was a chart. It was an appendix to the SSR report. And you see that? Have you seen this before? It's an appendix to it.

MR. BAYER: I might have a long time ago.

ALJ: So, what I'm doing is just, and again, you're the expert. But here I am, I'm the lay person, right? I'm looking at this. It gives me the manhole number, 44212, and it shows, if you can see that, def, defects in the segment sixty-seven. One of them is a defective joint. The rest of it says grease. So, my first question is, what, what's the deal with where it says grease? What, what does that mean? And does,

does that pose any worries to you at all?

MR. BAYER: Yeah, grease means when, sometimes people will put their grease into the sewer system and then that clogs up our sewer system. Yes, that's a huge concern of ours. It creates problems, blockages, which will cause, or could cause an overflow, or capacity deficiency. So, yes, grease is a very big concern.

ALJ: So, what happens when you see that grease? What do you, what happens? What's the remedy for that?

MR. BAYER: So, the Bureau of Utilities would be the ones that would have to clean that. So, they would run a jetter through it, let's just say for example, to try to flush the grease out.

ALJ: Okay. So, on this --

MR. BAYER: Or they could, they could also --

ALJ: I'm sorry.

MR. BAYER: -- add a chemical sometimes maybe.

ALJ: Add a chemical. So, so, if you look at this chart, where it says, this is again the SRRR plan and all these segments where it says grease, is, does the Bureau of Utilities just automatically correct that? And can I assume that these, all of these are corrected?

Like the first one here, for example, is in the sewer path. So, 44212 and 44211 is right here. So, see I'm a visual person, so I'm looking at this going now there's, there's

grease in here. So, do I assume that that's fixed or what?

MR. BAYER: I think the table you're looking at is very old (inaudible) --

ALJ: Is that right? So, that's the, yeah, you, you tell me, you're the expert, which is why I want, yeah, this is from the SRR report --

MR. BAYER: Which is 2012.

ALJ: Yeah.

MR. BAYER: So, I would hope they fixed it by now, but I don't know the answer to that without researching it and pulling up work orders and see.

ALJ: Okay.

MR. BAYER: That could, grease could get eliminated and come back in time, over time.

ALJ: But is there, so, but is there general maintenance that gets done by the Bureau of Utilities where, where they would, just on a regular basis do this?

MR. BAYER: Some, some segments are on what they call specials, that they do get regular maintenance. We're working on, what, what we have now is an asset management plan, which hopefully would, would identify some of those maintenance issues, which would require, or, or, yeah, they (inaudible) schedule that on a regular basis for cleaning, if it's a grease problem.

ALJ: Okay and in your research, because you looked

at all the, the sewer path, again, from, for this property, which, you know, it goes on for multiple pages here, did you see any, any issue then in terms of, I, you know, that, that would give you concern if, you know, homes were built? Obviously there's going to be plumbing, if, you know, they were connected to this path that you were concerned about?

MR. BAYER: Yeah, if you scroll up a little bit there was a concern, oops, you're going too fast.

ALJ: Which one, which one is it?

MR. BAYER: Scroll up a little bit further, yes. Keep going, okay. So, some of the segments there, 44222, 44223, so there was, we iden, when I was flow monitoring out there last year, we identified some issues. So, I asked the Bureau of Utilities to go out and clean some of those segments. And I think they went from 43786 all the way across the beltway. So, if you scroll down a little bit farther.

ALJ: 786, oh, scroll down again?

MR. BAYER: Yeah.

ALJ: Okay.

MR. BAYER: So, I think they, they went all the way down and cleaned up all the way across the beltway, maybe down to 44219.

ALJ: Uh huh, that's here.

MR. BAYER: Yeah, but I don't recollect, but there was a concern on, on those segments, what I was seeing on flow

monitoring. So, I asked the Bureau of Utilities if they would go out there and, and clean and inspect.

ALJ: Okay and, and when you say, and you, and how did you know that, that it was an issue? Was that the flow sensors?

MR. BAYER: Yes. Sometimes we see the flow censors will, will indicate that there's a, a blockage downstream or restriction downstream, and I think that's what I saw on that flow monitor, so I asked Bureau of Utilities to go out there and clean and inspect.

ALJ: Okay. So, and, is it your job then to, to watch the flow monitor sensors and, and to figure out whether you see new problems? Is, is that how it works?

MR. BAYER: Yeah, the ones that I have out in the field, yeah, we try to, we try to pass along any information like that that we get to the Bureau of Utilities so they can help their maintenance.

ALJ: Okay. So, so, okay. So, all right. That probably, you know, answers my questions on, on those. There were some, also some information, I guess, through evidence and, again, you weren't here.

It's not really fair to you to, I mean, I'm just highlighting for you that, that there was evidence produced that, that indicated that, at least the Protestants believe that there should be relief sewers installed, like down here

where it says 20767, to 20766. And then even on the next page over here at the top. You know, different size relief sewers. It, it, but it, was that something that was completed or did that even need to be done in the first place?

MR. BAYER: It was not completed and then yes, you bring up a good question, does it need to get done in the first place. So, that was, we go back and look at that model calibration summary table, where it indicated, I think, in these locations that there was some relief sewer necessary.

But again, we questioned that because of the over predicting that we were seeing in that table 5-3.1. So, when we have low confidence, we like to try to confirm before we move forward with anything.

ALJ: And so, you're still confirming?

MR. BAYER: I have meters out there and then, yep, we're watching, we watch to see if there's any kind of issues, so.

ALJ: Watch to see if there are issues, okay. And so, really that's, that's the game plan from here is, is watching the flow sensors, monitoring those and seeing what data you collect from that. And then you decide whether or not you're going to need relief sewers?

MR. BAYER: Yes, and then what we'll do is, we'll do an I&I analysis once we get all that data so we can try to find out if there's an area that is contributing a lot of extraneous

flow. And then also, we also are looking for, when we did those, we do those flow isolations in the middle of the night, we're looking for areas that are segments of pipe that are very leaky. So, there's a couple different tools that we use to keep an eye on things.

ALJ: Okay. But even with that, so the, you know, this flow sensor monitoring is ongoing. Is it, can you, sitting here today though you feel comfortable that, or do you, or can you tell me whether you do, that if this property is hooked up to this sewer, and these, saying that these Hopkins segments, keep calling them Hopkins segments, get repaired and the developer here does the first, the two that they have to do, you know.

But the rest of it are, you have any concern that hooking up this, these proposed houses to this sewer line as shown, that it would not be a problem or are you comfortable with that or what?

MR. BAYER: I'm not seeing anything on my flow monitoring that's concerning right now, but that doesn't mean I won't see something in the future.

ALJ: Okay. So, right, obviously that in the future there could always be something. But I just was curious as to, you know, at least as you see it today, sitting here today, is there any issue that you see?

MR. BAYER: Like I said, I'm not seeing anything in

that flow path there that we ran a couple minutes ago.

ALJ: Okay and then the other issue that I guess Mr. McCann showed you those photos of that lid that came off.

MR. BAYER: Yes.

ALJ: In the Jones Falls, that's down here, again, I'm just a visual person so I like to look at all these things. So, you know, with that, did, did, was work, did, did work take place to try to correct that problem? What, and so it, is there any concern that you have having seen those photos with this project?

MR. BAYER: Not with the project, but yeah, I was very concerned, so I immediately directed some staff to go out there and put that lid back on because that's a safety issue. I didn't want someone to get hurt. So, he went out there immediately after I got that e-mail and put the lid back on and locked it. It's a particular type of lid, so it needs to be locked.

ALJ: Understood. So, but for this particular project, does the fact that you saw those lids off in that Lake Roland, in that area, does that have any concern that the, you know, the sewage, again, from this project, would not be able to flow safely?

MR. BAYER: There was a concern, so I have sensors all the way down to the Jones Falls pumping station in Baltimore City.

ALJ: That's down here, right?

MR. BAYER: Yes, it goes way down, miles or so down into the City, along the Jones Falls interceptor in the City and all the way up into, into this area, so --

ALJ: So, you add, did you say you added sensors because of this?

MR. BAYER: No, no, no. I'm just saying I've had sensors in there for about a year.

ALJ: Oh.

MR. BAYER: All the way down to the City's Jones Falls pumping station. So, and this is a preliminary review of that January 13th storm, I think, showed that the wastewater was backing up all the way from the City back up into the County. Every one of my sensors or meters down below. So, again, that's just a preliminary review of what it appears might have happened.

ALJ: Okay.

MR. BAYER: So, to answer your question, I'm concerned, yeah.

ALJ: Well, you, you were concerned and so what you do is, what do you do then as a result of that concern?

MR. BAYER: Well, like I said, preliminary review is I, I looked at the information I was getting from all those meters, all the way down to the City's Jones Falls pumping station.

ALJ: And you just keep going, gathering the information and then, so then at what, is there a breaking point at one point where do you say, you know, there, something has to be done or, or you just, how long does it take?

MR. BAYER: Well, as I said, it's just a preliminary analysis so far. What, what is occurring is Baltimore City has some issues at their Jones Falls pumping station and they need to install some equipment and I think that that's part of the problem is the station wasn't able to pump as much as it possibly could, resulting in a backup into the County. But again, this is just a preliminary review.

ALJ: Yeah.

MR. BAYER: But that appears as, as what's happening is the City's Jones Falls pumping station is struggling to keep up.

ALJ: Okay, okay.

MR. BAYER: And then to, to ask you what we, what happens moving forward is hopefully the City is going to complete their improvements sometime in June, is what I've heard. And we'll continue to monitor and see if they're effective in their improvements.

ALJ: Okay, all right. But from your experience, you believe that these flow sensors, the flow monitors, I keep calling them sort of the same thing. Obviously, you're, you know, but using those is giving you a better picture of what is

going on and you just want to continue to look at that and gather that data?

MR. BAYER: Oh, yes. It gives us great information on how it, how, how the sewer system responds to wet weather, which is what we're really trying to figure out.

ALJ: Okay, understood. All right. That's all the questions that I have. You've been very patient with us. Most of your, most of your day today has been taken up with, with, with this, this, this case. We do appreciate it. Let's see. What's that?

MR. BAYER: I was just going to say, hopefully I answered all your questions as best I could, hopefully.

ALJ: Yeah, thank you very much. All right. So, Mr. McCann, you're going to e-mail over the, the pictures that you have and you're also going to drop off a copy of those pictures, that's 110. You might want to do a, revise an exhibit list as well. And so, this is due, my Order is due in thirty days from today, all right, everyone? Just trying to give everyone a heads up.

MR. MCCANN: Are we, are we submitting anything to you, Judge?

ALJ: Do you all need to? Would you, would you like to?

MR. MCCANN: As much as I don't want more work, I think it's, I think it's necessary. We, I, we can do it, I can

do it as soon as possible and, you know, not, not make it long. But I think it needs to be briefed, at least from my side anyway. So, if, if you're okay with that, I can suggest a date that will allow you time to do what you have to do.

ALJ: All right. Well, Mr. Rosenblatt?

MR. ROSENBLATT: Yeah, I mean, I was going to say we don't need it, we wrote sixty, seventy-page memos already. But if they're going to write one, we're going to write one.

ALJ: Mr. McCann does indicate that he wants to do that so, so what day would then work for you all, because I was counting the days and the Motion, or the Order would have been due end of March, if you count thirty days from today, which is under our rules, that's what it is, the Order has to be done. But I can leave it open to get your memos.

MR. MCCANN: Yeah, I mean, part of the problem is, Your Honor, kids' spring break is, you know, the 9th through the 16th, so.

ALJ: Yeah, you and I have the same spring break, (inaudible).

MR. MCCANN: Yeah, and I, there's no way I can get it done between then, now and then, unfortunately. But the, the week after. So, the week of the 18th at some point later in that week.

ALJ: All right. The 22nd, Friday?

MR. MCCANN: That's as good as any day, yes, thank

you.

ALJ: Mr. Rosenblatt?

MR. ROSENBLATT: Yeah, I mean, that's plenty of time. Do we want to put a page limit on what we submit?

ALJ: I don't, I don't, I don't like page limits. I don't know. I mean, what's, you know, what do you do then? Reduce the font size, expand the margin?

MR. ROSENBLATT: No, no, trying to save work on --

ALJ: I know.

MR. ROSENBLATT: -- on all sides --

ALJ: I know. Well, this isn't the Circuit Court, so I get you. But I, you know, I tend to go on and on, I always so, I'll let you guys do what you need to do, whatever you think you need to do. But, all right. We'll say the 22nd of March memos are due. We always say 3:30 because that's just end of the day to, to file those by e-mail and then drop off a copy. And I'm just assuming, I guess, Ms. Demillio, you're welcome to also do it if you'd like.

MS. DEMILLIO: I'm sure our office will have a memo--

ALJ: Okay.

MS. DEMILLIO: -- (inaudible) for the 22nd.

ALJ: Twenty-second, all right. And then, Mr. Wyatt, you're also welcome, if you feel like it, Mr. Sachse, you know you're both welcome to as well if you feel like it. I don't know that you all did last time, is what I'm trying to

remember. I don't think so, I'm trying to remember. Maybe you did. But in any event, both of you are also welcome. Okay. Anyone, anything else?

MR. MCCANN: No, thank you, Judge.

ALJ: All right. Thank you, all.

MS. DEMILLIO: Thank you. Thank you.

MR. WYATT: Thank you, Your Honor.

ALJ: All right, thank you.

[OFF THE RECORD]

CERTIFICATE OF TRANSCRIBER

I hereby certify that the hearing in the matter of Greenspring Manor, 2310 W. Joppa Road, case numbers 08-0922 and 2021-0250-SPH, heard before the Office of Administrative Hearings for Baltimore County, February 26, 2024, was recorded digitally.

I further certify that, to the best of my knowledge and belief, page numbers 1 through 132 constitute a complete and accurate transcript of the proceedings as transcribed by me.

I further certify that I am neither a relative to nor an employee of any attorney or party herein, and that I have no interest in the outcome of this case.

In witness thereof, I have affixed my signature this 11th day of March 2024.

Christine R. Leary

(ON RECORD)

ALJ: Good morning, everyone. Calling case number 08-0922 and 2021-250-SPH. This is the property address at 2310 West Joppa Road. And you're attending the Motion for Reconsideration hearing for the Order on the combined development plan and zoning case known as Greenspring Manor. And we're going to have counsel introduce themselves for the record, beginning with the Developer.

MR. ROSENBLATT: Good morning, Judge Murphy. Adam Rosenblatt and Chris Mudd of Venable, LLP on behalf of the Developer and Petitioner.

ALJ: All right. Mr. McCann?

MR. MCCANN: Good morning, Judge. Michael McCann on behalf of the Protestants.

ALJ: Mr. Wyatt? You're muted.

MR. WYATT: Yeah. Good morning, Your Honor. Michael Wyatt, I'm an adjoining property owner.

ALJ: All right. And Ms. Demillio, you're here for Mr. Zimmerman? Yep, you're muted. I just unmuted you. Can you hear me?

MS. DEMILLIO: Yes, I can. Good morning, Judge Murphy. Good to see you.

ALJ: Good to see you. All right. And you're here for People's Counsel.

MS. DEMILLIO: Yes.

ALJ: All right. I think that's everyone. All right. So, let's see. We are here on the Motion for Reconsideration hearing in that it's a limited hearing as outlined in the Order that was dated September 25th, 2023. And so, I know that Mr., I guess Mr. Mudd or Mr. Rosenblatt, have a witness to present or two.

Before we get to that, let me do this. I believe everyone on, it looks like on Friday afternoon, we all received an e-mail from the County Attorney, I believe. And so, I just wanted to start with that. Sorry. I'm just having a minute to open it and see if this works. For some reason it's putting up, try again. There we go, okay. All right.

So, just to, just so we can get, I guess, just the beginning here. We all got this e-mail. It looks like it was, it was dated Friday, and this was at 1:16. And it looks like everyone received it. I guess counsel of record received it. And it, attached to this e-mail was a letter from the County Attorney, which I'm now pulling up, is also on the screen and hopefully you all can see that. Can you all see that?

MR. ROSENBLATT: Yes.

ALJ: All right, great. And so here, this is the letter and I, I wasn't going to read it, but I think maybe everyone hopefully has had a chance to read it. It has to do with the, it looks like the, the sewer line and really the MOU that really formed a basis for a lot of the comments that came

in from the County on this case.

And so, this, this document, obviously, it shows, you know, it indicates that the, the MOU has expired. It expired in, looks like in, it was a September 27, 2017 MOU.

It expired and it looks like the County is in the middle of trying to negotiate a new MOU for the sewer segments that were, you know, there was, I guess, just express information from the County, from DPR, from DPW&T, I should say, that indicated that, you know, this was a, that these were, Hopkins was supposed to fix it and whatever, I'm not going to go through it and read it.

But it looks like they're going through there and they're, they're negotiating now a new MOU. And so, I, you know, I appreciate this letter that, that we received, that actually highlights some of the information and really kind of, in contrast, to some of the information that we had.

Here's the Memorandum of Understanding. I'm just showing it on the screen. This was referenced in the letter. In 2017, it has attachments to it. It shows what the land was, the pavilion that Hopkins was building at the time. And it also shows, you know, that there were sewer improvements. And so, there was an agreement here, under this MOU, who was supposed to do what.

But in summary, it was really, it looks like and, and everyone can read it in their time. But a coordinated effort

between the County and Hopkins to actually make these improvements, which are listed, referenced in Exhibit C, which is attached again. And so, there were specific things that each one was supposed to do.

But basically, it was a coordinated effort between the two. And, and, but I guess, what the County Attorney highlighted in his letter here for all of us, just to make clear, that what, that the use and occupancy permit, I guess, was one of the issues and the suggestion was that, you know, that, that the use and occupancy permit shouldn't have been issued, the, if the sewer improvements weren't completed.

But, in fact, what this MOU indicates, and what the County Attorney's letter indicates, that, in fact, the occ, use and occupancy permit could have been issued and should have been issued and was issued regardless of whether the improvements were done.

So, this, this document and, and this MOU in this letter, with the attachments, you can see it was signed, this was the prior administration, because Mr. Homan signed it and it looks like Steve Weber was the, was the Director of the Department of Public Works at the time.

And, and here are the attachments. And so, these are, I mean, you don't really need these, but you can see them, they're hard to read. But essentially, these are the ones that are referenced in the letter that he sent all of us.

So, in any event, I was going to make this, because this kind of, you know, gives us a, a bigger scope of just an understanding of the sewer system, I'm going to make this County Exhibit, I think we left off on, this should be fourteen. Make this an exhibit in our, in our case. So, this will be County exhibit number fourteen. And so, I just wanted to kind of put that out there before we got started today. And with that, let's see.

The next thing would be, on my list would be that Mr. Rosenblatt or Mr. Mudd, you all were going to provide a blue lined development plan and you did that, I see, back in January. And that is, you said marked as Exhibit 1-C. And so, I just wanted to note for the record we received that blue lined plan, it has to do with the emergency gate. And so, we actually are admitting that. And the Order indicates that we're not taking testimony on that, we're just admitting that in evidence.

MR. MCCANN: Your Honor, Your Honor, --

ALJ: So, --

MR. MCCANN: -- may I be heard on both of those issues?

ALJ: Okay, sure.

MR. MCCANN: Yeah, there's a lot here. It looks like you've already, with respect to the letter from Mr. Benjamin, it looks like you've already looked at it. But, and I do have

a lot of respect for Mr. Benjamin. I, I work with him often. But I, I think the admission of this letter at this time, after the hearing has closed, is, is really highly inappropriate. This, the County, if it wanted to chime in on any of this, it had plenty of opportunity to do so.

In fact, I think the record would reflect that someone from Mr. Benjamin's office has attended I don't know every day in this hearing, but has certainly been attending the hearings in this matter. So, this could have been submitted months ago. It could have been raised on the very first day of the hearing when the issue of this, Johns Hopkins segments first came up. So, I think for that reason alone it shouldn't come in.

It's new evidence and, you know, I've had conversations with counsel for Johns Hopkins, so I can surmise what's behind all this. But I don't think we need to get into that. But what I would say is I, I think it's absolutely irrelevant anyway. I think as Your, Your Honor's opinion makes clear, it doesn't matter, he, he addresses a number of things.

He addresses who is responsible for submitting plans, who is responsible for the permitting. You know, you described it as a coordinated effort. That may all be well and good, but it doesn't matter at all. The bottom line is that these sewer segments, as we sit here today, as we sat here on the first, very first day of this hearing, have not been replaced. And

they haven't been. So, it doesn't matter, at all frankly, whose responsibility it is or, or was to undertake the repairs.

And, in fact, Your Honor, you addressed this at the very end of your opinion. You said, because I guess there was some suggestion, maybe there wasn't, I don't recall specifically, whether the plan could be approved upon condition that these, what I'm calling this Johns Hopkins sewer segments, I'm calling them those, them that, Your Honor, because, just for ease of reference, there's eight of them. But what we know from the evidence that is in the record, that only six of them, of those eight were required to have been completed in connection with the Hopkins improvements.

But in any event, getting back to your opinion, you explicitly addressed this, and you said that I'm not willing, quote, I'm not willing to condition approval here on the possibility that Johns, Johns Hopkins may or may not complete that work.

And you cited the Bluestem decision, which is, as you know, I was involved in, and there was a similar condition proposed in connection with that case and you, essentially, took the position in your opinion that you didn't need to impose such a condition.

That it didn't matter whether Hopkins did or did not complete the work. You weren't going to impose that condition. And that's consistent, frankly, with the entirety of your

opinion, which you found, Your Honor, capacity problems, not just with these sewer segments, but beyond. So, I don't see any relevance, even if this was submitted on the first day as it should have been or some time thereafter, I don't see any relevance to this at all. It just simply doesn't matter.

ALJ: And you said that the law office was here in the, in the, in the hearing, who, who --

MR. MCCANN: Ms. Frankovich, Jennifer Frankovich, she was from Mr. Benjamin's office. I've noted, I, I can't say specifically, Your Honor, which day she was here, but she has definitely been here throughout the course of this hearing. And I've had conversations with her and Mr. Benjamin in connection with my multiple PIA requests. So, I think that's in part may have been why she's participating.

But, you know, again, I have a lot of respect for Mr. Benjamin. But I, I, I just think this cannot come in at this late hour.

ALJ: All right, understood. I, and I don't know Ms. Frankovich and so, I don't know whether she was in the hearing, or she wasn't in the hearing. I don't, I'm not privy to any of the conversations either, obviously, between you and Mr. Benjamin or with you and Hopkins.

I'm just reading this letter that I got that, that actually, you know, provides some background information in regard to, to the sewer segment --

MR. MCCANN: Let me say, let me just add. I'm not even sure to the extent it matters, I'm not even sure what this, you know, put aside relevance just for a moment, what, what corrections, he talks about factual inaccuracies Mr. Benjamin is seeking to advance. I mean, the state of the record right now, I think it's fair to say, is that the County has deemed that there's insufficient capacity to allow this development to go through because of these eight sewer segments.

I think, if I recall correctly, there have been random statements to the, to the effect that Johns Hopkins is to have, or was to or is to have replaced the segments. But beyond that, I'm not so sure what, what, what is inaccurate about the record.

I think, frankly, to be honest with Your Honor, and just to, you know, I'm basing this on my conversations, that this is an, is an attempt to sort of correct the record. Not our record, but some other record, as to who or who is not obligated under this now outdated or rather expired MOU. I think Hopkins is trying to protect itself, which I understand it wants to do. But this isn't the forum for that.

ALJ: Okay, understood. Understood your position --

MR. MCCANN: And I can speak to the, to the, the new development plan as well, because I think it's very much a similar issue. And that is, the evidence in this case has

closed, it was closed a long time ago. I know you ruled on the, the issue of the pass through. But you also indicated in your opinion, Your Honor, explicitly that you would not consider an amended plan showing, showing a pass through.

You said on page 109, I got the blue, blue lined plan this morning, though I didn't know it was submitted in January. But you say at the bottom of page 109, I find the green lined development plan must be denied because the proposed emergency access only gate violates DPR policy manual, etcetera. Given, moreover, given that the development proposal for May's Chapel was emergency access only and not a full access road, that proposal can only be approved or denied. The (inaudible) not rectify this policy, this policy non-compliance by changing the May's Chapel gate to a full access road in order to approve the green lined plan.

So, I think for very similar reasons, the now blue lined plan, which I got this morning, is both too little too late and is irrelevant anyway because you've already indicated in your ruling that you wouldn't consider it and wouldn't change, well, I guess your ruling or your approval or denial of the plan based on it.

ALJ: So, you read the Order on the Motion for Reconsideration though, right? Because the last part of it says that they can submit the, a, a revised version of the development plan as a separately numbered exhibit, right? And

that there would be no testimony? It's the last paragraph on the Order.

MR. MCCANN: Yeah. I do recall that.

ALJ: I just wanted to say it for the record that we had received it and that it's going to be marked as 1-C.

MR. MCCANN: Still, I, you know, I'd like to, you know, at least on that issue, that is, the, the issue of its belatedness, and its, and its relevance, frankly, I would like to preserve that objection. So, --

ALJ: Okay. Understand.

MR. MCCANN: I, I do recall now that you say it, and I apologize, I didn't recall that offhand. That you did say that.

ALJ: Yeah, right. So, yeah, that's 1-C.

MR. MCCANN: Okay.

ALJ: All right. Okay. I, and, I, you know, I don't want to open anything else up to a dialogue but I, I hesitate now, Mr. Rosenblatt, Mr. Mudd, is there anything you want to say? See, Mr. Benjamin is also here. I just, I, you know, obviously, you know, we don't want to give you all an opportunity to respond to Mr. McCann if you, if you need to.

MR. ROSENBLATT: Sure, I, I can, I'm happy to address both issues. I'm going to share my screen just for a moment, Judge Murphy. This is first, the last paragraph of your Order on Motion for Reconsideration, which you just explained allowed

the submittal of a blue lined plan and just because there's people watching, I wanted to just share that plan.

It's marked as Exhibit 1-C. And this is identical to the green lined plan in all respects except for crossing out with blue lines the note regarding the request that emergency access gate and access through the actual gate itself, is the only change to the plan. So, that is all we would say on that topic.

On the other topic, Judge, throughout, throughout this case the Developer has not taken any position on the Johns Hopkins sewer segment requirements, whether they're responsible, Baltimore County is responsible.

It's been our position throughout that we understand that those segments have to be upsize, have to be improved before any homes from this project connect to Baltimore County sewer system.

To the extent that the letter from the County attorney paints an updated and more accurate interpretation of, of where things stand, the development process is ongoing. There's case law we cite in every memo, in every opinion, the Monkton Preserve case that speaks to that.

It's an ongoing process. Months have gone by. To the extent it's helpful to have an up-to-date interpretation of where things stand, we obviously have no objection to that. The point today is to, is to provide information from Baltimore

County because you've heard only from experts on one side and another side about sewer issues. So, that's, we think that if the letter helps in any way, it's, it should be admitted for, into the record and considered as, as you see fit.

MR. MCCANN: Your Honor, may, quickly, I'm sorry. The standard isn't whether it helps you or not. This is an evidentiary proceeding, and the record is the record. It closed. This is not an ongoing development process that allows up until the day you make your decision to add additional, and believe me, believe me, I could add additional sewer evidence today as we speak. So, by that, by that argument, all that could happen today.

But the other thing I wanted to mention is, is the, the, the plan in any event, the blue line plan now, is moot. It doesn't matter. Your Honor has already denied the plan on the independent ground that the intersection is failing, and the Developer did not meet its burden of proving a Petition for Special Variance.

The development plan is denied, period. And this plan does not change that. And frankly, nor do the proceedings today. So, the, the plan is moot. And shouldn't be admitted for that additional reason.

ALJ: Okay, all right. Thank you. Mr. Benjamin, you didn't want to say anything, did you? I wasn't sure if you were just observing.

MR. BENJAMIN: I am observing but I did want to clarify a couple of things, if I may, Your Honor.

ALJ: Sure, absolutely.

MR. BENJAMIN: One, with regard to the, and by the way, I appreciate Mr. McCann's kind words. We do hold each other in very high regard, so I do appreciate that. But with regard to the representations as to Ms. Frankovich, she was merely observing, she wasn't participating in the prior hearing. She was observing the hearing.

And then also too, again, the reason why the letter was written was just to provide clarifications that we thought were necessary for purposes of the record that were developed earlier. Whether or not it's to be used as evidence, that's certainly Your Honor's call. But we were just simply trying to clarify the record for Your Honor, as well as counsel of record. That's all I wanted to say. And then I will go back to observing.

ALJ: Okay, thank you.

MR. BENJAMIN: Thank you.

ALJ: All right, great. Well, I mean, this is an administrative hearing and, and I do think that the, the information provided by Mr. Benjamin in his letter, as I said, is going to be County exhibit number fourteen.

And, and I do think it does add to clarify some of the inaccuracies, namely, there are references in the concept

plan comments, or the development plan comments, different documents that were submitted by both Protestants, I think, actually just the Protestants, that indicated that, you know, for example, an UNO should never have been given by the County for, to Hopkins.

And that, you know, essentially, the project was (inaudible). This actually adds light to that. It actually gives more clarification to, to that, that issue. And so, again, that will be County fourteen. And so, this, we are now going to proceed with, there is a witness, I think, Mr. Rosenblatt or Mr. Mudd, you're going to call today?

MR. ROSENBLATT: Yes, that's correct.

ALJ: All right.

MR. ROSENBLATT: We have Dave Bayer is here.

ALJ: All right. Mr. Bayer, I see you. All right. You unmuted yourself. Good morning.

MR. BAYER: Good morning.

ALJ: All right. I've never, I've never met you before. I've seen your name on things. Looks like you're in your office.

MR. BAYER: I am.

ALJ: Surrounded by paper, piles of paper.

MR. BAYER: I am.

ALJ: All right.

MR. BAYER: That's not mine. That paper belongs to

Baltimore County.

ALJ: Oh, it belongs to Baltimore County, okay. All right. Well, listen, I need to swear you in, so if you could raise your right hand, please? Do you swear and affirm under penalties of perjury, the testimony you're about to give is true and correct to the best of your knowledge and belief?

MR. BAYER: I do.

ALJ: All right. Mr. Rosenblatt or Mr. Mudd?

MR. ROSENBLATT: Yes, Mr. Rosenblatt. Thank you.

ALJ: All right, sure.

MR. ROSENBLATT: Good morning, Mr. Bayer.

MR. BAYER: Good morning.

MR. ROSENBLATT: Can you explain, what is your position with Baltimore County?

MR. BAYER: I'm a project engineer in the Sewer Design Section (inaudible) Construction and Department of Public Works and Transportation.

MR. ROSENBLATT: Okay. How long have you had that job?

MR. BAYER: About twenty-two years.

MR. ROSENBLATT: Were you with the Sewer Design Section for all twenty-two years?

MR. BAYER: Yes, yep.

MR. ROSENBLATT: And before that, did you have any other job with Baltimore County?

MR. BAYER: I did. I was in the Development Plan Review Section for about ten years.

MR. ROSENBLATT: Can you just describe your general duties and responsibilities, a couple sentences about what you do?

MR. BAYER: Actually, reviewing and designing capital improvement projects for Sewer Design Section.

MR. ROSENBLATT: Do you have, in terms of education, do you have a Bachelor's degree in Engineering?

MR. BAYER: I do, yes.

MR. ROSENBLATT: Do you have any other type of degree in engineering?

MR. BAYER: A Master's, a Master's degree in Environmental Pollution Control.

MR. ROSENBLATT: And have you, you've worked for Baltimore County for over thirty years?

MR. BAYER: Yes.

MR. ROSENBLATT: How often on a day to day basis in your job are you dealing with issues relating to Baltimore County sewer system?

MR. BAYER: Every day.

MR. ROSENBLATT: Were you subpoenaed to testify at this hearing?

MR. BAYER: Yes.

MR. ROSENBLATT: Have you ever testified at a

development plan hearing before?

MR. BAYER: No.

MR. ROSENBLATT: What did you do to prepare for this hearing?

MR. BAYER: Gathered my information and read, and read the testimony.

MR. ROSENBLATT: Okay. Did you, did you meet with me?

MR. BAYER: Yes, I did.

MR. ROSENBLATT: Was your attorney present?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Mr. McCann or Mr. Zimmerman or any other lawyers in the case ask to meet with you?

MR. BAYER: No.

MR. ROSENBLATT: Okay. I'm going to go through some of the exhibits that were presented in this case and just ask you some questions about them. So, starting with Protestant's Exhibit 65, the Consent Decree. And I want to ask you, Mr. Bayer, what was your involvement with the, with the Consent Decree from 2005?

MR. MCCANN: Objection, Your Honor. Your ruling was very specific. It says, quote, a hearing will be conducted to consider testimony and/or documents from DPW representatives or representative regarding the sewer path from the subject property.

ALJ: Um hm.

MR. MCCANN: So, I suspect what we're getting into now is what Mr. Bayer does or does not believe the County's obligations are under the Consent Decree. And I think that's, number one, it's beyond the scope of your ruling, which was very limited. I think purposely so.

And number two, this gentleman is a project engineer. He's, he's, he does not hold a leadership position, so the extent, to the extent he's going, he's purporting to speak on behalf of the County, I think that's problematic as well. But more importantly, I think this is beyond the scope of your ruling.

ALJ: Well, we don't --

MR. MCCANN: In fact, in fact, I don't even think, just to --

ALJ: We're not going to know until he asks the question. I mean, the, this Consent Decree was put in by you all and it has to do with, with the sewer line. I mean, I don't, I don't know where, where the question is going, so let's see where it goes.

MR. MCCANN: Fair enough. I thought I heard a question about, about the substance of the Consent Decree. So, before, I did, I thought I did hear a question, maybe I --

ALJ: It could be, it could just be background information but over, overruled. We're, we're going to let

him, go ahead and ask the question, Mr. Rosenblatt.

MR. ROSENBLATT: Judge, to, to prevent what may be constant disruption of flow, there are a number of exhibits submitted by Mr. McCann in this case all talking about the Jones Falls sewer shed, all relating to the path of sewage from this property down to Baltimore City. And Mr. Bayer, as you'll hear, is going to testify to his understanding of what a lot of these documents mean with respect to the sewage that is proposed from this project.

MR. MCCANN: The fact --

MR. ROSENBLATT: And it's all directly related to your Order and sheds light on the issue from the County's perspective.

MR. MCCANN: The, the fact that these exhibits are in evidence doesn't mean he gets to speak about them.

ALJ: Okay. I, I, I appreciate both of your positions. Overruled. Go ahead. Ask your question.

MR. ROSENBLATT: Okay. Mr. Bayer, what was your involvement with the Consent Decree, Pet, or Protestant's Exhibit 65?

MR. BAYER: From day one, we began negotiating with the Department of Justice, EPA and, and MDE.

MR. ROSENBLATT: Are you generally familiar with the Consent Decree and its requirements?

MR. BAYER: Yes.

MR. ROSENBLATT: Is this --

MR. MCCANN: Your Honor, may I have, again, I don't want to interrupt Mr. Rosenblatt, but I have to preserve my objection. May I have a continuing objection about, at least about this document, and I'll try not to interrupt again, all right?

ALJ: Yes, continuing objection.

MR. MCCANN: And any questions regarding his involvement in it.

ALJ: Yes, you can have a continuing objection.

MR. MCCANN: Or understanding of it.

ALJ: Okay, continuing objection. Thank you. Understood. I understand you want to preserve your objection for the record. I understand, Mr. McCann.

MR. MCCANN: Thank you.

ALJ: Thank you.

MR. ROSENBLATT: So, I'll ask you again, Mr. Bayer. Are you generally familiar with the Consent Decree and its requirements?

MR. BAYER: Yes.

MR. ROSENBLATT: Do you interpret and look to this document throughout your regular course of work?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay. Does the Consent Decree require Baltimore County to fix the sewer system to meet any

specific level of storm?

MR. BAYER: No.

MR. ROSENBLATT: Does it specifically exclude such a requirement?

MR. BAYER: Yes.

MR. ROSENBLATT: Did the Consent Decree require Baltimore County to prepare an SRRR plan?

MR. BAYER: It did, yes.

MR. ROSENBLATT: And did the Consent Decree require Baltimore County to prepare an LTC, long term capacity, report?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Baltimore County hire RK&K as a consultant to prepare these reports for the Jones Falls sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: Show you what's been marked as Protestant's Exhibit 68. The LTC report by RK&K. Are you familiar with this document?

MR. BAYER: Yes.

MR. ROSENBLATT: What is the purpose of this document?

MR. MCCANN: Same objection, Your Honor. And also, that question in particular, what's the purpose of the document, I, I have a problem with that for, I guess, additional reasons --

ALJ: All right, overruled. You can cross examine him on those points.

MR. MCCANN: Okay, thank you.

MR. ROSENBLATT: Go ahead, Mr. Bayer. What is, what was the purpose of developing this long-term capacity report?

MR. BAYER: To evaluate the impacts of dry and wet weather on the sewer system.

MR. ROSENBLATT: Does this report require any specific improvements?

MR. WYATT: Objection, Your Honor. The report would speak for itself.

ALJ: Okay. Mr. Wyatt?

MR. MCCANN: And these questions are also leading, Your Honor. And this is, this is classic, the classic hearsay objection that I get. Does this document say X? I get that all the time from Mr. Rosenblatt.

ALJ: That is true. You do get that objection a lot.

MR. MCCANN: Mr. Rosenblatt and Mr. Mudd. So, and I, listen, I understand while we want to cut to the chase here, but I think that is a loaded and hearsay question.

MR. ROSENBLATT: And again, this, these are issues that, if there's going to be constant objections, it's just to disrupt flow here, Your Honor. This is --

MR. MCCANN: It is not. Jesus.

ALJ: Okay, all right. All right, all right. So,

what we're going to do is we're going to let him ask his questions. It's overruled. But, Mr. Rosenblatt, please, you know, don't lead him through the questions. Again, he's a County witness so if you could please just ask him the questions.

MR. ROSENBLATT: And, and he is, Judge, to that point though, he is a County witness, just like the witnesses that--

ALJ: Right.

MR. ROSENBLATT: -- (inaudible) at the beginning of the case.

ALJ: Correct, right. And Mr. Wyatt and Mr. McCann will both have the opportunity to cross.

MR. ROSENBLATT: Right, okay. So, did RK&K model Baltimore County sewer system under five separate storm events, Mr. Bayer?

MR. BAYER: Yes.

MR. ROSENBLATT: And are there maps at the conclusion of this report that show the results under each of the modeled storms?

MR. BAYER: Yes.

MR. ROSENBLATT: Are you familiar with what was marked as Protestant's Exhibit 67, the SRRR plan, prepared by RK&K?

MR. BAYER: Yes.

MR. ROSENBLATT: What is, what is the purpose of, of

the SRRR plan?

MR. MCCANN: Objection. Standing, please.

ALJ: Yeah, you have a continuing objection.

MR. MCCANN: Thank you, Judge.

MR. BAYER: To evaluate the, the sewer system and prepare any corrective actions necessary.

MR. ROSENBLATT: Did RK&K adopt all of the improvements for all of the storms that were modeled and identified in the LTC report?

MR. BAYER: Did they adopt? I don't know, could you ask me that question again?

MR. ROSENBLATT: Sure. So, we, we showed the five different maps contained in the LTC report. Does this SRRR plan require all of the improvements to address all of the issues that were modeled under the five different storms?

MR. BAYER: No, --

MR. MCCANN: Objection, leading.

ALJ: Overruled.

MR. BAYER: No.

MR. ROSENBLATT: What storms did Baltimore County select for the purpose of determining what improvements to make to its sewer system?

MR. BAYER: We evaluated all five and, and we wanted to normalize across all sewer sheds, so we looked at the ten-year six-hour event.

MR. ROSENBLATT: And why did you choose that level storm?

MR. BAYER: Because the Maryland Department of Environment has suggested that that rainfall pattern from that design storm closely matched what's in the area. And we were cur, and we were curious to see how our system would respond during that particular rainfall event.

MR. ROSENBLATT: Did the Consent Decree allow Baltimore County to choose a level storm like the one you chose?

MR. BAYER: Yes.

MR. ROSENBLATT: Did the SRRR plan focus on measures that would reduce inflow and infiltration?

MR. BAYER: Yes.

MR. ROSENBLATT: Does the SRR plan outline repairs that are deemed necessary to eliminate SSOs in the Jones Falls sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: And were those repairs outlined in a corrective action recommended plan?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay. I'm going to show you a few maps from within this SRRR plan. Start with, pardon my scrolling, okay. Starting with map 4-2 and ask you, does the, does the SRR plan contain a map identifying areas of high

infiltration and SSOs throughout the Balt, throughout the Jones Falls sewer shed?

MR. BAYER: Yes, the SRR plan includes a map, this map that shows areas that exhibit high I&I.

MR. ROSENBLATT: Are you familiar with the path of sewage from the Greenspring Manor project down, from Joppa Road down to Baltimore City?

MR. BAYER: Yes.

MR. ROSENBLATT: And downstream from the project, were there any areas identified on this map as exhibiting high I&I?

MR. BAYER: No.

MR. ROSENBLATT: Does this map show any SSOs downstream from the path of sewage from this project?

MR. BAYER: No.

MR. ROSENBLATT: Show you another map. Okay. Map 6-1 and ask you, is this a map of the corrective action recommendations plan?

MR. BAYER: Yes.

MR. ROSENBLATT: And how would you characterize the recommended actions downstream from the Baltimore, I'm sorry, from the Greenspring Manor project, down to Baltimore City?

MR. BAYER: Hard, hard to see at this scale of the map, but I'm, I believe there were structural repairs, corrective actions that were needed to the sewer system

downstream.

MR. ROSENBLATT: Looking at the overall map, was the area downstream from the Greenspring Manor project a primary area of concern for Baltimore County?

MR. BAYER: The corrective actions were, were a concern. We wanted to get those repaired. The structure, structural defects downstream, they were a concern, yes. As well as the, the I, I&I areas that are shown in the upper righthand corner of that map.

MR. ROSENBLATT: So, is the area in the upper righthand corner, is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: And are, what type of fixes were required in that area?

MR. BAYER: In the upper righthand corner area?

MR. ROSENBLATT: Yes.

MR. BAYER: We opted to do what we call comprehensive lining effort, which is lining as much of the public portion of the sewer system as we possibly could in the hopes that that would reduce the I&I. And also correct the, the structural defects and ultimately extend the service life of the existing sewer system.

MR. ROSENBLATT: Were there any projects as significant as that downstream from the Greenspring Manor

project?

MR. BAYER: No.

MR. MCCANN: (inaudible) on this exhibit or, I'm sorry. Your Honor, the questions are so leading, I mean, Mr. Rosenblatt is not following your instruction, I mean, he just keeps asking the same questions he has on his paper, which, and essentially, testifying.

I think a witness as important as this on a Motion for Reconsideration after the hearing is concluded and he could have called this gentleman before, I think it's imperative that we stick to non-leading questions. This gentleman has something to say on the issue that you said he could talk about, then he should say it.

MR. ROSENBLATT: And he is saying it.

MR. MCCANN: No, he's not.

MR. ROSENBLATT: (inaudible) his own words.

ALJ: So, I, I (inaudible) --

MR. MCCANN: Your own words.

ALJ: -- I didn't find those questions to be particularly leading, let me say that, number one. Number two, the, you know, the Protestants could also have called Mr. Bayer. I just highlight that, I mean, a lot of the documents that were put in had to do with Mr. Bayer.

So, you could also have called him. So, that's for either party to call him and we're here on a Motion for

Reconsideration, it was granted. He's testifying in regard to the sewer path. I don't find that particular question to be leading. So, overruled. Go ahead, Mr. Rosenblatt.

MR. ROSENBLATT: Okay. Mr. Bayer, I'm now showing you what was marked as Developer's Exhibit 43, two-page document, first from Maryland Department of the Environment and second page, from United States Environmental Protection Agency. And ask you, did MDE and EPA confirm in writing that the SRRR plan developed by RK&K meets the requirements of the Consent Decree?

MR. BAYER: Yes, that letter on, on the screen right now is MDE's letter that says the SRR plans meet the requirements of the Consent Decree.

MR. ROSENBLATT: And page two, is that a similar letter from EPA?

MR. BAYER: Yeah, that's United States Environmental Protection Agency letter acknowledging that the plans, SR plans, meet the requirements of the Consent Decree.

MR. ROSENBLATT: Okay. I want to ask you some questions about the various consultants that Baltimore County hired in this case, so. Starting with RJN and ask you, did the Consent Decree require Baltimore County to conduct performance assessments for each sewer shed?

MR. BAYER: Yes.

MR. ROSENBLATT: Did Baltimore County hire RJN to prepare a report for the Jones Falls sewer shed?

MR. BAYER: Prepare, prepare the performance assessment report? Yes.

MR. ROSENBLATT: Yes, and did RJN identify improvements made under the SRR plan between 2010 and 2019?

MR. BAYER: Yes.

MR. ROSENBLATT: Show you a few maps attached to this report. So, map one, is this the same corrective action recommendations map that was contained in the, in the RK&K report?

MR. BAYER: Yes.

MR. ROSENBLATT: And then map two is entitled, sorry. (inaudible). I can't get that bottom to go away, sorry.

ALJ: Oh, it, we can't see it, we just see the map.

MR. ROSENBLATT: Oh, okay. Good. All right. Map two entitled rehabilitation completed, what does this map show?

MR. BAYER: A lining that we did and, and corrective actions, including frame seals and replacing framing covers, inflow inserts, other structural repairs.

MR. ROSENBLATT: Has Baltimore County made the improvements shown on this map?

MR. BAYER: Yes.

MR. ROSENBLATT: So, if we compare the corrective actions recommendations map, map one to the report, with the rehabilitation completed, do you know if there are any projects in the Jones Falls sewer shed that have not been completed to

date?

MR. BAYER: There are maybe four or five segments and two manholes that have not yet been, the corrective actions have not been completed yet.

MR. ROSENBLATT: Okay. Can you, can you talk to where those are located?

MR. BAYER: The Towson Run interceptor at this scale, it's very difficult for me to --

MR. ROSENBLATT: Sure.

MR. BAYER: -- say exactly where it is but. They're located on the Towson Run interceptor.

MR. ROSENBLATT: Is, and why hasn't that been completed?

MR. BAYER: We were going to try to build a relief sewer that we thought was necessary and at the time when we build the relief sewer we will use that as the bypass and then we'll be able to only impact regulated resources. And when I say regulated resources, I mean flood plain, wetlands, will only impact that one time and then we'll save money by using a relief sewer as the bypass.

MR. ROSENBLATT: Okay and is that Towson area improvement, is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: And is there another area beyond the

Towson improvements that, that have not been, an area of repair that has not been completed yet?

MR. BAYER: Not that I'm aware of.

MR. ROSENBLATT: We've, we've heard testimony in this case about Marnat Avenue. Can you explain what the situation is with Marnat Avenue?

MR. BAYER: That's an existing SSO and a sanitary sewer overflow structure that's over in the Pikesville area. Over there, if you look at JF 03206, it's over in that area, I think. And that's an existing structure that we can't eliminate because the downstream restriction and capacity is on the City property. The City hasn't completed their improvements yet.

MR. ROSENBLATT: Okay and is that downstream from the Greenspring Manor project?

MR. BAYER: No.

MR. ROSENBLATT: RJN's report contains an executive summary at the outset. Have you reviewed this document in its, in total?

MR. BAYER: A while ago, yes.

MR. ROSENBLATT: Okay. Did RJN find the rehabilitation performed and relief sewers constructed to be effective?

MR. BAYER: Yes.

MR. MCCANN: Objection, leading. Particularly since

he read it so long ago. Did it find X?

ALJ: Okay. Overruled. Go ahead.

MR. ROSENBLATT: Okay. Mr. Bayer, I want to ask you about the Hazen report. So, did Baltimore County hire Hazen as a consultant in 2022?

MR. BAYER: Yes.

MR. ROSENBLATT: And what was the purpose of Baltimore Count hiring Hazen in 2022?

MR. BAYER: They wanted them to do a comprehensive evaluation or a needs analysis.

MR. ROSENBLATT: Was it to identify short term or immediate improvements that were required to the system?

MR. BAYER: Mostly long, medium and long term.

MR. ROSENBLATT: What, what type of long term, what, what level outlook? How many years out in the future?

MR. BAYER: I think we had a fifty-year planning horizon.

MR. ROSENBLATT: The, is Hazen to make maintenance recommendations to Baltimore County?

MR. BAYER: I don't know about recommendations. They may offer strategies or options or alternatives.

MR. ROSENBLATT: Well, will the Hazen report help with future allocation of funding to specific sewer projects?

MR. BAYER: It, it might be a benefit, yes.

MR. ROSENBLATT: Will this report identify actions

that will require immediate fix before any connections are made to the Jones Falls sewer shed?

MR. BAYER: No.

MR. ROSENBLATT: And is there a final report from Hazen at this time?

MR. BAYER: For the comprehensive evaluation or the needs analysis? No.

MR. ROSENBLATT: Okay. I want to talk to you about the Ramboll report from June 2022. Did Baltimore County hire, hire Ramboll for a Lake Roland sewer rehabilitation project?

MR. BAYER: Yes.

MR. ROSENBLATT: And what was the purpose of hiring Ram, Ramboll?

MR. BAYER: We wanted a consultant on board that could help us with some design for some rehabilitation, (inaudible) the sewers in that Lake Roland area.

MR. ROSENBLATT: Did Baltimore County pursue this report because of concerns about capacity in the Jones Falls sewer shed?

MR. BAYER: No, we had seen, we finally got a good look at the interior, the inside the, the interceptor underneath the lake and we saw some corrosion which concerned us, and we felt we should be pro-active and try to initiate a rehabilitation project to take care of that corrosion.

MR. ROSENBLATT: So, was, was the purpose of

obtaining this, of, of retaining this consultant and this report related to the capacity of sewage in the Jones Falls sewer shed?

MR. BAYER: No. The benefit would be from the lining could be as increased capacity.

MR. ROSENBLATT: And does this Ramboll report, does it identify issues that must be corr, corrected before any new homes or fixtures are connected in the Jones Falls sewer shed?

MR. BAYER: No.

MR. ROSENBLATT: So, why did Baltimore County, why did you seek this analysis?

MR. BAYER: Like I said, we wanted to correct the, the corrosion that we saw on the interior of that Lake Roland sewer.

MR. ROSENBLATT: Would adding sixty homes to the Jones Falls sewer shed have any effect on this project?

MR. BAYER: No.

MR. MCCANN: Objection. That's an expert question that I don't think this gentleman is qualified to answer or has been qualified to answer.

ALJ: Sure, it is. He's, that's in the scope of his employment, what he does every day.

MR. MCCANN: It is --

ALJ: Sure, it is.

MR. MCCANN: I didn't, I didn't catch that, that he

does --

ALJ: Sure, it's in the scope of what he does every day. He's in the Sewer Design Section, he's a project manager and so the question, no, the question is within his scope of expertise. Overruled.

MR. ROSENBLATT: Take a break from documents for a minute. Mr. Bayer, are you aware, since the Consent Decree was entered into, how much money has Baltimore County spent on Consent Decree and non-Consent Decree projects to make repairs to the Jones Falls sewer system?

MR. BAYER: That's, the construction costs that we've got since the Consent Order, probably would be a little bit more than $25 million. And that's just the construction, that doesn't include design costs or anything else like that.

MR. ROSENBLATT: Okay and how many SSOs were there County wide when the Consent Decree was first entered into?

MR. BAYER: Forty-four structures, I believe.

MR. ROSENBLATT: How many have been eliminated since?

MR. BAYER: Thirty-four structures have been eliminated.

MR. ROSENBLATT: And so, ten remaining. How many of the ten remaining require Baltimore City improvements to fix?

MR. BAYER: Four require Baltimore City's assistance.

MR. ROSENBLATT: And of the ten remaining, how many are in the Jones Falls sewer shed?

MR. BAYER: One, that's the Marnat.

MR. ROSENBLATT: Just Marnat Avenue?

MR. BAYER: Yeah.

MR. ROSENBLATT: I want to talk about your bureau's involvement with development projects. So, when, when a project is first proposed, is your bureau often asked to analyze a proposed development to see if the sewer system is sufficient to handle a proposed project?

MR. BAYER: Yes, we evaluate all proposed subdivisions.

MR. ROSENBLATT: And I'm going to show you what was marked as Developer's, or sorry, Protestant's Exhibit 55 in this case. And ask you did, did Matt Bishop reach out to Lisa Eicholtz asking that question?

MR. BAYER: That's what that e-mail appears to do, is ask Lisa for some information on the capacity.

MR. ROSENBLATT: Okay and if we scroll up to the first page of this Exhibit 55, did Ms. Eicholtz copy you in responding to Mr. Bishop?

MR. BAYER: Yes.

MR. ROSENBLATT: Okay and did Ms. Eicholtz identify the eight sewer segments that we have spoken about, six referring to Johns Hopkins and two additional sewer segments as needing repair?

MR. BAYER: Yes.

MR. ROSENBLATT: Does Baltimore County use a model to conduct this analysis when people ask the question can the sewer system handle my additional project?

MR. BAYER: Yes.

MR. ROSENBLATT: Let me show you what was marked as Protestant's Exhibit 4, sorry, Protestant's Exhibit 64. And ask you is this the model that was used in this case?

MR. BAYER: Yes, that's our old, what we call the SS Cap model, yes.

MR. ROSENBLATT: Okay. I just want to ask you, does this, does this model only account for dry weather?

MR. BAYER: No.

MR. ROSENBLATT: What, I'm looking at all these columns. Where would you point to show that it, that it does not just account for dry weather?

MR. BAYER: It's been my understanding that in, that infiltration column, that infill column that you see there, includes extraneous flow, which would be infill, and infiltration.

MR. ROSENBLATT: Okay. So, the inflow column has all zeroes?

MR. BAYER: Yeah, it's my understanding that we combined the extraneous flow and filtration and inflow together and it's placed in that inflow column.

MR. ROSENBLATT: And would you, would you say that

that infill column accounts for wet weather?

MR. BAYER: Yeah, it was, yes, it was our best guess at what we thought the wet weather impacts would be.

MR. ROSENBLATT: Is Baltimore County working on a new model to evaluate projects?

MR. BAYER: Yes.

MR. ROSENBLATT: Is the model finished yet?

MR. BAYER: Not yet.

MR. ROSENBLATT: Were you able to use the model to, to evaluate this project?

MR. BAYER: This project?

MR. ROSENBLATT: Yes.

MR. BAYER: The Greenspring Manor project?

MR. ROSENBLATT: Yes.

MR. BAYER: Yeah, I was curious to see --

MR. MCCANN: Objection. Objection, Your Honor.

ALJ: What's your objection?

MR. MCCANN: Now we're getting way afield. We have a model that was used to, for the County's comments on this particular project. Apparently the County has a new model that hasn't been finalized but he's going to now tell us what this new model has to say.

This is, this is new evidence. This isn't, this isn't clarification, which is what the subject of your Order is, as to the County's position as, on the sewer path. This is

new evidence that Mr. Rosenblatt is seeking to introduce.

ALJ: Okay. I didn't hear it that way, so overruled. Go ahead.

MR. ROSENBLATT: Mr. Bayer, did you run your new model with respect to the Greenspring Manor project?

MR. BAYER: Yes.

MR. ROSENBLATT: And did you run the model --

MR. MCCANN: I would, again, interrupt. I'm going to ask for a continuing objection on this.

ALJ: Okay.

MR. MCCANN: This is absolutely new evidence --

ALJ: You have a continuing, you have a continuing objection. It is a Motion for Reconsideration hearing. He is here, he's never testified in the case before. So, he's going to have new information by just, you know, as, as (inaudible)--

MR. MCCANN: I, I hope that works both ways, Your Honor. I hope it does.

ALJ: Well, I'm just saying, he's going to have, he's going to have, he can't not have new information because he's, he hasn't been in the hearing before, you know, but again, either party could have called him and probably would have been helpful to everybody if Mr. Bayer had come earlier maybe to go through some of this stuff. So, overruled. Go ahead.

MR. ROSENBLATT: Okay. Mr. Bayer, did, were you able to run the new model considering that the eight segments Ms.

Eicholtz identified in Exhibit 55 were repaired?

MR. BAYER: Yes.

MR. ROSENBLATT: And did the system show any downstream problems from the project when these eight segments were repaired?

MR. BAYER: No, once the eight segments were improved there weren't any issues.

MR. ROSENBLATT: What was Jeff Peluso's role with Baltimore County before he retired?

MR. BAYER: He was the Bureau Chief of the Bureau of Engineering Construction.

MR. ROSENBLATT: I'm going to show you what was marked as Protestant's Exhibit 90. It's an e-mail from Jeff Peluso to you and Lisa Eicholtz dated March 22nd, 2021. Do you see this e-mail? Can you see it, Mr. Bayer?

MR. BAYER: I can, yes.

MR. ROSENBLATT: Okay and I want to turn your attention to, in particular, to number four. So, Mr. Peluso asks four questions, the fourth being, if Greenspring Manor were to continue through development, is there another way to provide capacity? Is there a breaking point for Greenspring Manor and number of units?

And then, at the top of this document is an e-mail back from you, from Dave Bayer to Jeff Peluso and Lisa Eicholtz, and you respond to number four. In particular you

say, zero is the breaking point of number of, number of units that could be built without causing an SSO. I want to ask you, did your response assume that the eight identified segments from Ms. Eicholtz are not improved before the new homes are connected?

MR. BAYER: Yes.

MR. ROSENBLATT: If the eight identified --

ALJ: Hold on, hold on. Can you say that question one more time? You're, you're going kind of fast.

MR. ROSENBLATT: Sure.

ALJ: One more time with the question, thanks.

MR. ROSENBLATT: No problem, Judge. Let me try and make this easy. So, Mr. Bayer, just to go back real quick to Exhibit 55, there were eight segments, six that say part of John, part of Hopkins project and two additional segments.

And then moving forward to Protestant's Exhibit 90, my question is, when you said that zero is the breaking point of number of units that could be built without causing an SSO, does your response assume that the eight segments identified by Ms. Eicholtz in Exhibit 55, were not improved prior to the connection of the sewer system to the new homes?

MR. BAYER: Yeah, those eight segments needed to be improved before, because there was a high possibility of overflow. So, those eight segments needed to be improved.

MR. ROSENBLATT: Okay. So, if you were asked if

those eight segments are repaired, then what is the breaking point for number of units that can connect, what would your answer be?

MR. BAYER: They could, they could connect once the, once the capacity has been improved, they could connect all the units.

MR. ROSENBLATT: I want to talk to you about modeled results versus real results that you see in the field. And I'll start with, this is map three, so Protestant's Exhibit 78 was the RJN report. We've talked about maps one and two. This is map three and entitled model predicted SSO and flow restriction locations. And my question is, does this map show issues downstream from the eight segments that Ms. Eicholtz identified as needing repair?

MR. BAYER: Yes.

MR. ROSENBLATT: And when you wrote your e-mail to Jeff Peluso saying zero is the breaking point without causing an SSO, did that e-mail have anything to do with the modeled issues shown in this map downstream from the eight segments that Ms. Eicholtz identified?

MR. BAYER: No.

MR. ROSENBLATT: When a model like this shows potential problems, do you immediately go and make those changes in the, in the field?

MR. BAYER: No.

MR. ROSENBLATT: Do you try to verify the issues such as those shown on this map three that are actually happening in the field before you allocate funding to repair or replacement project?

MR. MCCANN: Goodness that's leading, Your Honor. Come on, geez.

ALJ: It's getting a little long, Mr. Rosenblatt. So, could, could you, could you rephrase that question, please?

MR. ROSENBLATT: Sure. Do you try to verify issues in the field prior to allocating funding to a re, rehab or rehabilitation project?

MR. BAYER: Try to, yes.

MR. ROSENBLATT: And how do you do that? What do you do to, to verify in the field?

MR. BAYER: We install flow monitors, for example.

MR. ROSENBLATT: I'll turn your attention to, this is Developer's Exhibit 47-B. And were you asked to identify flow monitors in the vicinity of the Greenspring Manor property?

MR. BAYER: Yes.

MR. ROSENBLATT: And this e-mail, which is, again, Developer's Exhibit 47-B, does this identify the flow monitors that are in the vicinity of Greenspring Manor?

MR. BAYER: They were as of last, last March, yes.

MR. ROSENBLATT: Okay and how many were there?

MR. BAYER: Five.

MR. ROSENBLATT: In addition to flow monitoring, are there any other tools that you used to, to evaluate the state of the system?

MR. BAYER: Yeah, the, the models, simulations that are run.

MR. ROSENBLATT: Okay. Do you use tools such as SSES?

MR. BAYER: That's one tool we do use, yes.

MR. ROSENBLATT: Can you explain what that means?

MR. BAYER: That's sanitary sewer evaluation surveys. So, what essentially we do is we might go out and do night flow isolations to try to find out how much flow is in the pipes in the middle of the night. And then we would also do smoke testing so we could try to find if there are illegal connections.

MR. ROSENBLATT: And is there any kind of chart or, or map that shows a comparison of what has, what you've seen, observed in the field versus what is modeled under various models that you used to evaluate the system?

MR. BAYER: Yes, every one of the SRR plans that we had we required our consultants to compare model calibrations summary table, those are included in the SRR plans and that particular one in the Jones Falls is table 5-3.1, which was prepared by RK&K.

MR. ROSENBLATT: Bear with me. So, in the RK&K

report, share my screen. Which again was Protestant's Exhibit 67. You mentioned table 5-3.1. And can you explain what this table shows? It's entitled model calibration summary table.

MR. BAYER: Yeah, I'll do my best to, to try to explain so we can all understand it. This is kind of a self-assessment that we ask our consultants to do when they prepare their model simulations so we can have a quick look at if there are any issues we should be concerned about related to, that's under predicting or over predicting. And this table provides that information for each meter basin location.

MR. ROSENBLATT: Okay and how, how did this, how did this information impact Baltimore County's use of, of modeled outcomes like the map three that we just went over?

MR. BAYER: Map three?

MR. ROSENBLATT: So, map three being the --

MR. BAYER: Oh, okay. So, RJN, I'm sorry.

MR. ROSENBLATT: Map three of, sorry, let me just, just so the record is clear, how did that chart that we just went over, how does that impact Baltimore County's interpretation of map three from the RJN report, which is the model predicted SSO and flow restriction locations?

MR. BAYER: Okay. I'll, I'll start with RJN used the same model that RK&K did. So, if you could go back to the RK&K table, I should try to better explain.

MR. ROSENBLATT: Okay.

MR. BAYER: So, again, this is a, a calibration summary table that we had every consultant prepare. If you look at, go to the next page because I want to look at BC-22, which you'll see on the RJN map. So, we were quite concerned at BC-22 of the over predicting that we were seeing at that location.

So, an over prediction means, if it's significant, which you'll see in the far-right column, there was at this location, BC-22, a significant, we have low confidence in the, in the predictions that are, accuracy of the predictions that were being provided. So, that was a big concern to us.

MR. ROSENBLATT: Okay and which, where is that particular area located on, on map three?

MR. BAYER: You see BC-22, it's right at the, out of the middle of your map.

MR. ROSENBLATT: Okay.

MR. BAYER: That's downstream of the beltway.

MR. ROSENBLATT: Okay.

MR. BAYER: Where you see a lot of the red.

MR. ROSENBLATT: Got it.

MR. BAYER: So, the insight we were getting from that, those simulations we had low confidence in that, in those.

MR. ROSENBLATT: Okay. I want to ask you some questions about the timing of comments in this case. Let's go

to, sorry, I have so many things open. All right. Let's start with RJN report. So, this was sent directly to you. This is Protestant's Exhibit 78 again, the first page of it. And this was sent to you on May 27th, 2021, okay?

Okay and then, bear with me. Okay. Then in August, a few months later, there's correspondence from Ms. Eicholtz that we've gone over listing the eight segments, the six Hopkins, six part of Hopkins project, two additional segments as required for this project. You see that?

MR. BAYER: Yes.

MR. ROSENBLATT: So, my question is, after the RJN report and map three came out, did Ms. Eicholtz add any additional downstream improvements to these eight segments as being requirements for the Greenspring Manor project?

MR. BAYER: She did not.

MR. ROSENBLATT: And on August 10th, 2021, so the memo is dated August 2nd, then August 10th, the development plan conference comments come out for this case. And again, we go to number twenty, I'm at number twenty, provides the eight segments. Were any other additional downstream requirements listed in the development plan conference comments for this case?

MR. BAYER: Not, not that I'm aware of.

MR. ROSENBLATT: Okay. Now, both the Lisa Eicholtz memo and the development plan conference comments say that

issuance of use and occupancy permits for the residential units from Greenspring Manor should be subject to completion. And that's Eicholtz memo. And then, again, in the development plan conference comments, it says issuance of use and occupancy permits should be subject to the completion of the system improvements.

Any my question for you is, did your Department ever oppose approval of the development plan? Not use and occupancy permits, but the development plan for Greenspring Manor, prior to the eight segments being replaced?

MR. BAYER: Can you ask that question again?

MR. ROSENBLATT: Sure. Did your Department ever oppose approval of the development plan, not, not the issuance of use and occupancy permits, but the approval of the development plan for Greenspring Manor prior to the eight segments being replaced?

MR. BAYER: Not that I'm aware of.

MR. ROSENBLATT: All right. I just want to ask you a couple more questions about, about pipe design in general. So, some models show that pipes in the Jones Falls sewer shed will operate at or over a hundred percent capacity under certain storm events. In your opinion, when models show that, when pipes are shown at a hundred percent or higher, does that mean that the pipes are unsafe?

MR. BAYER: Not necessarily, no.

MR. ROSENBLATT: Do you look at other factors to determine whether the pipes are safe?

MR. BAYER: Other factors, we would try to find out what, what the frame and cover elevation would be at the ground surface where this surcharging might be.

MR. ROSENBLATT: Okay and in the design manual, which I'll share one more time. So, Protestant's Exhibit 70, the DPW sewer design manual, under hydraulic design of sewers, it speaks to sewers shall be designed to flow at depths not exceeding ninety percent and then for laterals and mains eighty percent and building connections seventy percent. And my question to you is, is this the standard you use when evaluating whether a project can connect to an existing sewer system?

MR. BAYER: This is guidance that we provided for design of new sewers.

MR. ROSENBLATT: If it's for new sewers, is this the standard you use when you're evaluating a proposed project and whether the project can connect to the existing sewer system?

MR. BAYER: Yeah, we would make, try to make sure that any new design would not exceed this guidance providing, provided in the design manual.

MR. ROSENBLATT: All right. Would you try and ensure that the entire system downstream meets these percentage requirements?

MR. MCCANN: Objection. Asked and answered and speculation. Would he, would he --

ALJ: (inaudible), I'm sorry, go ahead, Mr. McCann.

MR. MCCANN: Yeah, I mean, the question is would he do X. I, I, we have no circumstances under which or context to that question. Aside from the fact it's, it's, it's leading, and he's already answered and hasn't, twice hasn't answered the question, said what Mr. Rosenblatt wants him to say.

ALJ: Mr. Rosenblatt, could you rephrase your question, please?

MR. ROSENBLATT: Sure. So, Mr. Bayer, when you're evaluating a project, a new project, hooking up to Baltimore County sewer system, are these percentages the, that you see on the screen in the design manual, the ninety, eighty, seventy, are you evaluating a new project and ensuring that the entire existing sewer system meets these percentage requirements?

MR. BAYER: Someone is constructing a new sewer, they're supposed to follow these guidelines.

MR. ROSENBLATT: Okay. For the, for new constructed pipes or existing pipes?

MR. BAYER: New, new sewer construction.

MR. ROSENBLATT: All right. Were there improvements downstream of this project identified in the SRRR plan?

MR. BAYER: Improvements?

MR. ROSENBLATT: Yes.

MR. BAYER: Downstream there were structural repairs that were required to be, that we, we're going to complete.

MR. ROSENBLATT: Okay and were you asked to see if those improvements have been completed?

MR. BAYER: Yeah, I was asked to do some research to see if those, those structural repairs were completed, yes.

MR. ROSENBLATT: Okay. I'm going to show you what is marked as Developer's Exhibit 45-A. And ask you, is this an e-mail that you sent on May 30th, 2023 answering that question?

MR. BAYER: Yes.

MR. ROSENBLATT: And there's both an e-mail and then 45-B, a spreadsheet, and my question to you is, are the improvements that were identified in the SS, in the SRRR plan downstream from Greenspring Manor, were those improvements all completed?

MR. BAYER: To the best of my knowledge, they were. Or it could have been eliminated like for one instance you'll see on the top there, two things were not needed.

MR. ROSENBLATT: Okay. What else is left to complete downstream from this project under the SS, under the SRRR plan?

MR. BAYER: Downstream from this along that flow path, not, nothing that I'm aware of.

MR. ROSENBLATT: Okay. One final topic. I want to talk about areas of special concern. Can you explain what is an area of special concern?

MR. BAYER: On the basic services maps, the areas of special concerns were areas where we had those sanitary sewer overflow structures.

MR. ROSENBLATT: And is the area including and surrounding the Greenspring Manor property, is that in an area of special concern?

MR. BAYER: That was, that was another area we didn't have a sanitary sewer overflow structure at that location, but we did have information that one of the staff members had gathered that we were very concerned about the possibility of overflow. So, that, we added that to the area of special concern.

MR. ROSENBLATT: Okay and if the eight segments that we've gone over, that Ms. Eicholtz identified, if those eight segments are improved would that resolve DPWT's concern for this being an area of special concern?

MR. BAYER: If there's, if capacity is added, then, then that concern would go away.

MR. ROSENBLATT: So, if, if those eight segments are improved, does DPWT believe the County's sewer system can function safely?

MR. BAYER: Yes.

MR. ROSENBLATT: And can it function without detrimental impact to public health or environment?

MR. BAYER: Yes.

MR. ROSENBLATT: Thank you. That's all the questions I have.

ALJ: Mr. McCann, cross?

MR. MCCANN: Yes. Two things, Your Honor. First of all, because I did not object to every single question and I think that would have been too disruptive, I want to move to, to strike, just for the record, Mr. Bayer's entire testimony on the grounds I've already stated, as well as those set forth in the Motion. This is all new evidence that could have been submitted long ago and this is just a, yet another bite of, at the apple that has been afforded the Developer.

Number two, I would like a short break to look at my notes, since this is, this is a lot of new stuff. And number three, just to, I would ask certainly, if not only out of fairness, but for a host of other reasons, that we be allowed the opportunity at, at a future date to call witnesses to rebut, to respond to Mr. Bayer's testimony, since again, this all could have been submitted during the course of the hearing, certainly in, in the Developer's case.

So, I'm just asking those, those things now, but I would immediately anyway, I would ask that his testimony be stricken and that I be given a little bit of an opportunity, ten-minute break of so, just to collect my notes here.

ALJ: Okay. The motion to strike is denied. Obviously, Mr. Bayer was coming in today, the motion, the Order

has been in place set for today's hearing. And again, I've said it, and this is probably the third time now, Protestants had every opportunity as well to call Mr. Bayer as a witness.

And you can see in this kind of case, it actually is, you know, something that maybe some party should have done, have Mr. Bayer come in and testify. So, the motion to strike is denied. (inaudible) --

MR. MCCANN: But, Your Honor, it wasn't our burden, it wasn't --

ALJ: There is, there is no additional day for, for more testimony here. This is a County witness so if this County witness had shown up on, when all the other County witnesses came on day one, then you would have had the opportunity just like you, you would today to have, to cross examine. And, and Mr. Wyatt does, and Ms. Demillio does and, and we give that opportunity to, to cross examine, you know, the, the County witnesses.

Even more so as probably what, than what is contemplated in the Code, which is really for the County witnesses to come in and say whether or not there are unresolved comments or open conditions or something like that. I actually go beyond that and let everybody cross examine. So, so there would be no difference.

So, if he came in day one, you would have had the same opportunity to do that and, and again, or in your own

case, either one of you, Protestants or Developers, could have called Mr. Bayer. There's nothing to prevent somebody from issuing a subpoena, either to him or, or the other people.

And, and all this evidence, you know, the reason he's testifying, he's responding now to, that these are all things that the Protestants put in evidence. So, it's not new and surprising, it's, it's in response to those things. So, I hear you but a Motion for Reconsideration by, by its nature is going to have new information. It's going to have new testimony. We can't, we're not going to, so it, you know, he's explaining things as, as within his, you know, expertise.

So, there's no additional days. We're not going about it like that. The, the Motion and the Order was limited to one, the County witness coming in and explaining their position. That's what it was limited to, not back and forth and so, all right?

MR. MCCANN: I'm not going to argue with you (inaudible) --

ALJ: Okay, good.

MR. MCCANN: -- although it may appear that I am.

ALJ: No, you won't. I know, I know, you're stating your position and you're zealously advocating for your client, and I always appreciate that. I --

MR. MCCANN: (inaudible) what's missing from, what's missing from it you just said, and what's missing from your

comment that we could have called him is, first and foremost, it is the Developer's burden in this case. And you've already ruled in your opinion, by the way, that a presumption didn't rise on this issue and therefore, the burden at no time has shifted to us.

But today it apparently has and now I'm being denied the opportunity to respond to new evidence asserted for the first time on behalf of the Developer to meet its burden that it had on the very first day of this hearing. So, this is the first time anything like this has ever happened to me in twenty years. It's unprecedented --

ALJ: Actually, if you note in the Order for the Motion for Reconsideration, actually Judge Beverungen had actually --

MR. MCCANN: Nothing to do with this case. That, there's no similarity at all.

ALJ: No, no, but I'm saying, he, but he issued, but he allowed a, an additional evidentiary hearings in two different cases.

MR. MCCANN: That's not what happened at all.

ALJ: I think you were in those, weren't you?

MR. MCCANN: That's not what happened at all, Your Honor. I was in that case.

ALJ: Okay.

MR. MCCANN: So, in any event, --

ALJ: Yeah, I thought you were in those cases.
MR. MCCANN: I got your ruling, I got your ruling. If I could have fifteen minutes to go through my notes, I think that's fair,
ALJ: Yes, absolutely.
MR. MCCANN: And I'll be, I'll be ready for cross.
ALJ: Okay. Fifteen minutes, we'll come back. I'll pause the record.
MR. MCCANN: Great, thank you.
ALJ: Thank you.
MR. ROSENBLATT: Thank you.
(PAUSE)
ALJ: All right. We're back on the record. Mr. McCann, you had cross?
MR. MCCANN: Okay, thank you. Mr. Bayer, I don't see you. Are you there?
MR. BAYER: I am.
MR. MCCANN: Okay. How you doing?
MR. BAYER: Great, thanks.
MR. MCCANN: Good. So, I want to jump around here a little bit, as you might suspect. You are a project engineer for the Sewer Design Section, correct?
MR. BAYER: Correct.
MR. MCCANN: You are not chief of that section, correct?

MR. BAYER: Correct.
MR. MCCANN: Do you hold, other than project engineer, do you hold any other titles with DPW?
MR. BAYER: No.
MR. MCCANN: And you mentioned your experience in the Sewer Design Section, and I think you also mentioned some other experience with the County. Prior to that, did you ever have a job in the private industry?
MR. BAYER: I did, yes.
MR. MCCANN: And where were you and what'd you do?
MR. BAYER: Whitman Requardt and Associates.
MR. MCCANN: I'm sorry?
MR. BAYER: Whitman Requardt and Associates.
MR. MCCANN: Okay.
MR. BAYER: And I was civil engineering.
MR. MCCANN: And what type of work did you do there?
MR. BAYER: Civil engineering.
MR. MCCANN: (inaudible)?
MR. BAYER: Water, water, sewer, storm drains, dams, landfills.
MR. MCCANN: Okay. What, what, describe the work that that firm does in general? What, are they just a general --
MR. BAYER: They're a multi-disciplinary engineering company.

MR. MCCANN: Okay.
MR. BAYER: Structural, mechanical, electrical, civil, water resources.
MR. MCCANN: And where are they based?
MR. BAYER: I think they're in Canton now.
MR. MCCANN: Okay. Yeah, I think I've heard of them. And when was that? When were you there?
MR. BAYER: Nineteen eighty to 1989.
MR. MCCANN: So, just one year?
MR. BAYER: Nineteen eighty to 1989.
MR. MCCANN: Okay, I'm sorry. And then you went to the County after that?
MR. BAYER: Correct.
MR. MCCANN: Okay and during those nine years, it sounds like your work was more in the general area of civil engineering as opposed to limited to or specializing in sewer design or sewer evaluation, is that fair?
MR. BAYER: Yeah, I did, yes, landfill, yep, etcetera.
MR. MCCANN: Okay.
MR. BAYER: (inaudible) kind of engineering, yep.
MR. MCCANN: And any other --
MR. BAYER: (inaudible).
MR. MCCANN: -- I'm sorry?
MR. BAYER: Along with water and sewer, storm drain.

MR. MCCANN: Okay.
MR. BAYER: Sorry.
MR. MCCANN: Any other work in the private industry, other than that experience with that firm from 1980 to 1989?
MR. BAYER: No.
MR. MCCANN: Okay and where, where'd you go to school?
MR. BAYER: Penn State (inaudible).
MR. MCCANN: Okay and when did you graduate?
MR. BAYER: Let's see, 1980 for my Bachelor's and I, I don't recollect the year on my Master's degree.
MR. MCCANN: Okay. Who is the, the Chief of the Sewer Design Section?
MR. BAYER: Amy Bley.
MR. MCCANN: B-L-E-Y?
MR. BAYER: Yes.
MR. MCCANN: Okay and then in terms of the hierarchy, if, if there is one, above her in, in terms of sewer anyways, there, is there such a person?
MR. BAYER: No, she's Chief of the Sewer Design Section.
MR. MCCANN: Okay and that falls under DPW?
MR. BAYER: DPWT.
MR. MCCANN: DPWT, okay. All right. Let's talk quickly, as you might expect, about the meeting that you had,

it sounds like, with Mr. Rosenblatt. Do you recall that meeting?

MR. BAYER: Yes.

MR. MCCANN: What, when was that meeting?

MR. BAYER: Friday.

MR. MCCANN: This past Friday?

MR. BAYER: Yes, and then we had another meeting, I don't recollect the date, prior to that.

MR. MCCANN: Okay. When, when approximately was that prior meeting?

MR. BAYER: It would have been a week or so before this was canceled because of snow.

MR. MCCANN: Right, so sometime in the end of January of 2024?

MR. BAYER: I, I don't recollect the date.

MR. MCCANN: But it, a couple days before that last hearing, is that fair?

MR. BAYER: Plus or minus, I guess, yeah.

MR. MCCANN: Okay, very well. And who else attended that meeting other than it sounds like Mr. Benjamin or someone from his staff?

MR. BAYER: Mr. Benjamin.

MR. MCCANN: Okay. He attended both meetings, that is?

MR. BAYER: Yes.

MR. MCCANN: Okay. Did Mr. Rosenblatt tell you the questions he was going to ask you today?

MR. BAYER: Yes.

MR. MCCANN: Did you provide any documents to Mr. Rosenblatt during that meeting or at any other time since the last hearing in this case?

MR. BAYER: Did I provide any documents since the last, not that I'm aware of.

MR. MCCANN: Okay. Did you have any e-mail correspondence with Mr. Rosenblatt or anybody from his firm about the meetings or the hearing in this case?

MR. BAYER: Yes, I did e-mail Adam because I couldn't get into the, into the Webex when the meeting was canceled.

MR. MCCANN: Okay.

MR. BAYER: So, I e-mailed Adam telling him I could not get into the Webex.

MR. MCCANN: Other than that, --

MR. BAYER: I didn't know the, I didn't know the meeting was canceled, so.

MR. MCCANN: Got it.

MR. BAYER: Or the hearing, I'm sorry, the hearing was canceled. So, yes, I e-mailed Adam.

MR. MCCANN: Any other e-mail communications with Mr. Rosenblatt, his firm, about this hearing or the meetings that you had?

MR. BAYER: I don't believe so.

MR. MCCANN: Okay. Okay. I'm going to show you a couple documents, which we've already seen or talked about. Bear with me one second, Mr. Bayer. There we go. This is Protestant's Exhibit 13 for the record. It's a March 3rd, 2021 e-mail from you to Mr. Desai. I think Mr. Rosenblatt asked you about this. Do you, you see that?

MR. BAYER: I do see it, yes.

MR. MCCANN: Okay and do you recall it?

MR. BAYER: Yeah, because I've seen it before, yes, um hm.

MR. MCCANN: Okay. At the time you wrote this, drafted this memo in March of 2021, was it, was it accurate?

MR. BAYER: Actually, I think Lisa drafted it, since she signed it on my behalf, that's where you see LKE for, so as far as I know, at the time it was accurate.

MR. MCCANN: Okay. But you authorized her to sign and/or send it to Mr. Desai?

MR. BAYER: Yes, she could sign and send on my behalf.

MR. MCCANN: Okay and likewise, I want to show you Protestant's Exhibit 90, which Mr. Rosenblatt did ask you about. And that is your e-mail exchange with Mr. Peluso, do you see that?

MR. BAYER: I do.

MR. MCCANN: Okay. So, your response, specifically, your response is at the top of this exhibit on March 20th, 2021, where you mention, as we've discussed, a zero breaking point comment. Was, at the time this e-mail was sent from you to Mr. Peluso and Ms. Eicholtz, was it accurate?

MR. BAYER: As far as I know.

MR. MCCANN: Okay and then, more specifically, the other comment that you make in here, in response to Mr. Peluso's questions about what are the ramifications of a new connection, your answer about, your answer was sanitary sewer overflows. Was that response to Mr. Bayer's question accurate at the time you wrote this e-mail in March of 2021?

MR. BAYER: Was that an accurate response to Mr. Peluso's question? Yeah, we were concerned that, that if the added units, there was high probability of an SSO.

MR. MCCANN: You say a high probability?

MR. BAYER: Yes.

MR. MCCANN: Okay. So, as I understand your testimony today, there is some new model that Baltimore County is working on that you applied, correct?

MR. BAYER: Yes.

MR. MCCANN: Tell me about that new model.

MR. BAYER: It's a (inaudible) model that Hazen is developing on our behalf. So, I thought it was important to know that if the, the proper size of the improvement, so those

eight segments, if they were sized properly so I, I asked to have a simulation run.

MR. MCCANN: You asked Hazen for that?

MR. BAYER: I did, yes.

MR. MCCANN: And when you say simulation run, what do, what do you, be a little more specific about that. What does that entail?

MR. BAYER: To analyze what would happen if capacity was improved, how the sewer system would react.

MR. MCCANN: Okay and before I get, I guess, into the substance of that, you said Hazens, Hazen has prepared this model, correct?

MR. BAYER: In, in response to my request, they, they ran that simulation, yes.

MR. MCCANN: Yeah, I'm not asking about the simulation, about the, I'm asking about the model itself. The, the model is Hazen's?

MR. BAYER: They, they were develop, developing it on our behalf, yes, um hm.

MR. MCCANN: Okay and it sounds like, based on your testimony just now and before that they are still in the process of developing that model?

MR. BAYER: They are, yes.

MR. MCCANN: Okay and I, at least according to their newsletters, which I've, we don't need to get into. But let me

know if you need to see them. That was one of the things Hazen was tasked to do, that is, recalibrate or update the model that the County is using, correct?

MR. BAYER: There are quite a few things that they were tasked to do on our behalf.

MR. MCCANN: Okay. Was that one of them?

MR. BAYER: That was one of them.

MR. MCCANN: Okay. So, again, not the simulation, but the model, has, has that model, the one that the County has asked Hazen to, to prepare, has that model been, I guess, completed, for lack of a better word? Are you suggest --

MR. BAYER: Not that I'm, not that I'm aware of, no.

MR. MCCANN: Okay. Even though it hadn't been completed, you nevertheless asked Hazen to, to run a simulation, correct?

MR. BAYER: I did, yes.

MR. MCCANN: Okay. Did, is there any, did you pick up the phone and call someone at Hazen or did you send them an e-mail? How did that connection happen with Hazen?

MR. BAYER: Yeah, I think they sent them an e-mail asking them to run a simulation in that area where the eight segments were.

MR. MCCANN: Okay and when you say the area where the eight segments were, what specific, what specifically did you ask?

MR. BAYER: I wanted to make sure that, that the proposed size of the sewers were adequate.

MR. MCCANN: So, was the, was your request of Hazen limited to those eight segments?

MR. BAYER: Yeah.

MR. MCCANN: And you said that was an e-mail correspondence, your request anyway?

MR. BAYER: Yeah, I think so.

MR. MCCANN: Any, and was, did Hazen respond by e-mail and/or provide in writing or by e-mail the results of that simulation?

MR. BAYER: Yes.

MR. MCCANN: And what, when did that take place? Number one, when did your request take place and when did Hazen's response take place?

MR. BAYER: I think it was November, late November maybe of, of 2023.

MR. MCCANN: That is both your request and the response?

MR. BAYER: Yeah, I believe so.

MR. MCCANN: And remind me, maybe you've already said it but what, what prompted you to do that? That is, to ask Hazen to run a simulation regarding these eight segments?

MR. BAYER: I thought it was very important to know that the fix was going to correct the situation.

MR. MCCANN: And why did you think it was very important to know?

MR. BAYER: Well, that's what we should always be doing is making sure that what's going to be constructed will correct the deficiency.

MR. MCCANN: Well, did you, did you ask Hazen to run a simulation on a model that hadn't been completed yet for any other projects?

MR. BAYER: I'm sorry, can you ask that question again? What was it, I'm sorry?

MR. MCCANN: Did you ask Hazen to run a simulation or a model that had, hasn't yet been completed on any other projects?

MR. BAYER: On other projects? Yes. We, we, they are, they are modeling on our behalf, yes.

MR. MCCANN: Well, my question was, on other projects, you've asked them to do that?

MR. BAYER: Other, other subdivisions, yes. That's not my role, but yes, as far as I know that they are doing modeling when we have a (inaudible) subdivision.

MR. MCCANN: And when, when did they start doing that, do you know?

MR. BAYER: I don't know.

MR. MCCANN: Okay. Again, my question was, you said you thought it important to ask Hazen for that information,

which you said is something you don't normally do. Why did you, why specifically did you ask Hazen to do that in November of 2023?

MR. BAYER: I wanted to make sure that the design that was being done by both consultants would, would work, would, would correct the deficiency, the capacity deficiency.

MR. MCCANN: Well, why didn't you do it a year or so earlier, or back in 2021 when you first issued your comments in this case?

MR. BAYER: Well, I think that the, the issue back then was we could only improve the size to a twelve inch, I believe, because there are twelve inch downstream. So, you can't, we are opposed to building a fifteen-inch sewer, for example, that would discharge into a twelve-inch sewer.

That's not something that we find is the best way to operate our system. So, that the design was kind of fixed, that they could only improve it to a twelve because there's a twelve immediately downstream.

MR. MCCANN: Yeah, I --

MR. BAYER: So, I, I just wanted to make sure that would work.

MR. MCCANN: I understand why, I think you've answered why it is you made this request in November of 2023. I'm asking you why you didn't make it earlier in connection with this project, when this project has been going on for two

years.

MR. BAYER: Be, because that, that twelve inch was the largest that could possibly be done. There was, you couldn't make it any larger.

MR. MCCANN: I'm not sure what that has to do with the timing of your request, that's what I'm asking about --

MR. BAYER: (inaudible), there was no reason to, to run a simulation because that was the largest that could be done.

MR. MCCANN: Okay. I'm not sure you're answering my question, but I'll move on. Were you involved in any way, Mr. Bayer, in collecting documents responsive to my Public Information Act request, including the most recent one just about a month and a half ago or so?

MR. BAYER: Oh, yeah. I think we were all asked to search our documents, yep.

MR. MCCANN: Is there a reason why you did not produce to me, why the County did not produce to me, either your e-mail exchange with Hazen, or the simulations that were run, that were sent back to you from Hazen in response to your request?

MR. BAYER: I, I can't answer that question. I don't know when the dates were when you had your PIA request.

MR. MCCANN: Well, I'll, I'll tell you my PIA request was, was, was much later than November 2023.

MR. BAYER: Okay.

MR. MCCANN: But my question now is, do you know of any reason why you'd, why those documents that you already described, were not produced to me?

MR. BAYER: I, sorry, I can't answer that question, I don't know why.

MR. MCCANN: Were you told not to produce them?

MR. BAYER: No.

MR. MCCANN: Were you told not to produce any, any other documents?

MR. BAYER: No.

MR. MCCANN: Let me finish the question.

MR. BAYER: I'm sorry.

MR. MCCANN: Were you told not to produce any other documents to me in response to my PIA request, either the most recent one or any of the ones in the past?

MR. BAYER: No, not that I'm aware of, nope.

MR. MCCANN: So, there is a document either in your e-mail folder or printed somewhere in your office that shows the results of the simulation run by Hazen?

MR. BAYER: Yes.

MR. MCCANN: Did you tell Mr. Rosenblatt about that?

MR. BAYER: I don't think so.

MR. MCCANN: Well, you, you, did you tell him that you reran a model, a different model?

MR. BAYER: We, we run simulations all the time, I don't, I don't know if I recollect if I told Mr. Rosenblatt that.

MR. MCCANN: Okay. Let me show you Exhibit 45-A, which Mr. Rosenblatt asked you about and this is Developer's Exhibit 45-A, I'm sorry, which was produced and discussed previously in this case. Do you see that?

MR. BAYER: Yes.

MR. MCCANN: Okay and this is dated, your response, I guess, to internal request, well, your response is May 30th, 2023, right?

MR. BAYER: Yes.

MR. MCCANN: Okay and I think you've indicated --

MR. BAYER: Wait, no, it says May 23rd, doesn't it? The date is May 23rd, not May 30th?

MR. MCCANN: Well, the --

MR. BAYER: There it is, I'm sorry. My bad.

MR. MCCANN: Yeah, May 30th, 2023.

MR. BAYER: Yep, sorry.

MR. MCCANN: It's okay. And I think those under, the repairs that and, and, well, let me back up a little bit. This e-mail, if I recall, or that rather this information in this e-mail was produced by you in response to a request from Venable asking for the repairs that have been made by the County downstream of the subject property, correct?

MR. BAYER: Yes.
MR. MCCANN: Okay and those repairs are identified here un, in red where it says corrective actions status?
MR. BAYER: Yes.
MR. MCCANN: Okay and then, there's also an Exhibit 45-B I think that has the same ones. But a lot of these, without going through them in detail, would you agree with me that several of these corrective actions were, in fact, not done, it says deleted, for instance, correct?
MR. BAYER: Yeah, my research, these were not my projects, so I did a little research and yes, in that instance, right there at the bottom in accordance with the contractor RFI that lining was deleted from that manhole.
MR. MCCANN: Okay. So, for instance, we know that with, with respect to manhole at 43819, manhole lining was not needed so that work was eliminated, right?
MR. BAYER: That's what that says, I think.
MR. MCCANN: Yep. So, the work that was installed, I think, is, is, is in here. It's, we've got a rain pan installation, a brick collar installation and a watertight frame and cover. These were all, these are the dates as well when, when those things were done, 2017, 2019, correct?
MR. BAYER: That's what my research showed, I think, yeah.
MR. MCCANN: Okay. So, and again, since this was

produced in response to Mr. Rosenblatt's or, I'm sorry, Venable's question about repairs downstream of the subject property, is there a reason why in May of 2023 you didn't, well, strike that. Other, let me ask you this. Other than the repairs reflected in this e-mail, which is Developer's Exhibit 45-A, in May of 2023, have any other repairs been undertaken downstream from the subject property?
MR. BAYER: Yeah, I believe that this, these corrective actions were, was done by the Bureau of Utilities. So, and, and some contractors, so, --
MR. MCCANN: Right.
MR. BAYER: -- yep.
MR. MCCANN: Well, I'm asking you whether there's been anything else since.
MR. BAYER: Not, not that I'm aware of.
MR. MCCANN: Okay and then let's look at, I think you, you spoke with Mr. Rosenblatt about map two in RJN's report. This is Protestant's Exhibit 78. I'll blow it up. Do you see that?
MR. BAYER: I do.
MR. MCCANN: Oops, sorry about that. Would you agree with me that, well, this map, which is part of RJN's report, is intended, as its title indicates, to show the rehabilitation completed, at least as of the date of RJN's report in 2021, correct?

MR. BAYER: Yes.
MR. MCCANN: Okay and would you agree with me that, if I blow this up, that this map shows, and I know you, and I think you indicated you're familiar with the sewer path, so I won't ask you about that. But that this map shows only two repairs, right here where my cursor is, in the sewer path from the subject property, correct?
MR. BAYER: It shows two, looks like above the Green, yeah, above the, above that. I can't see what's down below, but it looks like there's only two.
MR. MCCANN: When you say above, what do you mean by above?
MR. BAYER: Well, where you had your cursor there, that's right there, yeah.
MR. MCCANN: Okay. Do you know where the subject property is?
MR. BAYER: Yeah, right there.
MR. MCCANN: Is it right here where my cursor is?
MR. BAYER: Close by, yeah.
MR. MCCANN: Well, where exactly is it, do you know?
MR. BAYER: I think it's right across Joppa, Joppa Road there.
MR. MCCANN: Okay. Is it where my cursor is right now, below, in other words, below or to the right of the green, the green square?

MR. BAYER: No.
MR. MCCANN: Is it, is it up here?
MR. BAYER: Yes, I believe so.
MR. MCCANN: Okay.
MR. BAYER: So, I was looking at the path. If you could scroll down.
MR. MCCANN: Oh, I'm sorry.
MR. BAYER: Yeah.
MR. MCCANN: So, no repairs along the sewer path other than those two before this, this, the sewer system (inaudible) reaches Lake Roland, correct?
MR. BAYER: I'm trying to think, there was two segments in pink up there.
MR. MCCANN: Yeah.
MR. BAYER: It could be.
MR. MCCANN: Well, could be or --
MR. BAYER: Well, like my research showed what, what was in that e-mail.
MR. MCCANN: Okay. Okay and in terms of what has not been done, we know from the long-term capacity report, which you've talked about, this is Protestant's Exhibit 68. I'm going to show you map 5.1, bear with me one sec. Okay. So, first map in Protestant's Exhibit 68 is hydraulic improvements for the two-year twenty-four storm, correct? Map 5.1?
MR. BAYER: Uh huh, yes.

MR. MCCANN: Which is a lesser storm than a ten six, correct?

MR. BAYER: It's more frequent, so, I guess you could describe it as less.

MR. MCCANN: Okay. For the two-year twenty-four-hour storm, RKK, RK&K recommended, did it not, in the sewer path a, replacement of a ten-inch sewer with an eighteen-inch sewer in this area, correct?

MR. BAYER: That's what it looks like is shown there.

MR. MCCANN: Okay and we know that was not done, correct?

MR. BAYER: Correct.

MR. MCCANN: And then for the ten-year six storm, which I'll scroll down to, which is the next map, map 6.1, do you see that in Protestant's Exhibit 68. We know, according to RK&K that the same replacement or upsizing rather, was recommended along with additional manhole repairs, correct? Right here?

MR. BAYER: Yeah, but I don't know, you said manhole corrections.

MR. MCCANN: Well, the, the dots, the brown dots and the yellow dots reflect, and I can go to the legend if you want, --

MR. BAYER: Yeah, that would be helpful, thank you.

MR. MCCANN: Well, the, the brown dots indicate a

manhole to be sealed, correct?

MR. BAYER: Yeah.

MR. MCCANN: Okay. So, for the ten year six an upsizing was proposed along with sealing of manholes, correct?

MR. BAYER: Yeah.

MR. MCCANN: Okay and I think there's a, in the legend, there's a description of, upper lefthand corner, this same map, the description of the upsize. So, thirteen hundred and seventy-seven linear feet, correct?

MR. BAYER: Yes, looks that, looks that way.

MR. MCCANN: All right. And that's just for those two storms. Would you agree with me that the, the other storms reflect considerable more upsizing, repairs, relief sewers, correct?

MR. BAYER: It could be.

MR. MCCANN: Okay. I want to talk about the Randoll report, which are you familiar with that?

MR. BAYER: Yes.

MR. MCCANN: Okay and how is it that you're familiar? Were you involved in any way personally --

MR. BAYER: Discussions before we opted to request a proposal from Ramboll.

MR. MCCANN: You were involved in those discussions?

MR. BAYER: We had some discussions about, yeah, what we saw on the internal inspection, yes.

MR. MCCANN: Okay. I'm looking through my notes to exactly what you said about the Ramboll report. But what, what I thought you said, correct me if I'm wrong, is that, let me find it. Bear with me one second, Mr. Bayer, I'm sorry. In your words, I think as you put it, you saw some corrosion in the pipe underneath Lake Roland, is that, did I say that, did I write that down correctly?

MR. BAYER: Yes, that's correct. We were concerned by the corrosion that, internal corrosion that we saw on the video, yes.

MR. MCCANN: And in that, that concern is that what prompted the Ramboll report? Is that what you were suggesting?

MR. BAYER: Yeah, we had, had discussions and we thought that it would probably be a good idea to, to be proactive and try to get started on the project to address that corrosion.

MR. MCCANN: Well, isn't it true the, the Ramboll report, and I'll pull it up as I'm asking you this question, that the Ramboll report is directed to, or covers not just the, the long sewer segment under Lake Roland, but all of the segments and interconnectors in and around Lake Roland, correct?

MR. BAYER: Yeah, that's correct.

MR. MCCANN: In fact, bear with me one second. I don't know why I'm having problems finding it. Okay. Let me

show you the report. Okay. This is, for the record, is Protestant's Exhibit 87. Do you see that? I'll go to the first page.

MR. BAYER: I do.

MR. MCCANN: You do see that?

MR. BAYER: Yes.

MR. MCCANN: Okay. In terms of what was asked of Ramboll, as I understand it, and by the way, figure 1.1, do you see that?

MR. BAYER: I do.

MR. MCCANN: So, in red, and I'm sure the Judge is familiar with it, but this is the sewer segment under Lake Roland that you were speaking to, correct?

MR. BAYER: Yes.

MR. MCCANN: Okay. But this map actually figure 1.1, it says project map, this in red identifies all of the sewer segments that are the, within the scope of this report, not just the sewer line under Lake Roland, correct?

MR. BAYER: Correct.

MR. MCCANN: Okay and I, am I correct, I'm sorry I'm scrolling around so much, I'm sure it's annoying on your end. I highlighted this sentence. Quote, the primary focus of this project is to minimize the inflow and infiltration, I&I, into the interceptors to reduce the likelihood of sanitary sewer overflows, and correct, end, end quote. Did, did I read that

correctly?

MR. BAYER: Yes.

MR. MCCANN: And do you agree with that, that is, what Ramboll has indicated in it, in its own report what it is, what is the focus of its report, for the project, that is?

MR. BAYER: That's their, their language.

MR. MCCANN: But do you agree with that?

MR. BAYER: Well, I, I said the initial inferences for the project was we saw some corrosion which was concerning. And then we decided that, well, rather than impact those resources with flood plain, wetlands and environmentally sensitive areas, that we would expand the scope and then just line everything in that area at the same time.

MR. MCCANN: So, are you, are you, are you telling me that the, the sewer segments that we, that I just showed you in that figure 1.1, other than the one under Lake Roland, don't need any work? Is that what you're suggesting?

MR. BAYER: I said, we, we expanded the scope to include all that work (inaudible) --

MR. MCCANN: (inaudible).

MR. BAYER: -- while we were doing the interceptor. We expanded the scope.

MR. MCCANN: But, so you're not suggesting that those segments don't need the repairs that are called for?

MR. BAYER: I, I didn't look at the video on all

those segments, so I can't say if they are in need of structural repairs or not.

MR. MCCANN: Okay. Well, isn't it true and I can, we can go through the, the, the report, but isn't it true that Ramboll, number one, takes a look at all of the CCTV inspection videos that the County has, County had, correct?

MR. BAYER: Oh, yeah, they were tasked with reviewing that, yes.

MR. MCCANN: Okay. In fact, this 2.3 is a helpful section. It says, quote, a review of pipeline inspection data was performed, correct? Ramboll did that, right?

MR. BAYER: As far as I know. Again, this was not my project, but as far as I know they did.

MR. MCCANN: Okay and then, in addition, they reviewed available red zone sonar reports to confirm condition of existing pipeline for rehabilitation, correct?

MR. BAYER: That's what that report says, yep.

MR. MCCANN: And then number three under 2.3 it says, provided, provided, past tense, a corrective action recommendation for each pipeline reviewed, right?

MR. BAYER: Um hm.

MR. MCCANN: And then the very next paragraph it says, quote, upon completing the review, it was determined that all pipe segments within the system can be rehabilitated using lining. Since the goal of the rehabilitation project is to

minimize the amount of I&I and prevent overflows, all lines have been identified for rehabilitation, correct?

MR. BAYER: That's what the report says.

MR. MCCANN: Even if structural damage was not identified, I just continued reading, sorry about that. But, in fact, doesn't, does not this report specifically say that, identify anyway, the amount of structural defects or active infiltration that was discovered by Ramboll in its review of the data, correct?

MR. BAYER: I'm sorry, could you repeat that question (inaudible) --

MR. MCCANN: I'm just referring to this highlighted section. It talks about --

MR. BAYER: Yeah, --

MR. MCCANN: -- twenty-four segments with active I, infiltration, correct?

MR. BAYER: That's what it says.

MR. MCCANN: Fourteen of which included some level of structural defects, correct?

MR. BAYER: That's what it says.

MR. MCCANN: Okay. Well, and you did agree, I think, as my notes reflect, Mr. Bayer, that these, this rehabilitation of all these segments will help, as you put it, benefit capacity, correct?

MR. BAYER: If, if there is I&I and we line it and

that's reduced, then it should be an improve in capacity. As well as lining provides, makes the interior pipe more slippery. So, in theory, the pipe can carry more flow as well --

MR. MCCANN: That's a good point. That's a good point. And so, a lining of pipe doesn't --

MR. BAYER: And, and it, I'm sorry, and last but not least is what's really important is we extend the, the service life of this, of the pipes in the area. The other fifty, sixty, seventy, eighty years old so.

MR. MCCANN: Okay.

MR. BAYER: Another benefit is we extend the service life, sorry.

MR. MCCANN: Okay. So, I understand that shovel has not been put to ground, put to the ground yet, correct, (inaudible)?

MR. BAYER: Yeah, this is not my project so I, I don't know, but as far as I know, no, they have not (inaudible) design and we have not started construction.

MR. MCCANN: Having, but having looked at the Ramboll report, you would agree with me that Ramboll has reviewed all the data and based on that data made recommendations for where the rehabilitation needs to take place, correct?

MR. BAYER: Yeah, that, that's apparently what this report says.

MR. MCCANN: Okay and, in fact, is it not true that

this project will cost the County $10 million? Does that sound familiar to you?

MR. BAYER: I did, I never saw the budgetary estimate, I don't think, so I don't know if $10 million is accurate or not.

MR. MCCANN: But there is a, there is, this, the amount of work to make these repairs in and around Lake Roland has, in fact, been budgeted for, correct?

MR. BAYER: As far as I know, we have the funds available to complete the project.

MR. MCCANN: Well, let me show you, and Your Honor, I believe we're on Exhibit 109. I'm going to show Mr. Bayer this document. Do you see that, Mr. Bayer?

MR. BAYER: Triennial Review?

MR. MCCANN: Yep. Are you familiar with the Triennial Review?

MR. BAYER: Draft report? That's not my role and responsibility.

MR. MCCANN: But what is, what is the Tri, Triennial Review, if you know?

MR. BAYER: I, I, I don't. Like I say, it's not my role and not my responsibility to --

MR. MCCANN: You don't, you don't know what it is?

MR. BAYER: It's not my responsibility to draft that report.

MR. MCCANN: Well, it's not your responsibility to say a lot of things but, well. Let me show you, and maybe this will help you. Bear with me one second, it's page twenty-two. Bear with me one second. I'm having problems finding it. Well, I don't think he recognizes it anyway, Your Honor. Or won't recognize it. But I would offer this as Protestant's Exhibit 109 as I said.

MR. ROSENBLATT: I do object, Judge. It's a draft report. It's only been presented to a witness that says he doesn't know what this is or have any role in it. I don't know how that gets into evidence.

ALJ: I'm not, I'm not sure either, Mr. McCann. I mean, I, I don't know how it comes in if he can't say what it is and he doesn't work on it, he's not familiar with it. It's not --

MR. MCCANN: He doesn't, he doesn't need to say what it is. It's a County document. We introduce County documents all the time. I simply went to the County website. This is, this is what the County has on its website for its --

ALJ: I, I know but what if, if he can't add to it, if he can't, he's here to talk about the (inaudible), I don't know what, I don't even know what this document is.

MR. MCCANN: Okay. Well, I'll wait till he's off the stand then I'll move it into evidence. But it, it, I don't need this witness to get this document into evidence. It's a

County record. It is --

ALJ: Mr., Mr. Rosenblatt, do you recognize this as a County record?

MR. ROSENBLATT: I, I've never seen it before, I, I don't know where it comes from and I don't think it is relevant to the reason we're here, which is not, as Mr. McCann said, a complete reopening of the case, but limited to a specific issue and the witness that's here to testify about that issue doesn't know anything about this.

ALJ: Yeah, I, I just, yeah. And so, yeah, I mean, I'm, this, this document just can't come in at this time. Again, we're here for a limited purpose, for, for Mr. Bayer to discuss the sewage path from this property. The documents that were discussed were already in evidence and this is some other new thing that he says he doesn't even --

MR. MCCANN: Your Honor, do, you don't recognize the irony of that?

ALJ: I, I, no, I don't. I, I, I think it's trying to put this document in when you can say that this is something that maybe you wanted to put in in the past and he doesn't know what it is. I mean, I thought you, he was going to be able to discuss it or --

MR. MCCANN: I'll represent to you, as an officer of this court, of this office, that I, this is a County document that was received from the County --

ALJ: Okay, I --

MR. MCCANN: -- it says Baltimore County, everybody knows what the water supply and sewerage plan is. Mr. Bayer apparently does not. But everybody knows what it is. Everybody, it's self-authenticating, it's obviously --

ALJ: But we're not, but we're not reopening the case for, for some information that could have been presented in the, in the, you know, bef, previously. This is, this hearing is just for the Motion for Reconsideration in regard to his testimony about the sewage path from this project. And not, not reopening it to put other documents in evidence. So --

MR. MCCANN: It's the doc, it's the document you have a problem with, it's the document --

ALJ: -- even, even if you could say that you, you got it by a PIA request at this point, I, you know, unless it has to do with his testimony today about this sewage path, it doesn't come in. He says he doesn't know what it is. I can't let the document in, okay?

MR. MCCANN: Your Honor, he just testified, downplayed, in fact, I will suggest, the significance of the Ramboll report, suggesting that it was something that was prospective, planning, whatever, something that was, that was not something, something that was, in fact, limited to the Lake Roland interceptor itself.

And the fact, the fact that I introduced a document

that wasn't previously produced doesn't automatically mean that it's beyond the scope of cross. It, the irony, the irony, the irony of your ruling that this does not limit it to the sewer path is thick. Everything that was discussed already this morning had nothing, or very little, or tangentially to do with the sewer, with the sewer --

ALJ: If that, if that, that's the case, then why did you, if it didn't have anything to do with the sewer path, all the documents introduced, then why did you introduce them in the case in the first place? Because you, all the documents that were pulled up other than one were all your documents that you produced.

MR. MCCANN: I think --

ALJ: So, if they didn't have anything to do with the case, then why do we have a hundred exhibits?

MR. MCCANN: I didn't say it didn't have anything to do with the case. What I'm, what I'm directing you to, Your Honor, is your ruling, which limited to the sewer path, which to me --

ALJ: Right.

MR. MCCANN: If you didn't, if you didn't say sewer path and you instead said sewer capacity issue or yes, sewer capacity issue whether the County, you know, what, you could have used a lot of different language that would have, you know, addressed my objection. But you didn't. You said sewer

path and that, to me, that's very specific.

And that's why, and I don't agree it shouldn't even be limited, there, we shouldn't be discussing the sewer path, frankly. I hope that's clear by now. But, in any event, if, if, if I'm, if my cross examination is limited to the sewer path and Mr. Rosenblatt's is not, --

ALJ: Well, your, your, okay, its sewer path, sewer capacity, deficiencies, structural improvements, to me that's all the same thing. I'm trying to find out whether the, whether the, the sewage can flow from, from this development down to where it goes. That, you know, so, so it's not the, you know, the specific, it includes all those things --

MR. MCCANN: Well, that's news to me.

ALJ: -- and Mr. Rosenblatt went through those documents, if you want to cross examine on the documents and things that he asked, then that's fine.

MR. MCCANN: Okay. I just can't use any new documents in my cross examination.

ALJ: Well, I, it, it's not that you, you couldn't, but he doesn't recognize that document.

MR. MCCANN: That's a different issue. That's a different issue. I'm not talking about the, I'm not talking about authenticity. I'll deal with that. I'll get an e, I'll get an e-mail for, like I always do when you ask me whether something's authentic, --

ALJ: But, but then, this isn't the, your case was already presented. This, this is just one County witness who's talking about the limited issue of the sewer flow from this project. Not, not opening it up again to add in all these new documents and PIA requests.

MR. MCCANN: Your Honor, I'll say one more thing and then I'll --

ALJ: Okay.

MR. MCCANN: -- stop arguing with you --

ALJ: Okay, okay --

MR. MCCANN: -- because I don't mean to argue with you. But it, it's just shocking to me so I can't refrain myself. It's absolutely shocking.

ALJ: It's shocking?

MR. BAYER: It is absolutely shocking to me, and I think if Mr. Zimmerman were here or Mr. Wyatt or Mrs. Demillio chimed in, I think they would agree. They're nodding their heads. It is shocking what's going on in this, in this proceeding today.

ALJ: Okay. I don't, I don't understand why you're even saying it's shocking when, when the Order was issued that we were going to have one more County witness, there's nothing shocking about it. I, I don't, it just doesn't even, I don't, doesn't ring true. I mean, we spent thirteen days on this case, putting in hundreds of documents. And there was only

maybe one excluded, I think, from either side, I excluded one from either side. I, as I recall.

So, I mean, but we're not here to reopen the case. We're here to discuss this one County witness' testimony. If he can identify it and he can, he, you know, that's part of what he needs to talk about and the sewer capacities, sewer paths, improvements, you know, whatever you want to talk about in terms of whether the sewage can flow or not from Greenspring Manor property down to where it needs to go. That, that's all I need to know, right? Okay. So, I mean, I'm, I'm not sure where you're going with it but I, okay? So, --

MR. MCCANN: Then, then, then why did you not grant my motion to strike this new testimony about a new model being run recently and a new, a completely new opinion that obviously could have been introduced long ago in this case, either by the County or by Mr. Rosenblatt and his clients?

ALJ: Because it, it pertains to the Order, it pertains to the, the Motion for Reconsideration, the Order that was issued that he's going to come in and talk and he's going to testify like any other County witness does.

MR. MCCANN: Okay. I'll stop arguing with you. I will.

ALJ: All right, thank you.

MR. MCCANN: I promise, I promise. Okay. Re, regarding Hazen, Mr. Bayer. Were you involved in that in any

way? That is either the solicitation of that work or the, the, its ongoing nature in any way?

MR. BAYER: When you reference that work, are you talking about the needs analysis of the comprehensive evaluation that Hazen is doing right now?

MR. MCCANN: Yeah, you, well, yeah, let's start with those two things because you were very careful to say those two things, yes.

MR. BAYER: Well, you said that work, I, I, it's hard for me to answer your question --

MR. MCCANN: I appreciate that.

MR. BAYER: -- unless you're more specific. So, what was your question then? Am I involved in that needs analysis and comprehensive evaluation? Yes, a little bit, yes. Correct.

MR. MCCANN: And how are you involved in that?

MR. BAYER: We've been discussing with them what we, what we expect from them, which was outlined in the proposal that we sent them and, and asked them to provide.

MR. MCCANN: So, those two, those two aspects of it and, and again, I think you were careful to say that, comprehensive evaluation --

MR. BAYER: Evaluation.

MR. MCCANN: -- evaluation and needs analysis, those have not been accomplished by Hazen as we sit here today,

correct?

MR. BAYER: No, they're still working on it, correct.

MR. MCCANN: Okay. Is there some other aspect of Hazen's work that has been completed and has been provided to the County?

MR. BAYER: Of the needs analysis or that --

MR. MCCANN: No, other than those, other than those two things.

MR. BAYER: Are there other things that Hazen is doing on our behalf? Yes, they are.

MR. MCCANN: Okay, that have not been completed as we sit here today?

MR. BAYER: That have not been completed? Yeah, I have, I have passed them with some work to actually add in the (inaudible) sewers and some of the other sewer shed models.

MR. MCCANN: Okay.

MR. BAYER: So, the task is ongoing. There's lots of tasks that Hazen has, working on on our behalf.

MR. MCCANN: Okay. Do we know when the report, the comprehensive evaluation, I guess, is what you're referring to and needs analysis will be completed?

MR. BAYER: I don't have the latest schedule in front of me so I don't answer, I can't answer that. I don't know.

MR. MCCANN: Okay and did, did you really say, did I hear it correctly, that you didn't, that County didn't hire

Ramboll to determine sewer capacity?

MR. BAYER: Well, like I said, we, we hired them to do a design for the rehabilitation as the sewers that were in that, within that Lake Roland area.

MR. MCCANN: I'm sorry, you're talking about Ramboll now, right?

MR. BAYER: That's exactly, that's what I thought you said, Ramboll.

MR. MCCANN: Right and I, and I switched gears, I'm sorry. Hazen. Was, was Hazen hired to, to evaluate capacity?

MR. BAYER: That will be part of the needs analysis, I suspect.

MR. MCCANN: Okay. Okay. Let me show you, this is Protestant's Exhibit 64. Mr. Rosenblatt was asking about that. Do you recall that testimony?

MR. BAYER: Yes.

MR. MCCANN: Okay. This is our exhibit and our exhibit as introduced have these manholes highlighted in yellow. Do you see that?

MR. BAYER: Yes.

MR. MCCANN: Okay. Am I correct, do you recognize these manholes, maybe you have the manhole numbers memorized by heart by now, but do you recognize that these highlighted manholes are the eight segments, so called Johns Hopkins segments, that are across the street from this property?

MR. BAYER: Yeah, it looks like those are the eight segments that were in that memo that you showed me a little while ago.

MR. MCCANN: Okay and this chart, as I think you've already described, well, strike that. Does, does this chart in the column percent full, does it not reflect what the, the percent, capacity percentages are for those segments, correct? This column --

MR. BAYER: Scroll back up the top and see what that says at the top of that column, please.

MR. MCCANN: Percent full.

MR. BAYER: Yeah, there you go.

MR. MCCANN: Okay. So, putting aside this new model that you apparently ran or you asked for, a simulation for, is it, it, is it a safe assumption on my part, Mr. Bayer, that if I were to look at RK&K's work product and RJN's work product, for capacity numbers, if I were to see capacity numbers that were either 94.32 or greater for any sewer segments, that those are probably sewer segments that should cause us con, some concern, correct? Would you agree with that?

MR. BAYER: If you're talking about a simulation, prediction that the model was run and it showed something like this it could be a cause of concern, yes.

MR. MCCANN: Okay.

MR. BAYER: We use, we use a model as a tool to kind

of direct us to areas that might be a concern, like we do with other tools, like the I&I analysis that you, that Mr. Rosenblatt showed me with, there was areas exhibiting high I&I. Those are all tools that we use to try to point us in the direction (inaudible) be concerned about.

MR. MCCANN: Well, those may be tools that you use day to day, but that's not what the Consent Decree requires, is it?

MR. BAYER: The Consent Decree required us to do a long-term capacity peak flow and management evaluation.

MR. MCCANN: Specifically, the Consent Decree, let me ask you about that, you, you agree with me, that the Consent Decree requires the County to conduct a long-term evaluation to identify corrective actions necessary to ensure long term capacity, do you agree with that?

MR. BAYER: I believe that's what be what the language is in the Consent Decree.

MR. MCCANN: And then the Consent Decree also then requires the County to prepare an SRR plan to iden, to identify the deficiencies in the system and then perform all corrective actions necessary to address those deficiencies, correct?

MR. BAYER: I believe that's what the language in the CD says.

MR. MCCANN: Okay. Your Honor, this is, this is probably a good time to stop. I think the benefit of a, of a

lunch break would be, would be great. So, if it's okay with you, that's what I would like to do.

ALJ: How long do you all need?

MR. MCCANN: I mean, a half hour, forty-five minutes would be great, would be fine.

ALJ: All right. Mr. Rosenblatt, a half hour, forty-five minutes? You must be muted, I don't know.

MR. ROSENBLATT: I did it, sorry. A half hour is fine by me.

ALJ: And Ms. Demillio, any longer that you needed?

MS. DEMILLIO: No, half hour is fine.

ALJ: Okay. Mr. Wyatt?

MR. WYATT: Half hour is perfect.

ALJ: Okay, sounds good. All right. We'll come back, you know, one-ish or so. I'll pause the record.

MR. MCCANN: This, is this the last witness for the day, Mr. Rosenblatt?

MR. ROSENBLATT: It's the last witness, yes, that we have.

MR. MCCANN: Okay, all right. Thank you, Judge.

(PAUSE)

ALJ: All right, we're back on the record. Mr. McCann, you were still in cross.

MR. MCCANN: Okay, thank you. Mr. Bayer, can you hear me?

MR. BAYER: Yes.

MR. MCCANN: Okay. One of the things I didn't ask you about your work with the County is, as I understand it, at least my interactions, that there are one or more folks within the County that are charged with ensuring compliance with the Consent Decree. I don't know what you call those people, compliance, CD compliance folks, or something like that. Is, is that correct?

MR. BAYER: There's staff that, that are involved and we also have a program manager, if that's what you mean.

MR. MCCANN: Yeah, who's the program manager?

MR. BAYER: WSP.

MR. MCCANN: Okay. But you're not involved in that is, as I understand it, correct?

MR. BAYER: Not involved in what? No, I don't work for the program manager now. We work together on, on a lot of things relating to the CD, as do the other staff.

MR. MCCANN: You're not, but you're not part of the staff that's charged with determining whether or not compliance with the Consent Decree is being accomplished?

MR. BAYER: I don't know if that's the County's decision to make. The compliance is probably related to MDE, EPA and DOJ.

MR. MCCANN: Okay. So, there's no one in, no one in the County that is charged with determining whether or not what

it's doing complies with the Consent Decree?

MR. BAYER: I, I think we submit everything that we are obligated to do and then we wait for comments back from EPA, MDE, EPA and MDE.

MR. MCCANN: Okay. Let's talk about map three. I think, and I've got it up on the board here, it is Protestant's, part of it, Protestant's Exhibit 78. I'm sorry, let me make sure of that. Yeah, Exhibit 78. I think you acknowledged during examination by Mr. Rosenblatt, can you see that, by the way, Mr. Bayer?

MR. BAYER: Yes.

MR. MCCANN: That, in your words, map three does show some, quote, issues of concern downstream, is that, from the subject site, is that fair?

MR. BAYER: Well, I think if you go to the legend in the upper right, it describes what is shown on the map. So, it looks like model predicted hydraulic restrictions.

MR. MCCANN: I'm just asking you about your testimony. Your, I think you said, did you not, that, at least agreed, that map three shows issues of concern downstream from the subject property?

MR. BAYER: Yes, it was predictions of surcharging, yep.

MR. MCCANN: Okay. But then you said, well, excuse me. Then you said in response to Mr. Rosenblatt's leading

question, that you don't, that that doesn't mean --
MR. ROSENBLATT: Objection, objection.
MR. MCCANN: -- that doesn't mean you --
MR. ROSENBLATT: Is this --
MR. MCCANN: (inaudible) --
ALJ: Hold on, hold on. You guys are both talking at the, hold on. You're both talking over each other. Mr. McCann, yeah, you don't need to say his leading question, but. I know that's what he's, Mr. Rosenblatt is getting at, right, Mr. Rosenblatt?
MR. ROSENBLATT: Yes, Judge.
ALJ: All right. Let's play nice, as I always say to you two.
MR. MCCANN: Okay. I think what you said during that discussion as well, Mr. Bayer, is that that does not mean, in your opinion, that you do repairs right away, is that, I think you put it like that, right?
MR. BAYER: Yeah, we like to evaluate and try to confirm, validate what is predicted by those models.
MR. MCCANN: Yeah. Well, and what, and I think you put it in terms of verifier, right? That's what you said. It's called, you verified it somehow?
MR. BAYER: Yeah, we tried to, to see if we can't verify what the predictions are.
MR. MCCANN: Yeah. And let me, in that regard, let

me pull up another document, which is Developer's Exhibit 47. And one, and I think when you were asked how do you verify, you said flow monitoring, correct?
MR. BAYER: Yes, that's one, one way, yep.
MR. MCCANN: Okay. So, here's, during the last hearing, and then again, you were referred to it today, this is 47-A and 47-B, which is, bear with me one second, sorry. It's the e-mail associated with that. Mr. Rosenblatt asked you about this e-mail, do you correct, do you recall?
MR. BAYER: Yes.
MR. MCCANN: Okay. So, these are five level sensors downstream of this subdivision, right? You have them right here listed, correct?
MR. BAYER: Yes.
MR. MCCANN: And so, and a, a level sensor is, essentially, a flow monitor, correct? Is, are they one and the same thing?
MR. BAYER: A level sensor only gives a limited information compared to the flow monitor, which gives us more information.
MR. MCCANN: Okay. But this was introduced last time, and it was spoken about again today and where's all the data from these sensors? Is that available to you?
MR. BAYER: Oh, yeah, um hm.
MR. MCCANN: Okay. If you wanted to look at it?

MR. BAYER: Yes.
MR. MCCANN: Okay. But you haven't brought it with you today, I take it, right?
MR. BAYER: No, I do not. It's actually hosted by our consultant that provides that service to us.
MR. MCCANN: All right. Well, in the past, the County has done flow monitoring, correct?
MR. BAYER: We have run staff that does our own flow monitoring sometimes, yes.
MR. MCCANN: Yeah, in fact, RJN did flow monitoring, did it not, in two thousand and, when it submitted its report in 2021?
MR. BAYER: Yes, they've done some flow monitoring for us.
MR. MCCANN: Bear with me one second, I'm trying to pull that report up. So, flow monitoring, flow monitoring, I'm sorry, is a way to verify model predicted SSOs, for instance, of the type shown in map three, correct?
MR. BAYER: That's one way.
MR. MCCANN: Okay. So, but RJN did it, in its actual report, the same report that map three is attached to, it did flow monitoring, correct?
MR. BAYER: They were doing some flow monitoring in Jones Falls, yes.
MR. MCCANN: Okay. So, I'm showing you, again, this

is the report, May 27, 2021, RJN performance assessment report. And at page thirty-two, I'll direct you to it, bear with me. It says this paragraph, and I'll highlight it just to focus us in on it.
Can you read it? I'll blow it up a little bit. It says, and I'm going to paraphrase, but correct me if I get anything wrong. It says, flow monitoring was performed in twenty-six locations back in 2008 apparently in connection with the SRR plan.
And then the second sentence says, or at the bottom here it says, post-rehabilitation flow monitoring, I'm sorry, post-rehabilitation flow meter locations were selected on the previously 2008 monitored locations, supplemented by additional locations selected to address the County's intent. So, and then the next paragraph, it goes on about the post-rehabilitation flow monitoring that was performed. Do you see that and does that ring a bell with you?
MR. BAYER: I see that.
MR. MCCANN: Does do, are you familiar with that, the fact that RJN did post-rehabilitation flow monitoring?
MR. BAYER: Yeah, that's in order for us to assess how effective we were in the rehabilitation side, we have to do post-rehab flow monitoring (inaudible).
MR. MCCANN: And, in fact, it refers to figure 1.2, which I think is on this page, I'll scroll down to the next

page in this exhibit. And it shows in table 1-1, pre- and post-rehabilitation flow monitoring. And it looks like, correct me if I'm wrong, but it looks like post-rehab flow monitoring was done for, between 2018 and 2020, for all of the, the water meter basins, correct?

MR. BAYER: For the basins, looks like, yep.

MR. MCCANN: Okay. So, when RJN prepared its map three, it had conducted post-rehabilitation flow monitoring, correct?

MR. BAYER: Yes.

MR. MCCANN: One other point about this report is I think you, you know, you were talking about the rehabilitation that was performed up in the, the water meter basins up here in the northeast corner, 03, 02, 04, I think. Do you recall that testimony?

MR. BAYER: Yes.

MR. MCCANN: Okay. I want to, I want to focus in on these two sentences here. This is again on page four of the RJN report, which is Exhibit 78. And I'll just read it. Quote, flow monitoring in basins 02, 03, 04 and 09, I'm sorry, I keep on doing this, was performed to evaluate the effectiveness of comprehensive I&I rehabilitation performed in these four-meter basins. Did I read that correctly?

MR. BAYER: I think so.

MR. MCCANN: And then the remaining meters listed in

table 1.1, which we just discussed, were installed to evaluate flows at model predicted SSO locations, as identified in support of the 2013 Jones Falls SRRR plan or to calibrate and verify the model. Did I read that correctly?

MR. BAYER: I think so.

MR. ROSENBLATT: Objection. Judge, I'm trying to let this go, but we, we're having repeat questions of just reading a document and asking if it's read correctly. And the document says what it says.

ALJ: And the same objection, I think, came when you were asking questions as well. I, I'm thinking Mr. McCann is going to get to his next question. Maybe this is the --

MR. MCCANN: Yeah.

ALJ: -- background question for the next question. So, I'll overrule it. Go ahead, Mr. McCann.

MR. MCCANN: So, it sounds to me, and correct me if I'm wrong, Mr. Bayer, that the flow monitoring that was performed elsewhere, other than in these four meter basins up in the northeast corner, was not used by RJN to evaluate the effectiveness of the rehabilitation, but rather for the purposes I just indicated in the second sentence, correct?

MR. BAYER: I believe that's what it says.

MR. MCCANN: Okay and that flow monitoring data for all these water meter basins, including the ones that would receive sewage from the subject property, you have that data

available to you, correct?

MR. BAYER: It should have been provided to us.

MR. MCCANN: Okay. Okay. Let's switch subjects. You, actually one more thing about the RJN map three. So, the, the map three, which indicates modeled capacity issues, the, the data that on the, that underlies those or the, the capacity numbers specifically, can be found in other data that was supp, was supplied by RJN in connection with that port, report, correct?

MR. BAYER: Can you ask that question again --

MR. MCCANN: Yeah, that was a, that was a terrible question. Let me, let me show you the exhibit first and see if you recognize it. So, this is Protestant's Exhibit 82. You see that?

MR. BAYER: I do.

MR. MCCANN: Okay. Are you familiar with this document?

MR. BAYER: Yeah, I believe this came from the performance assessment.

MR. MCCANN: Right. So, and it's a long document, and I won't go through all of it obviously, but what it basically is, it tells us what RJN found for each of the storm events post-rehabilitation as part of a wet weather capacity analysis, correct?

MR. BAYER: It appears to be.

MR. MCCANN: Okay. So, I could go down to the ten six storm, for instance, and see what capacities RJN found post-rehabilitation for the sewer segments that are the sub, that would receive flow from the subject property, correct?

MR. BAYER: I guess you could scroll down to the ten-year six hour.

MR. MCCANN: And RJ, RK&K had that same information, did it not?

MR. BAYER: Yes. Well, they didn't do a post-rehab, but they did a capacity analysis, yeah.

MR. MCCANN: Yes, so, this is Protestant's Exhibit 72. And this is entitled future pipe capacity and manhole surcharge summary. Again, a long document beginning with the two-year six-hour storm. This, this document, which was attached to the RK&K work product, likewise, would tell us what percentages of capacity RK&K found for all the pipe segments downstream of the subject property, correct?

MR. BAYER: It looks like it shows a column of capacity use and percent and capacity remaining and the gallons a day.

MR. MCCANN: Okay. Okay. I'll switch gears. You, you mentioned, you said that the County found and looks like fixed with exception of one, thirty-four structural SSOs. Do you recall talking about that?

MR. BAYER: We eliminated, I think, that many.

MR. MCCANN: Yeah, Mr., Mr., I think, Rosenblatt was asking you about what you had done as far, had accomplished under the Consent Decree in terms of eliminating structural SSOs, do you recall that?

MR. BAYER: Yes.

MR. MCCANN: And let me show you, there is a very distinct and significant difference between structural SSOs and just SSOs, is there not?

MR. BAYER: Yeah, the structural SSOs are structures that constructed.

MR. MCCANN: Yeah, so here's the Consent Decree. I can go to the top, but you probably recognize it. This is, I just lost it, I'm sorry. This is at the bottom of page eleven. It has the definition, under Z, it has the definition of sanitary sewer overflow or SSO, quote, shall mean any spill, release or discharge from the collection system, including all building backups, end quote. Do you see that?

MR. BAYER: I do.

MR. MCCANN: And then next page, double A, it talks about SSO structures. Is that what you were, or sanitary sewer overflow structures. Is that what you were refer, referring to in your testimony with Mr. Rosenblatt?

MR. BAYER: Yes, it's a structure that was constructed.

MR. MCCANN: Right. So, these structural SSOs, I

think as this definition reflects, are structures that are actually constructed by the County for the purpose of allowing discharge, correct?

MR. BAYER: I don't know the purpose of why they were constructed. That's way before my time. But they were constructed by the County as far as I know.

MR. MCCANN: Well, the definition is here, that's why I'm, I'm paraphrasing the language. It says, shall mean any structure in Baltimore County constructed for the purpose of allowing discharge, end quote. Do you see that?

MR. BAYER: I do.

MR. MCCANN: Okay. As you were suggesting, and maybe I didn't catch you, but you're not suggesting that there haven't been any SSOs in the Jones Falls recently have, are you?

MR. BAYER: No, they're not, no, there's been SSOs, as far as I know.

MR. MCCANN: In fact, there was one right in Lake Roland just about a month ago in January, correct?

MR. BAYER: I was sent an e-mail that showed that the lid was off the top of one of our manholes and it appeared that there could have been evidence of an overflow.

MR. MCCANN: Were you shown photographs?

MR. BAYER: Yes.

MR. MCCANN: Okay. Let me show you, I'll mark this

as Protestant's Exhibit 110. Do you see that? I'm going to scroll down, it's just a couple pages. Do you see that, Mr. Bayer?

MR. BAYER: Yes.

MR. MCCANN: Is that, are those the photographs or is that the same manhole that you were sent photographs?

MR. BAYER: Yeah, I believe those are the same photographs and that's the same, yeah, same manhole, I believe.

MR. MCCANN: And then, aside from that, it occurred in January, correct, of this year?

MR. BAYER: I believe it did.

MR. MCCANN: Do you know, do you know what manhole that was by, by chance?

MR. BAYER: I, I don't.

MR. MCCANN: And there was a, an SSO in a, in a, nearby, very nearby manhole a couple years ago as well, correct?

MR. BAYER: The same situation, yeah. I was sent photographs of what appeared to be evidence of an overflow a couple years ago, yes.

MR. MCCANN: Okay. Your Honor, I would move this, these photographs in as Protestant's Exhibit 110.

ALJ: Mr. Rosenblatt?

MR. ROSENBLATT: No objection.

ALJ: You object?

MR. ROSENBLATT: No objection.

ALJ: Oh, no objection. Thank you. So, one ten, Mr. McCann, that's the number? I don't know --

MR. MCCANN: That's what I have, yes.

ALJ: Okay, accepted.

MR. MCCANN: Thank you. And, Your Honor, if I could just have a minute, I think I may be done, quicker than I thought. So, can I have a minute or two?

ALJ: Sure.

MR. MCCANN: I may just go on mute while I do that.

(PAUSE)

MR. MCCANN: That is all I have. Thank you, Judge. Thank you, Mr. Bayer.

ALJ: All right. We have Mr. Wyatt. Mr. Wyatt, do you have any cross?

MR. WYATT: Yes, Your Honor. I just have a, a few questions for Mr. Bayer.

ALJ: Sure.

MR. WYATT: Good afternoon, Mr. Bayer. How are you?

MR. BAYER: Fine, thanks.

MR. WYATT: I reached out, you and I actually spoke a couple of weeks ago about this case, did we not?

MR. BAYER: Yes.

MR. WYATT: And you and I know one another socially, I don't think we've ever interacted professionally, is that

accurate?

MR. BAYER: Correct.

MR. WYATT: All right. And by the way, is that your desk behind you? Is that your, are those files you're working on behind you?

MR. BAYER: Paperwork.

MR. WYATT: I've never been to your office, that's why I ask. Anyway. Fair to say at the time we spoke, you were a little bit reticent in speaking to me about this project?

MR. BAYER: Yes.

MR. WYATT: I think your words to me were, you're, you're a little uneasy about talking about it with me?

MR. BAYER: Yes.

MR. WYATT: And I was respectful of that, correct? I didn't push you in any uncomfortable position in terms of trying to get you to answer questions that I may have had about the project, right?

MR. BAYER: Correct.

MR. WYATT: All right. But I did ask you one question and the question was, we were talking about, I think it's Exhibit 90, but it's your e-mail, it's the, it's the zero breaking point e-mail. I asked you just one question and you did answer it, looking at my notes. Has anything changed since your e-mail? And your response was, nothing has changed. Is that, is that a fair description of our conversation?

MR. BAYER: Yeah, as far as I know nothing has changed, yep.

MR. WYATT: Okay, all right. Thank you, Mr. Bayer. I have no further questions.

ALJ: All right. Mr. Sachse, do you have any cross?

MR. SACHSE: No, thank you, though.

ALJ: Thank you, Mr., Mr. Sachse. And then, Ms. Demillio, do you have any cross?

MS. DEMILLIO: No, I don't, Your Honor.

ALJ: Okay, thank you. All right. And so, I guess, I mean, it's an odd situation to come back to Mr. Rosenblatt. Let, let me do, let me do this. Maybe this first. Mr. Bayer, you've been so good with us and patient with us. So, I am just a visual person and I apologize if you've already answered all these questions. But just, just humor me, okay?

MR. BAYER: Certainly.

ALJ: You see, you see what's on the screen?

MR. BAYER: I do, yes.

ALJ: All right. So, the last number for the, what we keep calling the Hopkins segments, but we see from Mr. Benjamin's letter that perhaps, you know, this was more of a joint effort. But in any event, what I'm looking at is the number, 43, 4, 43786.

And this My Neighborhood map was produced by the Protestants. And it shows, it is, oh, it says it on there

actually. Let me hit the number just for the, sixty-three was Protestant's exhibit. All right. So, so this is the, the, the, the property, right? You recognize that?

MR. BAYER: Yes.

ALJ: So, this is the My Neighborhood map, everybody can pull this up. And this was submitted by the Protestants, but in reality, everybody agrees that this is the sewer path, right? Okay, so, so the last, so the last number is 43, 43786 and that's like right in here where my cursor is. And that's the last part. The, the rest, all this up to the property is either the Developer or it's the Hopkins segments, right?

MR. BAYER: Correct.

ALJ: All right. So, then we had this other document that the Protestants produced, which was seventy-seven, and this thing was a chart. It was an appendix to the SSR report. And you see that? Have you seen this before? It's an appendix to it.

MR. BAYER: I might have a long time ago.

ALJ: So, what I'm doing is just, and again, you're the expert. But here I am, I'm the lay person, right? I'm looking at this. It gives me the manhole number, 44212, and it shows, if you can see that, def, defects in the segment sixty-seven. One of them is a defective joint. The rest of it says grease. So, my first question is, what, what's the deal with where it says grease? What, what does that mean? And does,

does that pose any worries to you at all?

MR. BAYER: Yeah, grease means when, sometimes people will put their grease into the sewer system and then that clogs up our sewer system. Yes, that's a huge concern of ours. It creates problems, blockages, which will cause, or could cause an overflow, or capacity deficiency. So, yes, grease is a very big concern.

ALJ: So, what happens when you see that grease? What do you, what happens? What's the remedy for that?

MR. BAYER: So, the Bureau of Utilities would be the ones that would have to clean that. So, they would run a jetter through it, let's just say for example, to try to flush the grease out.

ALJ: Okay. So, on this --

MR. BAYER: Or they could, they could also --

ALJ: I'm sorry.

MR. BAYER: -- add a chemical sometimes maybe.

ALJ: Add a chemical. So, so, if you look at this chart, where it says, this is again the SRRR plan and all these segments where it says grease, is, does the Bureau of Utilities just automatically correct that? And can I assume that these, all of these are corrected?

Like the first one here, for example, is in the sewer path. So, 44212 and 44211 is right here. So, see I'm a visual person, so I'm looking at this going now there's, there's

grease in here. So, do I assume that that's fixed or what?

MR. BAYER: I think the table you're looking at is very old (inaudible) --

ALJ: Is that right? So, that's the, yeah, you, you tell me, you're the expert, which is why I want, yeah, this is from the SRR report --

MR. BAYER: Which is 2012.

ALJ: Yeah.

MR. BAYER: So, I would hope they fixed it by now, but I don't know the answer to that without researching it and pulling up work orders and see.

ALJ: Okay.

MR. BAYER: That could, grease could get eliminated and come back in time, over time.

ALJ: But is there, so, but is there general maintenance that gets done by the Bureau of Utilities where, where they would, just on a regular basis do this?

MR. BAYER: Some, some segments are on what they call specials, that they do get regular maintenance. We're working on, what, what we have now is an asset management plan, which hopefully would, would identify some of those maintenance issues, which would require, or, or, yeah, they (inaudible) schedule that on a regular basis for cleaning, if it's a grease problem.

ALJ: Okay and in your research, because you looked

at all the, the sewer path, again, from, for this property, which, you know, it goes on for multiple pages here, did you see any, any issue then in terms of, I, you know, that, that would give you concern if, you know, homes were built? Obviously there's going to be plumbing, if, you know, they were connected to this path that you were concerned about?

MR. BAYER: Yeah, if you scroll up a little bit there was a concern, oops, you're going too fast.

ALJ: Which one, which one is it?

MR. BAYER: Scroll up a little bit further, yes. Keep going, okay. So, some of the segments there, 44222, 44223, so there was, we iden, when I was flow monitoring out there last year, we identified some issues. So, I asked the Bureau of Utilities to go out and clean some of those segments. And I think they went from 43786 all the way across the beltway. So, if you scroll down a little bit farther.

ALJ: 786, oh, scroll down again?

MR. BAYER: Yeah.

ALJ: Okay.

MR. BAYER: So, I think they, they went all the way down and cleaned up all the way across the beltway, maybe down to 44219.

ALJ: Uh huh, that's here.

MR. BAYER: Yeah, but I don't recollect, but there was a concern on, on those segments, what I was seeing on flow

monitoring. So, I asked the Bureau of Utilities if they would go out there and, and clean and inspect.

ALJ: Okay and, and when you say, and you, and how did you know that, that it was an issue? Was that the flow sensors?

MR. BAYER: Yes. Sometimes we see the flow censors will, will indicate that there's a, a blockage downstream or restriction downstream, and I think that's what I saw on that flow monitor, so I asked Bureau of Utilities to go out there and clean and inspect.

ALJ: Okay. So, and, is it your job then to, to watch the flow monitor sensors and, and to figure out whether you see new problems? Is, is that how it works?

MR. BAYER: Yeah, the ones that I have out in the field, yeah, we try to, we try to pass along any information like that that we get to the Bureau of Utilities so they can help their maintenance.

ALJ: Okay. So, so, okay. So, all right. That probably, you know, answers my questions on, on those. There were some, also some information, I guess, through evidence and, again, you weren't here.

It's not really fair to you to, I mean, I'm just highlighting for you that, that there was evidence produced that, that indicated that, at least the Protestants believe that there should be relief sewers installed, like down here

where it says 20767, to 20766. And then even on the next page over here at the top. You know, different size relief sewers. It, it, but it, was that something that was completed or did that even need to be done in the first place?

MR. BAYER: It was not completed and then yes, you bring up a good question, does it need to get done in the first place. So, that was, we go back and look at that model calibration summary table, where it indicated, I think, in these locations that there was some relief sewer necessary.

But again, we questioned that because of the over predicting that we were seeing in that table 5-3.1. So, when we have low confidence, we like to try to confirm before we move forward with anything.

ALJ: And so, you're still confirming?

MR. BAYER: I have meters out there and then, yep, we're watching, we watch to see if there's any kind of issues, so.

ALJ: Watch to see if there are issues, okay. And so, really that's, that's the game plan from here is, is watching the flow sensors, monitoring those and seeing what data you collect from that. And then you decide whether or not you're going to need relief sewers?

MR. BAYER: Yes, and then what we'll do is, we'll do an I&I analysis once we get all that data so we can try to find out if there's an area that is contributing a lot of extraneous

flow. And then also, we also are looking for, when we did those, we do those flow isolations in the middle of the night, we're looking for areas that are segments of pipe that are very leaky. So, there's a couple different tools that we use to keep an eye on things.

ALJ: Okay. But even with that, so the, you know, this flow sensor monitoring is ongoing. Is it, can you, sitting here today though you feel comfortable that, or do you, or can you tell me whether you do, that if this property is hooked up to this sewer, and these, saying that these Hopkins segments, keep calling them Hopkins segments, get repaired and the developer here does the first, the two that they have to do, you know.

But the rest of it are, you have any concern that hooking up this, these proposed houses to this sewer line as shown, that it would not be a problem or are you comfortable with that or what?

MR. BAYER: I'm not seeing anything on my flow monitoring that's concerning right now, but that doesn't mean I won't see something in the future.

ALJ: Okay. So, right, obviously that in the future there could always be something. But I just was curious as to, you know, at least as you see it today, sitting here today, is there any issue that you see?

MR. BAYER: Like I said, I'm not seeing anything in

that flow path there that we ran a couple minutes ago.

ALJ: Okay and then the other issue that I guess Mr. McCann showed you those photos of that lid that came off.

MR. BAYER: Yes.

ALJ: In the Jones Falls, that's down here, again, I'm just a visual person so I like to look at all these things. So, you know, with that, did, did, was work, did, did work take place to try to correct that problem? What, and so it, is there any concern that you have having seen those photos with this project?

MR. BAYER: Not with the project, but yeah, I was very concerned, so I immediately directed some staff to go out there and put that lid back on because that's a safety issue. I didn't want someone to get hurt. So, he went out there immediately after I got that e-mail and put the lid back on and locked it. It's a particular type of lid, so it needs to be locked.

ALJ: Understood. So, but for this particular project, does the fact that you saw those lids off in that Lake Roland, in that area, does that have any concern that the, you know, the sewage, again, from this project, would not be able to flow safely?

MR. BAYER: There was a concern, so I have sensors all the way down to the Jones Falls pumping station in Baltimore City.

ALJ: That's down here, right?

MR. BAYER: Yes, it goes way down, miles or so down into the City, along the Jones Falls interceptor in the City and all the way up into, into this area, so --

ALJ: So, you add, did you say you added sensors because of this?

MR. BAYER: No, no, no. I'm just saying I've had sensors in there for about a year.

ALJ: Oh.

MR. BAYER: All the way down to the City's Jones Falls pumping station. So, and this is a preliminary review of that January 13th storm, I think, showed that the wastewater was backing up all the way from the City back up into the County. Every one of my sensors or meters down below. So, again, that's just a preliminary review of what it appears might have happened.

ALJ: Okay.

MR. BAYER: So, to answer your question, I'm concerned, yeah.

ALJ: Well, you, you were concerned and so what you do is, what do you do then as a result of that concern?

MR. BAYER: Well, like I said, preliminary review is I, I looked at the information I was getting from all those meters, all the way down to the City's Jones Falls pumping station.

ALJ: And you just keep going, gathering the information and then, so then at what, is there a breaking point at one point where do you say, you know, there, something has to be done or, or you just, how long does it take?

MR. BAYER: Well, as I said, it's just a preliminary analysis so far. What, what is occurring is Baltimore City has some issues at their Jones Falls pumping station and they need to install some equipment and I think that that's part of the problem is the station wasn't able to pump as much as it possibly could, resulting in a backup into the County. But again, this is just a preliminary review.

ALJ: Yeah.

MR. BAYER: But that appears as, as what's happening is the City's Jones Falls pumping station is struggling to keep up.

ALJ: Okay, okay.

MR. BAYER: And then to, to ask you what we, what happens moving forward is hopefully the City is going to complete their improvements sometime in June, is what I've heard. And we'll continue to monitor and see if they're effective in their improvements.

ALJ: Okay, all right. But from your experience, you believe that these flow sensors, the flow monitors, I keep calling them sort of the same thing. Obviously, you're, you know, but using those is giving you a better picture of what is

going on and you just want to continue to look at that and gather that data?

MR. BAYER: Oh, yes. It gives us great information on how it, how, how the sewer system responds to wet weather, which is what we're really trying to figure out.

ALJ: Okay, understood. All right. That's all the questions that I have. You've been very patient with us. Most of your, most of your day today has been taken up with, with, with this, this, this case. We do appreciate it. Let's see. What's that?

MR. BAYER: I was just going to say, hopefully I answered all your questions as best I could, hopefully.

ALJ: Yeah, thank you very much. All right. So, Mr. McCann, you're going to e-mail over the, the pictures that you have and you're also going to drop off a copy of those pictures, that's 110. You might want to do a, revise an exhibit list as well. And so, this is due, my Order is due in thirty days from today, all right, everyone? Just trying to give everyone a heads up.

MR. MCCANN: Are we, are we submitting anything to you, Judge?

ALJ: Do you all need to? Would you, would you like to?

MR. MCCANN: As much as I don't want more work, I think it's, I think it's necessary. We, I, we can do it, I can

do it as soon as possible and, you know, not, not make it long. But I think it needs to be briefed, at least from my side anyway. So, if, if you're okay with that, I can suggest a date that will allow you time to do what you have to do.

ALJ: All right. Well, Mr. Rosenblatt?

MR. ROSENBLATT: Yeah, I mean, I was going to say we don't need it, we wrote sixty, seventy-page memos already. But if they're going to write one, we're going to write one.

ALJ: Mr. McCann does indicate that he wants to do that so, so what day would then work for you all, because I was counting the days and the Motion, or the Order would have been due end of March, if you count thirty days from today, which is under our rules, that's what it is, the Order has to be done. But I can leave it open to get your memos.

MR. MCCANN: Yeah, I mean, part of the problem is, Your Honor, kids' spring break is, you know, the 9th through the 16th, so.

ALJ: Yeah, you and I have the same spring break, (inaudible).

MR. MCCANN: Yeah, and I, there's no way I can get it done between then, now and then, unfortunately. But the, the week after. So, the week of the 18th at some point later in that week.

ALJ: All right. The 22nd, Friday?

MR. MCCANN: That's as good as any day, yes, thank

you.

ALJ: Mr. Rosenblatt?

MR. ROSENBLATT: Yeah, I mean, that's plenty of time. Do we want to put a page limit on what we submit?

ALJ: I don't, I don't, I don't like page limits. I don't know. I mean, what's, you know, what do you do then? Reduce the font size, expand the margin?

MR. ROSENBLATT: No, no, trying to save work on --

ALJ: I know.

MR. ROSENBLATT: -- on all sides --

ALJ: I know. Well, this isn't the Circuit Court, so I get you. But I, you know, I tend to go on and on, I always so, I'll let you guys do what you need to do, whatever you think you need to do. But, all right. We'll say the 22nd of March memos are due. We always say 3:30 because that's just end of the day to, to file those by e-mail and then drop off a copy. And I'm just assuming, I guess, Ms. Demillio, you're welcome to also do it if you'd like.

MS. DEMILLIO: I'm sure our office will have a memo--

ALJ: Okay.

MS. DEMILLIO: -- (inaudible) for the 22nd.

ALJ: Twenty-second, all right. And then, Mr. Wyatt, you're also welcome, if you feel like it, Mr. Sachse, you know you're both welcome to as well if you feel like it. I don't know that you all did last time, is what I'm trying to

remember. I don't think so, I'm trying to remember. Maybe you did. But in any event, both of you are also welcome. Okay. Anyone, anything else?

MR. MCCANN: No, thank you, Judge.

ALJ: All right. Thank you, all.

MS. DEMILLIO: Thank you. Thank you.

MR. WYATT: Thank you, Your Honor.

ALJ: All right, thank you.

[OFF THE RECORD]

CERTIFICATE OF TRANSCRIBER

I hereby certify that the hearing in the matter of Greenspring Manor, 2310 W. Joppa Road, case numbers 08-0922 and 2021-0250-SPH, heard before the Office of Administrative Hearings for Baltimore County, February 26, 2024, was recorded digitally.

I further certify that, to the best of my knowledge and belief, page numbers 1 through 132 constitute a complete and accurate transcript of the proceedings as transcribed by me.

I further certify that I am neither a relative to nor an employee of any attorney or party herein, and that I have no interest in the outcome of this case.

In witness thereof, I have affixed my signature this 11th day of March 2024.

Christine R. Leary

IN THE MATTER OF:

GREENSPRING MANOR
2310 W. Joppa Road

CASE NUMBERS: 08-0922 & 2021-0250-SPH

Hearing Date: May 31, 2023

Pursuant to Notice, the above-entitled hearing was held before the Office of Administrative Hearings for Baltimore County by remote access.

PRESIDING:

MAUREEN J. MURPHY, ADMINISTRATIVE LAW JUDGE

FOR THE PARTIES:

ADAM ROSENBLATT, ESQUIRE
CHRISTOPHER MUDD, ESQUIRE

MICHAEL MCCANN, ESQUIRE

PETER MAX ZIMMERMAN, PEOPLE'S COUNSEL
FOR BALTIMORE COUNTY

Christine R. Leary

(ON RECORD)

ALJ: Good morning, everyone. You're attending day thirteen, case number 08-0922 and 2021-250-SPH. Property address is 2310 West Joppa Road. This is the combined development plan and zoning case for the project known as Greenspring Manor. Let's have counsel for the record identify themselves beginning with the Developer.

MR. ROSENBLATT: Judge, I think you're muted.

MR. MUDD: I can hear.

MR. SACHSE: I can hear.

ALJ: Did you hear me call the case?

MR. SACHSE: I did.

MR. MUDD: I did. While Mr. Rosenblatt is figuring out his sound, Judge Murphy, I'll enter our appearance. Christopher Mudd and Adam Rosenblatt with Venable, LLP here on behalf of the Applicant and the, the Developer.

ALJ: Okay.

MR. MCCANN: Good morning, Judge. Michael McCann on behalf of the Protestants.

MR. ZIMMERMAN: Peter Max Zimmerman, People's Counsel for Baltimore County. Good morning.

ALJ: All right. Good morning. I see that Mr. Wyatt is here, Mr. Sachse is also here. So, can you hear me now, everyone?

VOICES: Yes.

ALJ: Yeah, all right. I think it was Mr. Rosenblatt's sound.

MR. ROSENBLATT: Yeah, sorry about that.

ALJ: That's, that's all right. At least it wasn't me. So, we are here, as I said, in day thirteen and so we're still in the rebuttal case, the Developer. And what I had in my notes was that there was one witness remaining, is that correct?

MR. MUDD: That's right.

ALJ: Okay. One witness, so we're going to finish today?

MR. MUDD: We, we will, yes.

ALJ: All right. So, let's do this. I don't think there's anything preliminarily. I don't, I don't think, let me just ask and no one has anything? All right. Silence is good. We did get your exhibits, so, Mr. Mudd, and just so you know that we have, you know, the binders that you delivered to us. And we have made sure that we have the most recent Developer's exhibit list, which has in there 45-A and B. So, just to make sure that you knew that I had those.

MR. MUDD: Thank you.

ALJ: All right. So, with that said, I guess, everyone keep your microphones muted. If you've been here before, you know the drill. And the only people talking are the, are the attorneys or, you know, the witnesses that they're

calling. So, with that, Mr. Mudd, Mr. Rosenblatt, who are we calling?

MR. MUDD: We're going to call Mr. Nick Leffner.

ALJ: All right. I see him. Mr. Leffner? Oh, there he is. All right. So, let's swear you in. If you could raise your right hand, please? Do you swear and affirm under penalties of perjury, the testimony you're about to give is true and correct to the best of your knowledge and belief? Are you muted? Yep, you have to unmute yourself.

MR. LEFFNER: I do.

ALJ: Okay. You do? Okay, thank you. All right. Is it Mr. Mudd or Mr. Rosenblatt?

MR. MUDD: Yes, it'll be me.

ALJ: Okay, take it away. I'll mute myself.

MR. MUDD: All right. Good morning, Mr. Leffner. How are you?

MR. LEFFNER: Good morning.

MR. MUDD: Let me get situated here. Sorry. Do you see a copy of Exhibit 41 on your screen?

MR. LEFFNER: I do.

MR. MUDD: Okay.

ALJ: And I should say, Mr. Leffner has been here, at least been admitted as an expert before. I'm not sure what you're offering him as, but if, you know, we can short this at all. I don't know if anyone is going to have cross but what,

what areas are you offering him as an expert in?

MR. MUDD: I am going to offer him as an expert professional engineer with specific knowledge of the Baltimore County development regulations and related policies, sewerage design and capacity analysis and stormwater management design.

ALJ: All right. That's a lot, I'm trying to write it down. Development related, one more time, development related --

MR. MUDD: Sure. Development regulations and related policies.

ALJ: Related policies. Okay.

MR. MUDD: Sewerage design and capacity analysis.

ALJ: And capacity analysis. Okay.

MR. MUDD: And I should say sewer design and sewer capacity analysis, I guess is the best way to put that. And stormwater management design.

ALJ: Design.

MR. MUDD: Yes.

ALJ: Okay and with that, so, I, I believe, you counsel has probably seen Mr. Leffner before. Does anyone have any voir dire for Mr., Mr., excuse me, Mr. McCann, do you have any voir dire.

MR. MCCANN: Yeah, at least on the sewer design and sewer capacity analysis.

ALJ: Okay.

MR. MCCANN: (inaudible).

MR. MUDD: (inaudible). I'm sorry. Judge Murphy, I, I intended to ask him a few questions to describe his experience, if I may?

ALJ: Yep, understood. Well, now that Mr. McCann has voir dire anyway go right ahead. I'll be quiet.

MR. MUDD: That, that's okay, thank you. So, your, your resume speaks for itself here, Mr. Leffner. But can you just describe a little bit about, for Judge Murphy, about how long you've been an engineer?

MR. LEFFNER: Yeah, I've been an engineer for about fifteen years.

MR. MUDD: Okay and you've, you handled the zoning and development plan cases in Baltimore County, been involved in those before?

MR. LEFFNER: I have.

MR. MUDD: Okay and approximately how many cases have you been involved with in Baltimore County?

MR. LEFFNER: A couple development plan cases. A lot of the development plan cases that we work on have limited exemptions so we're not coming to a hearing necessarily.

MR. MUDD: Okay. Let's talk a little bit about, about sewer design. Have you previously designed sewer systems?

MR. LEFFNER: Yeah, I have.

MR. MUDD: And in general, how many sewer systems have you, have you designed over the years?

MR. LEFFNER: I mean, probably hundreds. Really any project that we work on that has any kind of wastewater generating use has a sewer system.

MR. MUDD: Okay and how many would you say you designed in Baltimore County?

MR. LEFFNER: Probably a dozen or two.

MR. MUDD: Okay and are you familiar with Baltimore County's sewerage design criteria?

MR. LEFFNER: I am.

MR. MUDD: Okay and where are the design criteria found?

MR. LEFFNER: They're in the Baltimore County design manual, I think it's chapter six.

MR. MUDD: Okay and, and have you applied that before in your, in your design of sewerage systems in Baltimore County?

MR. LEFFNER: Yeah, yeah. Every project in Baltimore County and they're, they're pretty similar to a lot of the other jurisdictions in the state.

MR. MUDD: Okay and are you familiar with how to evaluate capacity within a sewer system?

MR. LEFFNER: Yes.

MR. MUDD: And how is that performed?

MR. LEFFNER: It, it can be a mix depending on what the, the proposed design is. But I'd say generally it's a mix of determining projected sewer flows, you know, maybe just applicable to the use itself. Looking at long term or future use areas that the sewer system might use. As well as looking at any kind of existing condition uses that the sewer supports. Looking at infiltration into the system and then, you know, looking at the, essentially, the hydraulic capacity of the sewer line pipes.

MR. MUDD: Okay and to, to the extent that it matters, have, have you, have you designed these or, sorry, performed similar analysis like this on residential projects?

MR. LEFFNER: Yeah, I have.

MR. MUDD: Okay and have you also designed sewer systems for residential projects?

MR. LEFFNER: Yes.

MR. MUDD: Okay. Did you review the state of the sewer line that serves this property, and by that, I mean the public sewer line through which sewerage will connect?

MR. LEFFNER: I did.

MR. MUDD: Okay and can you just describe for the Judge the types of things that you did to evaluate that sewer line?

MR. LEFFNER: Sure. I think, you know, starting at the beginning of the project, there's a lot of record drawing

requests and receipts we get, which includes reviewing the My Neighborhood GIS mapping system, as well as getting record drawings from the County staff, the site survey, (inaudible) survey done that identifies the depths of some of the manholes, as well as pipe sizes and materials.

Met with County staff to discuss the system, put together a sewer capacity request letter to the County, which they responded to that helps identify any offsite improvements that are required. And then, you know, especially because of this case, just, you know, a lot of the documents related to the Jones Falls sewer shed and the various studies that the County and some of their consultants had done.

MR. MUDD: Okay. Let's switch for a second to stormwater management. Have you designed stormwater management facilities in Maryland before?

MR. LEFFNER: Yes.

MR. MUDD: How many?

MR. LEFFNER: Hundreds.

MR. MUDD: How about in Baltimore County?

MR. LEFFNER: Ditto. Probably dozens in Baltimore County.

MR. MUDD: Okay. Have you designed stormwater management facilities for residential projects?

MR. LEFFNER: I have.

MR. MUDD: And how many?

MR. LEFFNER: Hundreds, again.

MR. MUDD: And how many in Baltimore County would you say?

MR. LEFFNER: Yeah, a couple dozen.

MR. MUDD: Okay and what regulations or documents do you rely on when performing those, those design?

MR. LEFFNER: I think it was really two. I think the local regulations and design manual and then also the state manuals, especially the state manual has a lot of other technical guidance, supplements, they refer to other design manuals. But kind of the two main ones is the Baltimore County design manual and then the MDE stormwater design manual.

MR. MUDD: Okay.

MR. LEFFNER: And the supplement.

MR. MUDD: All right and then last question, and this is with regard to both sewerage and, and stormwater, are there any, any associations that you have with any engineering groups or is there any sort of continuing educational type of, of classes that you might take that would help you, to help your work in these areas?

MR. LEFFNER: Yeah, they, you know, there's, you know, state licensure required continuing education credit that we do. So, I take those. You know, I'm a member of ULI, which I wouldn't say is necessarily a technical association. But I also attend other events with organizational groups like ASCE

and then some of the other, you know, (inaudible).

MR. MUDD: What is ASCE?

MR. LEFFNER: ASCE is the American Society of Civil Engineers.

MR. MUDD: Okay, all right. I have no further questions. I would offer Mr. Leffner for the, the reasons previously stated, or for the purposes previously stated.

ALJ: Mr. McCann, did you have voir dire?

MR. MCCANN: I do, thank you. Good morning, Mr. Leffner, can you hear me?

MR. LEFFNER: Yep, good morning.

MR. MCCANN: Good morning. So, when you say you've designed sewer systems, obviously, I want to get some more clarity on that, is, prior to your experience with this project, is it fair to say that your experience with the design of sewer systems is, is what was in connection with proposed development of specific sites. Is that, is that a fair characterization?

MR. LEFFNER: I'd say it's typically related to proposed development, but a lot of that usually include analysis of the existing system in support of the proposed development. So, in some cases there may be an issue where there's an overflow or a break or some kind of system improvement required to just an existing system that has nothing to do with proposed development. And I'll work on

those as well.

MR. MCCANN: Okay. Well, let me put it this way. Have you ever conducted just an independent evaluation of a jurisdiction's or an area's sewer system or its capacity? Aside from any connection with a development project for a particular property.

MR. LEFFNER: I'd say yeah.

MR. MCCANN: You'd say yeah. What does that mean?

MR. LEFFNER: Looking at (inaudible) existing system that supports existing uses to identify pipe size increases or deficiencies in the (inaudible) system.

MR. MCCANN: Okay. When have you done that, as you just described?

MR. LEFFNER: I, it was years, you know, it kind of depends on the project and the, the area needing to look at it. I'd say a few years ago (inaudible) an existing residential zoned area. So, it was a large residentially owned area that they were looking at both sewer, sewer upsize requirements, relocation requirements and it was related to some pump station planning that they were doing.

MR. MCCANN: Okay and when was that? You said a couple years ago?

MR. LEFFNER: Yeah.

MR. MCCANN: And where was that?

MR. LEFFNER: One of them was in the state of Kansas

on a military facility and the other was located here in Maryland, also on a federal facility.

MR. MCCANN: Where, where was that? What, what federal facility was that?

MR. LEFFNER: It was Fort Meade.

MR. MCCANN: Okay. So, is it at least fair to say that you've never done what you've done in, in this case, I know you haven't described it fully yet, but in connection with any other project that you've ever worked on?

MR. LEFFNER: Could you, I'm not sure what you mean--

MR. MCCANN: Yeah, what, you've described some of the things you, you've done in, in this case for which we're here today. And I'm asking you whether you've ever done those sorts of things or, or not sorts of things, but done what, done that before in any other case or in connection with any other project?

MR. LEFFNER: I guess (inaudible) the analysis that I've done for this case that we've performed is very consistent with every development project that we work on.

MR. MCCANN: And, and --

MR. LEFFNER: As far as analyzing the downstream sewer capacity, meeting with the local jurisdiction, applying the design manual and identifying any downside, downstream upsizing required to support the project.

MR. MCCANN: When you say, when you say it's very

consistent, what do you mean by that --

MR. LEFFNER: Yeah.

MR. MCCANN: -- what do you, you've done the, you've done the (inaudible) --

MR. LEFFNER: Same process --

MR. MCCANN: Go ahead, I'm sorry.

MR. LEFFNER: Sorry. The, it's a standard process. We, we do, what, what I've done on this project is the same that we do for all projects.

MR. MCCANN: But have you done a comprehensive eval, let's put it this way. Have you done a comprehensive evaluation of capacity in a sewer shed or sub sewer shed before?

MR. LEFFNER: Yes.

MR. MCCANN: Without any connection to a particular development?

MR. LEFFNER: Again, those two areas that I shared. We analyze just the existing sewer system.

MR. MCCANN: All right. Are you a sanitary sewer engineer or a wastewater engineer?

MR. LEFFNER: I'm a civil engineer, which includes both of those disciplines.

MR. MCCANN: Okay. When you say includes both of those disciplines, do you, have you either published any articles in the area of wastewater engineering or sanitary

sewer engineering?

MR. LEFFNER: I have not published any articles.

MR. MCCANN: Do you perf, do you belong to any professional associations in, in the civil engineering field in the areas of wastewater engineering or sanitary sewer engineering?

MR. LEFFNER: Again, I'm not a member of the organizations, but I've attended events.

MR. MCCANN: Bear with me one second. I didn't see, I think your resume has been marked as Exhibit 41. I didn't see any reference in your resume to any sewer design or sanitary sewer design experiences. Is there a reason why it's not in your resume?

MR. LEFFNER: I'd have to look and see. I don't know if you guys have a copy of it. Usually, I think it's included up at the top with the design of water and sewer or utility infrastructure, which is common of all projects that I work on.

MR. MCCANN: Okay. I see a reference to utilities in this but no reference to sewer design.

MR. LEFFNER: Yeah, --

MR. MCCANN: Am I wrong about that?

MR. LEFFNER: Yeah, utilities would include water utilities, sewer utilities, conduit to support electrical and telecom utilities. So, a variety of different utilities.

MR. MCCANN: Okay, not just sewer?

MR. LEFFNER: Not just sewer.

MR. MCCANN: Right.

MR. LEFFNER: But including sewer.

MR. MCCANN: Have you ever, again, independent of any particular project or development that you, you're working on, have you ever served as an expert witness, whether you testified or not, on sanitary sewer or wastewater sewer design or capacity issues?

MR. LEFFNER: Hm. I don't think it was the only thing that I testified to, but there are often times, Board of Appeals, Planning Commission meetings where I have to provide testimony related to sewer, yes.

MR. MCCANN: Related to sewer. My question was specific to sewer design and then sewer capacity issues, as an expert witness?

MR. LEFFNER: Yes.

MR. MCCANN: When was that?

MR. LEFFNER: Again, it was a few years ago, maybe five years ago, six years ago. There was a specific case that included, you know, a retail center that had downstream sewer capacity analysis, (inaudible), onsite sewer design. It included the, the design of the system as well as the capacity analysis.

MR. MCCANN: And where was that again?

MR. LEFFNER: That property was in Matcom's

territory, down in St. Mary's County.

MR. MCCANN: Okay and again, I'm sorry, how long ago? I missed that.

MR. LEFFNER: It was like five, five years ago.

MR. MCCANN: Five years ago.

MR. LEFFNER: Five, six years ago. It too had many, many hearing (inaudible) it was about five or six years ago.

MR. MCCANN: Okay. Have you ever been involved at, in any modeling of sewer capacity? That is prepared the model, evaluated the model itself, things of that nature?

MR. LEFFNER: Yes.

MR. MCCANN: You've prepared modeling before?

MR. LEFFNER: Yes.

MR. MCCANN: In, in what, in what connection?

MR. LEFFNER: In doing the capacity analysis (inaudible) modeling software to identify the capacity and hydraulic design of the sewer system.

MR. MCCANN: Okay and what, and that's actual modeling that you did, you performed yourself?

MR. LEFFNER: Correct, yeah, in the computer.

MR. MCCANN: What modeling software are you talking about?

MR. LEFFNER: There was a couple of different sewer modeling kind of like software packages. In some cases, it's as simple as an Excel spreadsheet with engineering equations

used for the capacity analysis. In some cases, software programs that identify just hydraulic design of, you know, conduits where round circular pipe are used, like Flow Master. And then it's some more complicated hours. You can actually develop a network of, of the sewer model.

MR. MCCANN: Okay and where was that and when was that, as you just described it?

MR. LEFFNER: Again, I, we kind of used each of those three practices on all projects that have any kind of sewer generating wastes. So, yeah. Yesterday and over the past few years, it's common place on projects.

MR. MCCANN: Okay. Maybe, my, my question about modeling was really directed to a modeling pertaining to an entire sewer system in, in a sewer shed or sub sewer shed as opposed to some modeling in connection with something more localized. Have you ever engaged in the former?

MR. LEFFNER: Yes.

MR. MCCANN: You have?

MR. LEFFNER: Yes.

MR. MCCANN: In the modeling of a, of a sewer shed capacity or a sub sewer shed?

MR. LEFFNER: Yes.

MR. MCCANN: And what, what jurisdiction was that?

MR. LEFFNER: Again, there's, there's probably more. We did it on both of those cases with, on the federal

properties and there's a planning tool called the hydraulic planning analysis and the WSSC sewer territory that you prepare that look at both the existing conditions as well as proposed development. Where you come up with kind of a, a plan submission to WSSC to confirm that you have either support for any proposed development or identified downstream improvements that are required.

MR. MCCANN: Yeah, I'm sorry. I should have couched that question in terms of preparing the model itself. Did you, were, were you involved in that in, in the case in --

MR. LEFFNER: Yeah, yeah, in all three of those cases.

MR. MCCANN: Okay and how about the evaluation of an existing model? Have you done any of that type of work? That is, its efficacy? In other words, for example, and I'm sorry to, let me, let me rephrase. Have you ever been involved in the recalibration or updating of, of a model for sewer design or capacity?

MR. LEFFNER: I don't know that we've ever, I've ever verified or recalibrated the model. In some cases, we will update an existing model and include our proposed development.

MR. MCCANN: And whose model would that be? Not, not yours, but someone else's that --

MR. LEFFNER: Yeah, you know, usually it's another consultant that actually prepared the model.

MR. MCCANN: Okay. In your fifteen years, let me see if I can get this question out in a clear manner. You, you've been offered this morning as an expert in stormwater design, as well as the development regulations, related policies, in addition to being an expert in sewer design and sewer capacity and analysis.

In your fifteen years, particularly given you don't reference sewer design in your resume, what percentage of your time has been sent, has been spent rather, in the area of sewer design and sewer capacity analysis as opposed to stormwater management design or any of the other land development engineering type things that you're involved in and is represented in your resume, Exhibit 41? You understand that question?

MR. LEFFNER: Yeah, and I'd say, it's tough to say. I think there are periods working on projects where if there's a heavy need, again, some of those existing sewerage area analysis where it's a significant portion of your time because, you know, on a, on an annual basis.

There's other periods where, you know, I may be more focused on stormwater management support over a project or sediment erosion control in support of a project. So, I'd say it's a, a percentage of my fifteen years. Some periods it's a much higher percentage, some other times it's a much lower percentage.

MR. MCCANN: Overall, what's the amount of time in percentage, in a percentage, you spent over those fifteen years doing sewer design or sewer capacity analysis as opposed to the many other things you apparently do?

MR. MUDD: Objection. He was asked and answered it.

MR. MCCANN: No, he didn't.

ALJ: It's, it's, he wants a total percentage. What Mr. Leffner said is it's, you know, there's a percentage --

MR. LEFFNER: Yeah.

ALJ: -- as opposed to what the number is. He's looking for the number, I think.

MR. LEFFNER: I would have to totally guess at a number.

MR. MCCANN: Okay, fair enough. Bear with me one second. What, what modeling, you mentioned modeling software that, I guess, you or your firm uses or has access to, what, what is the name of that modeling software? Do you know offhand?

MR. LEFFNER: Which one?

MR. MCCANN: I'm asking you which one. You, you made reference to modeling software and I'm asking you, I think you were mentioning it, Mr. Leffner, in connection with what you have access to at your office and what you sometimes use.

MR. LEFFNER: Yeah, there were, there's a lot of software modeling programs that we have access to that I'm not

using on day, personally on a day-to-day basis.

MR. MCCANN: Um hm.

MR. LEFFNER: Previously, again, there were Excel, Flow Master, there's one that's like infra work that I'm very limited in and then there's plug ins for auto cad. There's storm and sanitary sewer analysis that I'd say is most commonly used on projects that we're working on.

MR. MCCANN: You're, are you familiar with the modeling that the County uses?

MR. LEFFNER: Not the specific model that they use, but yes.

MR. MCCANN: You've looked at it in connection with this case?

MR. LEFFNER: Yes.

MR. MCCANN: How so?

MR. LEFFNER: Well, there's a variety of reports from the engineering firms the County has retained related to the Consent Decree. And there's also the modeling software and outputs that the County generates, depending on proposed development for the model that they maintain. And I, I would say, I think pretty much all those have already been entered in as exhibits to this case.

MR. MCCANN: Yeah, I'm not talking about outputs or reports, I'm talking about the modeling itself, the software itself. Have you, are you familiar with and have you, are you

familiar with that (inaudible) --

MR. LEFFNER: I have not received any of the County models related to this project, just the reports and outputs.

MR. MCCANN: Okay. That's it, Judge. Thank you, Mr. Leffner. Appreciate it.

ALJ: And Mr. Zimmerman, did you have any voir dire?

MR. ZIMMERMAN: Yes, and let me say, this is the first case where I have the pleasure of being in a case with Mr. Leffner. And I haven't seen any of the later, new exhibits, so I'd just mention that. So, Mr. Leffner, what year did you graduate UPI?

MR. LEFFNER: I graduated in 2008.

MR. ZIMMERMAN: Okay and how long have you been a registered professional engineer in Maryland?

MR. LEFFNER: Since 2013.

MR. ZIMMERMAN: Okay. Are there any master's degrees available in specialties of engineering?

MR. LEFFNER: There are.

MR. ZIMMERMAN: That, would that include wastewater engineering, sanitary sewer engineering, anything like that?

MR. LEFFNER: I'm not sure of the specifics but yes, I would imagine so.

MR. ZIMMERMAN: Okay, okay. Are you currently in any master's program?

MR. LEFFNER: I'm not.

MR. ZIMMERMAN: Okay and in the last three years, how many projects have you worked on and, and testified in in Baltimore County, on County projects?

MR. LEFFNER: Hm. I think there have been one or two in the last three years.

MR. ZIMMERMAN: Okay and have they involved the Jones Falls sewer shed?

MR. LEFFNER: No.

MR. ZIMMERMAN: Okay.

MR. LEFFNER: Well, yes, one, one case is within the Jones Falls sewer shed.

MR. ZIMMERMAN: And which one is that?

MR. LEFFNER: There was a variance, zoning variance, case that was located in, at 6400 Falls Road. I believe Judge Murphy was involved in that case.

MR. ZIMMERMAN: And what was the nature of the variance?

MR. LEFFNER: Building setback variance.

MR. ZIMMERMAN: Okay. So, that did not involve the study of the whole sewer system, did it?

MR. LEFFNER: It did not, but it did include proposed development generated sewer flows (inaudible).

MR. ZIMMERMAN: (inaudible) I'm sorry, what was that? A house addition?

MR. LEFFNER: Commercial building renovate, total

redevelopment.

MR. ZIMMERMAN: Okay and what's the name of that case?

MR. LEFFNER: I don't know the for, the formal name of it (inaudible).

MR. ZIMMERMAN: Okay and, and did you testify in the Torch Hill case?

MR. LEFFNER: I did not.

MR. ZIMMERMAN: Okay, okay.

MR. LEFFNER: (inaudible) our company was not involved in that case.

MR. ZIMMERMAN: All right. Okay. All right. Those, that's all the questions I have. I have a comment, whether it's an objection or qualification. I, I certainly recognize Mr. Leffner as an expert engineer.

As I always say that, their opinions, the legal opinions of engineers and other such experts, I think, have to be taken with either a grain of salt or some limitations as to the extent to which they can interpret the law. So, I'll just say that, as I do with just about every expert.

The other comment, since I don't really know the scope of the testimony, or what is planned, to the extent that there's any interaction with County staff that's been mentioned, if there's any correspondence from County back, then I think we need to have County staff testify.

I don't think we can have hearsay e-mails or letters back and forth from Mr. Leffner from, to and from County staff. Maybe to County staff, but if County staff has communicated with Mr. Leffner in writing or, or verbally, then I think we need to have County staff here. Just as we kind of did with Chris Nebre.

And the other thing is, it's not clear to me whether much, if not all, of Mr. Leffner's testimony is, is really the presentation of the main case for the Developer, rather than actually rebuttal.

So, unless it's specifically rebutting certain things that witnesses for the Protestants said, namely, Mr. Grachek, Mr. Summers and maybe one of the other experts. Unless it's specific rebuttal we should not be sort of having the Developer's main case be, being presented at this time. So, that, so we'll, we'll see what happens but those are my concerns.

ALJ: Thank you, Mr. Zimmerman. Mr. Wyatt, did you have any voir dire?

MR. WYATT: None, thank you.

ALJ: Okay and Mr. Sachse, just to, did you have any voir dire?

MR. SACHSE: No.

ALJ: Okay.

MR. SACHSE: No, I don't.

ALJ: Thank you. All right. Sorry, just muted myself. All right. So, Mr. Leffner will be admitted as an engineer with specific knowledge in development regulations, related policies of sewer design and sewer capacity analysis, as well as stormwater management design. Okay. Mr. Mudd, go ahead.

MR. MUDD: Thank you. Mr. Leffner, let's, let's start with stormwater. Were you here for the testimony of Mr. O'Leary?

MR. LEFFNER: I was.

MR. MUDD: Okay and did you review the exhibits that he presented in this case?

MR. LEFFNER: I did.

MR. MUDD: Do, do you agree with his assessment, assessment of the stormwater management design for this project?

MR. LEFFNER: I don't.

MR. MUDD: And, and why not, generally speaking?

MR. LEFFNER: I think he, the main piece that he seemed to point out or propose was that the existing condition for the property used in the pre-development hydrology analysis was to be meadow instead of the, the current state, which it was as a farm field. And I think, you know, he didn't, didn't really make any specificity to the Baltimore County design requirements and mainly just focused on the, the MDE design

manual.

MR. MUDD: Okay. I'm going to show you what was submitted as Petitioner's Exhibit, or excuse me, Protestant's Exhibit 50. Do you see that?

MR. LEFFNER: I do.

MR. MUDD: Okay and do you recognize this?

MR. LEFFNER: I do.

MR. MUDD: And just remind the Judge what this, what this document is.

MR. LEFFNER: Sure. It's one of the sections from the Maryland stormwater design manual.

MR. MUDD: Okay and it's specifically Section 2.4 in this exhibit, right?

MR. LEFFNER: Correct, 2.4, which is related to overbank flood protection, which is kind of the ten-year storm, then Section 2.5, the extreme flood control, which is referred to as the hundred year.

MR. MUDD: Okay and did you hear Mr. O'Leary's testimony regarding these sections?

MR. LEFFNER: I did.

MR. MUDD: Did you agree with his testimony?

MR. LEFFNER: I did not.

MR. MUDD: Okay. So, first, I'd like you, well, I'd like you to explain why not but, but first describe or remind the Judge what your understanding of what Mr. O'Leary's

testimony is and then why you disagree with it.

MR. LEFFNER: Sure. I think, if this is the exhibit, I think down below there was a box made around one of the statements. Yeah, that I guess was proposing that the standard for characterizing pre-development hydrologic land use for non-forested areas, including agriculture, should be meadow in good condition.

But above, kind of before getting to that standard there's, again, the Maryland manual, that has generally been adopted by all the jurisdictions, including Baltimore County, that makes reference to it.

But the first paragraph above, I think the, I don't know which sentence it is, but it says overbank flood protection for the ten-year storm shall only be required if the local approval authorities have no control over flood plain development, no control over infrastructure and conveyance system capacity design or determine that downstream flooding would occur as a result of the development.

So, reading that, I think the, the criteria below aren't necessarily required, which I say is what Mr. O'Leary had proposed. Instead, as Baltimore County does have control over flood plain development, they also have control over infrastructure and conveyance system design.

And through the stormwater management or flood plain or any of the other studies that coordinate with the County,

determine whether they'll be any downstream flooding as a result of the development.

MR. MUDD: Okay and so what, so what, what specifically then is your opinion about whether or not this, this red box on Exhibit 2.4, excuse me, Section 2.4, Exhibit, Protestant's Exhibit 50, whether or not this applies in Baltimore County?

MR. LEFFNER: Yeah, I don't, I do not think it's a requirement in Baltimore County.

MR. MUDD: Okay. So, explain if you will for the Judge a little bit about why you think it is not a requirement, in, in more detail than you have already.

MR. LEFFNER: So, as I say, because the County does have control over those three areas, --

MR. MUDD: I'm sorry, let me cut you off there. Can you describe how Baltimore County has control over those three areas?

MR. LEFFNER: Yeah, related to the, kind of I'd say the first bullet point, which is flood plain development, the County --

MR. ZIMMERMAN: I, I object. That calls for a legal interpretation.

ALJ: Overruled. Go ahead.

MR. LEFFNER: So, the, the County does have a flood plain ordinance, which can prevent, which restricts, prevents

the development in the flood plain, requires flood plain studies in some cases, so they have control over development within the flood plain.

The no control over infrastructure conveyance system capacity design, again, the County, I know we've been referring to the sewer design manual. There's also a storm drain design manual. So, you know, which has to be applied to projects within Baltimore County and the County reviews and approves those, so they do have control over infrastructure conveyance system design.

And again, related to the downstream flooding that would occur as the proposed development, there's a requirement to prepare stormwater management plans that have to be reviewed and approved, as well as, you know, in some cases, a flood plain study depending on contributing drainage areas in a location within a certain watershed. So, they have control over all three of those, to which different engineering standards are applied to.

MR. MUDD: Okay. So, so then, it, it's your, let me, let's skip that. It, does, in your experience, does Baltimore County actually use overbank protection, even though it's not required?

MR. LEFFNER: In most cases they do, yes.

MR. MUDD: Okay. In, in your experience, does Baltimore County apply the meadow in good condition evaluation

that Mr. O'Leary states is mandatory under this section?

MR. ZIMMERMAN: Objection. Unless we've got County documents on when they do or don't, I don't think it's up to this witness to tell us when the County does or does not use meadow or anything else.

MR. MUDD: I think it's perfectly fine in his experience to explain whether or not he's done it.

ALJ: Right, yeah. It's, it's overruled. I'm sure he can explain what his experience is with the County and in terms of what the, he believes the County. I mean, he's familiar with these things. So, he can certainly (inaudible) that. Overruled.

MR. LEFFNER: Yeah, I mean, I would say the approved stormwater management concept plan for this project is a perfect example that it was not applied. Subsequent to the approval of the stormwater management and hearing Mr. O'Leary's testimony, I, we, I confirmed with the County that it, it was not their standard and that the standard used to develop the stormwater concept plan for this project was applicable.

MR. ZIMMERMAN: Move to strike. It's hearsay.

MR. MCCANN: And I, I join in that motion. On an issue like this, I think we need witnesses, not hearsay.

ALJ: Okay. Well, I, I, I'll strike the, the statement that the County said what, you know, that this was the standard that you confirmed with them, because it is

hearsay to the extent that, you know, the Protestants can't, and People's Counsel can't, cross examine on that, on that issue. They can cross examine you, but, but not in terms of what your understanding is and your experience is in the County in, in doing this, this type of work, so. Go ahead.

MR. MUDD: Did, did you, following the testimony of Mr. O'Leary, did you engage in discussions with Baltimore County?

MR. LEFFNER: Yes.

MR. MUDD: Is there anything that you learned in those discussions that caused you to want, to need to re-evaluate or want to re-evaluate stormwater management in this case?

MR. LEFFNER: No.

MR. MUDD: Okay.

MR. ZIMMERMAN: Same objection, same objection. That's, that's just another way of getting indirectly kind of hearsay in.

ALJ: Over, overruled. Mr. Leffner can testify about what he learned in, in terms of, you know, his discussions and so he can tell us what he's learned and understands.

MR. MUDD: Thank you, Judge. Let's talk about other, other jurisdictions. Have, have, what has been your experience in other jurisdictions in Maryland regarding this meadow in good condition evaluation?

MR. MCCANN: Objection. Relevance, Your Honor.

ALJ: Yeah, is, is it relevant to, to this case in the County?

MR. MUDD: Well, I, I would say it's relevant in the sense that this is a Maryland, a Maryland manual and the, I believe, and I realize that this is a, an argument here and not testimony. But I believe the assertion from Mr. O'Leary was that this is, this is required across Maryland. So, I think it's worthwhile to understand what other jurisdictions do to see whether or not they do, they evaluate things the same as Baltimore County does.

MR. MCCANN: I, I don't think that answers the question. I think that begs the question. The question is, there's, there's a state manual and there are local requirements in Baltimore County. Yes, this, this manual is adopted elsewhere.

But the fact that it's adopted elsewhere and how it's applied elsewhere doesn't make a whit of difference as to how, if at all, or when it's applied in this jurisdiction. The, the objection is still the same. The relevance is the same regardless of whether it's a state manual or not. That doesn't answer anything relevant.

MR. MUDD: I, I mean, Your Honor, I would say to, to the extent that there's an intimation that because this is a state document that it applies statewide uniformly, I think

it's worthwhile to understand what happens in other jurisdictions.

MR. MCCANN: I, when Mr., when Mr. O'Leary, just to finish that thought. When Mr. O'Leary said that, if he said that, I don't recall if he said that, I think that was entirely by way of background. That this is a state manual that's adopted by local jurisdictions.

He, when he said that, he was not trying to make a statement about extent to which it's applied in other jurisdictions. So, I think we're in new territory here, number one. It's not in response to anything Mr. O'Leary said. And number two, it's, it's irrelevant.

ALJ: So, I reviewed Mr. O'Leary's testimony, I, I don't recall, I mean, it didn't jump out to me that he was going through what other jurisdictions have, have said or what they apply.

And so, but I guess I'm trying to figure out is this going to move the ball forward for me at all? Or is this just a point that you thought maybe you needed to, that you thought maybe he said that, I, I mean, I, you know, I always have a tendency to like allow testimony. It's just that I'm not sure if this is something that I need, is this?

MR. MUDD: Well, I guess, Your Honor, if, if you're, if you're not accepting this as some sort of statewide mandate, then I'm not sure you do need it. If you're focused on, on

Baltimore County.

But I, but again, I know I'm saying it for the third time, to, to the extent that there's a suggestion, or that there will be argument made that the state manual says that you have to do it this way, and Baltimore County is some sort of outlier, I, I think this question is important.

ALJ: Okay, all right. Well, I'm going to, based on that last statement, I'm going to allow it just if, just for the sake of making sure the record is clear. And, in fact, if argument is made. It, the, it didn't jump out to me in his testimony. But I, I could have missed that. And so, if I missed that, I want to make sure that, that I got the point as well. So, I'm going to overrule the objection. Go ahead.

MR. MUDD: Thank you. Mr. Leffner, have you seen any other jurisdictions require the meadow in good condition evaluation?

MR. LEFFNER: Yes, yes.

MR. MUDD: And how many?

MR. LEFFNER: A couple in this state. And I'd say in most cases it's kind of project by project reviewed. Many times, projects that are on federal properties may be required to use the meadow in good condition for unforested areas. But, you know, pavement areas they'll consider as existing, which isn't identified down below there. There's a few other counties that I would say just do it across the board, just all

projects that are unforested use it.

There are some jurisdictions in Maryland that are more strict than this. They have a higher standard. But I'd say the majority of the jurisdictions that I've done work in do not apply this standard and specifically with agricultural farm fields to allow the existing land use to be considered as ag or (inaudible) cropland.

MR. MUDD: Okay. Let's assume for a second that Mr. O'Leary is correct, that you would need to evaluate using meadow in good condition as the pre-existing condition here. How, if at all, would that change your analysis in this case?

MR. LEFFNER: I think, there's kind of two parts that Mr. O'Leary, that I think did a good job of summarizing, which was the existing hydrologic analysis would be affected. When, when doing it, I think that his exhibits, he, he had had a mark up saying that the runoff curve number or kind of the land use within the property would change. You know, in general, those numbers would go down from what they're currently approved at.

Likewise, the time and concentration, so, how long water takes to move across the site would likely be increased some. So, with the land use going down and the time of concentration going up, the amount of runoff or the rate of runoff leaving the site would likely be reduced if we implemented what Mr. O'Leary said with the existing being meadow.

Similarly, in the proposed development, the current approved concept plan had some pretty conservative assumptions made related to both of those same two factors that affect the runoff rates. The land use curve numbers, when we do the final design, may also go down. The time of concentration paths were assumed at minimums when we prepared the concept plan, just in, to be conservative.

So, those two would likely become longer that would reduce the, the post-development runoff rates. And really what it does is the, the amount of quantity control, or the amount of (inaudible) that you have to do onsite to just maintain those existing runoff rates from the project, the more those rates are different. In general, there's more storage required within a stormwater management practice.

MR. MUDD: Okay. So, in a, in a, in a more direct way, do you think if, if Mr. O'Leary is correct, could you achieve a design that would work on this, this site, a stormwater management design?

MR. LEFFNER: Yes, --

MR. MCCANN: Objection, objection. Was, and I'm sorry if I misheard, was the question, could you achieve?

MR. MUDD: Yeah.

MR. MCCANN: I, well, I object to that.

ALJ: Well, it was based on the hypothetical before so.

MR. MCCANN: Yeah, but the point is, we're dealing with a plan, a hypothetical plan, that hasn't been apparently, hasn't been reviewed and approved by Baltimore County. So, will you meet, in other words, the question effectively is, if you have to, will you meet the regulations. And I don't think that's appropriate because we have a concept plan in front of us. And number two, I don't think it's, frankly, it's not relevant to the plan that's before us.

ALJ: Could you achieve the design, Mr., could you achieve the design if you used a meadow as existing conditions, wasn't that, wasn't that the question?

MR. MUDD: It is, yeah. Could, could, could you, could you achieve a stormwater design that would comply with laws and regs if, if you assumed that Mr. O'Leary's analysis was the way that you had to apply it?

ALJ: Yeah, overruled. Go ahead.

MR. LEFFNER: Yes.

MR. MUDD: Okay and how do you know that?

MR. LEFFNER: We performed an analysis and did just that.

MR. MUDD: Okay.

MR. MCCANN: That's, Your Honor, that's my, that's exactly my problem. What they're doing right now is they're amending the, the stormwater management plan and, you know, even if it's couched in, in terms of a hypothetical, what, what

they're effectively doing is saying that Mr. O'Leary was right and just to make sure, we changed the plan and to, to accommodate his, his points. And I don't think we should be doing that at this stage of this proceeding.

MR. MUDD: Judge Murphy, there was expert testimony on the other side that said this plan should fail because of this issue and all I'm trying to demonstrate, and will demonstrate, through Mr. O'Leary, excuse me, through Mr. Leffner's testimony is that, is that it would not fail and should not fail.

And as, as we talk about the testimony of when stormwater management design is finalized and achieved, I think you'll understand exactly what we're trying to do in presenting this exhibit and having this discussion and this testimony.

MR. MCCANN: Yeah, it, it will not fail if we're, if we amend the plan and that's the problem --

MR. ZIMMERMAN: Can, can I add something? If they wanted to do this, they should have presented an alternative plan already to the County for review and not just talk about it, you know, all of a sudden today in, in some hypothetical way. They should have presented it as a specific alternative plan.

MR. MCCANN: And I've asked --

MR. ZIMMERMAN: Months ago.

MR. MCCANN: And I've asked stormwater management, by

the way, for any updated plans, so.

MR. MUDD: Right, and, and, and Judge Murphy, this is a hypothetical. The testimony is we don't need to do it. And the purpose --

ALJ: Well, that's what I got out of it. I didn't get out of it they're changing the plan to meet what Mr. O'Leary decided was, should happen. I, I, what I got out of it is let's go through his hypothesis and see if his analysis is correct. That, that, that's the question --

MR. MCCANN: Well, I understand, Your Honor, I understand completely. My problem is, is the hypothesis is irrelevant because that's not the plan we have. It sounds great. Yeah, let's, let's let an expert hypothesize, that's what experts do. But the hypothesis is irrelevant, because that's not the plan. Period.

ALJ: Okay. I mean, but, but still, they have a right to go back and rebut what Mr. O'Leary says. So, to that extent, I mean, it may serve two purposes, but they can go back and rebut what his, his opinion was. So, I'm going to overrule, go ahead.

MR. MCCANN: (inaudible).

MR. ZIMMERMAN: But the timing is unfair the way it's being presented.

ALJ: It, it's not, it's not a new plan. It, right now, what it is is rebutting what Mr. O'Leary says. So,

that's, that's how I'm taking it. So, overruled.

MR. MUDD: Mr. Leffner, do you recognize Exhibit 42?

MR. LEFFNER: I do.

MR. MUDD: Okay and can you describe for the Judge what this shows?

MR. LEFFNER: Sure. The, what this exhibit shows is revisions to the preliminary grading within the two stormwater management areas that are proposed that would accommodate the additional quantity control storage that would be required of the project if the existing condition land use was considered meadow.

MR. MUDD: Okay and there are other stormwater management devices on site, aside from these two devices, is that correct?

MR. LEFFNER: Correct.

MR. MUDD: Would, would Mr. O, would, assuming Mr. O'Leary's analysis require any changes to those other facilities?

MR. LEFFNER: No.

MR. MUDD: Okay. When, when would you, in any development case, but in this case, when would you finalize the stormwater management design for this project?

MR. LEFFNER: During the phase two process, prior to permits.

MR. MUDD: Okay.

MR. MCCANN: That's where we are, Your Honor. We ended up exactly where I said we were going to end up.

MR. MUDD: Well, if I can continue with the questioning --

MR. MCCANN: (inaudible).

ALJ: It's not, no, but it's not, it's not an objection, you're not objecting, you're making (inaudible) --

MR. MCCANN: Well, I didn't say the word objection, but it is an objection. So, I'll just ask, I know you're, I'll ask for a continuing objection. But we're ending up exactly where I said we would.

ALJ: Okay, understood. All right. Overruled.

MR. MUDD: Thank you. Can you please remind Judge Murphy what is required in regard to stormwater management design for advancement of a development plan at this stage?

MR. LEFFNER: Sure. The stormwater management plan is supposed to identify the type and location of stormwater management practices and have preliminary computations prepared to support the design. And that the stormwater management requirements can be met as proposed.

MR. MUDD: Okay and so what, if anything, would change in that respect if you were required to apply the meadow in good condition and, and utilize this, this revised version of the plan?

MR. LEFFNER: Really nothing related to the

stormwater design. The, both the types of facilities and locations would remain the same. The fine grading and retaining wall design for the project would be really the only thing that's revised. And again, for a development plan, it's preliminary grading that's shown and it typically evolves during the final design phase two process.

MR. MUDD: Okay. Does, does the development plan as submitted show stormwater management easement areas?

MR. LEFFNER: It does.

MR. MUDD: Do the blue lines or any of the work that you are proposing or would propose if you were required to, require any changes to that easement area?

MR. LEFFNER: It would not.

MR. MUDD: Okay. In your opinion, should the concerns raised by Mr. O'Leary prevent the development plan from being approved?

MR. LEFFNER: No.

MR. MUDD: Does the green line plan that was previously presented in this case, which I'll refer to as the development plan, in your opinion, satisfy all County laws, rules and regulations pertaining to stormwater management?

MR. LEFFNER: Yes.

MR. MUDD: What is your opinion about the applicability or need for this blue line exhibit to accommodate an approval of the development plan in this case?

MR. LEFFNER: I don't think it should be required.

MR. MUDD: Are you asking the Judge to apply this blue line exhibit in response to Mr. O'Leary's concerns?

MR. LEFFNER: No.

MR. MUDD: Then why did you prepare it?

MR. LEFFNER: Based on Mr. O'Leary's testimony that the stormwater management design is, and specifically the areas, would not work should the meadow standard be required. So, we put this together to say, you know, it, it does not have some type of catastrophic affect on the stormwater management design.

Instead, with some refinement of the grading and quantity control that's provided, even if that standard did somehow become required during the final design, we should be able to accommodate in those blue line areas.

MR. MUDD: Okay. I'll move Exhibits 41 and 42 into evidence, Judge Murphy.

ALJ: And Mr. McCann, you're objecting?

MR. MCCANN: Yes, for the reasons I've stated. Thank you.

ALJ: Sure. Forty-two, forty-one is his resume though.

MR. MUDD: That's right.

ALJ: Yeah, you don't object to forty-one, Mr. McCann?

MR. MCCANN: No, I do not, I'm sorry.

ALJ: Okay and then, so forty-two --

MR. ZIMMERMAN: I join in the objection to forty-two.

ALJ: Forty-two. Okay and, and Mr. Wyatt, Mr. Sachse, Mr. Sachse? Let's see.

MR. SACHSE: I know you don't have my video up there but, yes, I join in the objection.

ALJ: All right. Mr. Wyatt?

MR. WYATT: So too do I join in.

ALJ: Okay, all right. Thank you. All right. We're going to accept exhibit number forty-two, just to the extent of his testimony here today.

MR. MUDD: Thank you. Let's move on and talk about sewer, Mr. Leffner. Were you, have you been present for all the days of testimony in this case?

MR. LEFFNER: No, not all of them.

MR. MUDD: Okay. Were you here for the testimony of Mr. Randall Grachek?

MR. LEFFNER: I was.

MR. MUDD: And Mr. Summers?

MR. LEFFNER: Yes.

MR. MUDD: Okay and have you reviewed all the exhibits that the Protestants submitted through those witnesses?

MR. LEFFNER: I believe so, yes. Some of them were

out of number, but I, I think I got the final copy of all them were, that were accepted.

MR. MUDD: Okay. Do you think that the testimony and exhibits presented by those witnesses provide any evidence that the development plan as proposed does not satisfy the County laws, rules and regulations pertaining to sewerage and the development plan standards?

MR. LEFFNER: No.

MR. MUDD: Okay. Let's talk about the Consent Decree. Are you familiar with that document, when I use that term?

MR. LEFFNER: I am.

MR. MUDD: All right. Bear with me here. And I'm showing you Protestant's Exhibit 65. Are you familiar with this?

MR. LEFFNER: Yes.

MR. MUDD: Can you see it?

MR. LEFFNER: Yep.

MR. MUDD: Okay. What's your, what, what is the stated purpose for the Consent Decree?

MR. LEFFNER: I, the kind of overall requirement for, for the purpose is to make sure that Baltimore County is taking all the measures to meet the Clean Water Act requirements. Specifically with the goal of eliminating sewer overflows.

MR. ZIMMERMAN: Move to strike. First, first of all,

the Consent Decree speaks for itself and there is much more in the Consent Decree as to its purposes than in that answer.

ALJ: Understood. Overruled. The other witnesses have actually said the same thing and they've described what they think the purpose is. It is, does speak for itself but I'll allow Mr. Leffner to testify.

MR. MUDD: Mr. Leffner, I'm directing your attention to the bottom of page three and the top of page four. Do you see, do you see that purpose?

MR. LEFFNER: Yes.

MR. MUDD: Okay. Is it this provision that, did, did, how did this provision impact your testimony that you just gave?

MR. LEFFNER: That's pretty much the main purpose I was referring to.

MR. MUDD: Okay and what, what measures has the County undertaken, are, are they undertaking, that you understand, to comply with the Consent Decree to achieve that goal?

MR. LEFFNER: A lot.

MR. MUDD: Okay. Are they contained in this document?

MR. LEFFNER: They are, yeah, and it's a, you know, a mix of existing condition assessments, studies that are being performed, improvements that are being constructed, programs

that are being established, maintenance and operation programs. There's, there's a lot packed in, at least that I'm aware of, that the County has been doing in order to react and compliant with this Consent Decree.

MR. MUDD: Okay and I, I, I want to be cognizant of the fact that the document does speak for itself, but I do want to touch on some of the, the provisions and, and go through a few things with you. So, let me zoom out a little bit here. Do you see this at the bottom of page eight?

MR. LEFFNER: I do.

MR. MUDD: Okay and we're in section seven here, paragraph seven?

MR. LEFFNER: Yep.

MR. MUDD: Okay. So, are you, do you know whether, strike that. Are you familiar with the long-term capacity analysis that, that Baltimore County performed?

MR. LEFFNER: I am.

MR. MUDD: Okay and do you know whether or not that was a requirement of the Consent Decree?

MR. LEFFNER: It was.

MR. MUDD: Okay. Bear with me here. What was the purpose for the long-term capacity analysis?

MR. LEFFNER: I'd say in general, it was to consider population, the existing infrastructure, so the existing sewer network within the Jones Falls. Well, I guess the Consent

Decree had a requirement across Baltimore County --

MR. ZIMMERMAN: Can I have a continuing, Judge Murphy, I'd like a continuing objection. This is a hundred-and fifteen-page Consent Decree. It speaks for itself. If there are any documents showing what the County did, then the documents speak for themselves.

It's not for this witness to give a narrative of, you know, the County's done this, that or the other. The County has done whatever it's done and the documents either are there or are not there. But I think this is all hearsay as to what the County's done or not done.

ALJ: Right, so Mr., Mr. Grachek did the same thing. He went through the Consent Decree, other witnesses have gone through the Consent Decree and highlighted paragraphs and gone through the long-term capacity analysis report as well, it extensive, extensively. So, we're going to allow this witness to do the same. Overruled.

MR. MUDD: Thank you. I think you were cut off, Mr. Leffner. I had asked you, I had asked you what your understanding of the purpose of the long-term capacity analysis was.

MR. LEFFNER: Yeah, and in the Consent Decree it, it was required in Baltimore County as kind of an evaluation tool to analyze the existing sewer network within Baltimore County, as well as existing uses and anticipated growth as a, kind of a

model or an appropriate baseline for considering future growth and system capacity within the County.

MR. MUDD: Okay. Let me draw your attention to paragraph 9.C., I guess roman two, g. And I'm going to ask you, what did the Consent Decree require of Baltimore County regarding implementation of design and construction activities relevant to any particular design storm? I'll (inaudible) it down there.

MR. LEFFNER: Yeah, I, I think it, it, there was kind of differing requirements of the Consent Decree. They identified, I believe it was three storm events that needed to be considered in the analysis of the long-term capacity and other studies. But didn't necessarily require Baltimore County to implement or construct improvements to meet any of those three storms.

MR. MUDD: Okay and are you aware that Baltimore County prepared a sewer shed repair and replacement, excuse me, sewer shed repair, replacement and rehabilitation plans?

MR. LEFFNER: Yes.

MR. MUDD: And they prepared one for, for the Jones Falls sewer shed?

MR. LEFFNER: Yes.

MR. MUDD: Okay and was that a requirement of the Consent Decree?

MR. LEFFNER: It was.

MR. MUDD: Okay. Did you hear Mr. Grachek's testimony regarding whether or not, sorry, and you're, you're familiar, let me show you, (inaudible), I think there's somebody --

ALJ: Hold on one second. Yeah, there are people who keep unmuting. Somebody keeps, hold on one second. Let me see what that is.

MR. MUDD: Thank you.

ALJ: If everyone, if everyone could just keep their microphones muted, please? Thank you.

MR. MUDD: So, I'm, I'm showing you Protestant's Exhibit 67. Are you familiar with this, Mr. Leffner?

MR. LEFFNER: Yes.

MR. MUDD: And this is the sewer shed repair, replacement and rehabilitation plan?

MR. LEFFNER: Correct.

MR. MUDD: Also know as the SRRR plan?

MR. LEFFNER: Yes.

MR. MUDD: Okay and this was performed by RK&K?

MR. LEFFNER: Correct.

MR. MUDD: Okay. Did you hear Mr. Grachek's testimony regarding whether or not this plan had been accepted or approved by MDE and EPA?

MR. LEFFNER: Yeah.

MR. MUDD: What, what did he say?

MR. LEFFNER: I believe he said it was not approved by MDE or the EPA.

MR. MUDD: Okay. Bear with me here. Share with you what we've marked as Developer's Exhibit 43. Do you recognize this, these documents?

MR. LEFFNER: I do.

MR. MUDD: Okay and what is, it's two pages, correct?

MR. LEFFNER: Correct.

MR. MUDD: All right. What does the first page say generally?

MR. LEFFNER: The first page --

MR. MUDD: I know it's, I'm sorry, I know that these speak for themselves. I just would like you to identify it for the record.

MR. LEFFNER: Yeah, the, this letter is from the Maryland Department of the Environment that identifies the review of the SRRR, which included the Jones Falls SRR plan and their, essentially, acceptance or approval of it.

MR. MUDD: Okay.

MR. LEFFNER: Meeting the requirements of the Consent Decree but also expresses that they, they do not speak on behalf of the EPA.

MR. MUDD: Okay and then, what's the second page?

MR. LEFFNER: The second letter is a similar letter from the EPA which, again, is related to the SRR plan, which

includes the Jones Falls SRR plan and acknowledges that it meets the requirements of the Consent Decree.

MR. MUDD: Okay, thank you. I'm going to switch back to Protestant's sixty-seven. And I'm going to ask you what, what, what specific improvements to the sewer system are dictated by this plan? You know where they're shown, or can you direct me to that?

MR. LEFFNER: Yeah, the figure near the end, I think it was map 5.1, 6.1.

MR. MUDD: Is this it?

MR. LEFFNER: Yes.

MR. MUDD: Okay, great. So, this is, this is from the SRR plan, map 6.1. All right. Sorry I keep bouncing around here. I'm going to move, I'm sorry, move Exhibit 43 into evidence while I'm pulling up this next exhibit.

ALJ: Any objection, Mr. McCann?

MR. MCCANN: No objection.

ALJ: And Mr. Zimmerman?

MR. ZIMMERMAN: No objection to that one.

ALJ: Thank you.

MR. MUDD: Okay. I'll show you what we marked as Developer's Exhibit 44. Can you explain what this document is?

MR. LEFFNER: Sure. It, it's a, a mark up of map 6.1 that I prepared identifying the one, just the route from the proposed project area down to the limits of Baltimore County

where it meets Baltimore City system. I think the route is very similar to some of the exhibits that were shared by the Protestant.

In addition, we identified manhole numbers and pipe run segments and tried the best to, to kind of color code them to the required improvement at each of those locations down in the legend key in the bottom left corner.

MR. MUDD: Okay. So, I want to go through it point by point. So, what, what's this, this pink line here?

MR. LEFFNER: The, the pink line is the sewer route from the proposed project area down to the, kind of the limits of the Baltimore County/Baltimore City line.

MR. MUDD: Okay and then each of these boxes, can you describe what these are? You don't, I'm not going to go box by box yet, but what are these boxes meant to show?

MR. LEFFNER: Yeah, any of the boxes with one number in it, it's a manhole improvement that was required and any of the boxes with two numbers in it, it was a pipe improvement that was required.

MR. MUDD: Okay and then what does the color have to do with it?

MR. LEFFNER: It's the type of repair that was recommended and required.

MR. MUDD: Okay and if we look on the bottom, I'm going to zoom in a little bit. If we look on the bottom left

of this plan, you, what, what, what, what, if any, impact or, not impact, but what's the, the meaning of this key versus what you've prepared on, what you've added to the plan?

MR. LEFFNER: I haven't really added much, just trying to call out manhole numbers, since the manhole numbers weren't included on this exhibit.

MR. MUDD: Uh huh.

MR. LEFFNER: And then also kind of color coded it with a key, just to help differentiate between, for example, the 6875 to 6874, I believe, the red box, was a lining improvement that was required along the sewer pipe.

MR. MUDD: Got it. So, it's red over here where you call it out and that's meant to correspond with the red over here?

MR. LEFFNER: Right, yep. And same for the (inaudible).

MR. MUDD: All right. So, then let's go, let's go through these improvements if we can, if you know. So, what, what was required to be performed in 43820, at manhole 43820?

MR. LEFFNER: Yeah, I think that was line, they were supposed to clean the manhole, line it and then do frame and cover work?

MR. MUDD: Okay and how about 43819?

MR. LEFFNER: Similar, but it was just a clean and line of the manhole.

MR. MUDD: Okay and 43794?

MR. LEFFNER: The, the same as the previous, the three, the 43820.

MR. MUDD: Okay and then 43794 to 43793, what's that?

MR. LEFFNER: Was a lining of the existing pipe.

MR. MUDD: Okay and 43793, stand alone, this, this pink box?

MR. LEFFNER: The, the same as the 43794.

MR. MUDD: Okay and then maybe these three, because they're the same color, can be handled the same. But how about 53270, 44213 and 44212? For those three, it was just frame and cover work.

MR. MUDD: Okay and then 6883?

MR. LEFFNER: The same as those previous three.

MR. MUDD: Okay and did you undertake any effort to verify whether that work has been completed?

MR. ZIMMERMAN: Objection, objection. That calls for, you know, hearsay. The County needs to be there to talk about that.

ALJ: But Mr. Grachek testified about that, and his testimony was that he did not believe the County did do these remedies. So, Mr. Leffner can come back in rebuttal and say what he thinks, whether they did or they didn't. So, overruled.

MR. MUDD: Thank you. What's your understanding, Mr.

Leffner?
